
$$CD = \frac{12 \times 16}{20} = 9.6\ \text{cm},$$

which is the radius of the sector.

Therefore, arc of the sector

$$= 2\pi \times 9.6 \times \frac{90}{360} = 4.8\pi$$

Let the radius of the cone be r, then

$2\pi r =$ arc of the sector

$2\pi r = 4.8\pi$

$r = 2.4$

$\therefore$ Height of the cone $(h) = \sqrt{l^2 - r^2}$

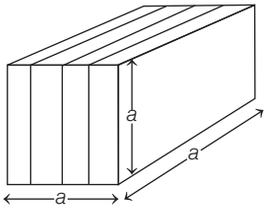
$$= \sqrt{(9.6)^2 - (2.4)^2} = 2.4\sqrt{15}\ \text{cm}$$

$\therefore$ Volume of the cone $= \dfrac{1}{3}\,\pi r^2 h$

$$= \frac{1}{3} \times \frac{22}{7} \times (2.4)^2 \times 2.4\sqrt{15}$$

$$= 56.1\ \text{cm}^3$$

29 To increase the value (or price of diamond) they should cut (divide) the diamond in such a way that the surface area will be maximum.



Thus, when four parts are parallel to each other.

In this way total surface area

$$= 6a^2 + 2a^2 + 2a^2 + 2a^2 = 12a^2$$

Actual surface area of cubical diamond = $6a^2$

Therefore, percentage increase in area

$$= \frac{12a^2 - 6a^2}{6a^2} \times 100 = 100\%$$

Remember that for the given volume, minimum surface area is possessed by a cube. So to maximize the area we have to increase the maximum possible difference between the edges of cuboid.

30 Side of square I = a

Side of square II = $\frac{a}{\sqrt{2}}$

Side of square III = $\frac{a}{2}$

Side of square IV = $\frac{a}{2\sqrt{2}}$

Side of square V = $\frac{a}{4}$

Therefore, sum of perimeters of all the squares

$$= 4\left(a + \frac{a}{\sqrt{2}} + \frac{a}{2} + \frac{a}{2\sqrt{2}} + \frac{a}{4}\right)$$

$$= 4a\left(1 + \frac{1}{\sqrt{2}} + \frac{1}{2} + \frac{1}{2\sqrt{2}} + \frac{1}{4}\right)$$

$$= 4a\left(\frac{4 + 2\sqrt{2} + 2 + \sqrt{2} + 1}{4}\right) = a(7 + 3\sqrt{2})$$

31 Total area of the five squares

$$= a^2 + \left(\frac{a}{\sqrt{2}}\right)^2 + \left(\frac{a}{2}\right)^2 + \left(\frac{a}{2\sqrt{2}}\right)^2 + \left(\frac{a}{4}\right)^2$$

$$= a^2\left[1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16}\right]$$

$$= a^2\left[\frac{16 + 8 + 4 + 2 + 1}{16}\right] = a^2 \times \frac{31}{16} = \frac{31a^2}{16}$$

32 $(n-2)^3$

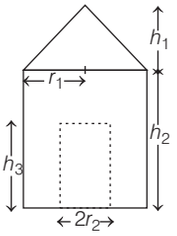
33 $6(n-2)^2$

34 $12(n-2)$

35 There are 8 cubes at the corners, which are always fix.

36 Volume of the whole body

$$V_1 = \frac{1}{3}\pi r_1^2 h_1 + \pi r_1^2 h_2$$



but $\frac{h_1}{h_2} = \frac{2}{3}$

$\therefore \quad V_1 = \pi r_1^2 \frac{11h_1}{6}$

and $h_3 = \frac{2}{3}(h_1 + h_2) = \frac{5h_1}{3}$

Hence, volume of the hole $(V_2) = \pi r_2^2 h_3$

$$= \frac{5}{3}\pi r_2^2 h_1$$

But it is given that $V_2 = \frac{V_1 - V_2}{3}$

$\therefore \quad V_1 = 4V_2$

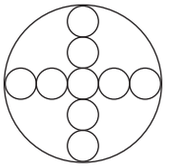
$\Rightarrow \quad 4 \times \frac{5}{3}\pi r_2^2 h_1 = \pi r_1^2 \times \frac{11}{6} h_1$

$\Rightarrow \quad r_2 = \sqrt{\frac{55}{8}}$ cm

37 $19 \times 19 = 361$

Thus, we make equal 19 measurements each of 19°, then we get $(361 - 360) = 1°$ angle at the centre. Thus, moving continuously in the similar fashion, we can get all the 360° angle *i. e.*, 360 equal sectors of 1°.

38 When we open the paper after cutting it, we will find it as shown in the following figure.



Radius of the larger circle = 5 cm

$\therefore$ Area of larger circle = 25π

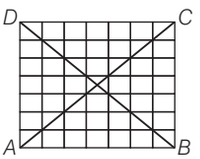
and the radius of each smaller circle is 1 cm.

Therefore, total area of all the 9 circles = $9 \times \pi \times (1)^2 = 9\pi$

$\therefore$ Remaining area = $(25 - 9)\pi = 16\pi$

Hence, the required ratio = 25 : 16

39 In the top layer we can see that total 13 cubes get a cut. So, in 7 layers total $13 \times 7 = 91$ cubes will get a cut and the remaining $(7^3 - 91) = 252$ cubes are without any cut.



Total number of pieces which are not a cube

$$= 12 \times 2 \times 7 + 4 \times 7 = 196$$

(Since 84 cubes are diagonally cut into two parts and 7 cubes which are in the centre are divided into 4 parts.)

Thus, total 196 children and teenagers will get one-one piece and 252 adults get one-one piece.

Thus total 252 + 196 = 448 people can get a piece of cake.

NOTE It is clear that everyone get equal number of pieces but not according to the volume of pieces.

Solutions (for Q. Nos. 40 to 42) *Diameter* $(2R)$ *of the outermost circle is equal to the diagonal of larger square.*

Hence, the side of square $= \dfrac{2R}{\sqrt{2}} = \sqrt{2}R$

Again the side of larger square is equal to the diameter of middle most circle.

Hence, the radius of mid-circle is $\dfrac{R}{\sqrt{2}}$.

Once again the diameter of the mid-circle is equal to the diagonal of smaller square. Hence, side of the smaller square $= R$. Similarly the diameter of innermost circle is equal to the side of the smaller square.

Hence, radius of the innermost circle $= \dfrac{R}{2}$.

40 $\dfrac{R}{2}$

41 Area of larger square $= (\sqrt{2}R)^2 = 2R^2$

and area of smaller square $= R^2$

$\therefore$ Total area of both squares $= 3R^2$

42 Sum of all the circumferences $= 2\pi\left(R + \dfrac{R}{\sqrt{2}} + \dfrac{R}{2}\right)$

$$= 2\pi R\left(\frac{2+\sqrt{2}+1}{2}\right)$$

$$= (3+\sqrt{2})\,\pi R$$

Sum of perimeters of all the squares $= 4(\sqrt{2}R + R)$

$$= 4R(\sqrt{2}+1)$$

$\therefore$ Required ratio $= \dfrac{(3+\sqrt{2})\,\pi R}{(\sqrt{2}+1)\,4R} = \dfrac{(3+\sqrt{2})\,\pi}{(\sqrt{2}+1)\,4}$

Alternatively Since circumference and perimeter both has R. So R will be cancelled in the ratio of circumference to the perimeter. Thus, neither of the choices *a, b* and *c* are admissible. Hence, the only correct choice is (d).

Solutions (for Q. Nos. 43 to 45) *Each side of outer (larger) hexagon is equal to the radius of circle which is R.*

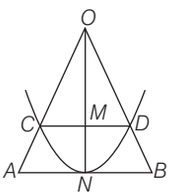
Now, $OC = ON = OD$

radii of the inner (smaller) circle

But $\dfrac{ON}{OA} = \sin 60° = \dfrac{\sqrt{3}}{2}$

$\Rightarrow$ $ON = \dfrac{\sqrt{3}}{2}OA = \dfrac{\sqrt{3}}{2}R$, radius of the inner circle

and this is also equal to the side of the inner hexagon.



43 Sum of perimeters of both the hexagons $= 6R + 6 \times \dfrac{\sqrt{3}}{2}R$

$$= 6R\left(1 + \frac{\sqrt{3}}{2}\right)$$

$$= 3(2+\sqrt{3})R$$

44 $\dfrac{\text{Area of inner circle}}{\text{Area of outer circle}} = \dfrac{\pi}{\pi}\dfrac{\left[\left(\frac{\sqrt{3}}{2}\right)R\right]^2}{(R)^2} = \dfrac{3}{4}$

45 Each side of the first hexagon $= R$

Each side of the second hexagon $= \dfrac{\sqrt{3}}{2}R$

Each side of the third hexagon $= \dfrac{3}{4}R$

Each side of the fourth hexagon $= \dfrac{3\sqrt{3}}{8}R$

$\therefore$ Required ratio $= \dfrac{R}{\frac{3\sqrt{3}}{8}R} = \dfrac{8}{3\sqrt{3}}$

46 From the concept of similarity of triangles. All the five quadrilaterals *viz., AOA′, BOB′, COC′, DOD′* and *EOE′* are similar.

From the figure (ii),

$$\frac{r_2 - r_1}{r_2 + r_1} = \frac{r_3 - r_2}{r_3 + r_2}$$

$$= \frac{r_4 - r_3}{r_4 + r_3} = \frac{r_5 - r_4}{r_5 + r_4} = K$$

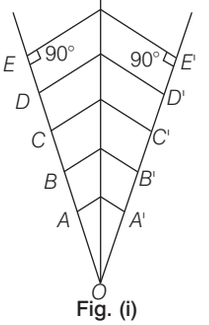


Fig. (i)

$\Rightarrow$ $\dfrac{r_2}{r_1} = \dfrac{r_3}{r_2} = \dfrac{r_4}{r_3} = \dfrac{r_5}{r_4} = K$

(By componendo and dividendo)

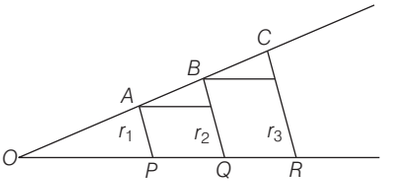

Fig. (ii)

It means all the radii are in GP.

Therefore, $\dfrac{r_5}{r_1} = (K)^4 = \dfrac{81}{16} = \left(\dfrac{3}{2}\right)^4$

$\Rightarrow$ $K = \dfrac{3}{2}$ $\therefore$ $r_3 = r_1\,(K)^2$

$r_3 = r_1 \times \dfrac{9}{4} = \dfrac{9r_1}{4} = \dfrac{9}{4} \times 16 = 36$ cm

47 $\because\ r_1 = 16,\ r_2 = 24,\quad r_3 = 36,\ \ldots$ etc.

$$\therefore \qquad \frac{OP}{AP} = \frac{OQ}{BQ}$$

$$\frac{h + r_1}{r_1} = \frac{h + 2r_1 + r_2}{r_2} \Rightarrow \frac{h + 16}{16} = \frac{h + 56}{24}$$

$$\Rightarrow \qquad h = 64 \text{ cm}$$

48
$$60 = 1 \times 1 \times 60$$
$$= 1 \times 2 \times 30$$
$$= 1 \times 3 \times 20$$
$$= 1 \times 4 \times 15$$
$$= 1 \times 5 \times 12$$
$$= 1 \times 6 \times 10$$
$$= 2 \times 2 \times 15$$
$$= 2 \times 3 \times 10$$
$$\ldots \ \ldots \ \ldots$$
$$\ldots \ \ldots \ \ldots$$
$$= 3 \times 4 \times 5$$

Out of the given different combinations the first combination $(1 \times 1 \times 60)$ gives maximum length of diagonal of cuboid, but in this case two of the edges are same. So, the second combination gives the proper value *i. e.*, which gives the maximum length of diagonal whose all sides are different. Hence, the length of such a pencil is equal to the diagonal of cuboid $= \sqrt{1^2 + 2^2 + 30^2} = \sqrt{905}$

49

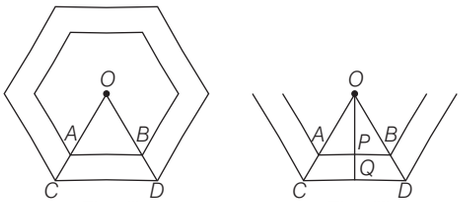

Fig. (i) Fig. (ii)

In figure (ii)

$$OP = \frac{\sqrt{3}}{2} OA = 4\sqrt{3} \text{ cm}$$

Again $\frac{OP}{OQ} = \frac{OA}{OC}, \frac{4\sqrt{3}}{6\sqrt{3}} = \frac{8}{OC}$ $(OQ = OP + PQ = 4\sqrt{3} + 2\sqrt{3})$

$$\Rightarrow \qquad OC = 12 \text{ cm}$$

$\therefore$ Each side of the outer hexagon is 12 cm.

$\therefore$ Required area = (Area of outer hexagon − Area of inner hexagon)

$$= \frac{3\sqrt{3}}{2}[12^2 - 8^2] = 120\sqrt{3} \text{ cm}^2$$

50 Area of region x = Area of square − Area of inscribed circle

$$= (4 - \pi)$$

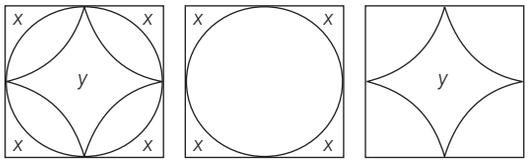

Fig. (i) Fig. (ii) Fig. (iii)

Area of region y = Area of square − 4 (area of quadrant)

$$= 4 - 4\left(\frac{1}{4}\pi \times (1)^2\right) = (4 - \pi)$$

$\therefore$ Required area (of shaded region)

= Area of square − [Area of region x + Area of region y]

$= 4 - [4 - \pi + 4 - \pi] = 2\pi - 4$

51 Let the volume of solid block be V and radius of the spheres formed from the first block be r_1, then the volume of each sphere be V_1.

Similarly, let the radius of each sphere obtained from second block be r_2 $(= 2r_1)$, then the volume of each sphere be

$$V_2 = (8V_1)$$

$$\therefore \qquad V = kV_1 + 14 \qquad \ldots(i)$$

and $\qquad V = lV_2 + 36$

or $\qquad V = 8lV_1 + 36 \qquad \ldots(ii)$

From eqs. (i) and (ii),

$$kV_1 + 14 = 8lV_1 + 36$$

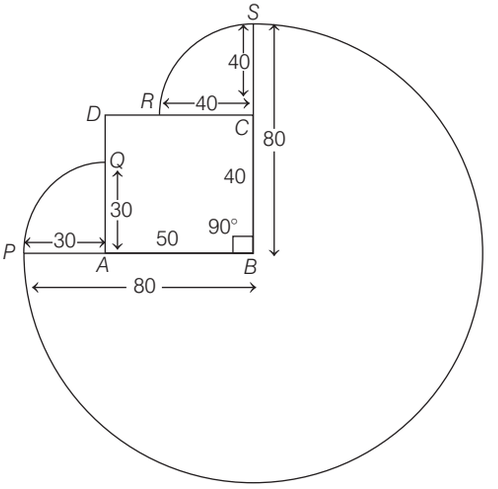
$$\Rightarrow \qquad V_1 (k - 8l) = 22$$

The possible value of $V_1 = 22, 11, 2$ or 1

But V_1 can never be equal to or less than 14 (since remainder is always less than divisior) So, the only possible value of $V_1 = 22$.

$$\therefore \qquad V_2 = 8 \times V_1 = 176 \text{ cm}^3$$

52 The length of tether of the horse is 80 m.



Area grazed by horse

$$= \left[\pi \times (80)^2 \times \frac{270}{360} + \pi \times (30)^2 \times \frac{90}{360} + \pi \times (40)^2 \times \frac{90}{360}\right]$$

$$= \pi\left(6400 \times \frac{3}{4} + 900 \times \frac{1}{4} + 1600 \times \frac{1}{4}\right)$$

$$= \pi\left[\frac{21700}{4}\right] = 5425\pi \text{ m}^2$$

Hint When horse is tethered at B, then he can move freely 270° *i. e.*, from P to S with the full length of his tether as the radius of the arc PS. Again when horse reaches P and tries to move further in the right direction *i. e.*, towards D, his tether gets fixed at A and now only 30 m tether is free which works as a radius of the quadrant PAQ. Similarly when horse reaches S and tries to move left further in the direction of D, due to wall BC his tether gets fixed at C and now only 40 m tether is free to move further. At this moment point C behaves like a fixed point of tether (as centre of quadrant RSC).

NOTE You can tether horse at any of the four corners A, B, C and D area grazed by horse remains same.

53 Here each side is broken up into 6 parts *i. e.*, $n = 6$

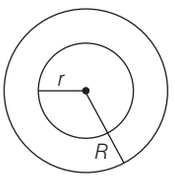
Now, $N_0 = (n-2)^3 = (4)^3 = 64$

$N_1 = 6(n-2)^2 = 6 \times (4)^2 = 96$

$N_2 = 12(n-2) = 12(4) = 48$

$\therefore \quad N_0 : N_1 : N_2 = 64 : 96 : 98 = 4 : 6 : 3$

54 Let the radius of seed be r and radius of the whole fruit (pulp + seed) be R, then thickness of the pulp $= (R - r)$



Volume of mango fruit $= \frac{4}{3}\pi R^3$

and Volume of pulp $= \frac{4}{3}\pi (R^3 - r^3)$

but $= \frac{4}{3}\pi\left[R^3 - \left(\frac{2}{7}R\right)^3\right]$

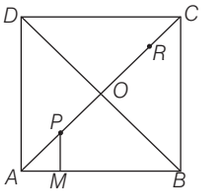
$\left[\because \frac{r}{R-r} = \frac{2}{5} \Rightarrow r = \frac{2}{7}R\right]$

$\therefore$ Percentage of volume of pulp to the total volume of fruit

$$= \frac{\frac{4}{3}\pi R^3\left[1 - \frac{8}{343}\right]}{\frac{4}{3}\pi R^3}$$

$$= \frac{335}{343} \times 100 = 97.66\%$$

55 Let the radius of each smaller circle is r and radius of the larger circle is R, then



$\pi R^2 = 4\pi r^2 \quad \Rightarrow \quad R = 2r$

$OR = OP = R + r = 3r$

Also $PM = r$

(PM is the perpendicular on AB)

$\therefore \quad AP = \sqrt{2}r$

$\therefore \quad AO = AP + PO$

$= r\sqrt{2} + 3r = r(3 + \sqrt{2})$

$\therefore AC = 2AO = 2r(3 + \sqrt{2})$, which is the diagonal of square

$\therefore$ Required ratio $= \frac{2r(3+\sqrt{2})}{\sqrt{2}\,r} = (2 + 3\sqrt{2})$

56 Initial radius = 14 cm

Radius at a time when the balloon explodes = 35 cm

Change in volume $= \frac{4}{3}\pi[(35)^3 - (14)^3]$

$= \frac{4}{3}\pi(7)^3[125 - 8]$

$= \frac{4}{3}\pi \times 343 \times 117$

Required time to explode $= \frac{\frac{4}{3}\pi \times 343 \times 117}{156} = 1078$ s

57 Let the each side of cube be a, then

$CD = \sqrt{2}a$

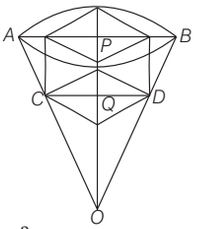
$\therefore \quad CQ = \frac{a}{\sqrt{2}}$

Let the radius of cone be r and height be h, then

$r = h\sqrt{2}$

$\therefore$ In ΔAPO and ΔCQO (Similar triangles)

$$\frac{AP}{PO} = \frac{CQ}{OQ} = \frac{r}{h} = \frac{\frac{a}{\sqrt{2}}}{(h-a)}$$



$\Rightarrow \quad \frac{\frac{a}{\sqrt{2}}}{(h-a)} = \sqrt{2}$

$\Rightarrow \quad a = 2(h-a)$

$\Rightarrow \quad h = \frac{3a}{2}$

$\therefore \quad r = \frac{3a}{2} \times \sqrt{2}$ and $h = \frac{3a}{2}$

$\therefore$ Volume of cone $= \frac{1}{3}\pi \times \left(\frac{3a\sqrt{2}}{2}\right)^2 \times \frac{3a}{2}$

$= \frac{9}{4}a^3\pi$

and Volume of cube $= a^3$

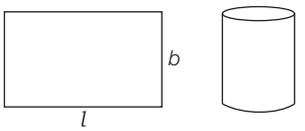
$\therefore$ Required ratio $= \frac{\frac{9}{4}\pi a^3}{a^3} = \frac{9}{4}\pi = 2.25\pi$

58 For the given volume, cube has minimum possible length of diagonal.

Therefore each side of cube = 4 cm

and its diagonal $= 4\sqrt{3}$ cm.

59 $l = 2\pi r \quad \Rightarrow \quad r = \frac{l}{2\pi}$



where r is the base radius of cylinder and l is the length of paper and $h = b$, where h is the height of cylinder and b is the breadth of the paper.

$\therefore$ Volume of cylinder $= \pi r^2 h = \pi \times \left(\frac{l}{2\pi}\right)^2 \times b$

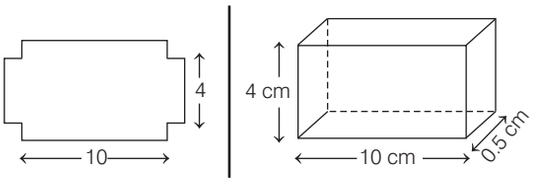
$\Rightarrow \quad \frac{\pi \times l^2 b}{4\pi^2} = 48.125 = \frac{385}{8}$

$\Rightarrow \quad l^2 b = 11 \times 11 \times 5$

$\Rightarrow$ $l = 11$ and $b = 5$ $(\because l > b)$

$\therefore$ Volume of the box $= l \times b \times 4$

$= 10 \times 4 \times 0.5 = 20 \text{ cm}^3$



60 Vertical spacing between any two turns $= \dfrac{\text{Height of cone}}{\text{Number of turns}}$

$= \dfrac{h}{n}$

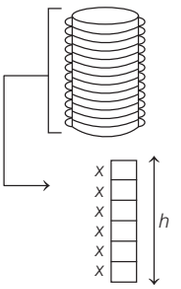
61 Number of turns $= \dfrac{h}{x}$

Length of string in each turn

$= 2\pi r = 2\pi \times \dfrac{4}{\pi} = 8$ cm

$\therefore$ Total length of string in all the n turns

$= \dfrac{h}{x} \times 8 = \dfrac{8h}{x}$ cm

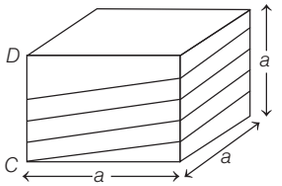


62 Total length of string $= 8n$ cm

Since, total length of string

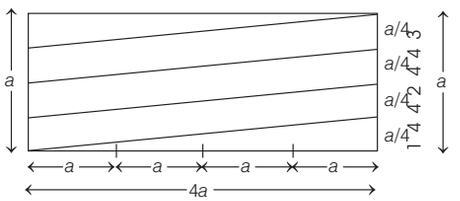
= number of turns $\times$ perimeter of cylinder

$= 8 \times n = 8n$ cm



Length of string required for 1 turn (or round) $= \dfrac{8n}{4} = 2n$

but $2n = \sqrt{\left(\dfrac{a}{4}\right)^2 + (4a)^2}$



$\Rightarrow$ $a = \dfrac{8n}{\sqrt{257}}$

where a is the side of cube.

63 From the sheet of 10 ft long, maximum $\dfrac{10}{2} = 5$ circular discs can be cut along the length of the iron sheet.

$CM = \sqrt{AC^2 - AM^2} = \sqrt{4x^2 - x^2}$

$CM = x\sqrt{3} = \sqrt{3}$ ft (Since $x = 1$ ft)

$\therefore$ Width of the sheet $= AK + MC + CT$

$= 1 + \sqrt{3} + 1 = (2 + \sqrt{3})$ ft

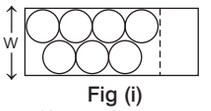


Fig (i)

or

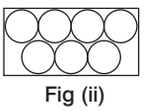

Fig (ii)

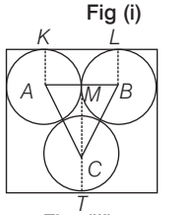

Fig. (iii)

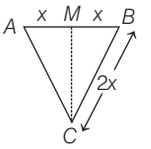

Fig. (iv)

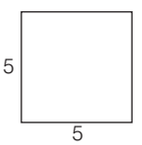
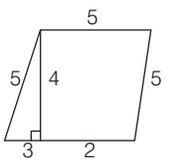
64 Recall that for a given perimeter the polygon of minimum number of sides has minimum area and the polygon of maximum number of sides has maximum area. So, the correct relation is $h > s > r$.

Thus, hexagon (6 sides) has maximum area.

Now, between square and rhombus, square has greater area than rhombus. For easier understanding consider some values.



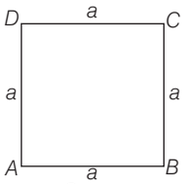
Area $= 25 \text{ cm}^2$



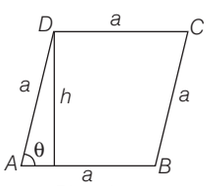
Area = base $\times$ height

$= 5 \times 4 = 20 \text{ cm}^2$

Alternatively



Square



Rhombus

In rhombus $ABCD$**:** Area of rhombus $= a \times h$

$= a \times a \sin\theta$ $\left(\dfrac{h}{a} = \sin\theta\right)$

$= a^2 \sin\theta$

As you know the maximum value of $\sin\theta$ is 1 at $\theta = 90°$ but at $\theta = 90°$ rhombus will become a square. So except $\theta = 90°$ for all the rest values the area of rhombus will be less than the area of square.

65

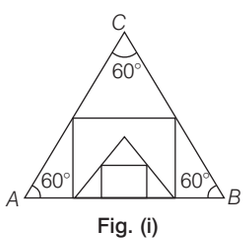


Fig. (i)

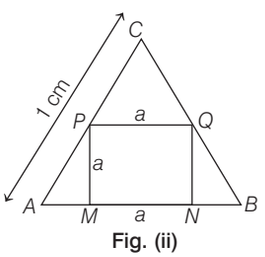

Fig. (ii)

PCQ is also an equilateral triangle

$\therefore$ $PC = PQ = PM = a$

$\therefore \quad \frac{a}{PA} = \frac{\sqrt{3}}{2} \Rightarrow PA = \frac{2a}{\sqrt{3}}$

$\therefore \quad AC = AP + PC = \frac{2a}{\sqrt{3}} + a = 1 \text{ cm}$

$\Rightarrow \quad a = \frac{\sqrt{3}}{(2+\sqrt{3})} = \sqrt{3}\,(2-\sqrt{3})$

Now, in figure (iii)

$PM = MT = a$

Let the each side of square $RSYX$ be K, then $RT = K$ also (since RTS is an equilateral triangle)

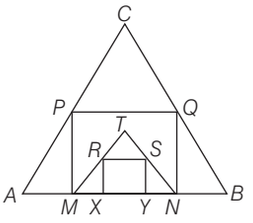

Fig. (iii)

$\therefore \quad \frac{K}{RM} = \frac{\sqrt{3}}{2}$

$\therefore \quad RM = \frac{2K}{\sqrt{3}}$

$\therefore \quad MT = RT + RM = K + \frac{2K}{\sqrt{3}}$

$MT = \frac{(\sqrt{3}+2)}{\sqrt{3}} K$

But $MT = a$

$\therefore \quad a = \left(\frac{\sqrt{3}+2}{\sqrt{3}}\right) K$

$\therefore \quad K = \frac{\sqrt{3}a}{(\sqrt{3}+2)}$

But $a = \sqrt{3}\,(2-\sqrt{3})$

$\therefore \quad K = \frac{\sqrt{3}}{(\sqrt{3}+2)}[\sqrt{3}\,(2-\sqrt{3})]$

$K = \frac{3\,(2-\sqrt{3})}{(2+\sqrt{3})} \times \frac{(2-\sqrt{3})}{(2-\sqrt{3})}$

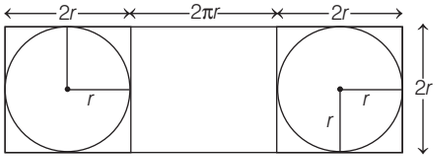
$\Rightarrow \quad K = \frac{3\,(2-\sqrt{3})^2}{1} = 3\,(7-4\sqrt{3})$

$\therefore$ Area of square $RSYX = K^2 = [3\,(7-4\sqrt{3})]^2$

$K^2 = 9\,(49 + 48 - 56\sqrt{3})$

$K^2 = (873 - 504\sqrt{3}) \text{ cm}^2$

66 For the minimum wastage of sheet he has to cut the sheet in the given manner.



Total area of sheet required

$(2\pi r + 4r) \times 2r = 4r^2\,(\pi + 2)$

Area of sheet utilised $= (2\pi r \times 2r) + 2\,(\pi r^2) = 6\pi r^2$

Area of wastage sheet $= 4r^2\,(\pi + 2) - 6\pi r^2$

$= 8r^2 - 2\pi r^2$

$\therefore \quad \text{Required ratio} = \frac{8r^2 - 2\pi r^2}{6\pi r^2} = \frac{2r^2\,(4-\pi)}{6r^2\pi} = \frac{1}{11}$

67 **Short cut:** Very quickly check the options. If all the options have values.

Alternatively The required capacity of box is 864 m^3. Let the length of the base be l and height of the box is 'h', then

$864 = l^2 h \quad \Rightarrow \quad h = \frac{864}{l^2}$

Now, surface area of the box $A = l^2 + 4lh$

$= l^2 + \frac{4l \times 864}{l^2}$

$= l^2 + \frac{3456}{l}$

Differentiating w.r. to l, we get

$\frac{dA}{dl} = 2l - \frac{3456}{l^2}$

For the minimum area $= \frac{dA}{dl} = 0$

$\therefore \quad 2l = \frac{3456}{l^2}$

$\Rightarrow \quad l^3 = 1728$

$\Rightarrow \quad l = 12$

$\therefore \quad \text{Base area} = (12)^2 = 144 \text{ m}^2$

and $\quad \text{Height} = \frac{864}{l^2} = 6 \text{ m}$

68 Let the initial radius be r and volume be V, then

$V = \pi r^2 \times 4$

Ist case: $V_1 = \pi\,(r+12)^2 \times 4$

IInd case: $V_2 = \pi r^2 \times (4+12)$

But $V_1 = V + K$

and $V_2 = V + K$

$\therefore \quad V_1 = V_2$

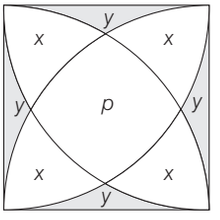
$\Rightarrow \quad \pi\,(r+12)^2 \times 4 = \pi r^2\,(16)$

$\Rightarrow \quad r = 12 \text{ ft}$

$\therefore$ Increased volume $= V_1 = V_2$

$= \pi \times (24)^2 \times 4 = 2304\pi$ cubic ft

69 Let us denote the distinct regions of the square by x, y and p as shown in the following figure.



Now, from this figure we have

$$4x + 4y + p = 1 \quad \text{(i)}$$

And, $$x + 2y = 1 - \frac{\pi}{4}$$

$$\Rightarrow \quad 4(x + 2y) = 4 - \pi \quad \text{(ii)}$$

But, it is given that $p = \frac{\pi}{3} - \sqrt{3} + 1$ (iii)

Now, substituting the values from eqs. (i) and (iii) in the equation (ii), we get

$$4x + 8y = 4 - \pi$$

$$\Rightarrow \quad (4x + 4y) + 4y = 4 - \pi$$

$$\Rightarrow \quad 4y = 4 - \sqrt{3} - \frac{2\pi}{3}$$

Hence, choice (a) is correct.

70 Let each side of the square at the corner be x cm and each side of the base of the cuboid be b cm, then

$$x + b + x = 24$$

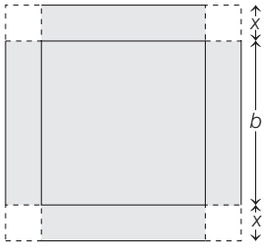
$$\Rightarrow \quad b = 24 - 2x$$

Therefore, each side of the base of the cuboid, which is $b = (24 - 2x)$ cm

Consequently, the height of the cuboid is $h = x$ cm

Therefore, volume of the cuboid $= (x)(24 - 2x)(24 - 2x)$

$$= 2(2x)(12 - x)(12 - x)$$



We know that $b + 2x = 24$, is constant.

We also know that if $p_1 + p_2 + p_3 + ... + p_n =$ some constant, then $p_1 \cdot p_2 \cdot p_3 ..... p_n$ will be maximum when

$$p_1 = p_2 = p_3 = ... = p_n.$$

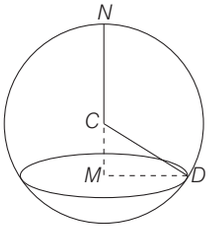
Accordingly, $2x + (12 - x) + (12 - x) = 24$ is a constant, therefore, the volume of cuboid will be maximum when $2x = (12 - x) = (12 - x)$

It implies that $x = 4$

So the volume of the cuboid will be maximum when $x = 4$ cm.

Hence, choice (d) is correct.

71 The man has to reach D from N. Let M is the centre of the latitude where the man is supposed to reach and MD is the radius of the pertinent latitude. Now, extend the radius NC to M so that MD becomes perpendicular to CM.



Given that $CD = 6370$ km and $MD = 3185\sqrt{3}$ km. That is $MD/CD = \sqrt{3}/2$.

It implies that $\angle MDC = 30°$ and $\angle MCD = 60°$, since $\angle CMD = 90°$

Therefore $\angle NCD = 120°$.

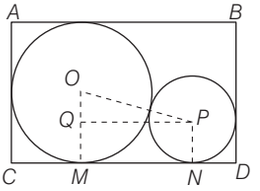
So the length of arc ND

$$= 2\pi \times 6370 \times \frac{120}{360} = 13346.67 \text{ km}$$

Hence, choice (c) is correct.

72 **Case 1:** When the radius of each circle is same, then in this case radius of each circle would be 49/4 and the total area of both the circles would be $2\pi (49/4)^2 \approx 300\pi$

Case 2: When there is one circle of the largest possible size and another circle is fitted in the remaining area.



Let the radius of larger circle be R and that of smaller circle be r.

Then, $OM = R = 16$

and $QM = PN = r$.

Therefore, $OQ = OM - QM = 16 - r$

And $OP = R + r = 16 + r$

Similarly,

$PQ = MN = 49 - (CM + ND) = 49 - (16 + r) = 33 - r$

Now, $OP^2 = OQ^2 + PQ^2$

$$\Rightarrow \quad (16 + r)^2 = (16 - r)^2 + (33 - r)^2$$

$$\Rightarrow \quad r^2 - 130r + 1089 = 0$$

$$\Rightarrow \quad r = 9 \text{ or } 121$$

Since, 121 is greater than 16, so it's unacceptable. Therefore $r = 9$. Thus, the total area of the two circles $= \pi(16^2 + 9^2) = 337\pi$

As in case 2, the total arc is more than that in case 1, so 337π is max. possible area.

Hence, choice (a) is the correct one.

73 Since, area of square field = 54 m^2,

so each side of the square $= 3\sqrt{6}$ m and

diagonal of the square $= 6\sqrt{3}$ m Consider the following diagram, now.

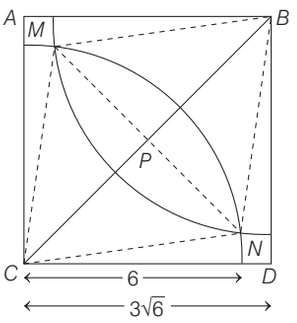
$MB = BN = CN = CM = 6$ m

$CP = 1/2(BC) = 3\sqrt{3}$ m

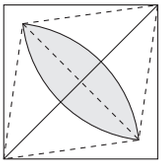
Therefore, using Pythagoras theorem, you can find PM

$$PM = \sqrt{CM^2 - CP^2} = 3$$

$$\therefore \quad MN = 2(PM) = 6.$$



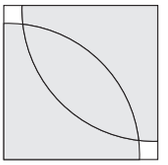
It implies that ΔMCN and ΔBMN are equilateral triangles.



Area of the common region = Area encapsulated between two arcs

$$= 2\left[\pi 6^2\left(\frac{60}{360}\right) - \frac{\sqrt{3}}{4}6^2\right]$$

$$= 2(6\pi - 9\sqrt{3})$$



Area grazed by sheep and goat = 2(Area of a quadrant) – area of the common region

$$= 2\left(\frac{\pi}{4}(6)^2\right) - 2(6\pi - 9\sqrt{3})$$

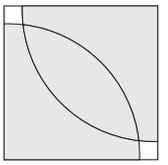
$$= 6(\pi + 3\sqrt{3})$$

Area that cannot be grazed by sheep and goat = (total area of square – area grazed by sheep and square)

$= 54 - 6(\pi + 3\sqrt{3}) = 3.97 \text{ m}^2$

Hence, choice (b) is the correct one.

Alternatively From the given information, you can find that side of the square is $3\sqrt{6} = 7.4\ m$ but the length of rope = 6 m



If you look at the following figure you see that at the corner of the field there are two white (or un-grazed) regions. Roughly, each such region looks like a square. And the side of each such square = 7.35 – 6 = 1.35 m.

Therefore area of both the un-grazed regions

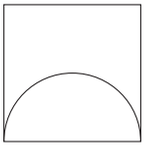
$= 2(1.35)^2 = 3.65 \approx 4$

So, the total un-grazed area is approx. 4 m^2

NOTE The actual area at the corners would be slightly more than the total area of the assumed squares at the two corners. That's why choices (a), (c) and (d) are invalid.

74 Given that each side of the square is a unit. Let r be the radius of such semicircle. Then, we can proceed as follows.

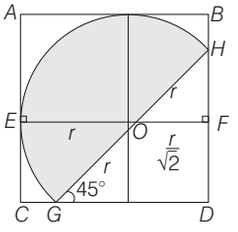
Case I: If the diameter of the semicircle coincides with one of the sides of the square, the maximum area of semicircle



$$= \frac{1}{2}\pi r^2 = \frac{1}{2}\pi\left(\frac{a}{2}\right)^2$$

$$= \frac{1}{8}(\pi a^2) = 0.125\pi a^2$$

Case II: If the diameter of the circle makes some angle with one of the sides of the square.



Let O is the centre of the semicircle. Since square is a symmetric diagram, so both the sides of the square must be tangent to the circle, as shown in the diagram. And, therefore, the diameter of the circle must make a 45° angle with the base in order to conform to the symmetry.

Now, the radii $GO = EO = HO = r$

Therefore, in ΔHOF either by using Pythagoras theorem or Trigonometric ratio, we have $OF = HF = \frac{HO}{\sqrt{2}} = \frac{r}{\sqrt{2}}$

Therefore, $CD = EF$

$\Rightarrow$ $CD = EO + OF$

$\Rightarrow$ $a = r + \frac{r}{\sqrt{2}}$

$\Rightarrow$ $r = a\left(\frac{\sqrt{2}}{1+\sqrt{2}}\right)$

$r = a(2 - \sqrt{2})$

Therefore, the required area of the semicircle

$$= \frac{1}{2}\pi r^2 = \frac{1}{2}\pi(a(2-\sqrt{2}))^2$$

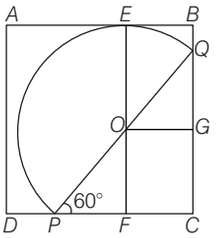
$$= \frac{1}{2}\pi a^2(6 - 4\sqrt{2})$$

$$= \pi a^2(3 - 2\sqrt{2}) \approx 0.172\,\pi a^2$$

Case II gives the highest possible value.

Hence choice (a) is the correct one.

75 Consider the following diagram, in which O is the centre of the circle and OG is perpendicular to BC and EF is parallel to BC.



Since, PQ makes a 60° angle with DC, therefore $\angle QPC = \angle QOG = 60°$ and $\angle PQC = \angle POF = 30°$

Since $OP = OQ = OE = r$ therefore, using 30-60-90 degree theorem (or trigonometric ratios) in ΔOPF, we can find that $PF = r/2$ and $OF = \frac{\sqrt{3}}{2}r$.

Therefore, $AB = BC = EF = OE + OF = r + \frac{\sqrt{3}}{2}r = \frac{r(2+\sqrt{3})}{2}$

So, the area of the smallest possible square

$$= \left[\frac{r(2+\sqrt{3})}{2}\right]^2 = \left(\frac{7+4\sqrt{3}}{4}\right)r^2$$

Hence, choice (a) is the correct one.

76 Look at the following figure (i), you will have $AB = RB$, as both of them are radii of the same circle centered at B. Similarly, $AB = AR$.

Therefore, $AR = BR = AB$. That is

$$\angle RAB = \angle RBA = \angle ARB = 60°$$

Now, look at the figure (ii) and find all the important angles.

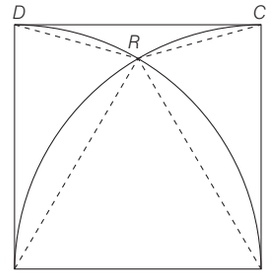


Fig (i)

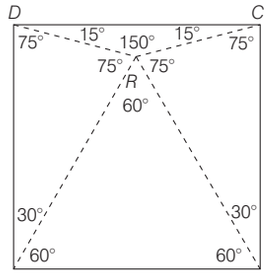

Fig (ii)

Now, with the help of fig (ii) find all the important angles in fig (iii).

$\angle CDR = 15°$, similarly $\angle DSA = 150°$

$\therefore \quad \angle RDS = 90 - (15 + 15) = 60°$

But, since $DR = DS$

$\therefore \quad \angle DSR = \angle DRS = 60°$

That is triangle DRS is an equilateral triangle.

That's why all the four triangles ΔDSR, ΔPBQ, ΔRCQ, ΔSAP in fig (iv) are equilateral ones.

Since, $RS = RQ = PQ = SP$ so the quadrilateral $SRQP$ is a square.

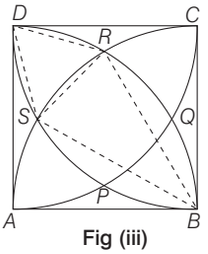

Fig (iii)

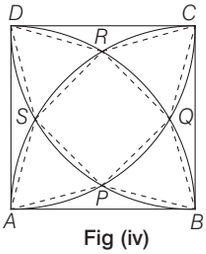

Fig (iv)

Now, look at the fig (v) and fig (vi).

Let us assume that each side of the square $SRQP$ is a, then

$SR = SD = DR = a$ and $PQ = PB = QB = a$

$\therefore \quad DM = BN = \dfrac{\sqrt{3}}{2}a$

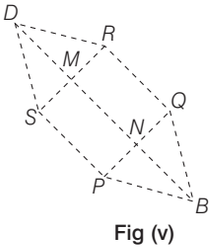

Fig (v)

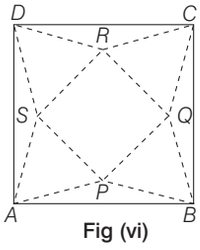

Fig (vi)

But, $DB = DM + MN + NB$

$\Rightarrow \quad 10\sqrt{2} = \dfrac{\sqrt{3}}{2}a + a + \dfrac{\sqrt{3}}{2}a$

$\Rightarrow \quad 10\sqrt{2} = (\sqrt{3} + 1)a$

$\Rightarrow \quad a = \dfrac{10\sqrt{2}}{(\sqrt{3} + 1)}$

$\Rightarrow \quad a^2 = \left(\dfrac{10\sqrt{2}}{\sqrt{3} + 1}\right) = \dfrac{100}{2 + \sqrt{3}} = 100\,(2 - \sqrt{3})$ sq cm

Hence, choice (b) is the correct one.

77 Look at the following figure (i), you will have $AB = RB$, as both of them are radii of the same circle centered at B Similarly, $AB = AR$

Therefore, $AR = BR = AB$.

That is $\angle RAB = \angle RBA = \angle ARB = 60°$

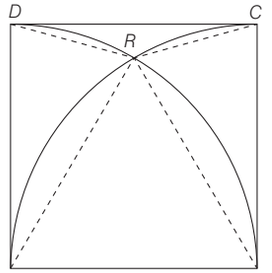

Fig (i)

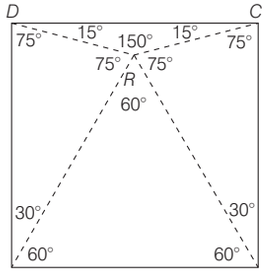

Fig (ii)

Now, with the help of fig (ii) find all important angles in fig (iii).

$\angle CDR = 15$, similarly $\angle DSA = 15°$

$\therefore \quad \angle RDS = 90° - (15° + 15°) = 60°$

But, since $DR = DS$, $\therefore \angle DSR = \angle DRS = 60°$

That is triangle DRS is an equilateral triangle.

That's why all the four triangles ΔDSR, ΔPBQ, ΔRCQ , ΔSAP in fig (iv) are equilateral ones. Since, $RS = RQ = PQ = SP$, so the quadrilateral $SRQP$ is a square.

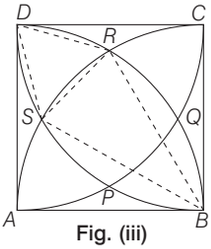

Fig. (iii)

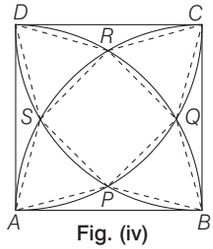

Fig. (iv)

Now, look at the fig (v) and fig (vi).

Let us assume that each side of the square $SRQP$ is a, then

$SR = SD = DR = a$ and $PQ = PB = QB = a$

$\therefore \quad DM = BN = \dfrac{\sqrt{3}}{2}a$

But, $DB = DM + MN + NB$

$\Rightarrow \quad 10\sqrt{2} = \dfrac{\sqrt{3}}{2}a + a + \dfrac{\sqrt{3}}{2}a$

$10\sqrt{2} = (\sqrt{3} + 1)a$

$\Rightarrow \quad a = \dfrac{10\sqrt{2}}{(\sqrt{3} + 1)}$

$\Rightarrow \quad a^2 = \left(\dfrac{10\sqrt{2}}{\sqrt{3} + 1}\right) = \dfrac{100}{2 + \sqrt{3}} = 100\,(2 - \sqrt{3})$ sq cm

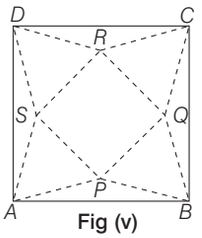

Fig (v)

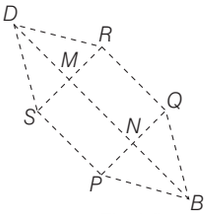

Fig (vi)

The area of the common region by two quadrants in fig (vii) is determined as follows. Area of common region
= 2 × area of each quadrant – area of the square

$$= 2\times\left(\frac{1}{4}\,\pi\times 10^2\right) - 10^2 = 50\pi - 100 \text{ sq cm}$$

Now, look at the fig (viii). The total area of the 6 shaded segments = Total area of the common region between the two quadrants – Total area of the two equilateral triangles and one square

$$= (50\,\pi - 100) - \left[2\times\frac{\sqrt{3}}{4}\times\left(\frac{10\sqrt{2}}{\sqrt{3}+1}\right)^2 + \left(\frac{10\sqrt{2}}{\sqrt{3}+1}\right)^2\right] \text{ sq cm}$$

$$= (50\,\pi - 100) - \left[\frac{\sqrt{3}}{2}\times 100\,(2-\sqrt{3}) + 100\,(2-\sqrt{3})\right] \text{ sq cm}$$

$$= (50\,\pi - 100) - 100\,(2-\sqrt{3})\left[\frac{\sqrt{3}}{2}+1\right] \text{sq cm}$$

$$= (50\,\pi - 100) - (50) \text{ sq cm} = 50\,(\pi - 3) \text{ sq cm}$$

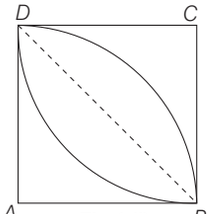

Fig (vii)

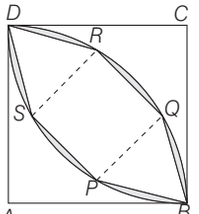

Fig (viii)

Therefore, the area of 4 shaded segments $= \frac{4}{6}\times 50\,(\pi - 3)$ sq cm

$$= \frac{100\,(\pi - 3)}{3} \text{ sq cm}$$

Thus, the required area = area of the 4 shaded segments around the square *SRQP* + area of the square *SRQP* inscribed in that region

$$= \frac{100\,(\pi - 3)}{3} + 100\,(2-\sqrt{3}) \text{ sq cm}$$

$$= 100\left(\frac{\pi}{3} + 1 - \sqrt{3}\right) \text{ sq cm}$$

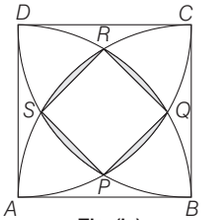

Fig (ix)

Hence, choice (b) is the correct one.

Alternatively Look at the following figures: fig (i) and fig (ii).

Area of the sector $BSR = \pi\times 10^2\times\frac{30^\circ}{360^\circ} = \frac{25\pi}{3}$ sq cm

Area of isosceles triangle $BSR = \frac{1}{2}\times 10^2 \sin 30^\circ$

$$= 25 \text{ sq cm}$$

Therefore, area of the segment $= \frac{25\pi}{3} - 25$ sq cm

$$= 25\left(\frac{\pi}{3} - 1\right) \text{ sq cm}$$

Thus the total area of all the four segments around the inscribed square $= 4\times 25\left(\frac{\pi}{3}-1\right) = 100\left(\frac{\pi}{3}-1\right)$ sq cm

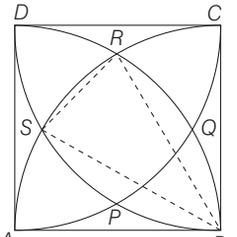

Fig (i)

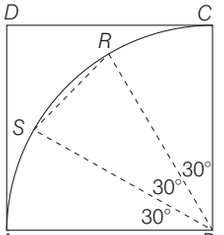

Fig (ii)

Now, using cosine rule you can obtain *RS*, the side of the inscribed square, as follows.

$$\cos 30^\circ = \frac{BS^2 + BR^2 - RS^2}{2\,(BS)\,(BR)}$$

$$\frac{\sqrt{3}}{2} = \frac{10^2 + 10^2 - RS^2}{2\times 10\times 10}$$

$$= \frac{200 - RS^2}{200}$$

$$\sqrt{3} = \frac{200 - RS^2}{100}$$

$$RS^2 = 100\,(2-\sqrt{3})$$

Therefore, area of the square $SRQP = SR^2 = 100\,(2-\sqrt{3})$ sq cm

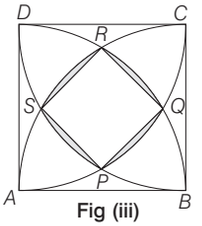

Fig (iii)

Thus, the required area

$$= 100\left(\frac{\pi}{3} - 1\right) + 100\,(2-\sqrt{3})$$

$$= 100\left(\frac{\pi}{3} + 1 - \sqrt{3}\right) \text{ sq cm}$$

Alternatively First of all, let us denote the different regions of the square as shown below.

Now, consider the fig (ii).

The area of the unshaded region = Area of square – area of the shaded quadrant $x + 2y = 100 - 25\pi$ (i)

Now, consider the fig (iv).

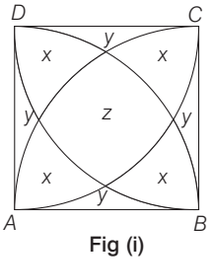

Fig (i)

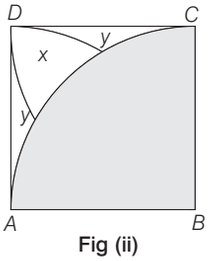

Fig (ii)

Area enclosed by the two overlapping quadrants = total areaof the two quadrants – area of the square

$$2x + z = 2 \times 25\pi - 100$$

$$\Rightarrow \quad 2x + z = 50\,\pi - 100 \quad \text{(ii)}$$

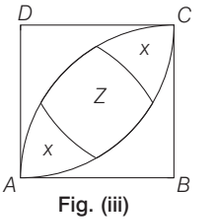

Fig. (iii)

Now, consider the fig (iv).

Area of the shaded region = area of the equilateral triangle + 2(area of the segments outside the equilateral triangle) $2x + y + z = \frac{\sqrt{3}}{4} \times 100 + 2$ (area of the segments outside the equilateral triangle)

$\Rightarrow 2x + y + z = 25\sqrt{3} + 2$ (area of the segments outside the equilateral triangle)

But the area of each segment = area of each sector with central angle 60°– area of equilateral triangle

$$= \frac{100\pi}{6} - 25\sqrt{3}$$

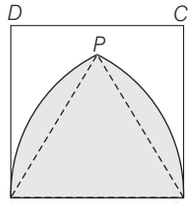

Fig. (iv)

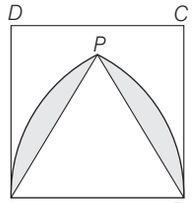

Fig. (v)

Therefore, area of the shade region in fig (iv) is

$$2x + y + z = 25\sqrt{3} + 2\left(\frac{100\,\pi}{6} - 25\sqrt{3}\right)$$

$$\Rightarrow \quad 2x + y + z = \frac{100\pi}{3} - 25\sqrt{3} \qquad \ldots\text{(iii)}$$

Now, solving the eqs. (ii) and (iii), we get

$$x = 100 - 25\sqrt{3} - \frac{50\,\pi}{3}$$

Then, from the eq. (i), we get

$$y = \frac{25\pi}{3} + 50\sqrt{3} - 100$$

Again, from eq. (ii), we get

$$z = 100\left(\frac{\pi}{3} + 1 - \sqrt{3}\right)$$

78 Given that $AB = BC = CD = DA = 30$ cm. Due to symmetrical cutting, EF and GH are perpendicular. Also, $AE = BG = CF = DH$ and $EB = GC = FD = HA$.

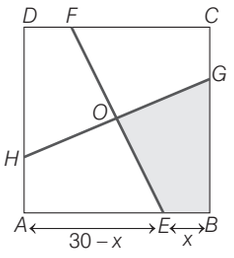

Fig. (i)

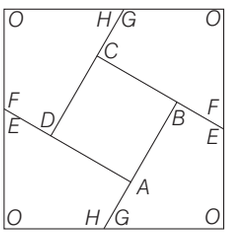

Fig. (ii)

In the fig (ii), we have $GB = 30 - x$ and $HA = GA = x$,

$\therefore \quad AB = GB - GA \Rightarrow 16 = 30 - 2x \Rightarrow x = 7$ cm

Now, from fig (i), we have $EB = GC = FD = HA = 7$ cm and $AE = BG = CF = DH = 23$ cm

Now, in fig (i), if we draw a perpendicular line FJ on AB, such that $FJ = AD = 30$

Since, $AJ = DF = 7$, therefore $JE = AE - AJ = 23 - 7$

$= 16$ cm

Therefore, in the right angle triangle FJE, we have

$$FE = \sqrt{30^2 + 16^2} = 34 \text{ cm}$$

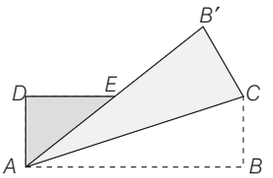
But, since $OF = OE = \frac{FE}{2} = 17$ cm

Similarly, $OH = OG = 17$ cm

Therefore, the side of the new larger square = 34 cm.

Hence, choice (a) is correct.

79 Since, the ratio of area of polygon to that of rectangle is 16/25, it means $9/25^{th}$ or 36% area is lost due to overlapping.



Therefore the lost area is equal to the area of triangle AEC.

It implies that area of triangle $AEC = 36\%$ of area of rectangle $ABCD$.

That is area of $\Delta AED + \Delta AEC + \Delta CEB' = 64\%$ of the area of rectangle $ABCD$

Since area of $\Delta AED = \Delta CEB'$ therefore,

$$\Delta\, AED = CEB' = 14\%(ABCD)$$

Now, see there are two triangles AEC and ECB' of same height.

$$\therefore \quad \frac{\frac{1}{2}(AE \times CB')}{\frac{1}{2}(EB' \times CB')} = \frac{\Delta AEC}{\Delta\, ECB'}$$

$$\Rightarrow \quad \frac{AE}{EB'} = \frac{36}{14} = \frac{18k}{7k}$$

But, $EC = EA = 18k$ and $EB' = 7k$

Therefore, by applying Pythagoras theorem in $\Delta\, ECB'$, we get $CB' = \sqrt{(18k)^2 - (7k)^2} = 5\sqrt{11}\,k$

And, $AB' = AE + EB' = 18k + 7k = 25k$

Therefore, the required percentage

$$= \frac{25k}{5\sqrt{11k}} = \frac{5}{\sqrt{11}}$$

Hence, choice (a) is correct.

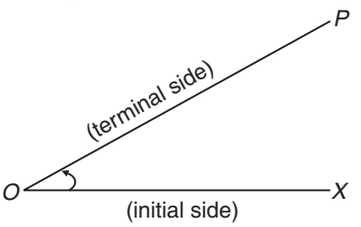
CHAPTER 11

Trigonometry

This chapter is basically written for those students who were either not so good in the secondary classes maths or who have not been in touch with the following concepts from 4-5 years. Hardly a question is asked in CAT, directly from this chapter, but almost every year there are one or two questions in which we can find the application of the concepts of trigonometry *e.g.,* sometimes in geometry or in height and distance problems. So just refresh the concepts of trigonometry. Therefore CAT aspirants are not required to waste so much of precious time on this chapter. But this chapter is useful for IIFT, NIFT, FMS, SSC, CGL etc.

11.1 Angle

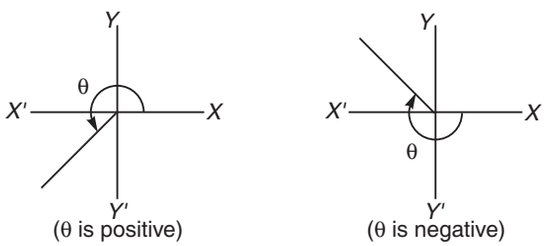
An angle is thought of as traced out by the rotation of a line (called the revolving line) from the initial position OX to a terminal position OP.



Then O is the vertex, OX is called the initial side and OP is called the terminal side of the angle.

11.2 Convention of Sign of Angles

It is customary to regard the angle traced out by a **counter-clockwise** rotation as positive and one traced out by a **clockwise** rotation as negative. The angle is indicated by using an arrow, starting from the initial line and ending at the terminal line.



Chapter Checklist

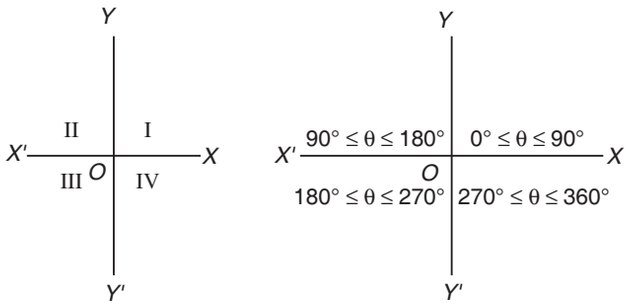
11.3 Quadrants

Let XOX' and YOY' be two mutually perpendicular lines in any plane. These lines divide the plane into four regions called quadrants, numbered counter- clockwise.

Thus the quadrants $XOY, YOX', X'OY'$ and $Y'OX$ are respectively called the first quadrant, the second quadrant, the third quadrant and the fourth quadrant.



NOTE θ will be more than 360°, if after making one complete revolution, the revolving line does not stop at the initial position OX but proceeds on further on.

11.4 Measures of Angles

There are three different systems of units for measurement in trigonometry, *viz.* (i) Sexagesimal system (ii) Centesimal system (iii) Circular system.

Sexagesimal System

In this system, 1 right angle is divided into 60 equal parts and each part (or division) is called a degree (*i.e.,* 1°, read as 1 degree).

$1° = 60'$ (60 sexagesimal minutes)

$1' = 60''$ (60 sexagesimal seconds)

This system is called the Common or the English system.

Centesimal System

In this system, 1 right angle is divided into 100 equal parts and each part (or division) is called a grade (or 1^g).

$90° = 100^g$

$1^g = 100'$ ($K' \to K$ centesimal minute)

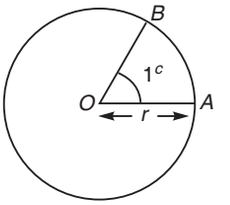
$1' = 100''$ ($K'' \to K$ centesimal second)

Circular Measure

The unit of measurement of angles in this system is a radian (or 1^c)

A **radian** is defined as the angle subtended at the centre of a circle by an arc whose length is equal to the radius of the circle and it is denoted by 1^c.

In the figure $OA = OB = r$, (radius of the circle) and $\angle AOB = 1$ radian or 1^c.



11.5 Important Facts

1. In all circles, the ratio of the circumference to its diameter is constant. (Circumference $= \pi \times$ diameter)π is an incommensurable number, *i.e.,* it cannot be expressed exactly either by a whole number or by a fraction. Its approximate value is 22/7 or 3.1416, correct to four places of decimal only.
2. A radian is a constant angle.
   1 radian (1^c) = a constant angle
3. π radian $= 180°$ (or $1° = \dfrac{\pi}{180}$ radian)
4. If an arc of length 's' subtends an angle θ radian at the centre of a circle of radius r, then $s = r\theta$. $\left(\theta = \dfrac{\text{arc}}{\text{radius}}\right)$
5. (i) Area of the sector $AOB = \dfrac{1}{2} r^2\theta$

   (ii) Area of the sector $AOB = \dfrac{1}{2} rs$ ($s \to$ length of arc AB)

***Exp.* 1)** Express the following angles in radian measure and centesimal measure :

(i) $45°$ *(ii)* $20° 35'$ *(iii)* $50° 38' 40''$

Solution

(i) $\because$ $180° = \pi$ rad $\therefore 1° = \dfrac{\pi}{180}$ rad

$\therefore$ $45° = 45 \times \dfrac{\pi}{180} = \dfrac{\pi}{4}$ rad

Now, $90° = 100$ grade

$\Rightarrow$ $45° = 50$ grade

(ii) $20° 35' = 20\dfrac{35}{60}$ degree $= \dfrac{247}{12}$ degree

Now, 180 degree = π rad

$\therefore$ $\dfrac{247}{12}$ degree $= \dfrac{247}{12} \times \dfrac{\pi}{180} = \dfrac{247}{2160}\pi$ rad

and $90° = 100$ grade

$\therefore$ $\left(\dfrac{247}{12}\right)^\circ = \dfrac{247}{12} \times \dfrac{100}{90} = \dfrac{2470}{108}$ grade

$$= \frac{1235}{54} \text{ grade}$$

(iii) $50^\circ\ 38'\ 40'' = 50^\circ\ 38\ \frac{40}{60}\text{min} = 50^\circ\ \frac{116}{3}\text{min} = 50^\circ\ \frac{116}{3\times 60}\text{degree}$

$$= \frac{2279}{45} \text{ degree}$$

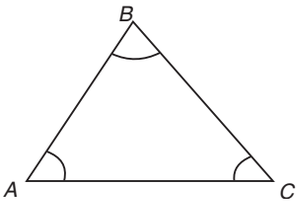
Now $180^\circ = \pi$ rad

$\because \quad \left(\frac{2279}{45}\right)^\circ = \frac{2279}{45}\times\frac{\pi}{180} = \frac{2279}{8100}\pi$ rad and $90^\circ = 100^g$

$\Rightarrow \quad \left(\frac{2279}{8100}\right)^\circ = \frac{2279}{8100}\times\frac{100}{90} = \frac{2279}{7290}$ grade.

***Exp.* 2)** One angle of a triangle is 54° and another angle is $\pi/4$ radian. Find the third angle in centesimal unit.

Solution Let $\angle A = 54^\circ$ and $\angle B = \frac{\pi}{4}$ rad



$\therefore \quad B = 45^\circ$

Thus, $\angle A + \angle B = 99^\circ$

$\therefore \quad \angle C = 180 - 99 = 81^\circ \quad (\because \angle A + \angle B + \angle C = 180^\circ)$

Now, since $90^\circ = 100$ grade

$\Rightarrow \quad 81^\circ = 81\times\frac{100}{90} = 90$ grade

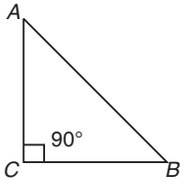
***Exp.* 3)** The difference between two acute angles of a right-angled triangle is $\pi/6$ radians. Find the angle in degrees.

Solution $\angle A + \angle B = 90^\circ$

and $\angle A - \angle B = \frac{\pi}{6} = 30^\circ$

$\therefore \quad \angle A = 60^\circ$ and $\angle B = 30^\circ$

Hence the two acute angles are 60° and 30°.



***Exp.* 4)** In a circle of diameter 60 m, the length of a chord is 30 m. Find the length of the minor arc on one side of the chord. What is the length of the major arc?

Solution $2r = 60$ m $\Rightarrow \quad r = 30$ m

$\therefore \quad OA = OB = AB = 30$ m

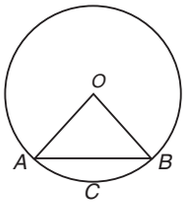
$\therefore \Delta OAB$ is an equilateral triangle.

Thus, $\angle AOB = 60^\circ = \frac{\pi}{3}$ rad

Now, since $s = \theta\ r = \frac{\pi}{3}\times 30$

$= 10\times 3.142$

$= 31.42$ m (approx.)

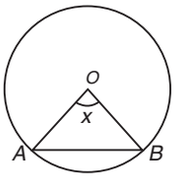


Thus the length of minor arc ACB = 31.42 m and the length of major arc = ($2\pi r$ − minor arc)

$= 2\pi\times 30 - 31.42 = 157.1$ m (approx.)

***Exp.* 5)** An arc AB of a circle subtends an angle x radians at the centre O of the circle. Given that the area of the sector AOB is equal to the square of the length of the arc AB, find the value of x.

Solution Let arc $AB = s$



Given that area of the sector

$AOB = (\text{arc } AB)^2$

$\therefore \quad \frac{1}{2}r^2x = s^2$ and $s = rx \quad (\because \theta = x)$

$\therefore \quad \frac{1}{2}r^2x = r^2x^2$ or $x = \frac{1}{2}$ radian

***Exp.* 6)** Two arcs of two different circles are of equal lengths. If these arcs subtends angles of 45° and 60° at the centres of the circles. Find the ratio of the radii of the two circles.

Solution $45^\circ = \frac{\pi}{4}$ rad and $60^\circ = \frac{\pi}{3}$ rad

Let r_1 and r_2 be the radii of the two circles and s be the length of each arc.

$\therefore \quad s = r_1\frac{\pi}{4} = r_2\frac{\pi}{3} \quad (\because s = r\,\theta)$

$\Rightarrow \quad \frac{r_1}{r_2} = \frac{4}{3}$

Hence the required ratio of radii = 4 : 3

***Exp.* 7)** The wheel of a railway carriage is 4 ft in diameter and makes 6 revolution per second, how fast is the train going ? ($\pi = 3.14$)

Solution Radius (r) of the wheel = 2 ft

$\therefore$ Circumference of wheel $= 2\times 3.14\times 2 = 12.56$ ft

Since the wheel makes 6 revolutions per second,

$\therefore$ Distance traversed in 1 second $= 6\times 12.56 = 75.36$ ft.

Hence the velocity of the train = 75.36 ft/s

$$= \frac{75.36\times 60\times 60}{3\times 1760} = 51.38 \text{ mile/h}$$

***Exp.* 8)** A horse trots uniformly along a circular track of radius 27 m. The angle subtended at the centre of the track by the arc passed over by the horse in 3 seconds is 70°. What distance will the horse pass over in $\frac{1}{2}$ minute.

Solution $r = 27$ m; $\theta = 70^\circ = \frac{7\pi}{18}$ radian

$\therefore \quad s = r\theta = 27\times\frac{7\pi}{18} = 33$ m (approx.)

$\therefore$ Distance passed over by the horse in $\frac{1}{2}$ minute

$$= \frac{33}{3}\times 30 = 330 \text{ m (approx.)}$$

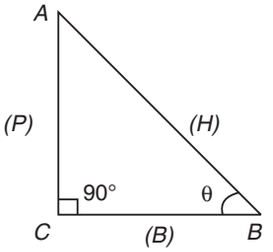
Introductory Exercise 11.1

1. The perimeter of a certain sector of a circle is equal to the length of the arc of the semicircle having the same radius. The angle of the sector (approx.) is :
   (a) 65° 27′ 16″ (b) 68° 18′ 19″
   (c) 56° 52′ 18″ (d) none of these
2. The length of a pendulum is 8 m while the pendulum swings through 1.5 rad, find the length of the arc through which the tip of the pendulum passes :
   (a) 8 m (b) 9 m
   (c) 12 m (c) none of these
3. The angles of a triangle are in AP and the greatest angle is 75°. Find all the three angles in degrees :
   (a) 55° , 55° , 70° (b) 45° , 60° , 75°
   (c) 40° , 65° , 75° (d) none of these
4. A circular wire of radius 2.5 cm is cut and bent so as to lie along the circumference of a hoop whose radius is 1.29 m. Find (in degrees) the angle which is subtended at the centre of the hoop :
   (a) 9.67° (b) 7.69°
   (c) 6.97° (d) none of these
5. A circle is drawn on AB as diameter. The centre of the circle is O and the length $AB = 13$ cm. P is a point on the circumference of the circle such that the chord $AP = 12$ cm. Calculate the value of the angles PAB and POB in radians :
   (a) 0.395, 0.789 (b) 0.786, 0.735
   (c) 0.398, 0.689 (d) 0.786, 0.753

11.6 Trigonometrical Ratios

$$\sin\theta = \frac{P}{H}, \cos\theta = \frac{B}{H}, \tan\theta = \frac{P}{B}$$

$$\text{cosec}\,\theta = \frac{H}{P}, \sec\theta = \frac{H}{B}, \cot\theta = \frac{B}{P}$$



Remember

sin θ	cos θ	tan θ	
P	B	P	⇒ Pandit Badri Prasad
H	H	B	⇒ Hari Hari Bol
cosec θ	sec θ	cot θ	

$P \to$ Perpendicular (AC) $\quad B \to$ Base (BC)

$H \to$ Hypotenuse (AB)

Thus, $\sin\theta \,\text{cosec}\,\theta = 1$ and $\tan\theta = \dfrac{\sin\theta}{\cos\theta}$

$\cos\theta \sec\theta = 1$

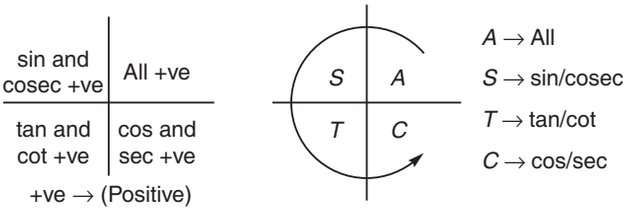
$\tan\theta \cot\theta = 1$ $\quad \cot\theta = \dfrac{\cos\theta}{\sin\theta}$

NOTE $(\sin\theta)^{-1}$ is not written as $\sin^{-1}\theta$. Thus $\sin^{-1}\theta \neq (\sin\theta)^{-1}$ etc but $(\sin\theta)^2 = \sin^2\theta$ and $(\sin\theta)^3 = \sin^3\theta$

$$\sin^2\theta + \cos^2\theta = 1 \Rightarrow \sec^2\theta - \tan^2\theta = 1$$

$$\text{cosec}^2\theta - \cot^2\theta = 1$$

Sign of Trigonometrical Functions



Remember ''Add Sugar To Coffee''

Values of T-Ratios

Angle	θ = 0	θ = 30°	θ = 45°	θ = 60°	θ = 90°	θ = 180°
sin	0	$1/2$	$1/\sqrt{2}$	$\sqrt{3}/2$	1	0
cos	1	$\sqrt{3}/2$	$1/\sqrt{2}$	$1/2$	0	-1
tan	0	$1/\sqrt{3}$	1	$\sqrt{3}$	∞	0
cosec	∞	2	$\sqrt{2}$	$2/\sqrt{3}$	1	∞
sec	1	$2/\sqrt{3}$	$\sqrt{2}$	2	∞	-1
cot	∞	$\sqrt{3}$	1	$1/\sqrt{3}$	0	∞

Remember

$$\text{cosec}\,\theta = \frac{1}{\sin\theta}, \sec\theta = \frac{1}{\cos\theta}, \cot\theta = \frac{1}{\tan\theta}$$

and $\tan\theta = \dfrac{\sin\theta}{\cos\theta}, \cot\theta = \dfrac{\cos\theta}{\sin\theta}$

and $\tan\theta = \dfrac{1}{\cot\theta}$

or $\cot\theta = \dfrac{1}{\tan\theta}$

Range of Trigonometric Ratios

(i) $-1 \le \sin\theta \le 1 \Rightarrow |\sin\theta| \le 1$

(ii) $-1 \le \cos\theta \le 1 \Rightarrow |\cos\theta| \le 1$

(iii) $\text{cosec}\,\theta \le -1$ and $\text{cosec}\,\theta \ge 1 \Rightarrow |\text{cosec}\,\theta| \ge 1$

(iv) $\sec\theta \le -1$ and $\sec\theta \ge 1 \Rightarrow |\sec\theta| \ge 1$

(v) $-\infty < \tan\theta < \infty$

i.e., $\tan\theta$ may assume any value.

Increasing and Decreasing Functions of T-Ratios

	1st quadrant	2nd quadrant	3rd quadrant	4th quadrant
$\sin\theta$	increases from 0 to 1	decreases from 1 to 0	decreases from 0 to – 1	increases from – 1 to 0
$\cos\theta$	decreases from 1 to 0	decreases from 0 to – 1	increases from – 1 to 0	increases from 0 to 1
$\tan\theta$	increases from 0 to ∞	increases from $-\infty$ to 0	increases from 0 to ∞	increases from $-\infty$ to 0

Introductory Exercise 11.2

Directions (for Q. Nos. 1 to 7) *Find the values of the following expressions.*

1. $\dfrac{\sec^2\theta - 1}{\tan^2\theta} = ?$

(a) 1 (b) 2 (c) 3 (d) 4

2. $\sin^4\theta + \sin^2\theta\cos^2\theta = ?$

(a) 0 (b) 1 (c) 2 (d) $\sin^2\theta$

3. $\dfrac{\sin\theta\,\text{cosec}\,\theta\,\tan\theta\cot\theta}{\sin^2\theta + \cos^2\theta} = ?$

(a) 0 (b) 1 (c) – 1 (d) 2

4. $\sin^2 A\cot^2 A + \cos^2 A\tan^2 A = ?$

(a) – 1 (b) 0
(c) 3 (d) 1

5. $\tan\theta + \cot\theta$ is

(a) 1 (b) $\tan\theta$
(c) $\text{cosec}\,\theta\cot\theta$ (d) $\sec\theta\,\text{cosec}\,\theta$

6. $\dfrac{3 - 4\sin^2\theta}{\cos^2\theta} + \tan^2\theta$ is

(a) 1 (b) 2
(c) 3 (d) none of these

7. $\dfrac{\cot A + \tan B}{\cot B + \tan A}$ is

(a) $\tan A\cot B$ (b) $\cot A\tan B$
(c) 1 (d) none of these

8. If $\sin\theta = \dfrac{21}{29}$, find the value of $\sec\theta + \tan\theta$, if θ lies between 0 and $\pi/2$

(a) 1 (b) $\pi/2$
(c) 5/2 (d) none of these

9. If A is in the fourth quadrant and $\cos A = \dfrac{5}{13}$, find the value of $\dfrac{13\sin A + 5\sec A}{5\tan A + 6\,\text{cosec}\,A}$

(a) – 2/37 (b) – 3/27
(c) 2/37 (d) can't be determined

10. Find the value of,

$\dfrac{4}{3}\cot^2 30° + 3\sin^2 60° - 2\,\text{cosec}^2 60° - \dfrac{3}{4}\tan^2 30°$:

(a) 10/3 (b) 11/3 (c) 4 (d) none

11. Find the perimeter of a regular octagon inscribed in a circle of radius 100 cm :

(a) 532.87 cm (b) 612.32 cm
(c) 378.32 cm (d) 875 cm

12. Find the altitude and base of an isosceles triangle whose vertical angle is 65° and whose equal sides are 415 cm :

(a) 350 cm, 646 cm (b) 350 cm, 446 cm
(c) 630 cm, 445 cm (d) none of these

13. If $5\sin^2\theta + 3\cos^2\theta = 4$, find the value of $\sin\theta$ and $\cos\theta$

(a) $\pm\dfrac{1}{\sqrt{2}}, \pm\dfrac{1}{\sqrt{2}}$ (b) $\pm\dfrac{\sqrt{3}}{2}, \pm\sqrt{2}$

(c) $\dfrac{\sqrt{3}}{2}, \dfrac{1}{\sqrt{2}}$ (d) none of these

14. Find the value of $\sqrt{\dfrac{1+\cos\theta}{1-\cos\theta}} + \sqrt{\dfrac{1-\cos\theta}{1+\cos\theta}}$:

(a) $2\sec\theta$ (b) $\sec\theta$
(c) $2\,\text{cosec}\,\theta$ (d) none of these

15. If $\tan\theta = \dfrac{a}{b}$, find the value of $\dfrac{a\sin\theta - b\cos\theta}{a\sin\theta + b\cos\theta}$

(a) $\dfrac{a^2 - b^2}{a^2 + b^2}$ (b) $\dfrac{b^2 - a^2}{b^2 + a^2}$ (c) $\dfrac{a^2 + b^2}{a^2 - b^2}$ (d) none

Directions (for Q. Nos. 16 to 18) *For the every* θ, $0 < \theta \le 90$, *find the values of the following angles.*

16. $\tan\theta + \cot\theta = 2$

(a) 30° (b) 45° (c) 60° (d) 55°

17. $2\sin^2\theta + 4\cos^2\theta = 3$:

(a) 30° (b) 60° (c) 45° (d) 80°

18. $2\sin^2\theta - 3\sin\theta = -1$:

(a) 30° (b) 45°
(c) 90° (d) both (a) and (c)

11.7 Trigonometrical Ratios of Negative and Associated Angles

Angle	$-\theta$	$(90-\theta)$	$(90+\theta)$	$(180-\theta)$	$(180+\theta)$	$(360-\theta)$	$(360+\theta)$
$\sin\theta$	$-\sin\theta$	$\cos\theta$	$\cos\theta$	$\sin\theta$	$-\sin\theta$	$-\sin\theta$	$\sin\theta$
$\cos\theta$	$\cos\theta$	$\sin\theta$	$-\sin\theta$	$-\cos\theta$	$-\cos\theta$	$\cos\theta$	$\cos\theta$
$\tan\theta$	$-\tan\theta$	$\cot\theta$	$-\cot\theta$	$-\tan\theta$	$\tan\theta$	$-\tan\theta$	$\tan\theta$

11.8 Sum, Difference and Product Formulae

1. $\sin(A+B)=\sin A\cos B+\cos A\sin B$
2. $\sin(A-B)=\sin A\cos B-\cos A\sin B$
3. $\cos(A+B)=\cos A\cos B-\sin A\sin B$
4. $\cos(A-B)=\cos A\cos B+\sin A\sin B$
5. $\tan(A+B)=\dfrac{\tan A+\tan B}{1-\tan A\tan B}$
6. $\tan(A-B)=\dfrac{\tan A-\tan B}{1+\tan A\tan B}$
7. $\sin(A+B)\sin(A-B)=\sin^2 A-\sin^2 B$
   $=\cos^2 B-\cos^2 A$
8. $\cos(A+B)\cos(A-B)=\cos^2 A-\sin^2 B$
   $=\cos^2 B-\sin^2 A$
9. $2\sin A\cos B=\sin(A+B)+\sin(A-B)$
10. $2\cos A\sin B=\sin(A+B)-\sin(A-B)$
11. $2\cos A\cos B=\cos(A+B)+\cos(A-B)$
12. $2\sin A\sin B=\cos(A-B)-\cos(A+B)$
13. $\cot(A+B)=\dfrac{\cot A\cot B-1}{\cot A+\cot B}$
14. $\cot(A-B)=\dfrac{\cot A\cot B+1}{\cot B-\cot A}$
15. $\sin C+\sin D=2\sin\dfrac{C+D}{2}\cos\dfrac{C-D}{2}$
16. $\sin C-\sin D=2\cos\dfrac{C+D}{2}\sin\dfrac{C-D}{2}$
17. $\cos C+\cos D=2\cos\dfrac{C+D}{2}\cos\dfrac{C-D}{2}$
18. $\cos C-\cos D=2\sin\dfrac{C+D}{2}\sin\dfrac{D-C}{2}$

Introductory Exercise 11.3

1. If $A+B=45°$, find the value of $\tan A+\tan B+\tan A\tan B$:
(a) -1 (b) $\frac{1}{2}$ (c) $\sqrt{3}$ (d) 1

2. Find the value of $\tan 75°$:
(a) $\dfrac{\sqrt{3}+1}{2\sqrt{2}}$ (b) $\dfrac{\sqrt{3}}{2+\sqrt{2}}$
(c) $\dfrac{\sqrt{3}-1}{2\sqrt{2}}$ (d) $\dfrac{2+\sqrt{2}}{\sqrt{3}}$

3. Find the value of $\cos 28°\cdot\cos 32°-\sin 28°\cdot\sin 32°$:
(a) 1 (b) 1/2
(c) 1/3 (d) can't be determined

4. If $\cos A=\dfrac{3}{5}$ and $\sin B=\dfrac{5}{13}$, find the value of $\dfrac{\tan A+\tan B}{1-\tan A\tan B}$:
(a) $\frac{63}{16}$ (b) $\frac{36}{16}$
(c) $\frac{61}{36}$ (d) none of these

5. Find the value of
$\sin^2(120°-A)+\sin^2 A+\sin^2(120°+A)$:
(a) $\frac{2}{3}$ (b) $\frac{3}{2}$ (c) $\frac{5}{2}$ (d) $\frac{\sqrt{3}}{2}$

6. If $\cos(\alpha+\beta)=\dfrac{4}{5}$ and $\sin(\alpha-\beta)=\dfrac{5}{13}$ and α,β lie between 0° and 45°, find the value of $\tan 2\alpha$:
(a) $\frac{56}{63}$ (b) $\frac{56}{33}$
(c) $\frac{25}{33}$ (d) $\frac{65}{63}$

7. Find the maximum and minimum values of $7\cos\theta+24\sin\theta$:
(a) 25 and -25 (b) 16 and -9
(c) 25 and 0 (d) 36 and 25

8. Find the value of $2\cos 45°\cdot\cos 15°$:
(a) $\dfrac{(\sqrt{3}+1)}{2\sqrt{2}}$ (b) $\dfrac{(\sqrt{3}-1)}{2}$
(c) $\dfrac{\sqrt{3}+1}{2}$ (d) none of these

9. Find the value of $\frac{\sin 75^\circ + \sin 15^\circ}{\cos 75^\circ + \cos 15^\circ}$:

(a) 1 (b) 2
(c) $\frac{\sqrt{3}}{2}$ (d) can't be determined

10. Find the value of $\cos 20^\circ + \cos 100^\circ + \cos 140^\circ$:

(a) – 1 (b) 0 (c) 1 (d) none

11. $\cos 20^\circ \cdot \cos 40^\circ \cdot \cos 60^\circ \cdot \cos 80^\circ$ is :

(a) $\frac{1}{16}$ (b) $\frac{1}{50}$ (c) $\frac{1}{24}$ (d) $\frac{1}{25}$

12. What is the value of;

$$\frac{\sin(90^\circ - \theta)\sec(180^\circ - \theta)\sin(-\theta)}{\sin(180^\circ + \theta)\cot(360^\circ - \theta)\operatorname{cosec}(90^\circ + \theta)}$$:

(a) $\sin\theta$ (b) $\cos\theta$ (c) 1 (d) $\frac{1}{\sqrt{2}}$

13. If $\sin(\alpha + \beta) = \frac{4}{5}$, $\sin(\alpha - \beta) = \frac{5}{13}$, find the value of $\tan 2\alpha$:

(a) $\frac{16}{36}$ (b) $\frac{63}{16}$
(c) $\frac{36}{16}$ (d) none of these

14. Find the value of $\frac{\cos 2B - \cos 2A}{\sin 2A + \sin 2B}$:

(a) $\tan(A - B)$
(b) $\cos(A - B)$
(c) $\cot(A - B)$
(d) $\tan(A + B)$

15. $\frac{\sin A + \sin 3A + \sin 5A + \sin 7A}{\cos A + \cos 3A + \cos 5A + \cos 7A}$ is :

(a) $\tan 2A$ (b) $\tan 3A$
(c) $\tan 4A$ (d) $\tan 8A$

11.9 Trigonometrical Ratios of Multiple and Sub-multiple Angles

1. $\sin 2A = 2\sin A\cos A = \frac{2\tan A}{1+\tan^2 A}$

2. $\cos 2A = \cos^2 A - \sin^2 A = 1 - 2\sin^2 A$

$= 2\cos^2 A - 1 = \frac{1-\tan^2 A}{1+\tan^2 A}$

3. $\tan 2A = \frac{2\tan A}{1-\tan^2 A}$

4. $\sin 3A = 3\sin A - 4\sin^3 A$

5. $\cos 3A = 4\cos^3 A - 3\cos A$

6. $\tan 3A = \frac{3\tan A - \tan^3 A}{1 - 3\tan^2 A}$

7. $\sin A = 2\sin\left(\frac{A}{2}\right)\cos\left(\frac{A}{2}\right) = \frac{2\tan(A/2)}{1+\tan^2(A/2)}$

8. $\cos A = \cos^2\left(\frac{A}{2}\right) - \sin^2\left(\frac{A}{2}\right)$ etc.

9. $\tan A = \frac{2\tan(A/2)}{1-\tan^2(A/2)}$

Introductory Exercise 11.4

1. If $\sin\theta = \frac{4}{5}$, find the value of $\sin 2\theta$:

(a) 24/25 (b) 16/25
(c) 9/20 (d) none of these

2. $\frac{\sin 2A}{1 + \cos 2A}$ is :

(a) $\tan 2A$ (b) $\cos 2A$
(c) $\tan A$ (d) none of these

3. $\cos^4\theta - \sin^4\theta$ is :

(a) $\cos 2\theta$ (b) $\sin 2\theta$
(c) $\tan 2\theta$ (d) none of these

4. If $\cot x = \frac{a}{b}$, find the value of $a\cos 2x + b\sin 2x$

(a) a (b) b
(c) $\sin a$ (d) a / b

5. Find the value of $\cot 3\theta$:

(a) $\frac{\cot^3\theta - 3\cot\theta}{3\cot^2\theta}$ (b) $\frac{\cot^3\theta - 3\cot\theta}{3\cot^2\theta - 1}$
(c) $\frac{3\cot\theta - \cot^3\theta}{3\cot^2\theta - 1}$ (d) none of these

6. Find the value of $\sin\left(22\frac{1}{2}\right)^\circ$:

(a) $\frac{\sqrt{(2-\sqrt{2})}}{2}$ (b) $\frac{\sqrt{(2-\sqrt{3})}}{3}$
(c) $\frac{\sqrt{2-\sqrt{2}}}{4}$ (d) none of these

7. If $2\cos\theta = x + \frac{1}{x}$, find the value of $2\cos 3\theta$

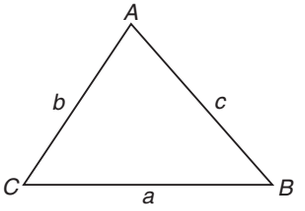
(a) $x^3 + \frac{1}{x^3}$ (b) $x^2 + \frac{1}{x^2}$ (c) $x^3 - \frac{1}{x^3}$ (d) $\sqrt{x + \frac{1}{x}}$

8. Find the value of $\tan A + \tan B + \tan C$, if $A + B + C = \pi$

(a) $\tan A \tan B \tan C$ (b) 1
(c) 0 (d) $\cot A \cot B \cot C$

11.10 Properties of Triangles

A triangle ABC has three angles and three sides. The three angles are denoted by A, B and C while the three sides are denoted by a, b and c respectively. The area of the triangle is denoted by Δ and its perimeter is denoted by $2s$, so that $a+b+c=2s$. Thus 's' is the semiperimeter of the triangle and $s=\frac{a+b+c}{2}$. Also we denote the circumradius by R and inradius by r.



1. *The law of sines*

In any triangle the sides are proportional to the sines of the opposite angles *i.e.*, $\frac{a}{\sin A}=\frac{b}{\sin B}=\frac{c}{\sin C}$

2. *The law of cosines*

The square on any side of a triangle is equal to the sum of the squares on the other two sides, minus twice the product of those two sides and the cosine of the included angle

i.e.,

$$a^2=b^2+c^2-2bc\cos A$$

$$\Rightarrow \quad b^2=c^2+a^2-2ca\cos B$$

$$c^2=a^2+b^2-2ab\cos C$$

3. *Area of a triangle*

(i) $\Delta=\frac{1}{2}bc\sin A=\frac{1}{2}ca\sin B=\frac{1}{2}ab\sin C$

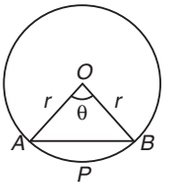
(ii) $\Delta=\sqrt{s(s-a)(s-b)(s-c)}$ (Hero's formula)

4. *The area of a segment of a circle*

Area of the segment APB

= Area of the sector AOB − Area of ΔAOB

$=\frac{1}{2}r^2\theta-\frac{1}{2}r^2\sin\theta=\frac{1}{2}r^2(\theta-\sin\theta)$



5. *Circumradius of a circle* (R)

(i) $R=\frac{a}{2\sin A}=\frac{b}{2\sin B}=\frac{c}{2\sin C}$

(ii) $R=\frac{abc}{4\Delta}$

6. *Inradius of a circle* (r)

$$r=\frac{\Delta}{s} \qquad \left(s=\frac{a+b+c}{2}\right)$$

Introductory Exercise 11.5

1. If $\cos B=\frac{\sin A}{2\sin C}$, find the nature of triangle :
(a) isosceles (b) scalene
(c) can't be determined (d) none of these

2. If the angles of a triangle are in the ratio 1 : 2 : 3 and its circumradius is 10 cm, find the sides of the triangle (in cm) :
(a) 8, 16, 24 (b) 18, 12, 6
(c) 10, 20, $20\sqrt{3}$ (d) 10, 20, $10\sqrt{3}$

3. If $a=1$, $b=\sqrt{3}$ and $A=30°$, find the value of the angle B
(a) 60° (b) 30°
(c) 120° (d) either (a) or (c)

4. Find B and C of a triangle ABC, if $b=2$ cm, $c=1$ cm and $A=60°$:
(a) 90° and 45° (b) 90° and 30°
(c) 60° and 30° (d) none of these

5. In a triangle ABC, $a=1$ cm, $b=\sqrt{3}$ cm and $C=\frac{\pi}{6}$, find the third side of the triangle :
(a) 1 cm (b) 1.5 cm (c) 2 cm (d) $3\sqrt{3}$ cm

6. If the angles of a triangle are in the ratio 1 : 2 : 3, find the ratio between corresponding sides :
(a) 3 : 2 : 1 (b) $1:\sqrt{3}:2$ (c) 6 : 3 : 2 (d) $1:\sqrt{2}:\sqrt{3}$

7. If $a=2b$ and $A=3B$, find the angles A, B, C of ΔABC :
(a) 90°, 30°, 60° (b) 30°, 60°, 90°
(c) 45°, 45°, 90° (d) data insufficient

8. If in any triangle $a=13$ cm, $b=14$ cm and $c=15$ cm, find the inradius of the circle :
(a) 2 cm (b) 6.5 cm (c) 4 cm (d) 7 cm

9. In a right angled triangle $a^2+b^2+c^2$ is :
(a) R^2 (b) $4R^2$ (c) $8R^2$ (d) none

10. Abhinav and Brijesh started walking simultaneously @ 3 km/h and 4 km/h from the same point 'C' on two different paths which diverge from each other at an angle of 120°. They walked for 6 hours and they stopped at A and B respectively. What is the least possible distance between Abhinav and Brijesh when they are at A and B respectively.
(a) $36\sqrt{37}$ km (b) $6\sqrt{37}$ km
(c) $12\sqrt{37}$ km (d) none of these

11.11 Height and Distance

Angle of Elevation

$\angle OPM$ is called as the angle of elevation.

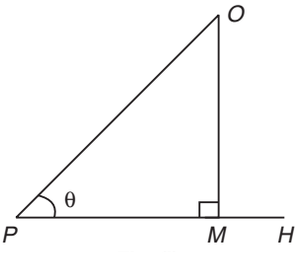


Fig. (i)

Suppose a person P is looking an object O which is at a higher level than P, then the angle θ ($\angle OPM$) is the angle of elevation for that person.

Angle of Depression

$\angle OPM$ in fig (ii) is called as angle of depression.

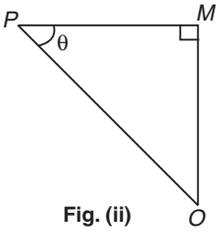

Fig. (ii)

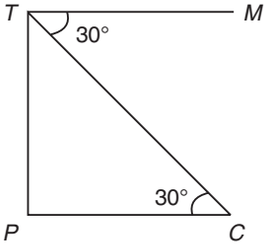
Suppose a person P is looking downward an object O, which is at a lower level than P, then the angle θ ($\angle OPM$) is called as the angle of depression.

NOTE It should be noted that the angle of elevation of one position as seen from the other is equal to the angle of depression of the latter as seen from the former.

Exp. 1) From the top of a tower 180 m high, it was observed that the angle of depression of the bottom of a cat sitting on the ground was 30°. Find the distance of the cat from the foot of the tower.

Solution Let PT be the tower and cat is sitting at C



Then $\angle MTC = \angle TCP$

Now in ΔCPT, $\angle TCP = 30°$

$\because$ $\tan 30° = \frac{TP}{PC} \Rightarrow \frac{1}{\sqrt{3}} = \frac{180}{PC}$

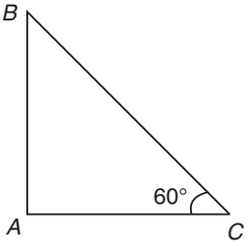
$\Rightarrow$ $PC = 180\sqrt{3}$ m $= 311.76$ m

Hence cat is 311.76 m away from the foot of the tower.

NOTE For a particular case, the angle of depression is equal to the angle of elevation.

Exp. 2) The angle of elevation of the top of a tower at a distance of 100 m from its foot on a horizontal plane is found to be 60°. Find the height of the tower.

Solution Let AB be the tower

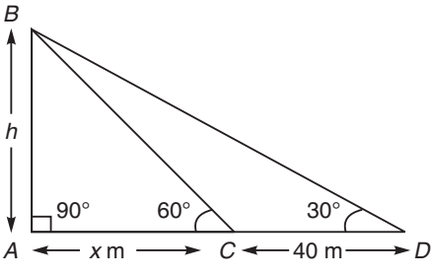


then $\tan 60° = \frac{AB}{AC}$; $\sqrt{3} = \frac{AB}{100} \Rightarrow AB = 100\sqrt{3}$ m $= 173.2$ m

Thus the height of the tower is 173.2 m.

Exp. 3) A person standing on the bank of a river observes that the angle subtended by a tree on the opposite bank is 60°, when he retreats 40 m from the bank he finds the angle to be 30°. Find the height of the tree and the breadth of the river.

Solution Let height of the tree be AB and width of the river be AC.



In ΔABC, $\tan 60° = \frac{h}{x}$

$$\sqrt{3} = \frac{h}{x} \Rightarrow h = x\sqrt{3} \quad \ldots(i)$$

and in ΔABD, $\frac{AB}{AD} = \tan 30°$

$$\frac{h}{(x+40)} = \frac{1}{\sqrt{3}} \quad \ldots(ii)$$

From eqs. (i) and (ii), we get

$$\frac{x\sqrt{3}}{(x+40)} = \frac{1}{\sqrt{3}} \Rightarrow x = 20 \text{ m}$$

$\therefore$ $h = x\sqrt{3} = 20\sqrt{3} = 34.64$ m (approx.)

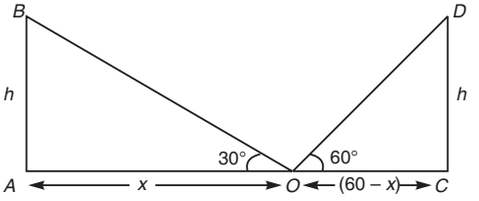
Thus the height of the tree is 34.46 m and breadth of the river is 20 m.

Exp. 4) Two towers of the same height stand on either side of a road 60 m wide. At a point on the road between the towers, the elevations of the towers are 60° and 30°. Find the height of the towers and the position of the point.

Solution In ΔAOB

$$\frac{AB}{AO} = \frac{h}{x} = \frac{1}{\sqrt{3}} \quad \ldots(i)$$

$$\Rightarrow \quad h = \frac{x}{\sqrt{3}}$$



and in ΔCOD, $\frac{CD}{OC} = \frac{h}{(60-x)} = \sqrt{3}$ …(ii)

from equation (i) and (ii)

$$\frac{x}{\sqrt{3}(60-x)} = \sqrt{3} \quad \Rightarrow \quad x = 45 \text{ m}$$

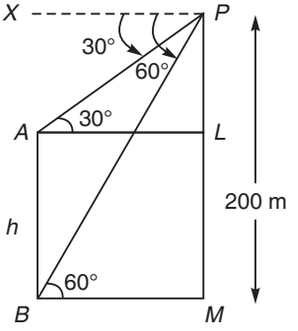
$$\therefore \quad h = \frac{45}{\sqrt{3}} = 15\sqrt{3} = 15 \times 1.732 = 25.98 \text{ m}$$

Hence, the height of the towers is 25.98m and the distance of the point '*O*' from *A* is 45 m and *C* is 15 m.

Exp. 5) From the top of a cliff, 200 m high, the angle of depression of the top and bottom of a tower are observed to be 30° and 60°, find the height of the tower.

Solution Let the height of the tower be *h* m, then

In ΔPBM, $\tan 60° = \frac{PM}{BM}$



$$\sqrt{3} = \frac{200}{BM}$$

$$BM = \frac{200}{\sqrt{3}} \text{ m} = AL \text{ (also)}$$

Now, in ΔALP, $\tan 30° = \frac{PL}{AL} \Rightarrow \frac{1}{\sqrt{3}} = \frac{PL}{(200/\sqrt{3})}$

$$\Rightarrow \quad PL = \frac{200}{3}$$

$$\therefore \quad LM = PM - PL = 200 - \left(\frac{200}{3}\right)$$

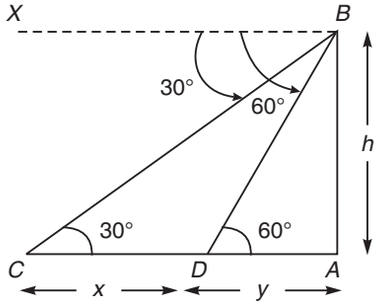
$$LM = \frac{400}{3}$$

But $LM = AB = h$

$\therefore$ Height of the tower $(h) = \frac{400}{3}$ m

Exp. 6) A man on the top of a rock rising on a seashore observes a boat coming towards it. If it takes 10 minutes for the angle of depression to change form 30° to 60°, how soon the boat reach the shore ?

Solution Let *AB* be the rock of height '*h*' metres.



Let *C* and *D* be the two positions of boat such that

$$\angle ACB = \angle XBC = 30°$$

and $\angle ADB = \angle XBD = 60°$

Let $CD = x$ m and $AD = y$ m

Now, in ΔABD, $\tan 60° = \frac{h}{y}$

$$\sqrt{3} = \frac{h}{y} \quad \ldots(i)$$

and in ΔABC, $\tan 30° = \frac{h}{x+y} = \frac{1}{\sqrt{3}}$ …(ii)

from equation (i) and (ii), we get

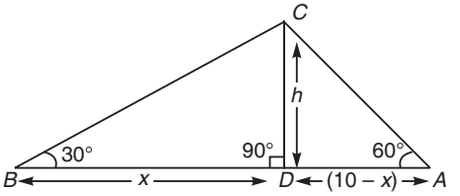
$$\frac{\sqrt{3}y}{x+y} = \frac{1}{\sqrt{3}} \quad \Rightarrow \quad x = 2y \quad \Rightarrow \quad y = \frac{x}{2}$$

Since the boat takes 10 minutes to cover *x* m, hence it will take $\frac{10}{2} = 5$ minutes to cover $y = \frac{x}{2}$ metres. Thus the required time $= 5$ minutes.

Exp. 7) The angles of elevation of an aeroplane from two places 10 km apart are found to be 60° and 30° respectively. Find the height of the aeroplane.

Solution Let *A* and *B* be the two places such that $AB = 10$ kms and let *C* be the position of the aeroplane at a height of *h* metres above *AB*. Let *CD* be perpendicular to *AB*.

In Ist case :



In ΔBCD,

$$\frac{h}{x} = \frac{1}{\sqrt{3}} \quad \ldots(i)$$

and $$\frac{h}{10-x} = \sqrt{3} \quad \ldots(ii)$$

from equation (i) and (ii)

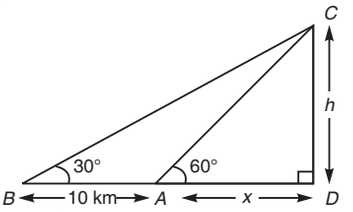
$$\frac{x}{\sqrt{3}\,(10-x)} = \sqrt{3}$$

$$\Rightarrow \quad x = 7.5 \text{ km}$$

$$\therefore \quad h = \frac{7.5}{\sqrt{3}} = \frac{7.5}{3} \times \sqrt{3} = 2.5 \times \sqrt{3}$$

$$= 4.33 \text{ km (approx.)}$$

In IInd case :



In ΔACD, $\quad \frac{h}{x} = \sqrt{3} \quad \ldots(i)$

In ΔBCD, $\quad \frac{h}{10+x} = \frac{1}{\sqrt{3}} \quad \ldots(ii)$

Therefore from equation (i) and (ii)

$$h = 5\sqrt{3} \text{ km} \quad \Rightarrow \quad h = 8.66 \text{ km}$$

Introductory Exercise 11.6

1. Two towers of the same height stand on opposite sides of a road 100 m wide. At a point on the road between the towers, the elevations of the towers are 30° and 45°. Find the height of the towers and the position of the point from the nearest tower :
(a) 36.6 m and 63.4 m (b) 63.3 m and 63.4 m
(c) 66.3 m and 63.4 m (d) 36.6 m and 86.4 m

2. The elevation of a tower at a station A due north of it is 45° and at a station B due west of A is 30°. If AB = 40 m, find the height of the tower :
(a) 26.26 m (b) 28.28 m
(c) 38.5 m (d) none of these

3. If the shadow of a tower is 30 m when the sun's altitude is 30° what is the length of the shadow when the sun's altitude is 60° ?
(a) $10\sqrt{3}$ m (b) 20 m (c) 10 m (d) 12 m

4. A helicopter is in a stationary position at a certain height over the lake. At a point 200 m above the surface of the lake, the angle of elevation of the helicopter is 45°. At the same time, the angle of depression of its reflection in the lake is 75°. Calculate the height of the helicopter from the surface of the lake :
(a) $\frac{200}{\sqrt{3}}$ m (b) $200\sqrt{3}$ m (c) 200 m (d) 150 m

5. A vertical tower stands on a horizontal plane and surmounted by a flagstaff of height 'h'. At a point on the plane, the angle of elevation of bottom of the flagstaff is α and that of the top of the flagstaff is β. Find the height of the tower :
(a) $h \tan\alpha$ (b) $\frac{h \tan\alpha}{\tan\alpha - \tan\beta}$
(c) $\frac{h \tan\alpha}{\tan\beta - \tan\alpha}$ (d) $\frac{\tan\alpha + \tan\beta}{h \tan\alpha}$

6. A round balloon of radius 'r' subtends an angle α at the eye of the observer, while the angle of elevation of its centre is β. Find the height of the centre of balloon.
(a) $r \operatorname{cosec}\left(\frac{\alpha}{2}\right) \sin\beta$ (b) $r \sin\alpha \operatorname{cosec}\beta$
(c) $\frac{r}{2} \sin\beta$ (d) $r \sec\left(\frac{\alpha}{2}\right)$

7. At the foot of a mountain the elevation of its summit is 45°, after ascending 1000 m towards the mountain up a stop of 30° inclination, the elevation is found to be 60°. Find the height of the mountain :
(a) 1.3 km (b) 1.366 km
(c) 2.72 km (d) none of these

8. An aeroplane when 3000 m high passes vertically above another aeroplane at an instant when their angles of elevation at the same observing point are 60° and 45° respectively. How many metres higher is the one than the other?
(a) 1248 m (b) 1188 m
(c) 1752 m (d) 1268 m

9. The angle of elevation of a cloud from a height h above the level of water in a lake is α and the angle of depression of its image in the lake is β. Find the height of the cloud above the surface of the lake :
(a) $\frac{h \sin(\beta - \alpha)}{\sin(\alpha + \beta)}$ (b) $h \sin\alpha$
(c) $\frac{h \sin(\alpha + \beta)}{\sin(\beta - \alpha)}$ (d) none of these

10. A palm tree 90 ft high, is broken by the wind and its upper part meet the ground at an angle of 30°. Find the distance of the point where the top of the tree meets the, ground , from its root :
(a) 43.69 ft (b) 51.96 ft
(c) 60 ft (d) 30 ft

CAT-Test

Questions Helping you bell the CAT

LEVEL 01 > BASIC LEVEL EXERCISE

1. If $0 < \theta < 90°$, then $(\sin\theta + \cos\theta)$ is :
(a) less than 1 (b) equal to 1
(c) greater than 1 (d) greater than 2

2. The value of x satisfying the equation $\sin x + \frac{1}{\sin x} = \frac{7}{2\sqrt{3}}$ is :
(a) 10° (b) 30°
(c) 45° (d) 60°

3. If $\sin\theta - \cos\theta = 0$ and $0 < \theta \le \pi/2$, then θ is equal to :
(a) $\frac{\pi}{2}$ (b) $\frac{\pi}{4}$
(c) $\frac{\pi}{6}$ (d) 0

4. Given that θ is acute and then $\sin\theta = \frac{3}{5}$. Let x, y be positive real numbers such that $3(x - y) = 1$, then one set of solutions for x and y expressed in terms of θ is given by :
(a) $x = \sec\theta$, $y = \text{cosec}\,\theta$ (b) $x = \cot\theta$, $y = \tan\theta$
(c) $x = \text{csoec}\,\theta$, $y = \cot\theta$ (d) $x = \sec\theta$, $y = \tan\theta$

5. Which one of the following pairs is correctly matched ?

If	then
(a) $x = \frac{1 + \sin 60° - \cos 60°}{1 + \sin 60° + \cos 60°}$	$x = \tan 60°$
(b) $x = \frac{1 + \sin 90° - \cos 90°}{1 + \sin 90° - \cos 90°}$	$x = \tan 30°$
(c) $x = \frac{2\tan 30°}{1 - \tan^2 30°}$	$x = \tan 60°$
(d) $x = \frac{1 - \tan^2 30°}{1 + \tan^2 30°}$	$x = \cos 60°$

6. If $x \tan 45° \cdot \cos 60° = \sin 60° \cot 60°$, then x is equal to
(a) 1 (b) 1/2
(c) $\sqrt{3}$ (d) $1/\sqrt{2}$

7. If θ lies in the second quadrant, then $\sqrt{\frac{1 - \sin\theta}{1 + \sin\theta}} + \sqrt{\frac{1 + \sin\theta}{1 - \sin\theta}}$ is equal to :
(a) $-2\sec\theta$ (b) $2\sec\theta$
(c) $2\,\text{cosec}\,\theta$ (d) $2\tan\theta$

8. $\sin^6 A + \cos^6 A$ is equal to :
(a) $1 - 3\sin^2 A\cos^2 A$ (b) $1 - 3\sin A\cos A$
(c) $1 + 3\sin^2 A\cos^2 A$ (d) 1

9. If $\sec x = P$, $\text{cosec}\,x = Q$, then :
(a) $P^2 + Q^2 = PQ$ (b) $P^2 + Q^2 = P^2Q^2$
(c) $P^2 - Q^2 = P^2Q^2$ (d) $P^2 + Q^2 = -P^2Q^2$

10. $\sin^2 A\cos^2 B - \cos^2 A\sin^2 B$ simplifies to :
(a) $\sin^2 A + \sin^2 B$ (b) $\cos^2 A + \cos^2 B$
(c) $\sin^2 A - \sin^2 B$ (d) $\sin^2 A - \cos^2 B$

11. If $\sin 2x = n\sin 2y$, then the value of $\frac{\tan(x + y)}{\tan(x - y)}$ is :
(a) $\frac{n+1}{n-1}$ (b) $\frac{n-1}{n+1}$ (c) $\frac{1-n}{n+1}$ (d) $\frac{1+n}{1-n}$

12. The least value of $2\sin^2\theta + 3\cos^2\theta$ is :
(a) 1 (b) 2 (c) 3 (d) 5

13. The value of $\tan(180 + \theta)\cdot\tan(90 - \theta)$ is :
(a) 1 (b) – 1
(c) 0 (d) none of these

14. $\log\tan 1° + \log\tan 2° + \ldots + \log\tan 89°$ is :
(a) 1 (b) $1/\sqrt{2}$
(c) 0 (d) – 1

15. If we convert $\sin(-566°)$ to same trigonometrical ratio of a positive angle lying between 0° and 45°, then we get :
(a) $\cos 26°$ (b) $-\cos 26°$
(c) $\sin 26°$ (d) $-\sin 26°$

16. From the mast head of ship, the angle of depression of a boat is 60°. If the mast head is 150 m, then the distance of the boat from the ship is :
(a) 86.6 m (b) 68.6 m
(c) 66.8 m (d) none of these

17. A portion of a 30 m long tree is broken by tornado and the top struck up the ground making an angle 30° with ground level. The height of the point where the tree is broken is equal to :
(a) $30/\sqrt{3}$ m (b) 10 m
(c) $30\sqrt{3}$ m (d) 60 m

18. Two posts are 25 m and 15 m high and the line joining their tips makes an angle of 45° with horizontal. The distance between these posts is :
(a) 5 m
(b) $10 / \sqrt{2}$ m
(c) 10 m
(d) $10\sqrt{2}$ m

19. The angle of elevation of the top of a tower at a point G on the ground is 30°. On walking 20 m towards the tower the angle of elevation becomes 60°. The height of the tower is equal to :
(a) $10 / \sqrt{3}$ m (b) $20\sqrt{3}$ m
(c) $20 / \sqrt{3}$ m (d) $10\sqrt{3}$ m

20. If $x = \sec\theta + \tan\theta$, $y = \sec\theta - \tan\theta$, then the relation between x and y is :
(a) $x^2 + y^2 = 0$ (b) $x^2 = y^2$
(c) $x^2 = y$ (d) $xy = 1$

21. The value of θ for which $\sqrt{3}\cos\theta + \sin\theta = 1$ is
(a) 0 (b) $\pi / 3$
(c) $\pi / 6$ (d) $\pi / 2$

22. If $\tan\theta = \frac{4}{3}$, then the value of $\sqrt{\frac{1+\cos\theta}{1-\cos\theta}}$ is
(a) 1 (b) 2
(c) 3 (d) 4

23. If the arcs of the same length in two circles subtend angles of 60° and 90° at the centre, then the ratio of their radii is
(a) $\frac{1}{3}$ (b) $\frac{1}{2}$
(c) $\frac{3}{2}$ (d) 2

24. In the third quadrant, the values of $\sin\theta$ and $\cos\theta$ are :
(a) positive and negative respectively
(b) negative and positive respectively
(c) both positive
(d) both negative

25. The value of $\frac{\cot 40^\circ}{\tan 50^\circ} - \frac{1}{2}\frac{\cos 35^\circ}{\sin 55^\circ}$ is :
(a) 1 (b) -1
(c) $\frac{1}{2}$ (d) $-\frac{1}{2}$

26. The value of $\theta\,(0 \le \theta \le \pi / 2)$ satisfying the equation $\sin^2\theta - 2\cos\theta + \frac{1}{4} = 0$ is :
(a) $\frac{\pi}{2}$ (b) $\frac{\pi}{3}$
(c) $\frac{\pi}{4}$ (d) $\frac{\pi}{6}$

27. If $\cos\theta = \frac{4}{5}$ and $0 < \theta < 90^\circ$, then the value of $\frac{3\cos\theta + 2\,\mathrm{cosec}\,\theta}{4\sin\theta - \cot\theta}$ is
(a) $-\frac{43}{2}$ (b) $-\frac{41}{2}$
(c) $\frac{43}{8}$ (d) $-\frac{43}{6}$

28. Maximum value of $(\cos\theta - \sin\theta)$ is :
(a) $\sqrt{2}$ (b) 1
(c) $\frac{1}{2}$ (d) $\frac{1}{\sqrt{2}}$

29. The value of $\sin 105^\circ$ is
(a) $\frac{\sqrt{3}-1}{2\sqrt{2}}$ (b) $\frac{\sqrt{3}-1}{\sqrt{2}}$
(c) $\frac{\sqrt{3}+1}{2\sqrt{2}}$ (d) $\frac{\sqrt{3}+1}{\sqrt{2}}$

30. If $\tan\theta = t$, then $\sin 2\theta$ is equal to
(a) $\frac{1}{1+t^2}$ (b) $\frac{2t}{1+t^2}$
(c) $\frac{t^2}{1+t}$ (d) $\frac{1+t^2}{1+t}$

31. If $\tan\theta = \sqrt{2}$, then the value of θ is
(a) less than $\frac{\pi}{4}$ (b) equal to $\frac{\pi}{4}$
(c) between $\frac{\pi}{4}$ and $\frac{\pi}{3}$ (d) greater than $\frac{\pi}{3}$

32. If $\tan\theta = 2 - \sqrt{3}$, then $\tan(90 - \theta)$ is equal to :
(a) $2 + \sqrt{3}$ (b) $2 - \sqrt{3}$
(c) $3 + \sqrt{2}$ (d) $3 - \sqrt{2}$

33. If from point 100 m above the ground the angles of depression of two objects due south on the ground are 60° and 45°, then the distance between the objects is :
(a) $\frac{50\,(3-\sqrt{3})}{3}$ m (b) $\frac{50\,(3+\sqrt{3})}{3}$ m
(c) $\frac{100\,(3+\sqrt{3})}{3}$ m (d) $\frac{100\,(3-\sqrt{3})}{3}$ m

34. If the length of shadow of a vertical pole on the horizontal ground is $\sqrt{3}$ times of its height, then the angle of elevation of sun is :
(a) 15° (b) 30° (c) 45° (d) 60°

35. A kite is flown with a thread of 250 m length. If the thread is assumed to be stretched and makes an angle of 60° with the horizontal, then the height of the kite above the ground is (approx.) :
(a) 216.25 m (b) 215. 25 m
(c) 212.25 m (d) 210.25 m

Hints & Solutions

☑ Level 01 *Basic Level Exercise*

1 Let $z = \sin\theta + \cos\theta$

$\Rightarrow \quad z^2 = 1 + \sin 2\theta$

$\because \quad 0 < \theta < 90°$ so $\sin 2\theta < 1$, so that $z^2 < 2$,

Thus $z < \sqrt{2}$ i.e., z is greater than 1.

2 Go through option.

3 $\sin\theta - \cos\theta = 0$

$\Rightarrow \quad \sin\theta = \cos\theta$

$\Rightarrow \quad \tan\theta = 1 \quad \Rightarrow \quad \theta = \frac{\pi}{4}$

4 Go through option.

Hint $\sin\theta = \frac{3}{5}$ and $\text{cosec}\,\theta = \frac{5}{3}$

7 $\sqrt{\frac{1-\sin\theta}{1+\sin\theta}} + \sqrt{\frac{1+\sin\theta}{1-\sin\theta}} = \frac{(1-\sin\theta)+(1+\sin\theta)}{\cos\theta}$

$= 2\sec\theta$

8 $a^3 + b^3 = (a+b)^3 - 3ab(a+b)$

Let $a = \sin^2\theta$, $b = \cos^2\theta$, so that

$a + b = \sin^2\theta + \cos^2\theta = 1$

$\Rightarrow \quad \sin^6\theta + \cos^6\theta = 1 - 3\sin^2\theta\cos^2\theta$

9 $\cos x = \frac{1}{P}$ and $\sin x = \frac{1}{Q}$

$1 = \cos^2 x + \sin^2 x = \frac{1}{P^2} + \frac{1}{Q^2}$

$\Rightarrow \quad P^2 + Q^2 = P^2Q^2$

10 $\sin^2 A(1 - \sin^2 B) - (1 - \sin^2 A)\sin^2 B = \sin^2 A - \sin^2 B$

11 $\frac{n}{1} = \frac{\sin 2x}{\sin 2y}$

$\Rightarrow \quad \frac{n+1}{n-1} = \frac{\sin 2x + \sin 2y}{\sin 2x - \sin 2y} = \frac{2\sin(x+y)\cos(x-y)}{2\cos(x+y)\sin(x-y)}$

$= \frac{\tan(x+y)}{\tan(x-y)}$

12 The value is least when $\theta = 90°$.

14 $\log\tan 1° + \log\tan 89° = \log\tan 1° + \log\tan(90-1)$

$= \log\tan 1° + \log\cot 1°$

$= \log\tan 1° \cdot \cot 1° = \log 1 = 0$

Similarly, $\log\tan 2° + \log\tan 88° = 0$

Also, $\log\tan 45° = \log 1 = 0$

Thus, the value of the expression is 0.

15 $\sin(-566°) = -\sin(566°)$

$= -\sin(90 \times 6 + 26) = \sin 26°$.

CHAPTER 12

Geometry

12.1 Introduction

I think geometry is all about visualization and creativity. By connecting some dots or extending some line segments or rotating some angles you can easily figure out the correct answers. Practically, you need not be an artist or a painter, but at least you must be capable of visualizing the geometrical figures. So before going for the tedious and complex geometrical problems you must make yourself familiar and comfortable with the fundamental concepts of geometry. Basically, geometry consists of a very large proportion of problems in CAT. Sometimes, 15-20% problems related to this chapter are asked in CAT. Apart from CAT other competitive exams such as XAT, IIFT and SSC also ask a plethora of questions from this chapter. Therefore, it is strongly advised that you must learn this chapter religiously for the sake of a decent score.

Mind me if you don't understand the theorems, axioms or concepts minutely you cannot perform well, as the intricacy of diagrams and concepts makes it a daunting task for you.

For the sake of convenience this chapter is divided into 5 parts

1. Lines and Angles
2. Triangles
3. Quadrilaterals
4. Polygons
5. Circles and Loci

Chapter Checklist

- *Lines and Angles*
- *Triangles*
- *Quadrilaterals*
- *Polygons*
- *Circles*
- *Tangential Quadrilateral*
- ***CAT Test***

12.2 Lines and Angles

Point : The figure of which length, breadth and height cannot be measured is called a point. It is infinitesimal.

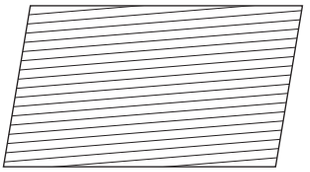
Line : A line is made up of a infinite number of points and it has only length *i.e.,* it does not has any thickness (or width). A line is endless *i.e.,* it can be extended in both directions.

Line segment : A line segments has two end points, but generally speaking line segment is called a line.

(line segment $\overrightarrow{AB}$)

Ray : A ray extends indefinitely in one direction from any given point. This is exhibited by an arrow. The starting point is called as the initial point.

Plane : It is a flat surface, having length and breadth both, but no thickness. It is a two dimensional figure.



(Plane)

Type of Lines	Definition	Diagram
Parallel lines	Two lines, lying in a plane and having no common intersecting point are called parallel lines. The distance between two parallel lines is constant.	Symbol : $\parallel$
Perpendicular lines	Two lines, which lie in a single plane and intersect eachother at right angle, are called perpendicular lines.	Symbol : $\perp$
Concurrent lines	More than two straight lines intersecting at the same point.	

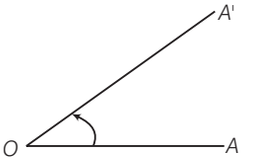
Points to Remember

1. A line contains infinitely many points.
2. The intersection of two different lines is a point.
3. Through a given point, there pass an infinite number of lines and these lines are called **concurrent lines.**
4. Only one line can pass through any two particular points.
5. When more than two points lie on a line, they are called as **collinear points** else they are called as **non-collinear** points.
6. Two lines can intersect maximum at one point. This point is called as **point of intersection** and these lines are called as **intersecting lines**.
7. There are an infinite number of planes which pass through a single (particular) point.
8. When more than three points lie in the same plane, they are called as **coplanar,** else they are called as **non-coplanar.**
9. When more than one line lie in the same plane, then these lines are called as coplanar else they are called as non-coplanar.
10. When two planes intersect each other, they form a line *i.e.,* intersecting region is a line.
11. Two different lines which are perpendicular to the same (a third line) line, are necessarily parallel to each other, if all of them are lying on the same plane.
12. When two or more parallel lines are intercepted by some other intercepting lines, then the ratio of corresponding intercepts are equal. An intercepting line is generally called as a transversal.

i.e., $\frac{AB}{BC} = \frac{DE}{EF}$

Angles

The amount of rotation about O, the vertex of the angle AOA', is called the magnitude of the angle.



$m\angle AOA'$ denotes the measure of $\angle AOA'$. Angles are said to be congruent when their measure is same.
(symbol : $\cong$)

Types of Angles	Property	Diagram
Acute	$0° < \theta < 90°$ ($\angle AOB$ is an acute angle)	Right	$\theta = 90°$ ($\angle AOB$ is a right angle)	
Types of Angles	Property	Diagram
Obtuse	$90° < \theta < 180°$ ($\angle AOB$ is an obtuse angle)	Straight	$\theta = 180°$ ($\angle AOB$ is a straight angle)	Reflex	$180° < \theta < 360°$ ($\angle AOB$ is a reflex angle)	Complementary	$\theta_1 + \theta_2 = 90°$ Two angles whose sum is 90°, are complementary to each other	 Supplementary	$\theta_1 + \theta_2 = 180°$ Two angles whose sum is 180°, are supplementary to each other.	 Vertically opposite	$\angle DOA = \angle BOC$ and $\angle DOB = \angle AOC$	Adjacent angles	$\angle AOB$ and $\angle BOC$ are adjacent angles Adjacent angles must have a common side. (*e.g., OB*)	Linear pair	$\angle AOB$ and $\angle BOC$ are linear pair angles. One side must be common (*e.g., OB*) and these two angles must be supplementary.	
Types of Angles	Property	Diagram
Angles on the one side of a line	$\theta_1 + \theta_2 + \theta_3 = 180°$	Angles round the point	$\theta_1 + \theta_2 + \theta_3 + \theta_4 = 360°$	Angle bisector	*OC* is the angle bisector of $\angle AOB$. *i.e.,* $\angle AOC = \angle BOC = \frac{1}{2}(\angle AOB)$ When a line segment divides an angle equally into two parts, then it is said to be the angle bisector (*OC*)	 (Angle bisector is equidistant from the two sides of the angle) *i.e.,* $AC = BC$ Corresponding angles	When two lines are intersected by a transversal, then they form four pairs of corresponding angles (a) $\angle AGE, \angle CHG \Rightarrow (\angle 2, \angle 6)$ (b) $\angle AGH, \angle CHF \Rightarrow (\angle 3, \angle 7)$ (c) $\angle EGB, \angle GHD \Rightarrow (\angle 1, \angle 5)$ (d) $\angle BGH, \angle DHF \Rightarrow (\angle 4, \angle 8)$	Exterior angles	These are following four angles (i) $\angle AGE \Rightarrow \angle 2$ (ii) $\angle CHF \Rightarrow \angle 7$ (iii) $\angle EGB \Rightarrow \angle 1$ (iv) $\angle DHF \Rightarrow \angle 8$	
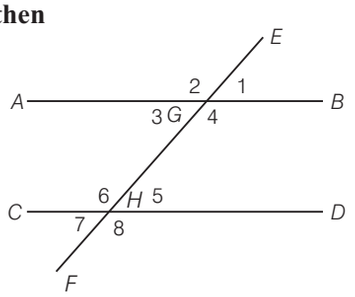
Interior angles	These are following four angles (i) $\angle AGH \Rightarrow \angle 3$ (ii) $\angle GHC \Rightarrow \angle 6$ (iii) $\angle BGH \Rightarrow \angle 4$ (iv) $\angle DHF \Rightarrow \angle 5$	
Alternate angles	These are two pairs angles as following: (i) $\angle AGH, \angle GHD$ $(\angle 3, \angle 5)$ (ii) $\angle GHC, \angle BGH$ $(\angle 6, \angle 4)$	

When two parallel lines are intersected by a transversal, then



1. The pairs of corresponding angles so formed are congruent.
   i.e., $\angle 2 = \angle 6$

$$\angle 3 = \angle 7$$
$$\angle 1 = \angle 5$$
$$\angle 4 = \angle 8$$

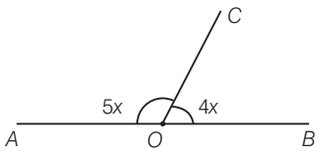
NOTE 1. If one pair of corresponding angles is congruent, then the rest pairs of corresponding angles are also congruent.

2. The pairs of alternate angles so formed are congruent
   i.e., $\angle 3 = \angle 5$ and $\angle 4 = \angle 6$
3. The pair of interior angles (*i.e.,* the interior angles on the same side of a transversal) are supplementary.

NOTE The converse of all the 3 rules is also true *i.e.,* if the pair of corresponding angles, or alternate angles or interior angles is equal (*i.e.,* congruent), then the two lines are parallel which are intersected by a transversal.

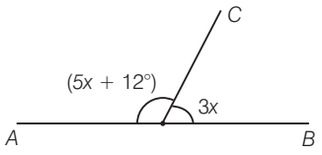
Introductory *Exercise 12.1*

1. What is the value of x in the following figure?



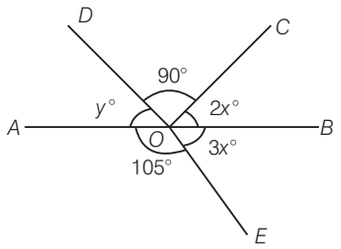
(a) 80° (b) 40°
(c) 20° (d) 25°

2. What is the value of x in the following figure?



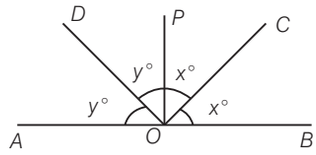
(a) 18° (b) 20°
(c) 21° (d) 24°

3. In the following figure AB is a straight line. Find $(x + y)$.



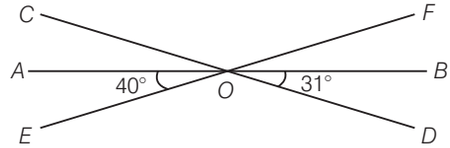
(a) 55° (b) 65°
(c) 75° (d) 80°

4. In the following figure $\angle BOP = 2x°$, $\angle AOP = 2y°$, OC and OD are angle bisectors of $\angle BOP$ and $\angle AOP$ respectively.



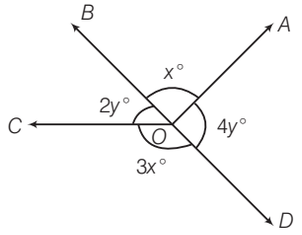
Find the value of $\angle COD$.
(a) 75° (b) 90° (c) 100° (d) 120°

5. In the following figure find the value of $\angle BOC$.



(a) 101° (b) 149° (c) 71° (d) 140°

6. Find y, if $x° = 36°$, as per the given diagram.



(a) 36° (b) 16° (c) 12° (d) 42°

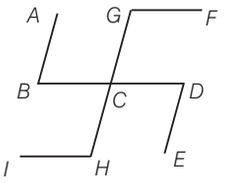
7. If $(2x + 17)°$, $(x + 4)°$ are complementary, find x.
(a) 63° (b) 53° (c) 35° (d) 23°

8. If $(5y + 62)°$, $(22° + y)$ are supplementary, find y.
(a) 16° (b) 32° (c) 8° (d) 1°

9. If two supplementary angles are in the ratio 13 : 5. find the greater angle.
(a) 130° (b) 65° (c) 230° (d) 28°

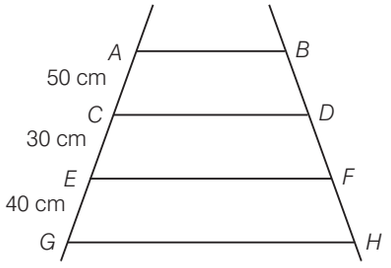
10. An angle is 30° more than one half of its complement. Find the angle in degrees.
(a) 60° (b) 50° (c) 45° (d) 80°

11. In the given diagram $AB \| GH \| DE$ and $GF \| BD \| HI$, $\angle FGC = 80°$. Find the value of $\angle CHI$.



(a) 80° (b) 120°
(c) 100° (d) 160°

12. In the given figure $AB \| CD \| EF \| GH$ and $BH = 100$ cm. Find the value of DF.



(a) 26 cm (b) 40 cm
(c) 25 cm (d) 24 cm

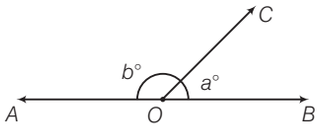
13. The complement of 65°50′ is :
(a) 24° 50′ (b) 24°10′
(c) 14° 50′ (d) 34° 10′

14. The supplement of 123° 45′ is :
(a) 56° 55′
(b) 56° 15′
(c) 55° 56′
(d) None of the above

15. If two angles are complementary to each other, then each angle is :
(a) a right angle
(b) a supplementary angle
(c) an obtuse angle
(d) an acute angle

16. How many degrees are there in an angle which equals one-fifth of its supplement?
(a) 15° (b) 30°
(c) 75° (d) 150°

17. In the given figure, $\angle a$ is greater than one-sixth of right angle, then.



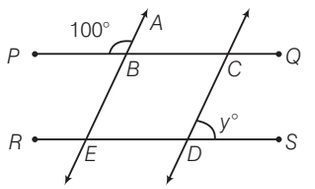
(a) $b > 165°$ (b) $b < 165°$
(c) $b \le 165°$ (d) $b \ge 165°$

18. Let D be the mid–point of a straight line AB and let C be a point different from D such that $AC = BC$, then.
(a) $AC \perp AB$ (b) $\angle BDC = 90°$
(c) $\angle BDC$ is acute (d) $\angle BDC > 90°$

19. Answer on the basis of the following statements.
When two straight lines intersect, then :
1. adjacent angles are complementary
2. adjacent angles are supplementary
3. opposite angles are equal
4. opposite angles are supplementary
(a) 2 and 3 are correct
(b) 1 and 4 are correct
(c) 1 and 3 are correct
(d) 2 and 4 are correct

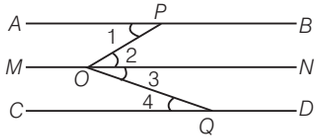
20. AB is a straight line and O is a point on AB, if a line OC is drawn not coinciding with OA or OB, then $\angle AOC$ and $\angle BOC$ are
(a) equal
(b) complementary
(c) supplementary
(d) together equal to 100

21. In the adjoining figure $AE \| CD$ and $BC \| ED$, then find Y.



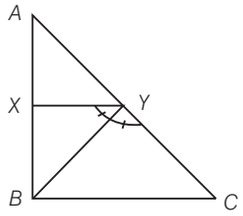
(a) 60° (b) 80°
(c) 90° (d) 75°

22. In the adjoining figure $\angle APO = 42°$ and $\angle CQO = 38°$. Find the value of $\angle POQ$.



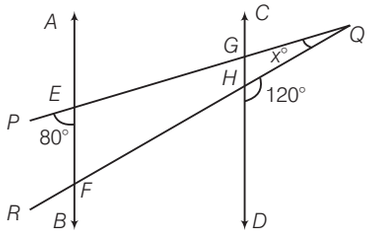
(a) 68° (b) 72°
(c) 80° (d) 126°

23. In a ΔABC, a line XY parallel to BC intersects AB at X and AC at Y :
If BY bisects $\angle XYC$, then $m\angle CBY : m\angle CYB$ is :



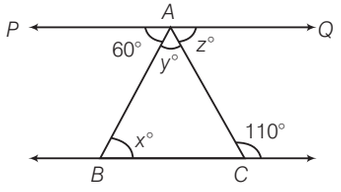
(a) 5 : 4 (b) 4 : 5
(c) 1 : 1 (d) 6 : 5

24. In the adjoining figure $AB \| CD$ and PQ, QR intersects AB and CD both at E, F and G, H respectively. Given that $m\angle PEB = 80°$, $m\angle QHD = 120°$ and $m\angle PQR = x°$, find the value of x.



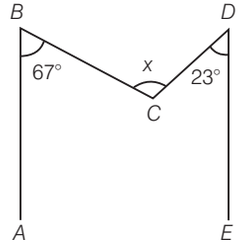
(a) 40° (b) 20°
(c) 100° (d) 30°

25. In the following figure, find the value of y.



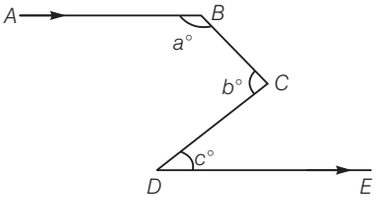
(a) 70° (b) 60°
(c) 50° (d) 80°

26. In the adjoining figure $AB \| DE$, $\angle ABC = 67°$ and $\angle EDC = 23°$. Find $\angle BCD$.



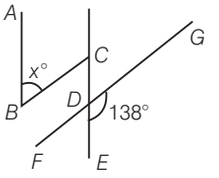
(a) 90°
(b) 44°
(c) 46°
(d) none of the above

27. In the given figure $AB \| DE$. Find $a° + b° - c°$:



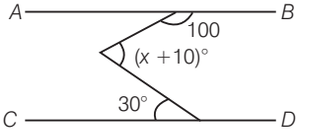
(a) 160° (b) 120° (c) 180° (d) 210°

28. In the given figure $AB \| CE$ and $BC \| FG$. Find the value of $x°$.



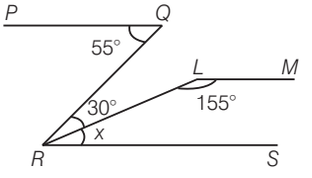
(a) 52° b) 32° (c) 42° (d) 36°

29. $AB \| CD$, shown in the figure. Find the value of x.



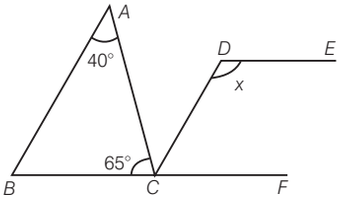
(a) 100° (b) 90° (c) 110° (d) 140°

30. In the figure $PQ \| LM \| RS$. Find the value of $\angle LRS$.



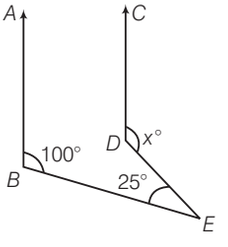
(a) 30° (b) 25° (c) 35° (d) 40°

31. In the figure $AB \| DC$ and $DE \| BF$. Find the value of x.



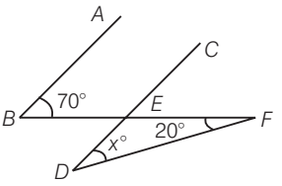
(a) 140° (b) 155° (c) 105° (d) 115°

32. In the figure $AB \| CD$, $\angle ABE = 100$. Find $m\angle CDE$.



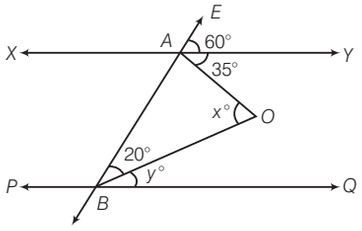
(a) 125° (b) 55° (c) 65° (d) 75°

33. In the figure $AB \| CD$, find $x°$ (*i.e.*, $\angle CDF$).



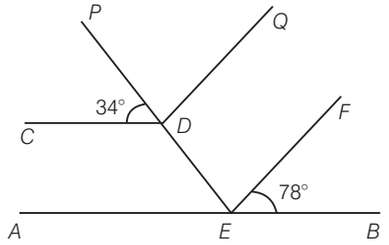
(a) 50° (b) 90° (c) 30° (d) 70°

34. In the given figure $XY \| PQ$, find the value of x.



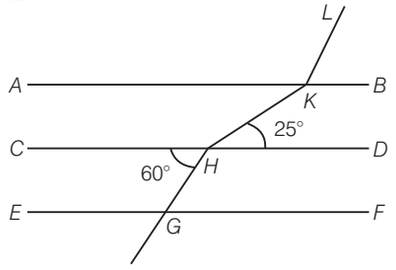
(a) 70° (b) 40° (c) 75° (d) 15°

35. In the given figure $AB \| CD$ and $EF \| DQ$. Find the value of $\angle DEF$.



(a) 68° (b) 78° (c) 34° (d) 39°

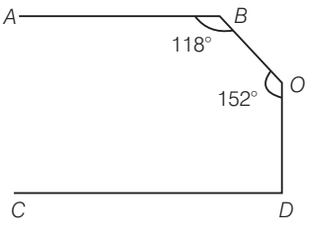
36. In the given figure $AB \| CD \| EF$ and $GH \| KL$. Find $m\angle HKL$.



(a) 85° (b) 145° (c) 120° (d) 95°

37. Which one of the following statements is false?
(a) Two straight lines can intersect at only one point.
(b) Through a given point, only one straight line can be drawn.
(c) A line segment can be produced to any desired length.
(d) Through two given points, it is possible to draw one and only one straight line.

38. $AB \| CD$. $\angle ABO = 118°$, $\angle BOD = 152°$, find $\angle ODC$.



(a) 70° (b) 80°
(c) 90° (d) 34°

39. Two parallel lines AB and CD are intersected by a transversal EF at M and N respectively. The lines MP and NP are the bisectors of interior angles $\angle BMN$ and $\angle DNM$ on the same side of the transversal. Then $\angle MPN$ is equal to :
(a) 60° (b) 90°
(c) 45° (d) 120°

40. If the arms of one angle are respectively parallel to the arms of another angle, then the two angles are :
(a) either equal or supplementary
(b) neither equal not supplementary
(c) equal but not supplementary
(d) not equal but supplementary

41. AB and CD are two parallel lines. PQ cuts AB and CD at E and F respectively. EL is the bisector of $\angle BEF$. If $\angle LEB = 35°$, then $\angle CFQ$ will be :
(a) 70° (b) 55°
(c) 110° (d) 125°

42. A plane figure is bounded by straight lines only. If n is the number of these lines, then the least value of n is :
(a) 1 (b) 2
(c) 3 (d) 4

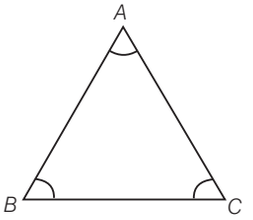
43. How many planes can pass through any three arbitrary points?
(a) 1 (b) 2
(c) 3 (d) 0

44. Out of the four arbitrary non–collinear points three points are taken at a time, then the number of planes that can be drawn through the three points is :
(a) 3 (b) 4
(c) 6 (d) 12

45. Maximum number of points of intersection of four lines on a plane is :
(a) 4 (b) 6
(c) 8 (d) 5

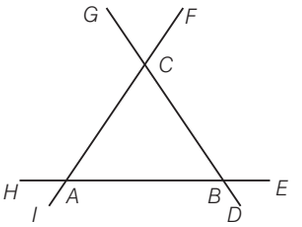
12.3 Triangles

Triangle : A three sided closed plane figure, which is formed by joining the three non-collinear points, is called as a triangle. It is denoted by the symbol Δ.



In the above Δ (triangle) ABC, A, B and C are three **vertices**, line segments AB, BC and AC are the three **sides** of the triangle. $\angle A, \angle B$ and $\angle C$ are the three **interior angles** of a triangle ABC.

In the adjoining figure $\angle FCB$, $\angle CBE$, $\angle ABD$, $\angle IAB$, $\angle HAC$, $\angle GCA$ are the **exterior angles** of the ΔABC.



Sum of the three interior angles of a triangle is always 180°.

Exterior angle = Sum of two interior opposite angles

e.g., $\angle CBE = \angle CAB + \angle BCA$

Perimeter of triangle is equal to sum of all the three sides *i.e.,* $a + b + c$

Semiperimeter of a triangle is half of the perimeter

i.e., $s = \frac{a+b+c}{2}$, a, b, c are the length of three sides of a triangle.

Types of Triangles

(A) According to interior angles

Types of Triangles	Property/Definition	Diagram
Acute angle triangle	Each of the angle of a triangle is less than 90° *i.e.,* $a < 90°, b < 90°, c < 90°$	 $\{\angle a, \angle b, \angle c\} < 90°$
Right angled triangle	One of the angle is equal to 90°, then it is called as right angled triangle. Rest two angles are complementary to each other.	 $\angle C = 90°$
Obtuse angle triangle	One of the angle is obtuse (*i.e.,* greater than 90°), then it is called as obtuse angle triangle.	 $\angle C > 90°$

(B) According to the length of sides.

Types of Triangles	Property/Definition	Diagram
Scalene triangle	A triangle in which none of the three sides is equal is called a scalene triangle (all the three angles are also different).	 $a \neq b \neq c$

Isosceles triangle	A triangles in which at least two sides are equal is called an isosceles triangle. In this triangle, the angles opposite to the congruent sides are also equal.	 $AB = AC,\ \angle B = \angle C$
Equilateral triangle	A triangle in which all the three sides are equal called an equilateral triangle. In this triangle each angle is congruent and equal to 60°.	 $AB = BC = AC$ $\angle A = \angle B = \angle C = 60°$

Fundamental Properties of Triangles

1. Sum of any two sides is always greater than the third side.
2. The difference of any two sides is always less than the third side.
3. Greater angle has a greater side opposite to it and smaller angle has a smaller side opposite to it *i.e.,* if two sides of a triangle are not congruent then the angle opposite to the greater side is greater.
4. Let a, b and c be the three sides of a ΔABC and c is the largest side. Then

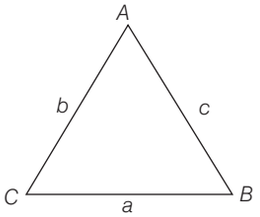
   (i) if $c^2 < a^2 + b^2$, the triangle is **acute angle triangle**

   (ii) if $c^2 = a^2 + b^2$, the triangle is **right angled triangle**

   (iii) if $c^2 > a^2 + b^2$, the triangle is **obtuse angle triangle**

5. **Sine rule :** In a ΔABC, if a, b, c be the three sides opposite to the angles A, B, C respectively, then

$$\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$$



6. **Cosine rule :** In a ΔABC, if a, b, c be the sides opposite to angle A, B and C respectively, then

$$\cos A = \frac{b^2 + c^2 - a^2}{2bc}, \cos B = \frac{c^2 + a^2 - b^2}{2ca},$$

$$\cos C = \frac{a^2 + b^2 - c^2}{2ab}$$

   (These rules have been discussed already in trigonometry.)

7. The sum of all the three interior angles is always 180°

   i.e., $\angle CAB + \angle ABC + \angle BCA = 180°$

8. The sum of three (ordered) exterior angles of a triangle is 360°

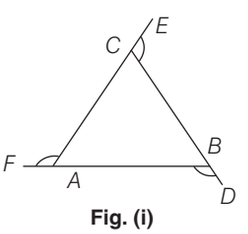


Fig. (i)

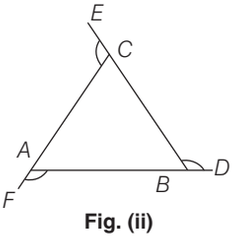

Fig. (ii)

   In fig. (i) : $(\angle FAC + \angle ECB + \angle DBA) = 360°$

   In fig. (ii) : $(\angle FAB + \angle DBC + \angle ECA) = 360°$

9. The sum of an interior angle and its adjacent exterior angle is 180°.

10. A triangle must has at least two acute angles.
11. In a triangle, the measure of an exterior angle equals the sum of the measures of the interior opposite angles.
12. The measure of an exterior angle of a triangle is greater than the measure of each of the opposite interior angles.

Important Definitions

Nomenclature	Property/Definition	Diagram
Altitude (or height)	The perpendicular drawn from the opposite vertex of a side in a triangle is called an altitude of the triangle. • There are three altitudes in a triangle.	 *AE*, *CD* and *BF* are the altitudes
Median	The line segment joining the mid-point of a side to the vertex opposite to the side is called a median. • There are three medians in a triangle. • A median bisects the area of the triangle *i.e.,* $A(\Delta ABE) = A(\Delta AEC) = \frac{1}{2} A(\Delta ABC)$ etc.	 *AE*, *CD* and *BF* are the medians ($BE = CE$, $AD = BD$, $AF = CF$)
Angle bisector	A line segment which originates from a vertex and bisects the same angle is called an angle bisector. $\left(\angle BAE = \angle CAE = \frac{1}{2} \angle BAC\right)$ etc.	 *AE*, *CD* and *BF* are the angle bisectors.
Perpendicular bisector	A line segment which bisects a side perpendicularly (i.e, at right angle) is called a perpendicular bisector of a side of triangle. • All points on the perpendicular bisector of a line are equidistant from the ends of the line.	 *DO*, *EO* and *FO* are the perpendicular bisectors.
Orthocentre	The point of intersection of the three altitudes of the triangle is called the orthocentre. $\angle BOC = 180 - \angle A$ $\angle COA = 180 - \angle B$ $\angle AOB = 180 - \angle C$	 '*O*' is the orthocentre

Types of Triangles	Property/Definition	Diagram
Centroid	The point of intersection of the three medians of a triangle is called the centroid. A centroid divides each median in the ratio 2 : 1 (vertex : base) $\frac{AO}{OE}=\frac{CO}{OD}=\frac{BO}{OF}=\frac{2}{1}$	 '*O*' is the centroid.
Incentre	The point of intersection of the angle bisectors of a triangle is called the incentre. Incentre *O* is the always equidistant from all three sides *i.e.,* the perpendicular distance between the sides and incentre is always same for all the three sides.	 '*O*' is the incentre.
Circumcentre	The point of intersection of the perpendicular bisectors of the sides of a triangle is called the circumcentre. $OA = OB = OC$ = (circum radius) Circumcentre *O* is always equidistant from all the three vertices *A*, *B* and *C*.	 '*O*' is the circumcentre.

Important Theorems on Triangles

Theorem	Statement/Explanation	Diagram
Pythagoras theorem	The square of the hypotenuse of a right angled triangle is equal to the sum of the squares of the other two sides. *i.e.,* $(AC)^2 = (AB)^2 + (BC)^2$ • The converse of this theorem is also true. • The numbers which satisfy this relation, are called Pythagorean triplets. *e.g.,* (3, 4, 5), (5, 12, 13), (7, 24, 25), (8, 15, 17), (9, 40, 41), (11, 60, 61), (12, 35, 37), (16, 63, 65), (20, 21, 29), (28, 45, 53), (33, 56, 65) **Note :** All the multiples (or submultiples) of Pythagorean triplets also satisfy the relation. *e.g.,* (6, 8,10), (15,36, 39), (1.5, 2, 2.5) etc	 $\angle B = 90°$ $\overline{AC} \rightarrow$ Hypotenuse $AD = CD = BD$ (*D* is the mid-point of *AC*)
45° – 45° – 90° triangle theorem	If the angles of a triangle are 45°, 45° and 90°, then the hypotenuse (*i.e.,* longest side) is $\sqrt{2}$ times of any smaller side. Excluding hypotenuse rest two sides are equal. *i.e.,* $AB = BC$ and $AC = \sqrt{2}AB = \sqrt{2}BC$	 $\angle A = 45°, \angle B = 90°, \angle C = 45°$

Theorem	Statement/Explanation	Diagram
30° – 60° – 90° triangle theorem	If the angles of a triangle are 30°, 60° and 90°,then the sides opposite to 30° angle is half of the hypotenuse and the side opposite to 60° is $\frac{\sqrt{3}}{2}$ times the hypotenuse . e.g., $AB = \frac{AC}{2}$ and $BC = \frac{\sqrt{3}}{2}AC$ $\therefore \quad AB : BC : AC = 1 : \sqrt{3} : 2$	Basic proportionality theorem (BPT) **or Thales theorem**	Any line parallel to one side of a triangle divides the other two sides proportionally. So if DE is drawn parallel to BC, it would divide sides AB and AC proportionally *i.e.,* $\frac{AD}{DB} = \frac{AE}{EC}$ or $\frac{AD}{AB} = \frac{AE}{AC}$ $\frac{AD}{DE} = \frac{AB}{BC} = \frac{AE}{DE} = \frac{AC}{BC}$	Mid-point theorem	If the mid-points of two adjacent sides of a triangle are joined by a line segment, then this segment is parallel to the third side. *i.e.,* if $AD = BD$ and $AE = CE$, then $DE \parallel BC$	Apollonius theorem	In a triangle, the sum of the squares of any two sides of a triangle is equal to twice the sum of the square of the median to the third side and square of half the third side. *i.e.,* $AB^2 + AC^2 = 2(AD^2 + BD^2)$	 $BD = CD$ AD is the median
Interior angle bisector theorem	In a triangle the angle bisector of an angle divides the opposite side to the angle in the ratio of the remaining two sides. *i.e.,* $\frac{BD}{CD} = \frac{AB}{AC}$ and $BD \times AC - CD \times AB = AD^2$	Exterior angle bisector theorem	In a triangle the angle bisector of any exterior angle of a triangle divides the side opposite to the external angle in the ratio of the remaining two sides *i.e.,* $\frac{BE}{AE} = \frac{BC}{AC}$	
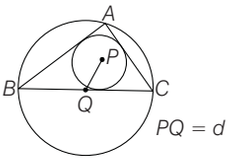
Euler's Theorem for a triangle

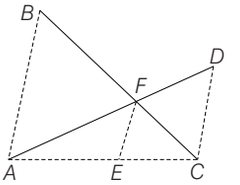
Let ΔABC have circumradius R and inradius r. Let d be the distance between the circumcentre and the incenter. Then we have $d^2 = R(R - 2r)$



Crossed Ladder Theorem

Let the two line segments BC and AD intersect at a point F, such that the point E lies on AC and $AB \parallel CD \parallel EF$. Then, we have

$$\frac{1}{AB} + \frac{1}{CD} = \frac{1}{EF}$$

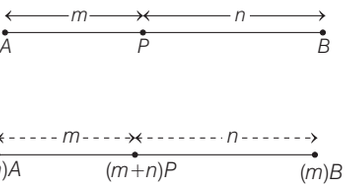


Mass Point Geometry

Let us consider a line AB which is intersected by a point P, such that $AP = m$ and $BP = n$, we have

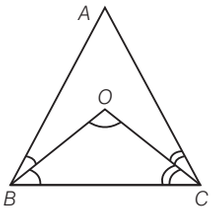
$$\frac{\text{wt}(A)}{\text{wt}(B)} = \frac{n}{m}$$

Therefore, the weight at A will be n, the weight at B will be m and the total weight at P will be $(m + n)$.

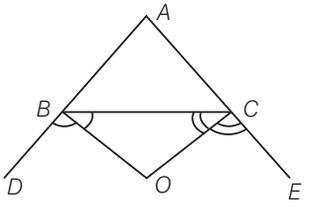


Useful Results

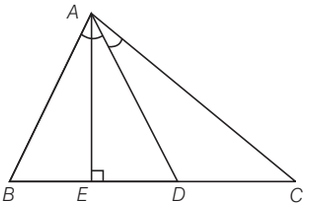
1. In a ΔABC, if the bisectors of $\angle B$ and $\angle C$ meet at O, then $\angle BOC = 90° + \frac{1}{2}\angle A$



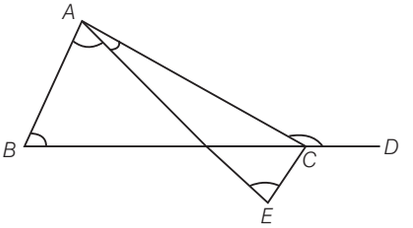
2. In a ΔABC, if sides AB and AC are produced to D and E respectively and the bisectors of $\angle DBC$ and $\angle ECB$ intersect at O, then $\angle BOC = 90° - \frac{1}{2}\angle A$



3. In a ΔABC, if AD is the angle bisector of $\angle BAC$ and $AE \perp BC$, then $\angle DAE = \frac{1}{2}(\angle ABC - \angle ACB)$

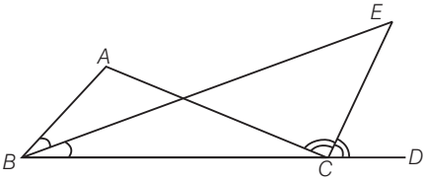


4. In a ΔABC, if BC is produced to D and AE is the angle bisector of $\angle A$, then



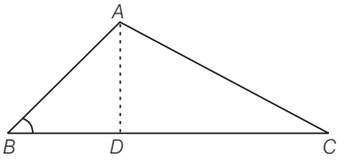
$$\angle ABC + \angle ACD = 2\angle AEC.$$

5. In a ΔABC, if side BC is produced to D and bisectors of $\angle ABC$ and $\angle ACD$ meet at E, then



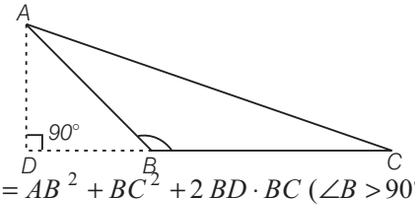
$$\angle BEC = \frac{1}{2}\angle BAC$$

6. In an acute angle ΔABC, AD is a perpendicular dropped on the opposite side of $\angle A$, then



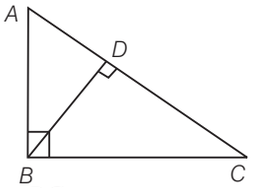
$$AC^2 = AB^2 + BC^2 - 2BD \cdot BC \ (\angle B < 90°)$$

7. In an obtuse angle ΔABC, AD is perpendicular dropped on BC. BC is produced to D to meet AD, then



$$AC^2 = AB^2 + BC^2 + 2\,BD \cdot BC \;(\angle B > 90°)$$

8. In a right angle ΔABC, $\angle B = 90°$ and AC is hypotenuse. The perpendicular BD is dropped on hypotenuse AC from right angle vertex B, then



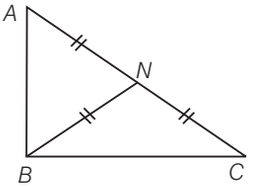
(i) $BD = \dfrac{AB \times BC}{AC}$ (ii) $AD = \dfrac{AB^2}{AC}$

(iii) $CD = \dfrac{BC^2}{AC}$

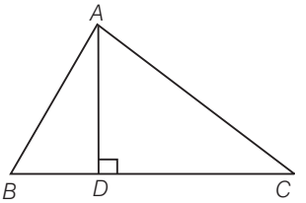
(iv) $\dfrac{1}{BD^2} = \dfrac{1}{AB^2} + \dfrac{1}{BC^2}$

In a right angled triangle, the median to the hypotenuse $= \dfrac{1}{2} \times$ hypotenuse

i.e., $BN = \dfrac{AC}{2}$ (as per the fig.)



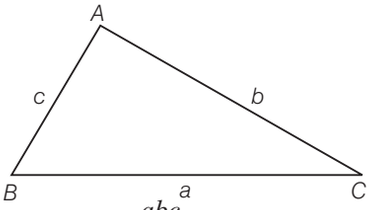
9. **Area of a triangle (General formula)**



$$A\,(\Delta) = \frac{1}{2} \times \text{base} \times \text{height}$$

$$A\,(\Delta) = \frac{1}{2} \times BC \times AD \qquad \text{(as per the figure.)}$$

10. **Area of scalene triangle** $= \sqrt{s\,(s-a)\,(s-b)\,(s-c)}$



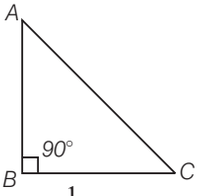
Also, $A\,(\Delta) = r \times s = \dfrac{abc}{4R}$

where a, b and c are the sides of the triangle.

$s \rightarrow$ semiperimeter $= \dfrac{a+b+c}{2}$, $r \rightarrow$ inradius

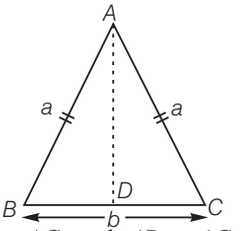
$R \rightarrow$ circumradius

11. **Area of right angled triangle**



$= \dfrac{1}{2} \times$ base $\times$ height $= \dfrac{1}{2} \times BC \times AB$ (as per the figure)

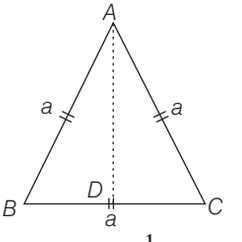
12. **Area of an isosceles triangle** $= \dfrac{b}{4}\sqrt{4a^2 - b^2}$



$AB = AC$ and $\angle B = \angle C$

$\Delta ABD \cong \Delta ACD$ ($AD \rightarrow$ Angle bisector, median, altitude and perpendicular bisector)

13. **Area of an equilateral triangle** $= \dfrac{\sqrt{3}}{4}a^2$



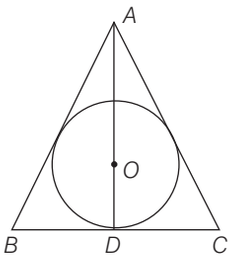
$$\left[A\,(\Delta) = \frac{1}{2}BC \times AD = \frac{1}{2} \times a \times \frac{\sqrt{3}}{2}a = \frac{\sqrt{3}}{4}a^2\right]$$

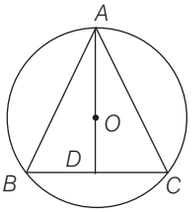
($a \rightarrow$ each side of the triangle)

$AD \rightarrow$ Altitude, median, angle bisector and perpendicular bisector also.

Inradius : $\frac{1}{3} \times \text{height} = \frac{\text{side}}{2\sqrt{3}}$,

$OD \rightarrow$ Inradius





Circumradius $= \frac{2}{3} \times \text{height} = \frac{\text{side}}{\sqrt{3}}$

$OA \rightarrow$ Circumradius

NOTE In equilateral triangle orthocentre centroid, incentre and circumcentre coincide at the same point.

Circumradius = 2 × inradius

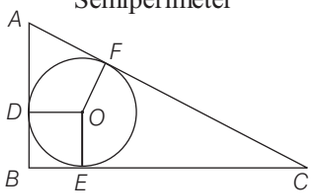
For the given perimeter of a triangle, the area of equilateral triangle is maximum.

For the given area of a triangle, the perimeter of equilateral triangle is minimum.

14. In a right angled triangle

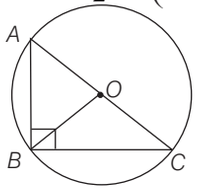
(i) Inradius $(r) = \frac{AB + BC - AC}{2}$

(ii) Inradius $(r) = \frac{\text{Area}}{\text{Semiperimeter}}$



$DO = EO = FO\ (r)$

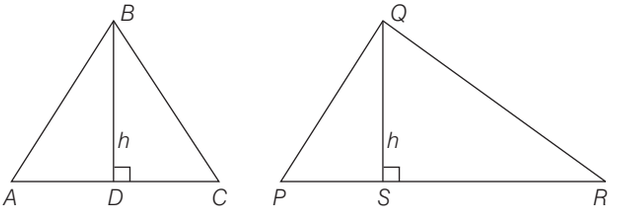
(iii) Circumradius $(R) = \frac{AC}{2} = \left(\frac{\text{hypotenuse}}{2}\right)$



$AO = CO = BO = (R)$

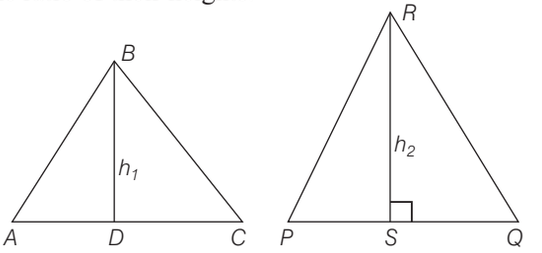
AC is the diameter.

15. The ratio of areas of two triangles of equal heights is equal to the ratio of their corresponding bases. i.e.,



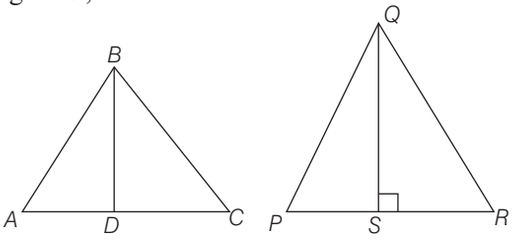
$$\frac{A\,(\Delta ABC)}{A\,(\Delta PQR)} = \frac{AC}{PR}$$

16. The ratio of areas of triangles of equal bases is equal to the ratio of their heights.



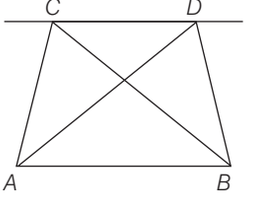
i.e., $\frac{A\,(\Delta ABC)}{A\,(\Delta PQR)} = \frac{BD}{RS}$

17. The ratio of the areas of two triangles is equal to the ratio of the products of base and its corresponding height i.e.,



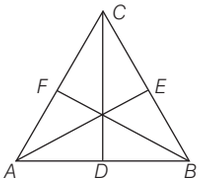
$$\frac{A\,(\Delta ABC)}{A\,(\Delta PQR)} = \frac{AC \times BD}{PR \times QS}$$

18. If the two triangles have the same base and lie between the same parallel lines (as shown in figure), then the area of two triangles will be equal.



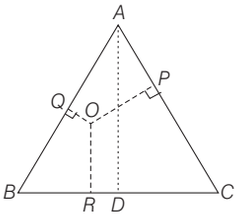
i.e., $A\,(\Delta ABC) = A\,(\Delta ADB)$

19. In a triangle AE, CD and BF are the medians, then

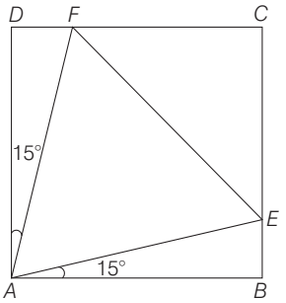


$$3\,(AB^2 + BC^2 + AC^2) = 4\,(CD^2 + BF^2 + AE^2)$$

20. In an equilateral triangle, if O is a point anywhere inside the equilateral triangle ABC, the sum of its distances from three sides is equal to the length of the altitude of the triangle. That is, as per the given diagram, $OP + OQ + OR = AD$.



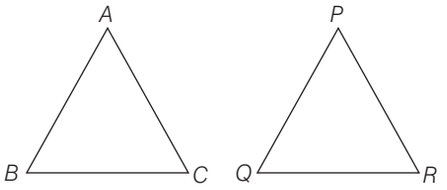
21. The largest possible area of an equilateral triangle inscribed in a unit square is $(2\sqrt{3} - 3)$.



- The maximum area can be enclosed only when one of the vertices of the triangle coincides with one of the vertices of the square and angle between the side of the triangle and the side of the rectangle at the point of coincidence is 15°.
- Also, the side of the equilateral triangle is $\sqrt{6} - \sqrt{2}$.
- Also, the area of $\Delta ADF = \Delta ABE = \frac{1}{2}(\Delta ECF)$.

Congruency of triangles

Two triangles are said to be congruent if they are equal in all respects. i.e.,



1. Each of the three sides of one triangle must be equal to the three respective sides of the other.
2. Each of the three angles of the one triangle must be equal to the three respective angles of the other.

$$\text{i.e.,}\quad \left.\begin{matrix} AB = PQ \\ AC = PR \\ BC = QR \end{matrix}\right\} \quad \text{and} \quad \left.\begin{matrix} \angle A = \angle P \\ \angle B = \angle Q \\ \angle C = \angle R \end{matrix}\right\}$$

Tests for congruency

With the help of the following given tests, we can deduce without having detailed information about triangles that whether the given two triangles are congruent or not.

Test	Property	Diagram
$S - S - S$	(Side–Side–Side) If the three sides of one triangle are equal to the corresponding three sides of the other triangle, then the two triangles are congruent. $AB \cong PQ,\ AC \cong PR,\ BC \cong QR$ $\therefore \quad \Delta ABC \cong \Delta PQR$	$S - A - S$	(Side–Angle–Side) If two sides and the angle included between them are congruent to the corresponding sides and the angle included between them, of the other triangle, then the two triangles are congruent. $AB \cong PQ,\ \angle ABC \cong \angle PQR,\ BC \cong QR$ $\therefore \quad \Delta ABC \cong \Delta PQR$	
Test	Property	Diagram
$A-S-A$	(Angle–Side–Angle) If two angles and the included side of a triangle are congruent to the corresponding angles and the included side of the other triangle, then the two triangles are congruent. $\angle ABC \cong \angle PQR, BC \cong QR, \angle ACB \cong \angle PRQ$ $\therefore \quad \Delta ABC \cong \Delta PQR$	$A-A-S$	(Angle–Angle–Side) If two angles and a side other than the included side of a one triangle are congruent to the corresponding angles and a corresponding side other than the included side of the other triangle, then the two triangles are congruent. $\angle ABC \cong \angle PQR, \angle ACB \cong \angle PRQ$ and $AC \cong PR$ (or $AB \cong PQ$)	$R—H—S$	(Right angle–Hypotenuse–Side) If the hypotenuse and one side of the right angled triangle are congruent to the hypotenuse and a corresponding side of the other right angled triangle, then the two given triangles are congruent. $AC \cong PR, \angle B = \angle Q$ and $BC \cong QR$ $\therefore \quad \Delta ABC \cong \Delta PQR$	
Similarity of triangles

Two triangles are said to be similar if the corresponding **angles** are **congruent** and their corresponding **sides** are in **proportion**. The symbol for similarity is '~'. If $\Delta ABC \sim \Delta PQR$, then $\angle ABC \cong \angle PQR, \quad \angle BCA \cong \angle QRP, \quad \angle BAC \cong \angle QPR$

Tests for Similarity

Through the tests for similarity we can deduce the similarity of triangles with minimum required information.

Test	Property/Definition	Diagram
$A-A$	Angle-Angle If the two angles of one triangle are congruent to the corresponding two angles of the other triangle, then the two triangles are said to be similar. $\angle ABC \cong \angle PQR$ $\angle ACB \cong \angle PRQ$ $\therefore \quad \Delta ABC \sim \Delta PQR$	$S\text{-}A\text{-}S$	Side-Angle-Side If the two sides of one triangle are proportional to the corresponding two sides of the other triangle and the angle included by them are congruent, then the two triangles are similar. *i.e.,* $\frac{AB}{PQ} = \frac{BC}{QR}$ and $\angle ABC = \angle PQR$ $\therefore \quad \Delta ABC \sim \Delta PQR.$	 $\frac{AB}{PQ} = \frac{BC}{QR} = K$ (K is any constant)
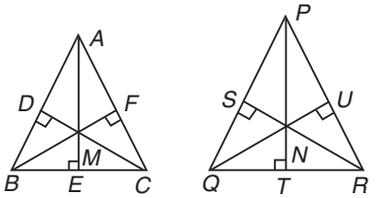
$S\text{-}S\text{-}S$	Side-Side-Side If the three sides of one triangle are proportional to the corresponding three sides of the other triangle, then the two triangles are similar. *i.e.,* $\frac{AB}{PQ} = \frac{BC}{QR} = \frac{AC}{PR}$ $\therefore \quad \Delta ABC \sim \Delta PQR$	 $\frac{AB}{PQ} = \frac{BC}{QR} = \frac{AC}{PR} = K$

NOTE When the corresponding sides are in proportion , then the corresponding angles are in proportion.

Properties of Similar Triangles

If the two triangles are similar, then for the proportional/corresponding sides we have the following results.

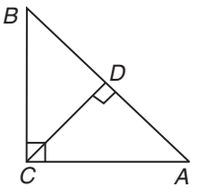


1. Ratio of sides = Ratio of heights (altitudes)
   = Ratio of medians
   = Ratio of angle bisectors
   = Ratio of inradii
   = Ratio of circumradii

2. Ratio of areas = Ratio of squares of corresponding sides.
   i.e., if $\Delta ABC \sim \Delta PQR$, then
   $$\frac{A(\Delta ABC)}{A(\Delta PQR)} = \frac{(AB)^2}{(PQ)^2} = \frac{(BC)^2}{(QR)^2} = \frac{(AC)^2}{(PR)^2}$$

NOTE Rule 1 can also apply with rule 2.

3. In a right angled triangle, the triangles on each side of the altitude drawn from the vertex of the right angle to the hypotenuse are similar to the original triangle and to each other too. *i.e.,* $\Delta BCA \sim \Delta BDC \sim \Delta CDA$.

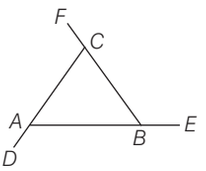


Introductory *Exercise 12.2*

1. In a triangle ABC, if AB, BC and AC are the three sides of the triangle, then which of the statements is necessarily true?
(a) $AB + BC < AC$ (b) $AB + BC > AC$
(c) $AB + BC = AC$ (d) $AB^2 + BC^2 = AC^2$

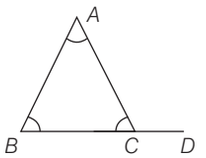
2. The sides of a triangle are 12 cm, 8 cm and 6 cm respectively, the triangle is :
(a) acute (b) obtuse
(c) right (d) can't be determined

3. If the sides of a triangle are produced then the sum of the exterior angles *i.e,*
$\angle DAB + \angle EBC + \angle FCA$ is equal to :



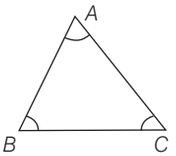
(a) 180° (b) 270° (c) 360° (d) 240°

4. In the given figure BC is produced to D and $\angle BAC = 40°$ and $\angle ABC = 70°$. Find the value of $\angle ACD$.



(a) 30° (b) 40°
(c) 70° (d) 110°

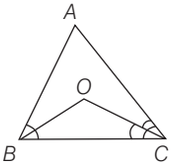
5. In a ΔABC, $\angle BAC > 90°$, then $\angle ABC$ and $\angle ACB$ must be :



(a) acute
(b) obtuse
(c) one acute and one obtuse
(d) can't be determined

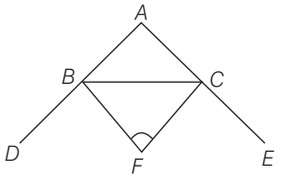
6. If the angles of a triangle are in the ratio 1 : 4 : 7, then the value of the largest angle is :
(a) 135°
(b) 84°
(c) 105°
(d) none of the above

7. In the adjoining figure $\angle B = 70°$ and $\angle C = 30°$. BO and CO are the angle bisectors of $\angle ABC$ and $\angle ACB$. Find the value of $\angle BOC$.



(a) 30° (b) 40°
(c) 120° (d) 130°

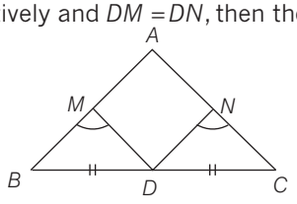
8. In the given diagram of ΔABC, $\angle B = 80°$, $\angle C = 30°$. BF and CF are the angle bisectors of $\angle CBD$ and $\angle BCE$ respectively. Find the value of $\angle BFC$.



(a) 110° (b) 50° (c) 125° (d) 55°

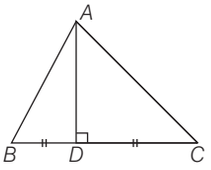
9. In an equilateral triangle, the incentre, circumcentre, orthocentre and centroid are :
(a) concylic (b) coincident
(c) collinear (d) None of these

10. In the adjoining figure, D is the midpoint of BC of a ΔABC. DM and DN are the perpendiculars on AB and AC respectively and $DM = DN$, then the ΔABC is :



(a) right angled (b) isosceles
(c) equilateral (d) scalene

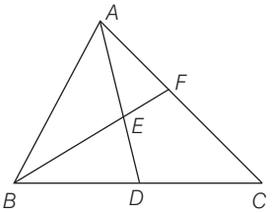
11. In the adjoining figure of ΔABC, AD is the perpendicular bisector of side BC. The triangle ABC is:
(a) right angled
(b) isosceles
(c) scalene
(d) equilateral



12. Triangle ABC is such that $AB = 9$ cm, $BC = 6$ cm, $AC = 7.5$ cm. Triangle DEF is similar to ΔABC. If $EF = 12$ cm then DE is :
(a) 6 cm (b) 16 cm (c) 18 cm (d) 15 cm

13. In ΔABC, $AB = 5$ cm, $AC = 7$ cm. If AD is the angle bisector of $\angle A$. Then $BD : CD$ is :
(a) 25 : 49 (b) 49 : 25 (c) 6 : 1 (d) 5 : 7

14. In a ΔABC, D is the mid-point of BC and E is mid-point of AD, BF passes through E. What is the ratio of $AF : FC$?



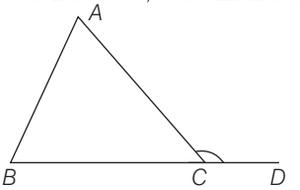
(a) 1 : 1 (b) 1 : 2 (c) 1 : 3 (d) 2 : 3

15. In a ΔABC, $AB = AC$ and $AD \perp BC$, then :
(a) $AB < AD$ (b) $AB > AD$
(c) $AB = AD$ (d) $AB \leq AD$

16. The difference between altitude and base of a right angled triangle is 17 cm and its hypotenuse is 25 cm. What is the sum of the base and altitude of the triangle is :
(a) 24 cm (b) 31 cm
(c) 34 cm (d) can't be determined

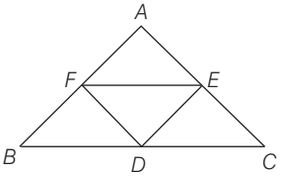
17. If AB, BC and AC be the three sides of a triangle ABC, then which one of the following is true?
(a) $AB - BC = AC$ (b) $(AB - BC) > AC$
(c) $(AB - BA) < AC$ (d) $AB^2 - BC^2 = AC^2$

18. In the triangle ABC, side BC is produced to D. $\angle ACD = 100°$ if $BC = AC$, then $\angle ABC$ is :



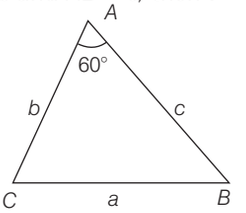
(a) 40°
(b) 50°
(c) 80°
(d) can't be determined

19. In the adjoining figure D, E and F are the mid-points of the sides BC, AC and AB respectively. ΔDEF is congruent to triangle :



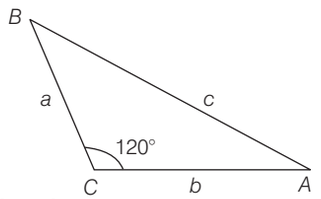
(a) ABC (b) AEF
(c) CDE, BFD (d) AFE, BFD and CDE

20. In the adjoining figure, $\angle BAC = 60°$ and $BC = a$, $AC = b$ and $AB = c$, then :



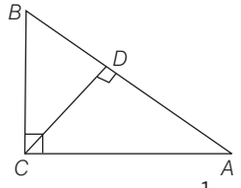
(a) $a^2 = b^2 + c^2$
(b) $a^2 = b^2 + c^2 - bc$
(c) $a^2 = b^2 + c^2 + bc$
(d) $a^2 = b^2 + 2bc$

21. In the adjoining figure of ΔABC, $\angle BCA = 120°$ and $AB = c$, $BC = a$, $AC = b$, then:



(a) $c^2 = a^2 + b^2 + ba$
(b) $c^2 = a^2 + b^2 - ba$
(c) $c^2 = a^2 + b^2 - 2ba$
(d) $c^2 = a^2 + b^2 + 2ab$

22. In a right angled ΔABC, $\angle C = 90°$ and CD is the perpendicular on the hypotenuse AB, $AB = c$, $BC = a$, $AC = b$ and $CD = p$, then :



(a) $\frac{p}{a} = \frac{p}{b}$ (b) $\frac{1}{p^2} + \frac{1}{b^2} = \frac{1}{a^2}$
(c) $p^2 = b^2 + c^2$ (d) $\frac{1}{p^2} = \frac{1}{a^2} + \frac{1}{b^2}$

23. If the medians of a triangle are equal, then the triangle is :
(a) right angled (b) isoscles
(c) equilateral (d) scalene

24. The incentre of a triangle is determined by the :
(a) medians
(b) angle bisector
(c) perpendicular bisectors
(d) altitudes

25. The circumcentre of a triangle is determined by the :
(a) altitudes
(b) median
(c) perpendicular bisector
(d) angle bisectors

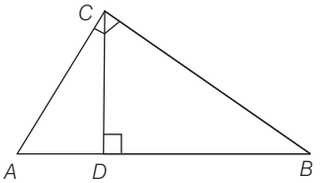
26. The point of intersection of the angle bisectors of a triangle is :
(a) orthocentre (b) centroid
(c) incentre (d) circumcentre

27. A triangle PQR is formed by joining the mid-points of the sides of a triangle ABC. 'O' is the circumcentre of ΔABC, then for ΔPQR, the point 'O' is :
(a) incentre (b) circumcentre
(c) orthocentre (d) centroid

28. If in a ΔABC, 'S' is the circumcentre, then :
(a) S is equidistant from all the vertices of a triangle
(b) S is equidistant from all the sides of a triangle
(c) AS, BS and CS are the angular bisectors
(d) AS, BS and CS produced are the altitudes on the opposite sides.

29. If AD, BE, CF are the altitudes of ΔABC whose orthocentre is H, then C is the orthocentre of :
(a) ΔABH (b) ΔBDH
(c) ΔABD (d) ΔBEA

30. In a right angled ΔABC, $\angle C = 90°$ and CD is the perpendicular on hypotenuse AB if $BC = 15$ cm and $AC = 20$ cm, then CD is equal to :



(a) 18 cm (b) 12 cm
(c) 17.5 cm (d) can't be determined

31. In an equilateral ΔABC, if a, b and c denote the lengths of perpendiculars from A, B and C respectively on the opposite sides, then :
(a) $a > b > c$ (b) $a > b < c$
(c) $a = b = c$ (d) $a = c \neq b$

32. What is the ratio of side and height of an equilateral triangle?
(a) 2 : 1 (b) 1 : 1
(c) $2 : \sqrt{3}$ (d) $\sqrt{3} : 2$

33. The triangle is formed by joining the mid-points of the sides AB, BC and CA of ΔABC and the area of ΔPQR is 6 cm^2, then the area of ΔABC is :
(a) 36 cm^2 (b) 12 cm^2
(c) 18 cm^2 (d) 24 cm^2

34. One side other than the hypotenuse of right angle isosceles triangle is 6 cm. The length of the perpendicular on the hypotenuse from the opposite vertex is :
(a) 6 cm (b) $6\sqrt{2}$ cm
(c) 4 cm (d) $3\sqrt{2}$ cm

35. Any two of the four triangles formed by joining the mid- points of the sides of a given triangle are :
(a) congruent
(b) equal in area but not congruent
(c) unequal in area and not congruent
(d) None of the above

36. The internal bisectors of $\angle B$ and $\angle C$ of ΔABC meet at O. If $\angle A = 80°$ then $\angle BOC$ is :
(a) 50° (b) 160°
(c) 100° (d) 130°

37. The point in the plane of a triangle which is at equal perpendicular distance from the sides of the triangle is :
(a) centroid (b) incentre
(c) circumcenre (d) orthocentre

38. Incentre of a triangle lies in the interior of :
(a) an isosceles triangle only
(b) a right angled triangle only
(c) any equilateral triangle only
(d) any triangle

39. In a triangle PQR, PQ=20 cm and PR = 6 cm, the side QR is :
(a) equal to 14 cm
(b) less than 14 cm
(c) greater than 14 cm
(d) none of the above

40. The four triangles formed by joining the pairs of mid-points of the sides of a given triangle are congruent if the given triangle is :
(a) an isosceles triangle
(b) an equilateral triangle
(c) a right angled triangle
(d) of any shape

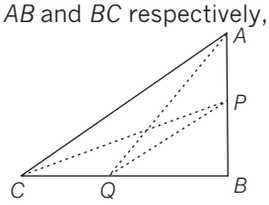
41. O is orthocentre of a triangle PQR, which is formed by joining the mid-points of the sides of a ΔABC, O is :
(a) orthocentre (b) incentre
(c) circumcentre (d) centroid

42. In a ΔABC, a line PQ parallel to BC cuts AB at P and AC at Q. If BQ bisects $\angle PQC$, then which one of the following relation is always true :
(a) $BC = CQ$ (b) $BC = BQ$
(c) $BC \neq CQ$ (d) $BC \neq BQ$

43. Which of the following is true, in the given figure, where AD is the altitude to the hypotenuse of a right angled ΔABC?
(i) ΔCAD and ΔABD are similar
(ii) ΔCDA and ΔADB are congruent
(iii) ΔADB and ΔCAB are similar
Select the correct answer using the codes given below :
(a) 1 and 2
(b) 2 and 3
(c) 1 and 3
(d) 1, 2 and 3

44. If D is such a point on the side BC of ΔABC that $\frac{AB}{AC} = \frac{BD}{CD}$, then AD must be a/an :
(a) altitude of ΔABC
(b) median of ΔABC
(c) angle bisector of ΔABC
(d) perpendicular bisector of ΔABC

45. In right angled ΔABC, $\angle B = 90°$, if P and Q are points on the sides AB and BC respectively, then :



(a) $AQ^2 + CP^2 = 2\,(AC^2 + PQ^2)$
(b) $AQ^2 + CP^2 = AC^2 + PQ^2$
(c) $(AQ^2 + CP^2) = \frac{1}{2}\,(AC^2 + PQ^2)$
(d) $(AQ + CP) = \frac{1}{2}\,(AC + PQ)$

46. If ABC is a right angled triangle at B and M, N are the mid-points of AB and BC, then 4 $(AN^2 + CM^2)$ is equal to :
(a) $4AC^2$ (b) $6AC^2$
(c) $5AC^2$ (d) $\frac{5}{4}AC^2$

47. If ΔABC and ΔDEF are so related that $\frac{AB}{FD} = \frac{BC}{DE} = \frac{CA}{EF}$, then which of the following is true ?
(a) $\angle A = \angle F$ and $\angle B = \angle D$
(b) $\angle C = \angle F$ and $\angle A = \angle D$
(c) $\angle B = \angle F$ and $\angle C = \angle D$
(d) $\angle A = \angle E$ and $\angle B = \angle D$

48. ABC is a right angle triangle at A and AD is perpendicular to the hypotenuse. Then $\frac{BD}{CD}$ is equal to :
(a) $\left(\frac{AB}{AC}\right)^2$ (b) $\left(\frac{AB}{AD}\right)^2$ (c) $\frac{AB}{AC}$ (d) $\frac{AB}{AD}$

49. Let ABC be an equilateral triangle. Let $BE \perp CA$ meeting CA at E, then $(AB^2 + BC^2 + CA^2)$ is equal to :
(a) $2BE^2$ (b) $3BE^2$ (c) $4BE^2$ (d) $6BE^2$

50. If D, E and F are respectively the mid-points of sides BC, CA and AB of a ΔABC. If EF = 3 cm, FD = 4 cm and AB = 10 cm, then DE, BC and CA respectively will be equal to :
(a) 6, 8 and 20 cm (b) 4, 6 and 8 cm
(c) 5, 6 and 8 cm (d) $\frac{10}{3}$, 9 and 12 cm

51. In the right angle triangle $\angle C = 90°$. AE and BD are two medians of a triangle ABC meeting at F. The ratio of the area of ΔABF and the quadrilateral $FDCE$ is :
(a) 1 : 1 (b) 1 : 2
(c) 2 : 1 (d) 2 : 3

52. ABC is a triangle and DE is drawn parallel to BC cutting the other sides at D and E. If $AB = 3.6$ cm, $AC = 2.4$ cm and $AD = 2.1$ cm, then AE is equal to :

(a) 1.4 cm (b) 1.8 cm
(c) 1.2 cm (d) 1.05 m

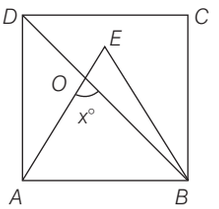
53. Consider the following statements :

(1) If three sides of a triangle are equal to three sides of another triangle, then the triangles are congruent.

(2) If three angles of a triangle are equal to three angles of another triangle respectively, then the two triangles are congruent. Out of these statements :

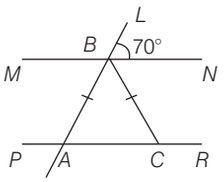
(a) 1 is correct and 2 is false
(b) both 1and 2 are false
(c) both 1 and 2 are correct
(d) 1 is false and 2 is correct

54. In the figure ΔABE is an equilateral triangle in a square $ABCD$. Find the value of angle x in degrees :



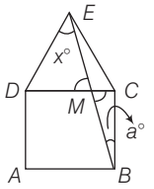
(a) 60° (b) 45° (c) 75° (d) 90°

55. In the given diagram $MN \parallel PR$ and $m\angle LBN = 70°$, $AB = BC$. Find $m\angle ABC$:



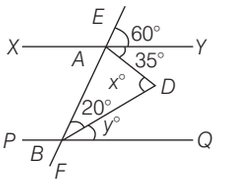
(a) 40° (b) 30°
(c) 35° (d) 55°

56. In the given diagram, equilateral triangle EDC surmounts square $ABCD$. Find the $m\angle BED$ represented by x where $m\angle EBC = \alpha°$.



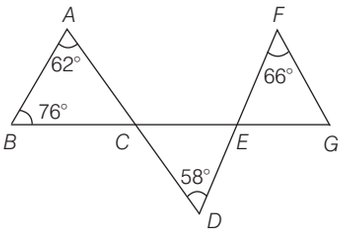
(a) 45° (b) 60°
(c) 30° (d) none of these

57. In the given diagram $XY \parallel PQ$. Find $m\angle x°$ and $m\angle y°$.



(a) 75° and 40° (b) 45°, 60°
(c) 75°, 45° (d) 60° and 45°

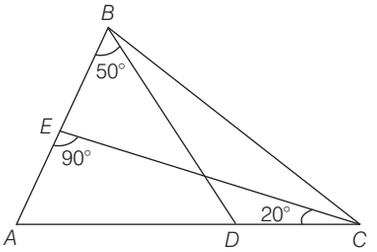
58. In the adjoining figure $m\angle CAB = 62°$, $m\angle CBA = 76°$ $m\angle ADE = 58°$ and $\angle DFG = 66°$,



Find $m\angle FGE$.

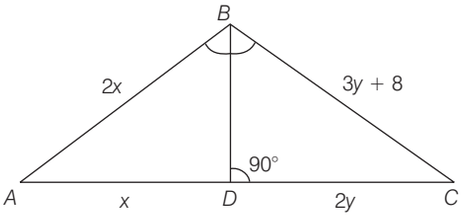
(a) 44° (b) 34°
(c) 36° (d) none of these

59. In the given figure $CE \perp AB$, $m\angle ACE = 20°$ and $m\angle ABD = 50°$. Find $m\angle BDA$.



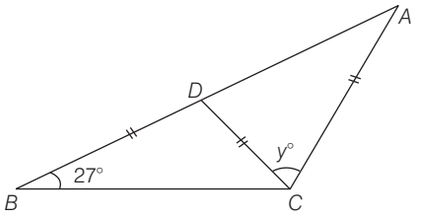
(a) 50° (b) 60°
(c) 70° (d) 80°

60. In the ΔABC, BD bisects $\angle B$, and is perpendicular to AC. If the lengths of the sides of the triangle are expressed in terms of x and y as shown,find the value of x and y.



(a) 6, 12 (b) 10, 12
(c) 16, 8 (d) 8, 15

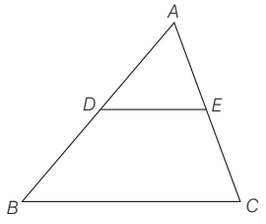
61. In the following figure $ADBC$. $BD = CD = AC$, $m\angle ABC = 27°$, $m\angle ACD = y$. Find the value of y.



(a) 27° (b) 54°
(c) 72° (d) 58°

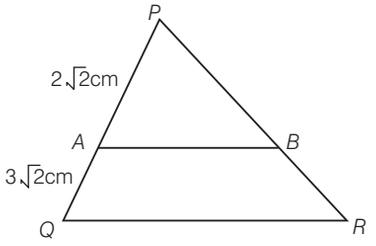
62. ABC is an isosceles triangle with $AB = AC$. Side BA is produced to D such that $AB = AD$. Find $m\angle BCD$.
(a) 60° (b) 90°
(c) 120° (d) can't be determined

63. In ΔABC, $AC = 5$ cm. Calculate the length of AE where $DE \parallel BC$. Given that $AD = 3$ cm and $BD = 7$ cm.



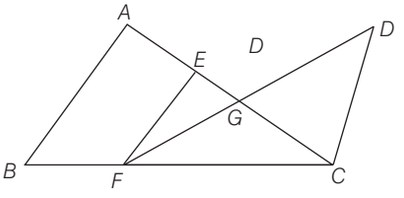
(a) 2 cm (b) 1 cm (c) 1.5 cm (d) 2.5 cm

64. In ΔPQR, $AP = 2\sqrt{2}$ cm, $AQ = 3\sqrt{2}$ cm and $PR = 10$ cm, $AB \parallel QR$. Find the length of BR.



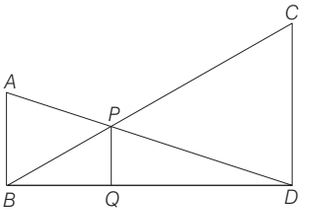
(a) $6\sqrt{2}$ cm (b) 6 cm
(c) $5\sqrt{2}$ cm (d) none of these

65. In the adjoining figure (not drawn to scale) AB, EF and CD are parallel lines. Given that $EG = 5$ cm, $GC = 10$ cm and $DC = 18$ cm. Calculate AC, if $AB = 15$ cm.



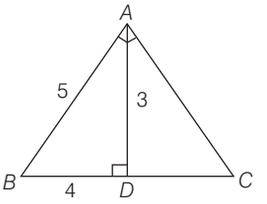
(a) 21 cm (b) 25 cm
(c) 18 cm (d) 28 cm

66. In the given figure, AB, PQ and CD are perpendiculars on the line segment BD. If $AB = x$, $CD = y$ and $BD = z$, find the length of PQ.



(a) $\frac{3xyz}{x+y+z}$ (b) $\frac{x+y}{z}$ (c) $\frac{xy}{x+y}$ (d) $\frac{x+y+z}{xyz}$

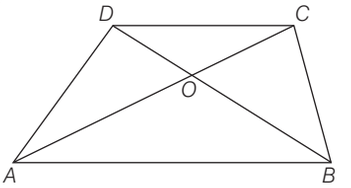
67. In the adjoining figure the angle BAC and $\angle ADB$ are right angles. $BA = 5$ cm, $AD = 3$ cm and $BD = 4$ cm, what is the length of DC ?



(a) 2.5 (b) 3 (c) 2.25 (d) 2

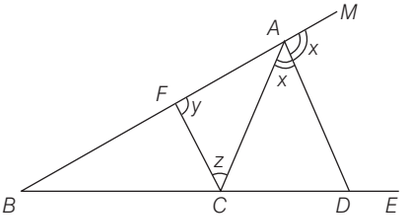
68. The areas of the similar triangles are in the ratio of 25 : 36. What is the ratio of their respective heights?
(a) 5 : 6 (b) 6 : 5 (c) 1 : 11 (d) 2 : 3

69. In the given diagram $AB \parallel CD$, then which one of the following is true ?



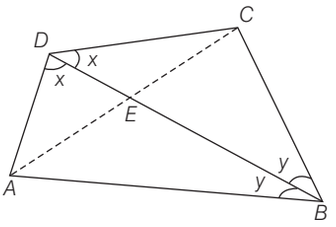
(a) $\frac{AB}{CD} = \frac{AO}{OC}$ (b) $\frac{AB}{CD} = \frac{BO}{OD}$
(c) $\Delta AOB \sim \Delta COD$ (d) All of these

70. The bisector of the exterior $\angle A$ of ΔABC intersects the side BC produced to D. Here CF is parallel to AD. Which one of the following is correct?



(a) $\frac{AB}{AC} = \frac{BD}{CD}$ (b) $\frac{AB}{AC} = \frac{CD}{BD}$
(c) $\frac{AB}{AC} = \frac{BC}{CD}$ (d) none of these

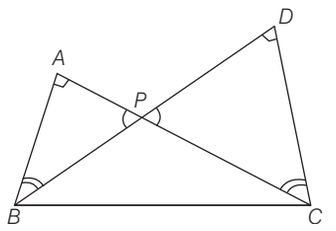
71. The diagonal BD of a quadrilateral $ABCD$ bisects $\angle B$ and $\angle D$, then :



(a) $\frac{AB}{CD} = \frac{AD}{BC}$ (b) $\frac{AB}{BC} = \frac{AD}{CD}$

(c) $AB = AD \times BC$ (d) none of these is true

72. Two right triangles ABC and DBC are drawn on the same hypotenuse BC on the same side of BC. If AC and DB intersects at P, then :



(a) $\frac{AP}{PC} = \frac{BP}{DP}$ (b) $AP \times DP = PC \times BP$

(c) $AP \times PC = BP \times DP$ (d) $AP \times BP = PC \times PD$

73. A man goes 150 m due east and then 200 m due north. How far is he from the starting point?

(a) 200 m (b) 350 m

(c) 250 m (d) 175 m

74. From a point O in the interior of a ΔABC perpendiculars OD, OE and OF are drawn to the sides BC, CA and AB respectively, then which one of the following is true ?

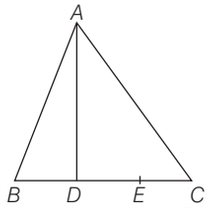
(a) $AF^2 + BD^2 + CE^2 = AE^2 + CD^2 + BF^2$

(b) $AB^2 + BC^2 = AC^2$

(c) $AF^2 + BD^2 + CE^2 = OA^2 + OB^2 + OC^2$

(d) $AF^2 + BD^2 + CE^2 = OD^2 + OE^2 + OF^2$

75. In an equilateral triangle ABC, the side BC is trisected at D. Find the value of AD^2 :



(a) $\frac{9}{7} AB^2$ (b) $\frac{7}{9} AB^2$

(c) $\frac{3}{4} AB^2$ (d) $\frac{4}{5} AB^2$

76. ABC is a triangle in which $\angle A = 90°$.

$AN \perp BC$, $AC = 12$ cm and $AB = 5$ cm. Find the ratio of the areas of ΔANC and ΔANB.

(a) 125 : 44 (b) 25 : 144

(c) 144 : 25 (d) 12 : 5

77. A vertical stick 15 cm long casts it shadow 10 cm long on the ground. At the same time a flag pole casts a shadow 60 cm long. Find the height of the flag pole.

(a) 40 cm (b) 45 cm

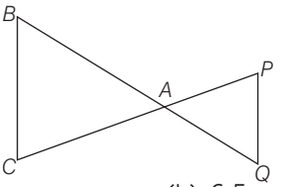
(c) 90 cm (d) none of these

78. Vertical angles of two isoceles triangles are equal. Then corresponding altitudes are in the ratio 4 : 9. Find the ratio of their areas :

(a) 16 : 49 (b) 16 : 81

(c) 16 : 65 (d) none of these

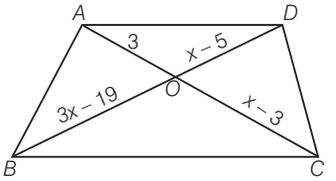
79. In the figure $\Delta ACB \sim \Delta APQ$. If $BC = 8$ cm, $PQ = 4$ cm, $AP = 2.8$ cm, find CA :



(a) 8 cm (b) 6.5 cm

(c) 5.6 cm (d) none of these

80. In the figure $BC \| AD$. Find the value of x.



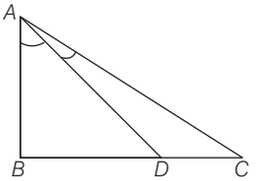
(a) 9, 10 (b) 7, 8 (c) 10, 12 (d) 8, 9

81. In an equilateral triangle of side $2a$, calculate the length of its altitude.

(a) $2a\sqrt{3}$ (b) $a\sqrt{3}$

(c) $a\frac{\sqrt{3}}{2}$ (d) none of these

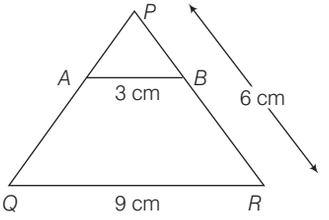
82. In figure AD is the bisector of $\angle BAC$. If $BD = 2$ cm, $CD = 3$ cm and $AB = 5$ cm. Find AC :



(a) 6 cm (b) 7.5 cm

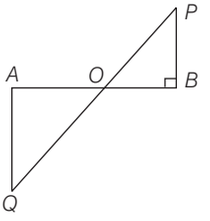
(c) 10 cm (d) 15 cm

83. In the figure $AB \parallel QR$. Find the length of PB.



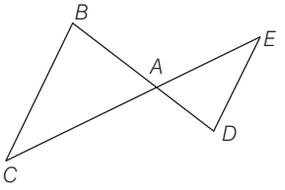
(a) 2 cm (b) 3 cm (c) 2.5 cm (d) 4 cm

84. In the figure QA and PB are perpendicular to AB. If $AO = 10$ cm, $BO = 6$ cm and $PB = 9$ cm. Find AQ.



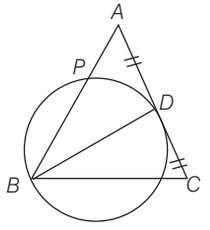
(a) 8 cm (b) 9 cm (c) 15 cm (d) 12 cm

85. In the given figure $AB = 12$ cm, $AC = 15$ cm and $AD = 6$ cm. $BC \parallel DE$, find the length of AE.



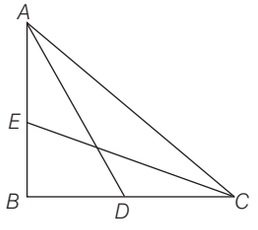
(a) 6 cm (b) 7.5 cm (c) 9 cm (d) 10 cm

86. In the figure, ABC is a triangle in which $AB = AC$. A circle through B touches AC at D and intersects AB at P. If D is the mid-point of AC, Find the value of AB :



(a) $2AP$
(b) $3AP$
(c) $4AP$
(d) none of the above

87. In figure, ABC is a right angled triangle, right angled at B. AD and CE are the two medians drawn from A and C respectively. If $AC = 5$ cm and $AD = 3\sqrt{5}/2$ cm, find the length of CE.



(a) $2\sqrt{5}$ cm (b) 2.5 cm (c) 5 cm (d) $4\sqrt{2}$ cm

88. In a ΔABC, $AB = 10$ cm, $BC = 12$ cm and $AC = 14$ cm. Find the length of median AD. If G is the centroid, find length of GA.

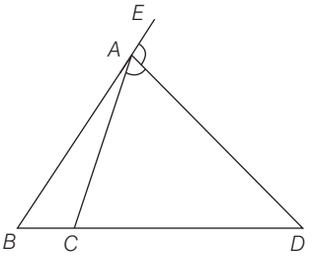
(a) $\frac{5}{3}\sqrt{7}, \frac{5}{9}\sqrt{7}$ (b) $5\sqrt{7}, 4\sqrt{7}$
(c) $\frac{10}{\sqrt{3}}, \frac{8}{3}\sqrt{7}$ (d) $4\sqrt{7}, \frac{8}{3}\sqrt{7}$

89. ΔABC is a right angled at A and AD is the altitude to BC. If $AB = 7$ cm and $AC = 24$ cm. Find the ratio of AD is to AM if M is the mid–point of BC.
(a) 25 : 41 (b) 32 : 41
(c) 336/625 (d) 625/336

90. Area of $\Delta ABC = 30$ cm^2. D and E are the mid-points of BC and AB respectively. Find $A(\Delta BDE)$.
(a) 10 cm^2 (b) 7.5 cm^2
(c) 15 cm^2 (d) none of these

91. The three sides of a triangle are given which one of the following is not a right angle?
(a) 20, 21, 29 (b) 16, 63, 65
(c) 56, 90, 106 (d) 36, 35, 74

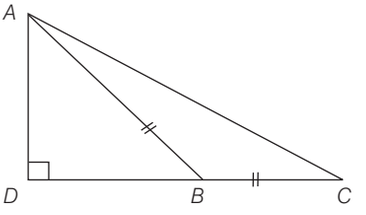
92. In the following figure, AD is the external bisector of $\angle EAC$, and it intersects BC produced to D. If $AB = 12$ cm, $AC = 8$ cm and $BC = 4$ cm, find CD.



(a) 10 cm (b) 6 cm
(c) 8 cm (d) 9 cm

93. In ΔABC, $AB^2 + AC^2 = 2500$ cm^2 and median $AD = 25$ cm, Find BC.
(a) 25 cm
(b) 40 cm
(c) 50 cm
(d) 48 cm

94. In the given figure, $AB = BC$ and $\angle BAC = 15°$, $AB = 10$ cm. Find the area of ΔABC.



(a) 50 cm^2 (b) 40 cm^2
(c) 25 cm^2 (d) 32 cm^2

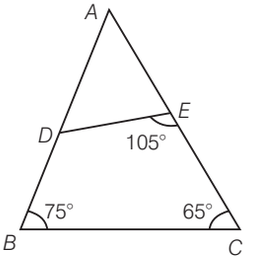
95. In ABC, G is the centroid, $AB = 15$ cm, $BC = 18$ cm and $AC = 25$ cm. Find GD, where D is the mid–point of BC.

(a) $\frac{1}{3}\sqrt{86}$ cm (b) $\frac{2}{3}\sqrt{86}$ cm

(c) $\frac{8}{3}\sqrt{15}$ cm (d) none of the above

96. In the given figure , if $\frac{DE}{BC} = \frac{2}{3}$ and if $AE = 10$ cm.

Find AB.



(a) 16 cm (b) 12 cm (c) 15 cm (d) 18 cm

97. Find the maximum area that can be enclosed in a triangle of perimeter 24 cm.

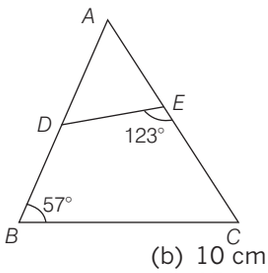
(a) 32 cm^2

(b) $16\sqrt{3}$ cm^2

(c) $16\sqrt{2}$ cm^2

(d) 27 cm^2

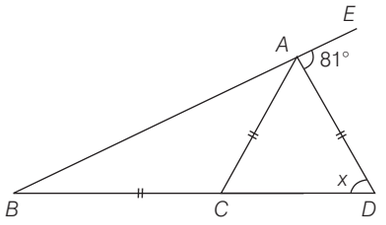
98. In the figure $AD = 12$ cm, $AB = 20$ cm and $AE = 10$ cm. Find EC.



(a) 14 cm (b) 10 cm

(c) 8 cm (d) 15 cm

99. In the given figure, $BC = AC = AD$, $\angle EAD = 81°$. Find the value of x.



(a) 45° (b) 54° (c) 63° (d) 36°

100. What is the ratio of inradius to the circumradius of a right angled triangle?

(a) 1 : 2 (b) $1 : \sqrt{2}$

(c) 2 : 5 (d) can't be determined

101. In a ΔABC, $AC = BC$. Point D lies on BC such that $CD = AD = AB$. Find $\angle ACB$.

(a) 18° (b) 30°

(c) 36° (d) 48°

102. In ΔABC, AD is the angle bisector of AB and a median to BC. If $AC = 15$ cm, find AB.

(a) 12 cm (b) 18 cm

(c) 15 cm (d) can't be determined

103. In a ΔABC, $\frac{(\angle BAC)}{(\angle ACB)} = \frac{1}{2}$ and $AC = 4$ cm, $BC = 6$ cm. Find AB.

(a) 6 (b) 10

(c) 9 (d) none of these

104. In a ΔABC, BD is the angle bisector of $\angle ABC$ and E is a point on AB such that $ED = AD$ and

$$\frac{(BD)\,(BC)}{CD} = \frac{(BE)\,(AB)}{AE}.$$

If $\angle A + \angle C = 66°$, what is the value of $\angle A - \angle C$?

(a) 10° (b) 22°

(c) 12° (d) 20°

105. Find the area of an isosceles triangle ABC in which $\angle ABC = 120°$ and each of the smaller side is 1 unit.

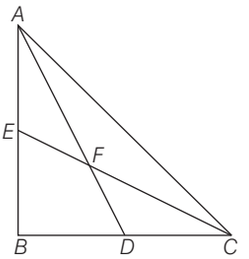
(a) $\frac{\sqrt{3}}{4}$ (b) $\frac{\sqrt{3}}{2}$ (c) $2\sqrt{3}$ (d) $\frac{3\sqrt{3}}{10}$

106. If O is the incentre of a triangle ABC and $\angle AOC = 124°$, find the $\angle ABC$.

(a) 56 (b) 112

(c) 68 (d) can't be determined

107. The following diagram depicts the right angle triangle ABC, where line segments AD and CE are the medians intersecting at a point F. Find the ratio of the area of ΔAEF to that of quadrilateral $BEFD$.



(a) 2 : 3 (b) 4 : 9

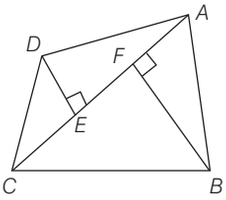
(c) 1 : 2 (d) none of these

12.4 **Quadrilaterals**

A four sided closed figure is called a quadrilateral. It is denoted by symbol ‘ ’.

Properties

1. Sum of four interior angles is 360°.
2. The figure formed by joining the mid-points of a quadrilateral is a parallelogram.



3. The sum of opposite sides of a quadrilateral circumscribed about a circle, is always equal.
4. Area of quadrilateral $= \frac{1}{2} \times$ one of the diagonals × sum of the perpendiculars drawn to the diagonals from the opposite vertices. *i.e.,* $A\ (ABCD) = \frac{1}{2} \times AC \times (DE + BF)$

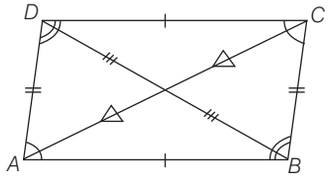
Types of Quadrilaterals

Parallelogram

A quadrilateral whose opposite sides are parallel.

Properties

1. The opposite sides are parallel and equal.



2. Opposite angles are equal.
3. Sum of any two adjacent angles is 180°.
4. Diagonals bisect each other.

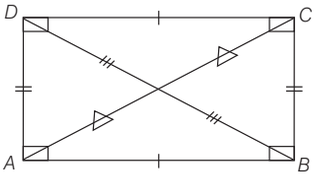
5. Diagonals need not be equal in length.
6. Diagonals need not bisect at right angle.
7. Diagonals need not bisect angles at the vertices.
8. Each diagonal divides a parallelogram into two congruent triangles.
9. Lines joining the mid-points of the adjacent sides of a **quadrilateral** form a **parallelogram.**
10. Lines joining the mid-points of of the adjacent sides of a **parallelogram** is a **parallelogram.**
11. The parallelogram that is inscribed in a circle is a rectangle.
12. The parallelogram that is circumscribed about a circle is a rhombus.
13. (a) Area of a parallelogram = base × height
    (b) Area of parallelogram
    = product of any two adjacent sides × sine of the included angles.
    $= AB \times AD \times \sin\theta$
14. Perimeter of a parallelogram $= 2$ (sum of any two adjacent sides)
15. $(AC)^2 + (BD)^2 = (AB)^2 + (BC)^2 + (CD)^2 + (AD)^2$
    $= 2\,(AB^2 + BC^2)$
16. Parallelogram that lie on the same base and between the same parallel lines are equal in area.
17. Area of a triangle is half of the area of a parallelogram which lie on the same base and between the same parallel lines.
18. A parallelogram is a rectangle if its diagonals are equal.

Rectangle

A parallelogram in which all the four angles at vertices are right (*i.e.,* 90°), is called a rectangle.

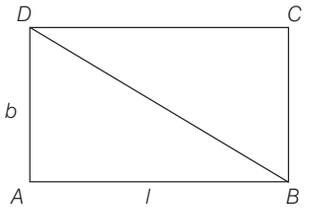
Properties

1. Opposite sides are parallel and equal.
2. Opposite angles are equal and of 90°.



3. Diagonals are equal and bisect each other, but not necessarily at right angles.
4. When a rectangle is inscribed in a circle, the diameter of the circle is equal to the diagonal of the rectangle.
5. For the given perimeter of rectangles, a square has maximum area.
6. The figure formed by joining the mid-points of the adjacent sides of a rectangle is a rhombus.

7. The quadrilateral formed by joining the mid-points of intersection of the angle bisectors of a parallelogram is a rectangle.
8. Every rectangle is a parallelogram.
9. Area of a rectangle = length × breadth $(= l \times b)$



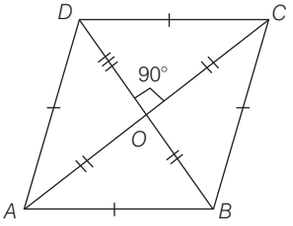
10. Diagonals of a rectangle $= \sqrt{l^2 + b^2}$
11. Perimeter of a rectangle $= 2(l + b)$
    $l \rightarrow$ length and $b \rightarrow$ breadth

Rhombus

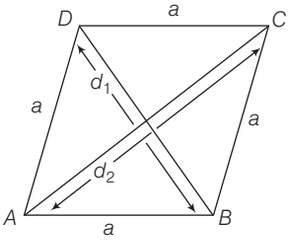
A parallelogram in which all sides are equal, is called a rhombus.

Properties

1. Opposite sides are parallel and equal.
2. Opposite angles are equal.
3. Diagonals bisect each other at right angle, but they are not necessarily equal.



4. Diagonals bisect the vertex angles.
5. Sum of any two adjacent angles is 180°.



6. Figure formed by joining the mid-points of the adjacent sides of a rhombus is a rectangle.
7. A parallelogram is a rhombus if its diagonals are perpendicular to each other.
8. (a) Area of a rhombus $= \frac{1}{2} \times$ product of diagonals

$$= \frac{1}{2} \times d_1 \times d_2$$

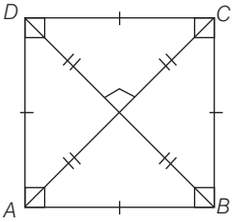
(b) Area of a rhombus = Product of adjacent sides × sine of the included angle.

Square

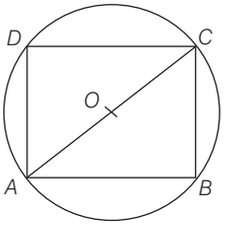
A rectangle whose all sides are equal or a rhombus whose all angles are equal is called a square. Thus each square is a parallelogram, a rectangle and a rhombus.

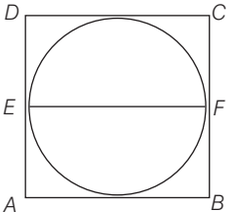
Properties

1. All side are equal and parallel.
2. All angles are right angles.
3. Diagonals are equal and bisect each other at right angle.

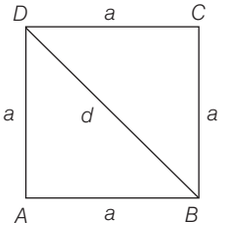


4. Diagonal of an inscribed square is equal to diameter of the inscribing circle.
5. Side of a circumscribed square is equal to the diameter of the inscribed circle.





6. The figure formed by joining the mid-points of the adjacent sides of a square is a square.
7. Area $= (\text{side})^2 = a^2 = \frac{(\text{diagonal})^2}{2} = \frac{d^2}{2}$



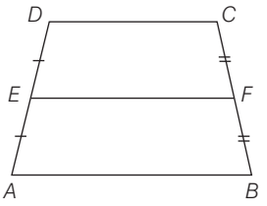
8. Diagonal = side $\sqrt{2} = a\sqrt{2}$
9. Perimeter = 4 × side = $4a$

Trapezium

A quadrilateral whose only one pair of sides is parallel and other two sides are not parallel.

Properties

1. The line joining the mid-points of the oblique (non-parallel) sides is half the sum of the parallel sides and is called the median.



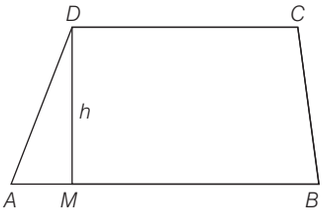
(*i.e.,* Median $= \frac{1}{2} \times$ sum of parallel sides

$= \frac{1}{2} \times (AB + DC) = EF$)

2. If the non-parallel sides are equal then the diagonals will also be equal to each other.
3. Diagonals intersect each other proportionally in the ratio of lengths of parallel sides.
4. By joining the mid-points of adjacent sides of a trapezium four similar triangles are obtained.
5. If a trapezium is inscribed in a circle, then it is an isosceles trapezium with equal oblique sides.
6. Area of trapezium $= \frac{1}{2} \times$ (sum of parallel sides $\times$ height)

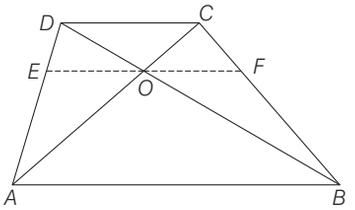
$= \frac{1}{2} \times (AB + CD) \times h$

7. $AC^2 + BD^2 = BC^2 + AD^2 + 2AB \cdot CD$



8. If a line segment EF, which is parallel to the two parallel sides of a trapezium $ABCD$, passes through a point O, which is the point of intersection of the two diagdiagonals AC and BD, where point E lies on AD and point F lies on BC, we have

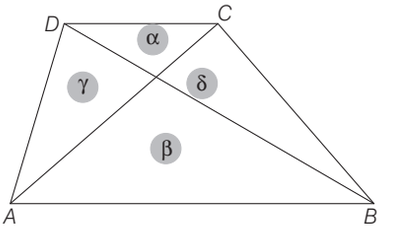
(i) Point O bisects the line EF. (ii) $EF = \frac{2(AB)(CD)}{AB + CD}$



9. In a trapezium $ABCD$, as shown in the diagram, where AB is parallel to CD and the diagonals AC and BD intersect each other at O, and if the total area of the trapezium is A, we have

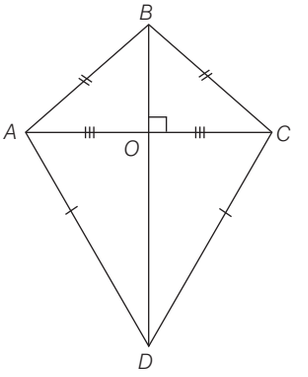
(i) $\sqrt{A} = \sqrt{\alpha} + \sqrt{\beta}$

(ii) $\gamma = \delta = \sqrt{\alpha \cdot \beta}$



Kite

In a kite two pairs of adjacent sides are equal.



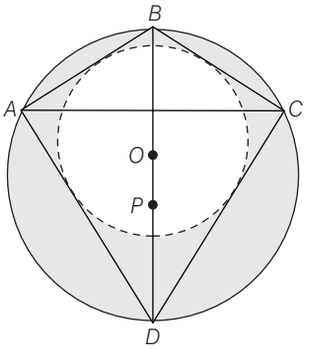
Properties

1. $AB = BC$ and $AD = CD$
2. Diagonals, AC and BD, are the perpendicular bisectors.
3. Longer diagonal (BD) bisects the shorter diagonal (AC).
4. Longer diagonal (BD) is the angle bisector of the pair of opposite angles.
5. Area of kite $= \frac{1}{2} \times$ product of diagonals

$=$ inradius $\times$ semi-perimeter

6. A kite is symmetrical about the longer diagonal BD.
7. The longer diagonal (BD) divides the kite into two congruent triangles ABD and CBD.
8. The shorter diagonal divides the kite into two isosceles triangles ABC and ADC.
9. The kites are exactly the quadrilaterals that are both tangential and orthodiagonal.
10. A kite can always inscribe an incircle and the incentre is the intersection of the angular bisectors of kite.

11. The inradius of the incircle
$$r = \frac{\text{Area of kite}}{\text{semiperimeter of kite}}$$
12. If a kite is equilateral, it must be a rhombus.
13. If a kite is equiangular, it must be equilateral and thus it is a square.
14. The kites that are also cyclic quadrilaterals are exactly the ones formed from two congruent right triangles. That is, for these kites the two equal angles on opposite sides of the axis of symmetry are each 90 degrees. These shapes are called right kites and they are in fact bi-centric quadrilaterals.



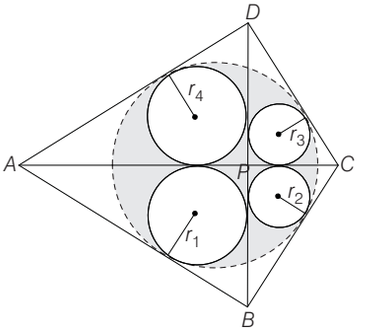
In the above diagram, points A, B, C, D are concyclic, so the quadrilateral $ABCD$ is a concyclic one and the centre of the larger circle is P. And the two congruent right triangles are ΔBAD and ΔBCD. The centre of inscribed circle (smaller one) is O. Since the kite has two centers – incentre and circumcentre, that's why a right kite is bi-centric kite.

15. There are only eight polygons that can tile the plane in such a way that reflecting any tile across any one of its edges produces another tile; one of them is a right kite, with 60°, 90°, and 120° angles.

Condition for a Tangential Quadrilateral to Become a Kite

A tangential quadrilateral is a kite if and only if any one of the following conditions is/are true :

(i) The diagonals are perpendicular.
(ii) The area is one half the product of the diagonals.
(iii) The two line segments connecting opposite points of tangency have equal length.
(iv) One pair of opposite tangent lengths has equal length.
(v) The bi-medians have equal length.
(vi) The products of opposite sides are equal.
(vii) The center of the incircle lies on a line of symmetry that is also a diagonal.
(viii) If the diagonals in a tangential quadrilateral $ABCD$ intersect at P, and the incircles in triangles ABP, BCP, CDP, DAP have radii r_1, r_2, r_3 and r_4, respectively, then the quadrilateral is a kite if and only if $r_1 + r_3 = r_2 + r_4$.



(ix) If the excircles to the same four triangles opposite the vertex P have radii R_1, R_2, R_3 and R_4, respectively, the quadrilateral is a kite if and only if $R_1 + R_3 = R_2 + R_4$.

Introductory *Exercise 12.3*

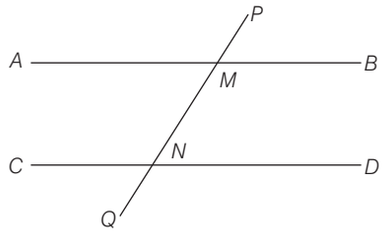
1. The measures of the angles of a quadrilateral taken in order are proportional to 1 : 2 : 3 : 4, then the quadrilateral is :
(a) parallelogram (b) trapezium
(c) rectangle (d) rhombus

2. Find the measure of largest angle of a quadrilateral if the measures of its interior angles are in the ratio of 3 : 4 : 5 : 6.
(a) 60° (b) 120°
(c) 90° (d) can't be determined

3. *ABCD* is a parallelogram, *P* and *Q* are the points on the diagonal *AC* such that *AP* = *QC*, then quadrilateral *BPDQ* is a :
(a) trapezium (b) parallelogram
(c) square (d) none of these

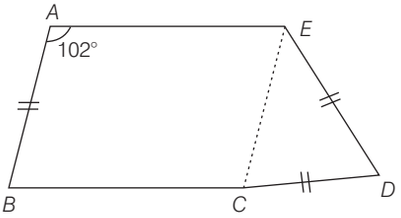
4. In a parallelogram *ABCD*, bisectors of consecutive angles *A* and *B* intersect at *P*. Find the measure of $\angle APB$:
(a) 90° (b) 60°
(c) 120° (d) data insufficient

5. AB and CD are two parallel lines and a transversal PQ intersects AB and CD at M and N respectively. The bisector of the interior angles form a quadrilateral :



(a) rectangle (b) square
(c) parallelogram (d) none of these

6. In the given figure $AE = BC$ and $AE \parallel BC$ and the three sides AB, CD and ED are equal in length. If $m\angle A = 102°$, find measures of $\angle BCD$.



(a) 138° (b) 162°
(c) 88° (d) none of these

7. $ABCD$ is a square, A is joined to a point P on BC and D is joined to a point Q on AB. If $AP = DQ$ and AP intersects DQ at R then, $\angle DRP$ is :
(a) 60° (b) 120°
(c) 90° (d) can't be determined

8. A point X inside a rectangle $PQRS$ is joined to the vertices then, which of the following is true :
(a) $A(\Delta PSX) = A(\Delta RXQ)$
(b) $A(\Delta PSX) + A(\Delta PXQ) = A(\Delta RSX) + A(\Delta RQX)$
(c) $A(\Delta PXS) + A(\Delta RXQ) = A(\Delta SRX) + A(\Delta PXQ)$
(d) None of the above

9. $ABCD$ is a parallelogram and m $\angle DAB = 30°$, $BC = 20$ cm and $AB = 20$ cm. Find the area of parallelogram :
(a) 150 cm^2 (b) 200 cm^2
(c) 400 cm^2 (d) 260 cm^2

10. The length of a side of a rhombus is 10 m and one of its diagonal is 12 m. The length of the other diagonal is :
(a) 15 m (b) 18 m
(c) 16 m (d) can't be determined

11. $ABCD$ is a parallelogram and BD is a diagonal. $\angle BAD = 65°$ and $\angle DBC = 45°$,then $m\angle BDC$ is :
(a) 65° (b) 70°
(c) 20° (d) none of these

12. If $ABCD$ is a parallelogram in which P and Q are the centroids of ΔABD and ΔBCD, then PQ equals :
(a) AQ (b) AP (c) BP (d) DQ

13. Two parallelograms stand on equal bases and between the same parallels. The ratio of their areas is :
(a) 1 : 1 (b) $\sqrt{2}$: 1 (c) 1 : 3 (d) 1 : 2

14. If a rectangle and a parallelogram are equal in area and have the same base and are situated on the same side, then the ratio of perimeter of rectangle and that of parallelogram is k, then k is :
(a) $k > 1$ (b) $k < 1$
(c) $k = 1$ (d) can't be determined

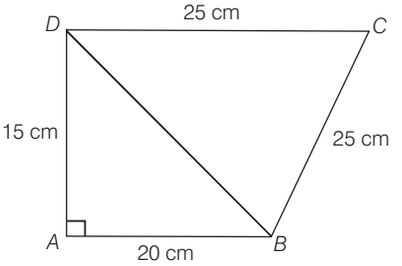
15. If area of a parallelogram with sides l and b is A and that of a rectangle with sides l and b is B, then :
(a) $A < B$ (b) $A = B$
(c) $A > B$ (d) none of these

16. $ABCD$ is a parallelogram and M is the mid-point of BC. AB and DM are produced to meet at N, then :
(a) $AN = \sqrt{3}AB$ (b) $AN = 2AB$
(c) $AN^2 = \frac{3}{2}AB^2$ (d) $AN^2 = 2AB^2$

17. In a rectangle $ABCD$, P, Q are the mid-points of BC and AD respectively and R is any point on PQ, then ΔARB equals :
(a) $\frac{1}{2}$ ($\square ABCD$) (b) $\frac{1}{3}$ ($\square ABCD$)
(c) $\frac{1}{4}$ ($\square ABCD$) (d) none of these

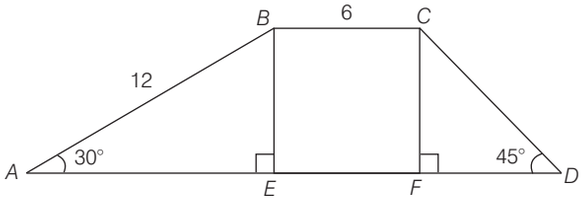
18. Diagonals of a parallelogram are 8 m and 6 m respectively. If one of side is 5m, then the area of parallelogram is :
(a) 18 m^2 (b) 30 m^2
(c) 24 m^2 (d) 48 m^2

19. In the given figure $AD = 15$ cm, $AB = 20$ cm and $BC = CD = 25$ cm. Find the area of $\square ABCD$.



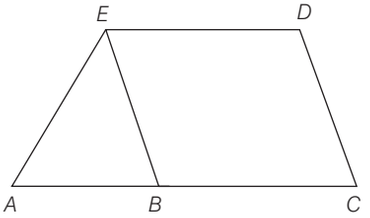
(a) $\frac{25}{4}(24 + 25\sqrt{3})$ cm^2
(b) $24(25 + 24\sqrt{3})$ cm^2
(c) $\frac{25}{2}(24 + 25\sqrt{3})$ cm^2
(d) none of the above

20. In the trapezium $ABCD$, $\angle BAE = 30°$, $\angle CDF = 45°$. $BC = 6$ cm and $AB = 12$ cm. Find the area of trapezium.



(a) $18\,(3 + \sqrt{3})\,\text{cm}^2$
(b) $36\sqrt{3}\ \text{cm}^2$
(c) $12\,(3 + 2\sqrt{3})\,\text{cm}^2$
(d) none of the above

21. Area of quadrilateral $ACDE$ is 36 cm^2, B is the mid–point of AC. Find the area of ΔABE if $AC \parallel DE$ and $BE \parallel DC$.



(a) 10 cm^2 (b) 9 cm^2
(c) 12 cm^2 (d) can't be determined

22. A square and a rhombus have the same base and the rhombus is inclined at 30°. What is the ratio of area of the square to the area of the rhombus?
(a) $\sqrt{2}:1$ (b) 2 : 1
(c) 1 : 1 (d) $2:\sqrt{3}$

23. Find the area of a quadrilateral with sides 17, 25, 30 and 28 cm and one of its diagonal is 26 cm.
(a) 450 cm^2 (b) 360 cm^2
(c) 540 cm^2 (d) 720 cm^2

24. $PQRS$ is a parallelogram in which $\angle P = 70°$, $\angle Q = 90°$ and $\angle R = 100°$. How many points in the plane of the quadrilateral are there such that a point is equidistant from its vertices ?
(a) 0 (b) 1
(c) 2 (d) 3

25. $ABCD$ is a parallelogram. The diagonals AC and BD intersect at a point O. If E, F, G and H are the mid-points of AO, DO, CO and BO respectively, then the ratio of $(EF + FG + GH + HE)$ to $(AD + DC + CB + BA)$ is :
(a) 1 : 1 (b) 1 : 2
(c) 1 : 3 (d) 1 : 4

26. If $ABCD$ is a rhombus, then :
(a) $AC^2 + BD^2 = 4AB^2$
(b) $AC^2 + BD^2 = AB^2$
(c) $AC^2 + BD^2 = 2AB^2$
(d) $2\,(AC^2 + BD^2) = 3AB^2$

27. If P is a point within a rectangle $ABCD$, then :
(a) $AP^2 + PC^2 = BP^2 + PD^2$
(b) $AP^2 + BP^2 = PC^2 + PD^2$
(c) $AP + PC = BP + PD$
(d) $AP \times PC = BP \times PD$

28. $\square ABCD$ is a parallelogram, $AB = 14$ cm, $BC = 18$ cm and $AC = 16$ cm. Find the length of the other diagonal.
(a) 24 cm (b) 28 cm
(c) 36 cm (d) 32 cm

29. In a trapezium $ABCD$, where $AB \parallel CD$ and diagonal AC intersects the other diagonal BC at O. Which of the followings are always correct?

(i) $\dfrac{DO}{AO} = \dfrac{CO}{BO}$ (ii) $\dfrac{DO}{OC} = \dfrac{AO}{OB}$

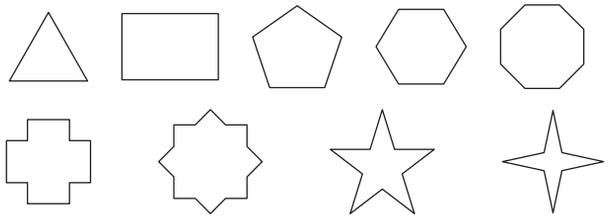
(iii) $\dfrac{DO}{OB} = \dfrac{CO}{OA}$

(a) only (i) and (ii)
(b) only (ii) and (iii)
(c) only (i) and (iii)
(d) only (iii)

30. In a trapezium $ABCD$, where $AB \parallel CD$ and diagonals AC intersects the other diagonal BC at O. If a line segment EF parallel to AB and CD passes through the point O, where E lies on AD and F lies on BC, find the length of EF, provided $AB = 6$ cm and $CD = 2$ cm.
(a) 3 cm (b) 4 cm
(c) 4.5 cm (d) none of these

12.5 **Polygons**

When three or more than three line segments are joined end to end on the same plane they form the closed area in various shapes. These shapes are called the polygons. Essentially, polygons are 2-dimensional plane figures. Look at the following figures to get the better picture of the shapes of polygons.



A polygon gets its name on the basis of the number of sides that it has. For example, a triangle has three sides, a quadrilateral has 4 sides, a pentagon has 5 sides, and so on.

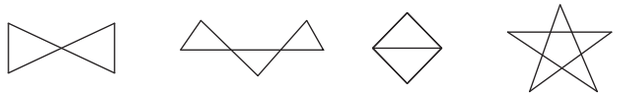
Types of Polygon

Simple Polygon

A polygon in which no more than two line segments meet at any vertex. In other words, the sides of the polygon do not self-intersect each other.

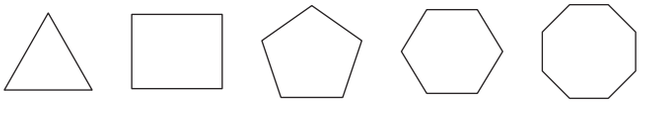
Complex Polygon

A polygon in which more than two line segments meet at any vertex. In other words the sides of the polygon self-intersect each other. A complex polygon is neither convex nor concave.



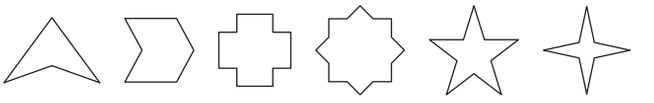
Convex Polygon

A polygon in which each of its interior angle is less than 180° is known as a convex polygon. A polygon is convex if and only if any line containing a side of the polygon doesn't contain a point in the interior of the polygon.



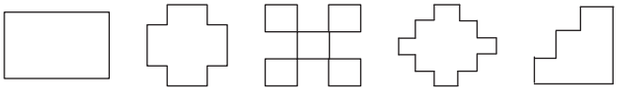
Concave Polygon

A polygon in which even if one interior angle is greater than 180° is known as a concave polygon.



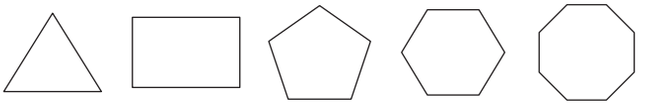
Rectilinear Polygon

A polygon whose sides meet at right angles, i.e., all its interior angles are 90° or 270°.



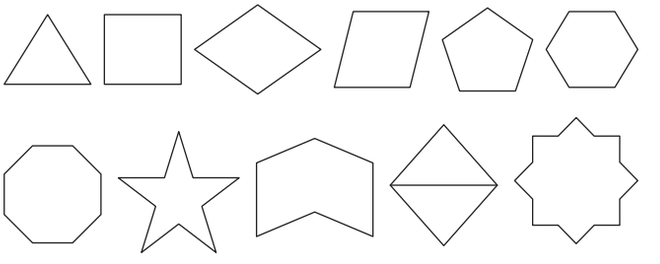
Equiangular Polygon

A polygon in which all its interior angles are equal is known as equiangular polygon.



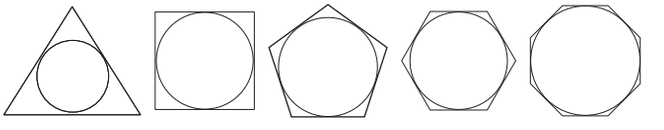
Equilateral Polygon

A polygon in which all sides
(or edges) are of the same length.



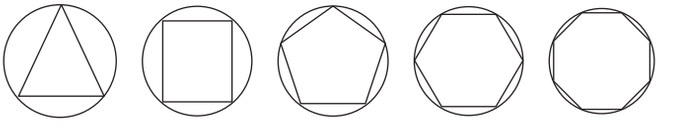
Tangential Polygon

A polygon whose all sides are tangent to an inscribed circle.



Cyclic Polygon

A polygon whose all the vertices lie on the circle.

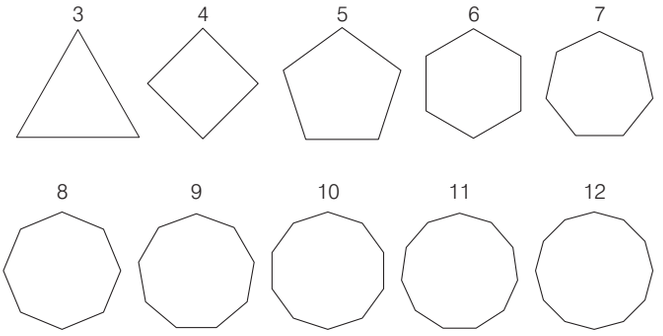


Regular Polygon

A polygon is regular if it is both cyclic and equilateral.

- A regular polygon has all its sides equal and all its interior angles equal.

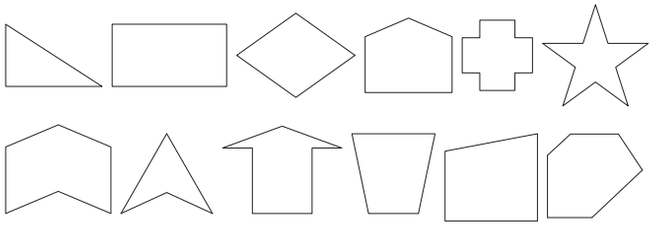
- A regular polygon has an incircle and a circumcircle. That is every regular polygon is tangential and cyclic polygon.



Irregular Polygon

A polygon which is not a regular one is known as an irregular polygon.

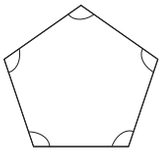
- If all the sides of a polygon are not equal, it's an irregular polygon.
- If all the interior angles of a polygon are not equal, it's an irregular polygon.



Basics of a Polygon

Interior Angle

Angle formed by two adjacent sides inside the polygon is known as interior angle.



Sum of all the interior angles of a regular polygon $= (n-2)\times 180°$

Each interior angle of a regular polygon

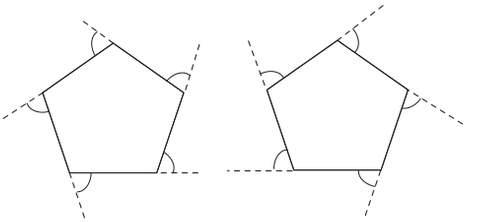
$$= \frac{(n-2)\times 180°}{n}$$

Each interior angle of a regular polygon

$= (180° - \text{exterior angle})$

Exterior Angle

Angle formed by two adjacent sides outside the polygon.



Sum of all exterior angles of a regular polygon $= 360°$ (always constant)

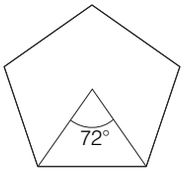
Each exterior angle of a regular polygon $= \frac{360°}{n}$

Each exterior angle of a regular polygon

$= (180° - \text{interior angle})$

Central Angle

The angle at the center of the polygon formed by two radii, connected independently to the two adjacent vertices, is known as the central angle.

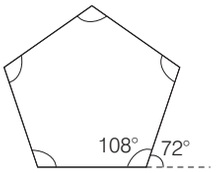


Each Central Angle $= \frac{2\pi}{n} = \frac{360°}{n}$

The following table shows some angles of the various regular polygons.

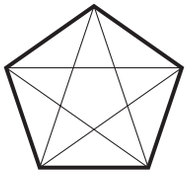
Number of Sides	Polygon	Sum of all the Angles	Each Interior Angle	Each Exterior Angle	Each Central Angle
3	Triangle	180°	60°	120°	120°
4	Quadrilateral	360°	90°	90°	90°
5	Pentagon	540°	108°	72°	72°
6	Hexagon	720°	120°	60°	60°
7	Heptagon	900°	$\left(128\frac{4}{7}\right)^{\circ}$	$\left(51\frac{3}{7}\right)^{\circ}$	$\left(51\frac{3}{7}\right)^{\circ}$
8	Octagon	1080°	135°	45°	45°
9	Nonagon	1260°	140°	40°	40°
10	Decagon	1440°	144°	36°	36°
…	…	…	…	…	…
…	…	…	…	…	…
n	n-gon	$(n-2)180°$	$\frac{(n-2)\times 180°}{n}$	$\frac{360°}{n}$	$\frac{360°}{n}$

In a polygon, Interior angle + Exterior angle = 180°



Diagonal

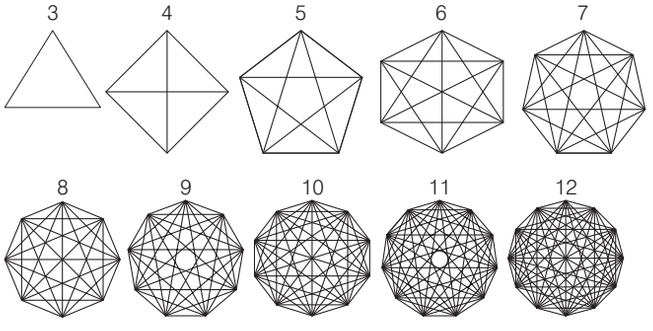
The line segments joining any two non-adjacent vertices are known as diagonals.



The number of diagonals in a polygon

$$= {}^{n}C_2 - n = \frac{n(n-3)}{2};\ \text{for } n \geq 3$$

Number of Sides	Polygon	Number of diagonals
3	Triangle	0
4	Quadrilateral	2
5	Pentagon	5
6	Hexagon	9
7	Heptagon	14
8	Octagon	20
9	Nonagon	27
10	Decagon	35
…	…	…
…	…	…
n	n-gon	$\frac{n(n-3)}{2}$



Longest Diagonal of a Regular Polygon

There are two different cases.

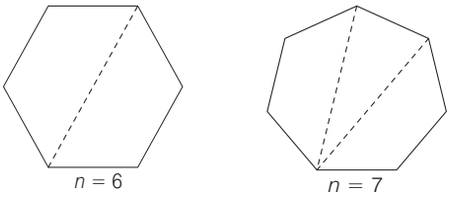
One when there is even number of sides in a polygon and the other one when there is odd number of sides in a polygon.

When n is even : The longest diagonal

$$= 2 \times \text{radius of the polygon}$$

When n is odd : The longest diagonal $= \dfrac{s}{2\sin\left(\dfrac{90}{n}\right)^{\circ}}$

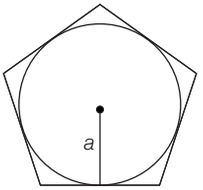
Where s denotes the length of each side and n denotes the number of sides in the regular polygon. And radius means circumradius.



Apothem (or Inradius)

It is the radius of the incircle of the regular polygon.

Apothem is perpendicular bisector of the side of the polygon.



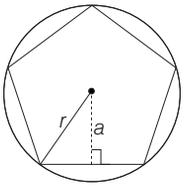
$$\text{Apothem of a regular polygon} = \frac{1}{2} \times s \times \cot\left(\frac{\pi}{n}\right)$$

$$= r\cos\left(\frac{\pi}{n}\right)$$

(Where, s and r are the side and radius of the regular polygon.)

Radius (or Circumradius)

It is the radius of the circumcircle of the regular polygon.



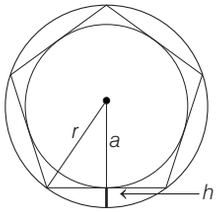
$$\text{Radius of a polygon} = \frac{1}{2} \times s \times \operatorname{cosec}\left(\frac{\pi}{n}\right) = a\sec\left(\frac{\pi}{n}\right)$$

Where, s and a are the side and apothem of a regular polygon.

Sagitta

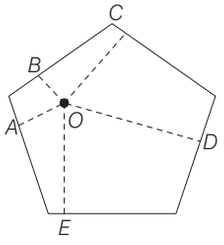
The perpendicular distance h from an arc's midpoint to the chord across it, equal to the radius r minus the apothem a.

That is $h = r - a$



Interior Point

For a regular n-gon (polygon of n-sides), the sum of the perpendicular distances from any interior point to the n sides is n times the apothem. Here, the apothem being the distance from the center to any side.



In the above diagram, if the apothem of the pentagon is a and since there are 5 sides in pentagon, so we have

$$AO + BO + CO + DO + EO = 5a$$

Perimeter

It is the total sum of the measurements of all the sides of a polygon.

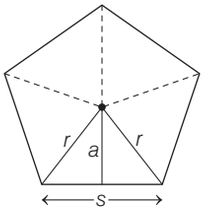
The perimeter of a regular polygon

= number of sides × length of each side

Area

Area of a polygon is the region enclosed by all the n sides of the polygon.

An n-sided polygon can be divided into n congruent triangles having a common vertex at the centre.



Let s, a, p and r be the side, apothem, perimeter and radius, respectively, then

Area of a regular polygon $= n \times \left(\frac{1}{2} \times s \times a\right) = \frac{1}{2} \times n \times s \times a$

Area of a regular polygon $= \frac{1}{2} \times a \times p$

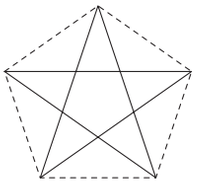
NOTE The other formulae for the area of polygon can be derived by using the trigonometric ratios, as following.

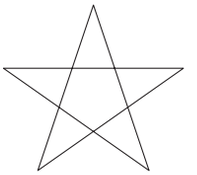
- Area of a regular polygon $= \frac{1}{4} \times n \times s^2 \cot\left(\frac{\pi}{n}\right)$
- Area of a regular polygon $= n \times a^2 \times \tan\left(\frac{\pi}{n}\right)$
- Area of a regular polygon $= \frac{1}{2} \times n \times r^2 \times \sin\left(\frac{2\pi}{n}\right)$

Regular Polygram (or Star Polygon)

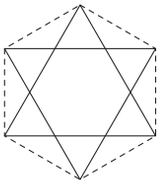
A regular star polygon is a self-intersecting, equilateral equiangular polygon, created by connecting one vertex of a simple, regular, n-sided polygon to another, non-adjacent vertex and continuing the process until the original vertex is reached again. Thus, if out of total n vertices of an n-gon (i.e., an n-sided polygon) every k-th vertex is connected with each other, it is denoted by $\{n, k\}$, where $k < \frac{n}{2}$.

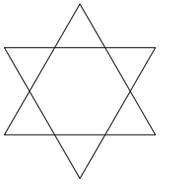
	$k = 1$	$k = 2$	$k = 3$	$k = 4$	$k = 5$
$n = 3$					
$n = 4$					
$n = 5$					
$n = 6$					
$n = 7$					
$n = 8$					
$n = 9$					
$n = 10$					
$n = 11$					
$n = 12$					



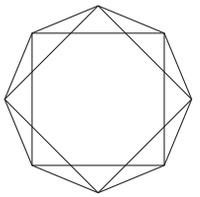


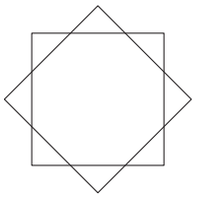
In the above figure out of 5 vertices of pentagon every 2nd vertex is connected with each other. It is denoted by $\left\{\frac{5}{2}\right\}$.



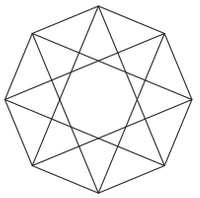


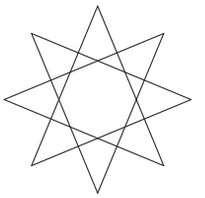
In the above figure out of 6 vertices of hexagon every 2nd vertex is connected with each other. It is denoted by $\left\{\frac{6}{2}\right\}$.





In the above figure out of 8 vertices of octagon every 2nd vertex is connected with each other. It is denoted by $\left\{\frac{8}{2}\right\}$.





In the above figure out of 8 vertices of octagon every 3rd vertex is connected with each other. It is denoted by $\left\{\frac{8}{3}\right\}$.

Under certain conditions a regular star polygon can be drawn in a single stroke such as polygon {5/2}, {8/3} and it has to be drawn in more than one stroke as polygon {6/2}, {8/2}, shown above. A star polygon $\{n/k\}$ can be drawn in a single stroke (or it is connected or irreducible) if and only if n and k are relatively prime.

The following table depicts the various polygons and their respective polygrams $\{n/k\}$. Following is the list of some best-known polygrams (or star polygons).

Number of sides n	Symbol	Polygram
5	{5/2}	Pentagram
6	{6/2}	Hexagram
7	{7/2}	Heptagram
8	{8/2}	Star of Laxmi
8	{8/3}	Octagon
9	{9/3}	Nonagram
10	{10/3}	Decagram

Circumradius of a Polygram : If a star polygon $\{n, k\}$, with n, k positive integers such that HCF $(n, k) = 1$ and the edge length of the polygon is 1 unit, the circumradius of the star polygon is

$$R = \frac{\sin\left[\left(\frac{n-2k}{2n}\right)\pi\right]}{\sin\left[\left(\frac{2k}{n}\right)\pi\right]}$$

Sum of the Interior Angles of a Polygram : For any value of n, if $k = 2$, the sum of all the internal angles of such a polygram $= (n-4)\pi$.

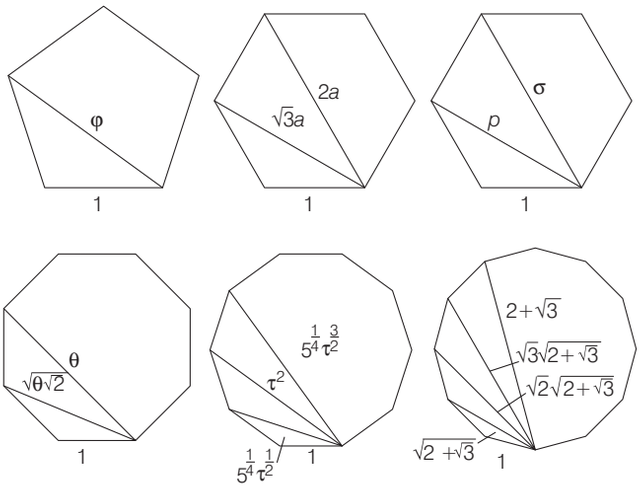
Edge of a Polygon (or Star Polygon) **:** The edge of a star polygon is equal to the length of the diagonal of a corresponding regular polygon depending upon the value of k. However, in case of even number of sides $(n = 4, 6, 8, \ldots)$ the longest possible diagonal of the regular polygon does not act in a manner to form a polygram so I have not mentioned this value in the following table.

Let us consider the edge of the regular polygon be 1 unit and $d_1, d_2, d_3, \ldots, d_n$ denote the lengths of the diagonals of the regular polygon, such that $d_1 < d_2 < d_3 < \ldots < d_n$, then we have the following values of various possible diagonals for the selected regular polygons.

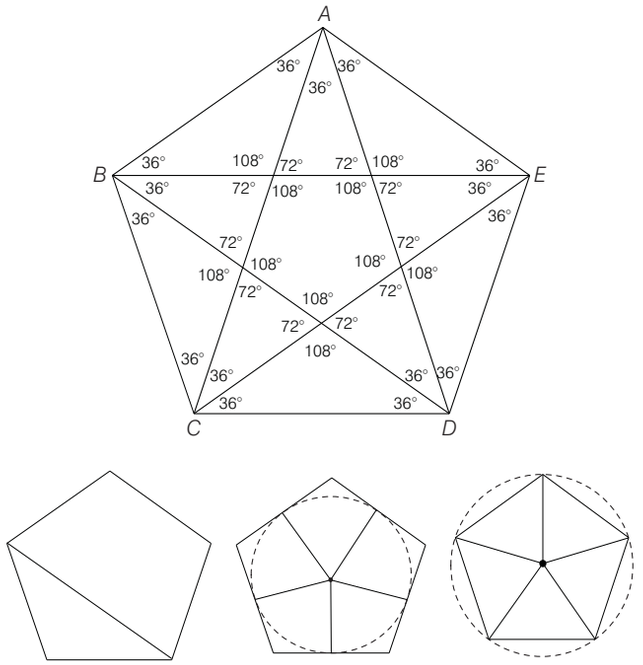
n	$k=1$	$k=2$	$k=3$	$k=4$
	d_1	d_2	d_3	d_4
5	φ			
6	$\sqrt{3}$			
7	ρ	σ		
8	$\sqrt{\theta\sqrt{2}}$	θ		
10	$5^{1/2} \times \tau^{1/2}$	τ^2	$5^{1/4} \times \tau^{3/2}$	
12	$\sqrt{2+\sqrt{3}}$	$\sqrt{2}(\sqrt{2+\sqrt{3}})$	$\sqrt{3}(\sqrt{2+\sqrt{3}})$	$2+\sqrt{3}$

$$\varphi = \left(\frac{1+\sqrt{5}}{2}\right), \quad \theta = (1+\sqrt{2}) = 2.414213, \quad \rho = 1.8019377,$$

$$\sigma = 2.2469796$$



Pentagon



Let s, d, a, r, A denote side, diagonal, apothem, radius, area of a pentagon, then we have

$$d = \frac{1}{2}(1+\sqrt{5})s = \varphi s$$

$$a = \frac{1}{10}(\sqrt{25+10\sqrt{5}})s$$

$$r = \frac{1}{10}(\sqrt{50+10\sqrt{5}})s$$

$$A = \frac{1}{4}(\sqrt{25+10\sqrt{5}})s^2$$

$$a = \frac{1}{4}(1+\sqrt{5})r$$

$$s = 2\sqrt{r^2 - a^2}$$

Pentaflake

When five pentagons can be arranged around an identical pentagon, then it forms the first iteration of the pentaflake. This cluster of six pentagons has the shape of a pentagon with five triangular wedges removed, as you can see in the following figure.

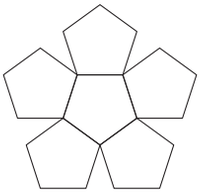


Fig. (i)

For a pentagon of side length 1, the first ring of pentagons has centers at radius

$$d_1 = 2a = \frac{1}{2}(1+\sqrt{5})(r)$$

(Where a is the apothem and r is the radius of each of the six pentagons)

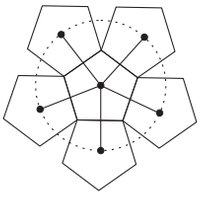

Fig. (ii)

For a pentagon of side length 1, the second ring of pentagons has centers at radius

$$d_2 = 2(r+h) = (2+\sqrt{5})r = \left[\frac{1}{2}(1+\sqrt{5})\right]^3 (r)$$

(Where a is the apothem and r is the radius of each of the six pentagons)

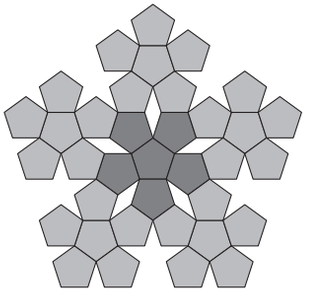

Fig. (iii)

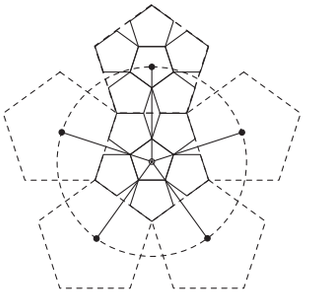

Fig. (iv)

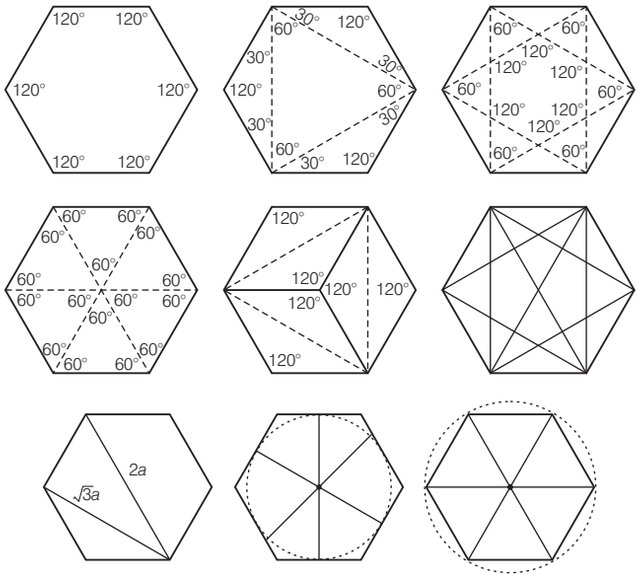
For a pentagon of side length 1, the n-th ring of pentagons has centers at radius

$$d_n = (r)\left[\frac{1}{2}(1+\sqrt{5})\right]^{2n-1}$$

(Where a is the apothem and r is the radius of each of the six pentagons)

Hexagon



Let a, d, r, R, A denote side, diagonal, apothem (or inradius), radius (or Circumradius), area of a pentagon, then we have

$$d_1 = \sqrt{3}a; \qquad d_2 = 2a$$

$$r = \frac{\sqrt{3}}{2}a; \qquad R = a$$

$$A = \frac{3\sqrt{3}}{2}a^2; \qquad \frac{r}{R} = \frac{\sqrt{3}}{2}$$

$$\frac{A_r}{A_R} = \frac{3}{4}$$

Hexaflakes

When six hexagons can be arranged around an identical hexagon, then it forms the first iteration of the hexaflake. This cluster of seven hexagons has the shape of a hexagon with six triangular wedges removed from the sides and six from the canters, as you can see in the first figure. Fig. (ii) shows the hexaflake of double iteration and Fig. (iii) shows the triple iteration.

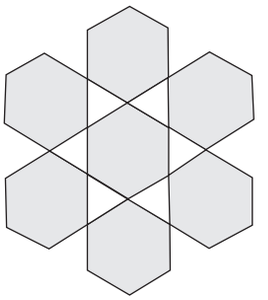


Fig. (i)

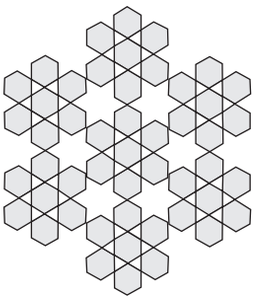

Fig. (ii)

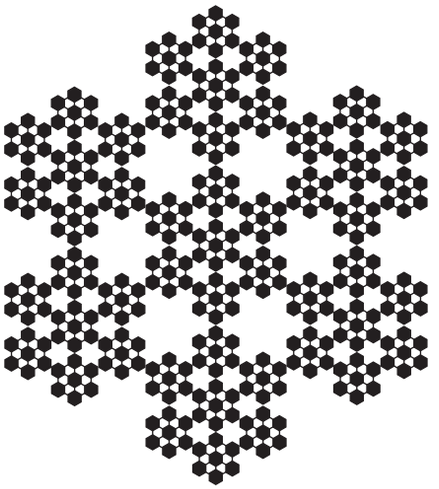

Fig. (iii)

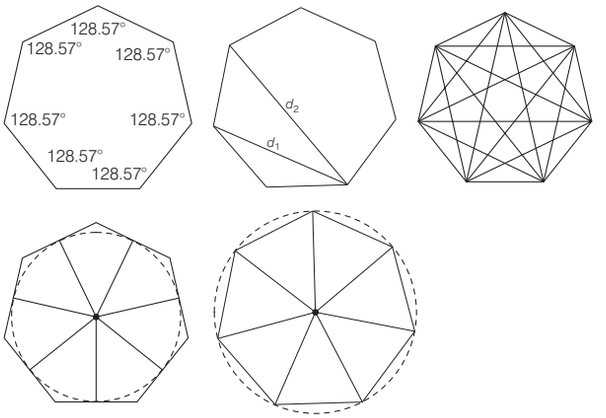
Heptagon



Area of a heptagon $= 3.633\, s^2$

(s is the side of the regular heptagon)

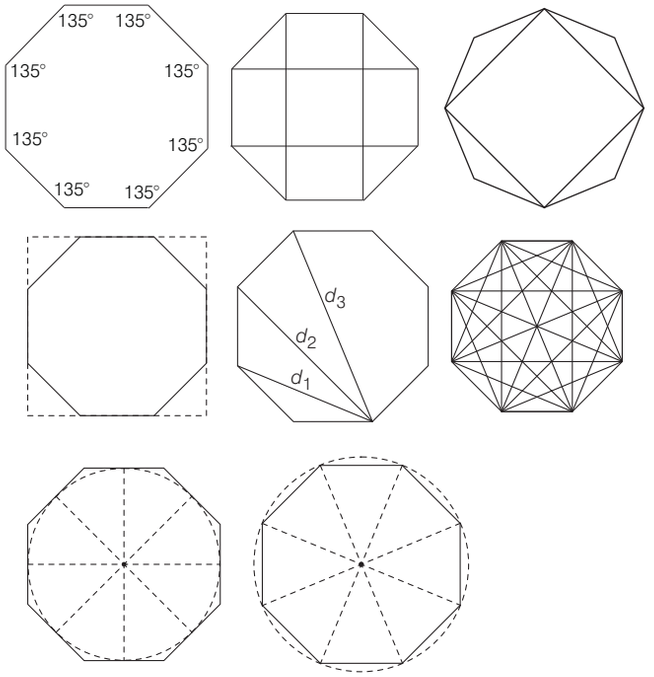
Area of a heptagon $= 3.371\, a^2$

(a is the apothem of the regular heptagon)

Area of a heptagon $= 2.7364\, r^2$

(r is the circumradius of the regular heptagon)

Octagon



Let s, d, a, r, A denote side, diagonal, apothem (inradius), radius (or circumradius), area of an octagon, then we have

$$d_1 = (\sqrt{2+\sqrt{2}}\,)\,s \qquad d_2 = (1+\sqrt{2})\,s$$

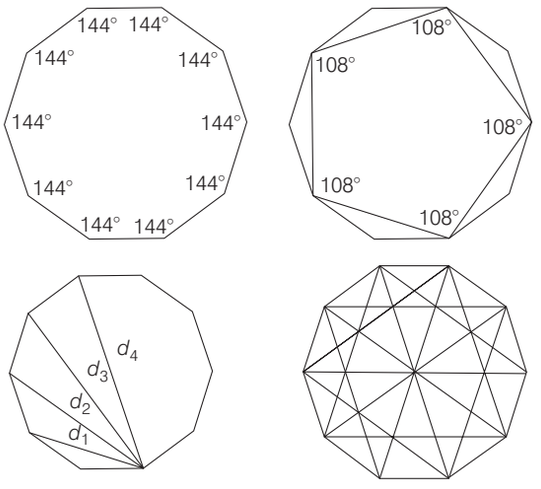
$$d_3 = (\sqrt{4+2\sqrt{2}}\,)\,s \qquad d_3 = \sqrt{2}(d_1)$$

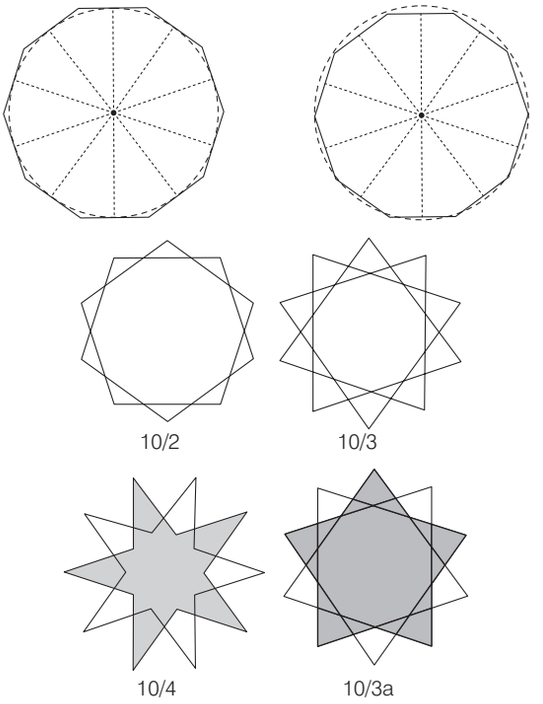
$$a = \frac{(1+\sqrt{2})\,s}{2} \qquad r = \frac{(\sqrt{4+2\sqrt{2}}\,)\,s}{2}$$

$$A = 2(1+\sqrt{2})s^2 = d_2^2 - s^2$$

$$A = 2(d_2 s) = 4as$$

Decagon





Here s, d, a, r, A denote side, diagonal apothem (inradius), radius (or circumradius), area of a decagon, then we have

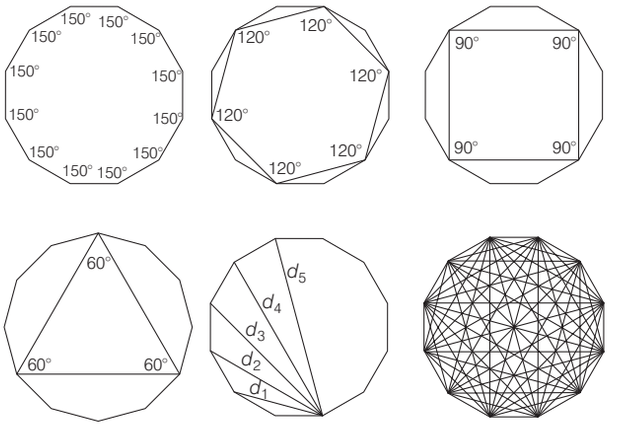
$$d_1 = \frac{2as}{r} = \frac{2(\sqrt{5+2\sqrt{5}}\,)\,s}{(1+\sqrt{5})} \qquad d_2 = \frac{(3+\sqrt{5})s}{2} = \varphi^2 s = \varphi r$$

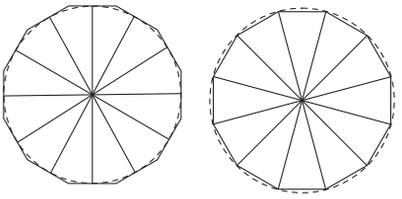
$$d_3 = (\sqrt{5+2\sqrt{5}}\,)s = 2a \qquad d_4 = (1+\sqrt{5})s = 2\varphi s = 2r$$

$$a = \frac{(\sqrt{5+2\sqrt{5}}\,)s}{2} \qquad r = \frac{(1+\sqrt{5})s}{2} = \varphi \cdot s$$

$$A = \frac{5(\sqrt{5+2\sqrt{5}}\,)s^2}{2} = 5as$$

Dodecagon





Let s, d, a, r, A denote side, diagonal, apothem (inradius), radius (or circumradius), area of a decagon, then we have

$$d_1 = (\sqrt{2+\sqrt{3}})\, s$$

$$d_2 = (\sqrt{3}+1)s$$

$$d_3 = (\sqrt{2+\sqrt{3}}+\sqrt{2})s = d_1 + \sqrt{2} = \sqrt{3}(d_1)$$

$$d_4 = (\sqrt{3}+2)s$$

$$d_5 = 2(\sqrt{2+\sqrt{3}})s = 2(d_1) = \sqrt{2}(d_2)$$

$$d_5 = (\sqrt{2}+\sqrt{6})\, s$$

$$a = \frac{(\sqrt{3}+2)s}{2} = \frac{d_4}{2}$$

$$r = (\sqrt{2+\sqrt{3}})\, s = d_1 = \frac{d_5}{2}$$

$$A = 3(\sqrt{3}+2)s^2 = 6as = 3r^2$$

Introductory *Exercise 12.4*

1. Each interior angle of a regular polygon is 140°. The number of sides is :
(a) 10 (b) 8 (c) 6 (d) 9

2. Each angle of a regular hexagon is :
(a) 60° (b) 120°
(c) 90° (d) none of these

3. If one of the interior angles of a regular polygon is equal to 5/6 times of one of the interior angles of a regular pentagon, then the number of sides of the polygon is :
(a) 3 (b) 4 (c) 6 (d) 8

4. The sum of the interior angles of a polygon is 1260°. The number of sides of the polygon is :
(a) 6 (b) 7 (c) 8 (d) 9

5. If each interior angle of a regular polygon is 3 times its exterior angle, the number of sides of the polygon is :
(a) 4 (b) 5 (c) 6 (d) 8

6. Difference between the interior and exterior angles of regular polygon is 60°. The number of sides in the polygon is :
(a) 5 (b) 6 (c) 8 (d) 9

7. A polygon has 54 diagonals. The number of sides in the polygon is :
(a) 7 (b) 9
(c) 12 (d) none of these

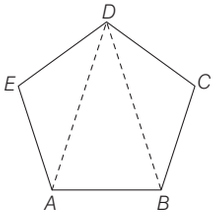
8. The ratio between the number of sides of two regular polygons is 1 : 2 and the ratio between their interior angle is 3 : 4. The number of sides of these polygons are respectively :
(a) 3, 6 (b) 4, 8 (c) 6, 9 (d) 5, 10

9. The sum of all the interior angles of a regular polygon is four times the sum of its exterior angles. The polygon is :
(a) hexagon (b) triangle (c) decagon (d) nonagon

10. The ratio of the measure of an angle of a regular nonagon to the measure of its exterior angle is :
(a) 3 : 5 (b) 5 : 2 (c) 7 : 2 (d) 4 : 5

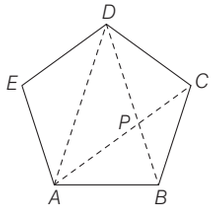
11. In a regular polygon, if the number of diagonals is k times the number of diagonals is k times the number of sides and each interior angle is θ, then k is
(a) $\frac{3\theta - 2\pi}{2\pi - 2\theta}$ (b) $\frac{4\theta - \pi}{2\pi - 2\theta}$ (c) $\frac{3\theta - \pi}{2\pi - 2\theta}$ (d) $\frac{3(\theta - \pi)}{2(\pi - \theta)}$

12. In the following figure, $ABCDE$ is a regular pentagon. Find $\angle ADB$,



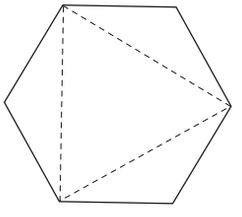
(a) 36° (b) 30°
(c) 24° (d) cannot be determined

13. In the following figure, $ABCDE$ is a regular pentagon. Find $\angle DPC$.



(a) 54° (b) 72° (c) 24° (d) 60°

14. In the following figure find the ratio of the area of the triangle to that of the regular hexagon.



(a) 2 : 1 (b) $\sqrt{3} : \sqrt{6}$
(c) $\sqrt{2} : \sqrt{3}$ (d) 1 : 2

12.6 Circles

Definition : A circle is a set of points on a plane which lie at a fixed distance from a fixed point.

Nomenclature	Definition	Diagram
Centre	The fixed point is called the centre. In the given diagram '*O*' is the centre of the circle.	Radius	The fixed distance is called a radius. In the given diagram *OP* is the radius of the circle. (Point *P* lies on the circumference)	Circumference	The circumference of a circle is the distance around a circle, which is equal to $2\pi r$. ($r \rightarrow$ radius of the circle)	Secant	A line segment which intersects the circle at two distinct points, is called as secant. In the given diagram secant *PQ* intersects circle at two points *A* and *B*.	Tangent	A line segment which has one common point with the circumference of a circle *i.e.,* it touches only at one point is called as tangent of circle. The common point is called as point of contact. In the given diagram *PQ* is a tangent which touches the circle at a point *R*.	 (*R* is the point of contact) **NOTE** Radius is always perpendicular to tangent.
Chord	A line segment whose end points lie on the circle. In the given diagram *AB* is a chord.	Diameter	A chord which passes through the centre of the circle is called the diameter of the circle. The length of the diameter is twice the length of the radius. In the given diagram *PQ* is the diameter of the circle. ($O \rightarrow$ is the centre of the circle)	Arc	Any two points on the circle divides the circle into two parts the smaller part is called as minor arc and the larger part is called as major arc. It is denoted as '$\overset{\frown}{\quad}$'. In the given diagram $\overset{\frown}{PQ}$ is arc.	 $PQ \rightarrow$ minor arc  $PQ \rightarrow$ major arc

Nomenclature	Definition	Diagram
Semicircle	A diameter of the circle divides the circle into two equal parts. Each part is called as semicircle.	Central angle	An angle formed at the centre of the circle, is called the central angle. In the given diagram $\angle AOB$ is the central angle.	Inscribed angle	When two chords have one common end point, then the angle included between these two chords at the common point is called the inscribed angle. $\angle ABC$ is the inscribed angle by the arc $\overset{\frown}{ADC}$.	Measure of an arc	Basically it is the central angle formed by an arc. *e.g.,* (a) measure of a circle = 360° (b) measure of a semicircle = 180° (c) measure of a minor arc = $\angle POQ$ (d) measure of a major arc = 360 − $\angle POQ$	 m (arc PRQ) = $m\angle POQ$ m (arc PSQ) = 360° − m (arc PRQ)
Intercepted arc	In the given diagram $\overset{\frown}{AB}$ and $\overset{\frown}{CD}$ are the two intercepted arcs, intercepted by $\angle CPD$. The end points of the arc must touch the arms of $\angle CPD$ *i.e., CP* and *DP*.	Concentric circles	Circles having the same centre at a plane are called the concentric circles. In the given diagram there are two circles with radii r_1 and r_2 having the common (or same) centre. These are called as concentric circles.	Congruent circles	Circles with equal radii are called as congruent circles.	
Nomenclature	Definition	Diagram
Segment of a circle	A chord divides a circle into two regions. These two regions are called the segments of a circle. (a) major segment (b) minor segment	Cyclic Quadrilateral	A quadrilateral whose all the four vertices (A, B, C, D) lie on the circle. For a cyclic quadrilateral $ABCD$, we must have $(AB \times CD) + (BC \times AD) = (AC \times BD)$	Tangential Quadrilateral	A tangential quadrilateral or circumscribed quadrilateral is a convex quadrilateral whose sides are all tangent to a single circle within the quadrilateral . For a tangential quadrilateral, we must have $AB + CD = BC + AD$	Bicentric Quadrilateral	A quadrilateral is said to be bicentric if it is cyclic and tangential.	Circumcircle	A circle which passes through all the three vertices of a triangle. Thus the circumcentre is always equidistant from the vertices of the triangle. $OA = OB = OC$ (circumradius)	Incircle	A circle which touches all the three sides of a triangle *i.e.,* all the three sides of a triangle are tangents to the circle is called an incircle. Incircle is always equidistant from the sides of a triangle. $OP = OQ = OR$ (inradius of the circle)	Curvature	Curvatures is a measure of how quickly a tangent line turns on a curve. We would expect the curvature to be 0 for a straight line, to be very small for curves which bend very little and to be large for curves which bend sharply. Larger the circle, smaller the curvature. Curvature of a circle $= \frac{1}{\text{radius}}$	
Theorems

NOTE

- Two arcs of a circle (or of congruent circles) are congruent if their degree measures are equal.
- There is one and only one circle passes through three non-collinear points.

S. No.	Theorem	Diagram
1.	In a circle (or in congruent circles) equal chords are made by equal arcs. $\{OP = OQ\} = \{O'R = O'S\}$ and $PQ = RS$ $\therefore$ $PQ = RS$	2.	Equal arcs (or chords) subtend equal angles at the centre $\because$ $PQ = AB$ $\therefore$ $\angle POQ = \angle AOB$	3.	The perpendicular from the centre of a circle to a chord bisects the chord *i.e.,* if $OD \perp AB$ $\therefore$ $AB = 2AD = 2BD$	4.	The line joining the centre of a circle to the mid-point of a chord is perpendicular to the chord. $\because$ $AD = DB$ $\therefore$ $OD \perp AB$	5.	Perpendicular bisector of a chord passes through the centre. *i.e.,* if $OD \perp AB$ and $AD = DB$ $\therefore$ O is the centre of the circle.	6.	Equal chords of a circle (or of congruent circles) are equidistant from the centre. $\because$ $AB = PQ$ $\therefore$ $OD = OR$	7.	Chords which are equidistant from the centre in a circle (or in congruent, circles) are equal. $\because$ $OD = OR$ $\therefore$ $AB = PQ$	
S. No.	Theorem	Diagram
8.	The angle subtended by an arc (the degree measure of the arc) at the centre of a circle is twice the angle subtended by the arc at any point on the remaining part of the circle. $m\angle AOB = 2m\angle ACB.$	9.	Angle in a semicircle is a right angle.	10.	Angles in the same segment of a circle are equal. *i.e.,* $\angle ACB = \angle ADB$	11.	If a line segment joining two points subtends equal angle at two other points lying on the same side of the line containing the segment, then the four points lie on the same circle. $\angle ACB = \angle ADB$ $\therefore$ Points *A, C, D, B* are concyclic *i.e.,* lie on the circle.	12.	The sum of pair of opposite angles of a cyclic quadrilateral is 180°. $\angle DAB + \angle BCD = 180°$ and $\angle ABC + \angle CDA = 180°$ (Inverse of this theorem is also true)	13.	Equal chords (or equal arcs) of a circle (or congruent circles) subtended equal angles at the centre. $AB = CD$ (or $AB = CD$) $\therefore$ $\angle AOB = \angle COD$ (Inverse of this theorem is also true)	14.	If a side of a cyclic quadrilateral is produced, then the exterior angle is equal to the interior opposite angle. $m\angle CDE = m\angle ABC$	
S. No.	Theorem	Diagram
15.	A tangent at any point of a circle is perpendicular to the radius through the point of contact. (Inverse of this theorem is also true)	16.	The lengths of two tangents drawn from an external point to a circle are equal. *i.e.,* $AP = BP$	17.	If two chords AB and CD of a circle, intersect inside a circle (outside the circle when produced at a point E), then $AE \times BE = CE \times DE$	 18.	If PB be a secant which intersects the circle at A and B and PT be a tangent at T, then $PA \cdot PB = (PT)^2$	19.	From an external point from which the tangents are drawn to the circle with centre O, then (a) they subtend equal angles at the centre. (b) they are equally inclined to the line segment joining the centre of that point. $\angle AOP = \angle BOP$ and $\angle APO = \angle BPO$	20.	If P is an external point from which the tangents to the circle with centre O touch it at A and B, then OP is the perpendicular bisector of AB. $OP \perp AB$ and $AC = BC$	21.	**Alternate segment theorem :** If from the point of contact of a tangent, a chord is drawn, then the angles which the chord makes with the tangent line are equal respectively to the angles formed in the corresponding alternate segments. In the adjoining diagram. $\angle BAT = \angle BCA$ and $\angle BAP = \angle BDA$	
S. No.	Theorem	Diagram
22.	The point of contact of two tangents lies on the straight line joining the two centres. (a) When two circles touch externally, then the distance between their centres is equal to sum of their radii. *i.e.,* $AB = AC + BC$ (b) When two circles touch internally, the distance between their centres is equal to the difference between their radii. *i.e.,* $AB = AC - BC$	23.	For the two circles with centre X and Y and radii r_1 and r_2. AB and CD are two Direct Common Tangents (DCT), then the length of DCT $= \sqrt{(\text{distance between centres})^2 - (r_1 - r_2)^2}$	24.	For the two circles with centre X and Y and radii r_1 and r_2. PQ and RS are two transverse common tangent, then length of TCT $= \sqrt{(\text{distance between centres})^2 - (r_1 + r_2)^2}$	25.	**Descartes' circle equation theorem :** Given four mutually tangent circles with curvatures a, b, c and d, then $(a + b + c + d)^2 = 2(a^2 + b^2 + c^2 + d^2)$		If any one of the circles is circumscribing, say a circle of curvature d is circumscribing the circles of curvatures a, b and c, then $(a + b + c - d)^2 = 2(a^2 + b^2 + c^2 + (-d^2))$		In lay terms, if all the points of tangency are external, the curvatures are considered positive, but if one circle encompasses the others, that circle has negative curvature. Here, as all three circles are tangent to each other at the same point, Descartes' theorem does not apply.	
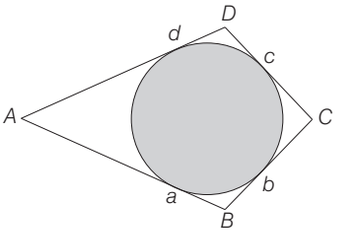
12.7 **Tangential Quadrilateral**

A tangential quadrilateral or circumscribed quadrilateral is a convex quadrilateral whose sides are all tangent to a single circle within the quadrilateral. This circle is called the incircle of the quadrilateral; its center is the incenter and its radius is called the inradius.

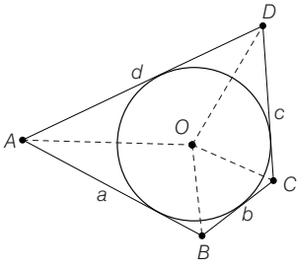


All triangles have an incircle, but not all quadrilaterals do. An example of a quadrilateral that cannot be tangential is a non-square rectangle.

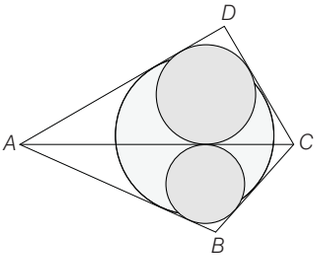
If a quadrilateral is both tangential and cyclic, it is called a bicentric quadrilateral. Examples of tangential quadrilaterals are squares, rhombi, and kites.

Properties

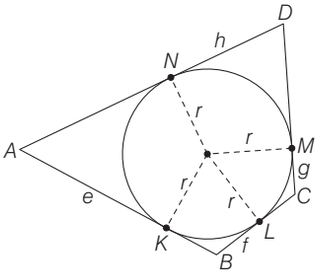
1. In a tangential quadrilateral, the four angle bisectors meet at the center of the incircle.
2. Conversely, a convex quadrilateral in which the four angle bisectors meet at a point must be tangential and the common point is the incenter.



3. The two pairs of opposite sides in a tangential quadrilateral add up to the same total length, which equals the semi perimeter s of the quadrilateral : $a + c = b + d = s$.
4. Conversely, a convex quadrilateral in which $a + c = b + d$ must be tangential.
5. A convex quadrilateral $ABCD$ is tangential, if and only if the incircles in the two triangles ABC and ADC are tangent to each other.



6. Area of the tangential quadrilateral —



(i) $A = r \times s$; where r is the inradius and s is the semi-perimeter

(ii) $A = \sqrt{(e+f+g+h)(efg+fgh+ghe+hef)}$; where, e, f, g, h are the lengths of the tangents.

(iii) $A = \frac{1}{2}\sqrt{p^2q^2 - (ac-bd)^2}$; where p, q are the diagonals and a, b, c, d are the sides of tangential quadrilateral.

(iv) $A = \sqrt{abcd - (eg-fh)^2}$; where a, b, c, d are the sides and e, f, g, h are the successive tangent lengths.

(v) When the tangential quadrilateral is cyclic, that is bi-centric, then $eg = fh$ and so the tangential quadrilateral will have the maximum area $\sqrt{abcd}$.

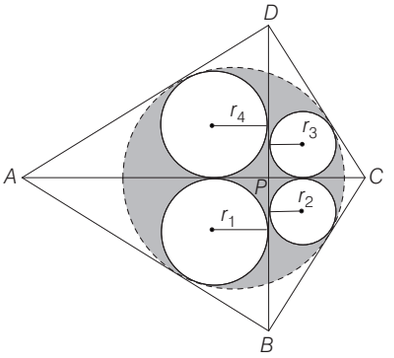
NOTE In the above diagram, it is considered as $AB = a, BC = b, CD = c, DA = d$ and $AK = e, BL = f, CM = g, DN = h$.

7. The maximum area of a tangential quadrilateral $A \le \sqrt{abcd}$
8. The minimum area of a tangential quadrilateral $A \ge 4r^2$
9. The minimum value of the semi-perimeter $s \ge 4r$
10. The inradius of a tangential quadrilateral $r = A/s$; where A is the area and s is the semi-perimeter of the tangential quadrilateral.
11. If e, f, g and h are the tangent lengths from A, B, C and D, respectively, to the points where the incircle is tangent to the sides of a tangential quadrilateral $ABCD$, then the lengths of the diagonals $p = AC$ and $q = BD$ are

$$p = \sqrt{\left(\frac{e+g}{f+h}\right)[(e+g)(f+h)+4fh]}$$

and $$q = \sqrt{\left(\frac{f+h}{e+g}\right)[(e+g)(f+h)+4eg]}$$

12. In the non-overlapping triangles APB, BPC, CPD, DPA formed by the diagonals in a convex quadrilateral $ABCD$, where the diagonals intersect at P, there are the following characterizations of tangential quadrilaterals.



(i) Let r_1, r_2, r_3 and r_4 denote the radii of the incircles in the four triangles APB, BPC, CPD and DPA respectively, then the quadrilateral is tangential if and only if $\frac{1}{r_1}+\frac{1}{r_3}=\frac{1}{r_2}+\frac{1}{r_4}$

(ii) If h_1, h_2, h_3 and h_4 denote the altitudes in the four triangles APB, BPC, CPD and DPA respectively, (from the diagonal intersection to the sides of the quadrilateral), then quadrilateral is tangential if and only if

$$\frac{1}{h_1}+\frac{1}{h_3}=\frac{1}{h_2}+\frac{1}{h_4}$$

(iii) If the exradii r_a, r_b, r_c and r_d in the four triangles APB, BPC, CPD and DPA respectively, (the four excircles are each tangent to one side of the quadrilateral and the extensions of its diagonals). A quadrilateral is tangential if and only if

$$\frac{1}{r_a}+\frac{1}{r_c}=\frac{1}{r_b}+\frac{1}{r_d}$$

(iv) If R_1, R_2, R_3 and R_4 denote the radii in the circumcircles of triangles APB, BPC, CPD and DPA, respectively, then the quadrilateral $ABCD$ is tangential if and only if

$$R_1+R_3=R_2+R_4$$

(v) A convex quadrilateral $ABCD$, with diagonals intersecting at P, is tangential if and only if the four excenters in triangles APB, BPC, CPD and DPA opposite the vertices B and D are concyclic. If R_a, R_b, R_c and R_d are the exradii in the triangles APB, BPC, CPD and DPA, respectively, opposite the vertices B and D, then another condition is that the quadrilateral is tangential if and only if

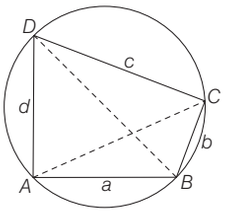
$$\frac{1}{R_a}+\frac{1}{R_c}=\frac{1}{R_b}=\frac{1}{R_d}$$

(vi) A convex quadrilateral $ABCD$ with diagonals intersecting at P is tangential if and only if

$$\frac{a}{\Delta(APB)}+\frac{c}{\Delta(CPD)}=\frac{b}{\Delta(BPC)}+\frac{d}{\Delta(DPA)}$$

Cyclic Quadrilateral

A cyclic quadrilateral is a quadrilateral for which a circle can be circumscribed so that it touches each vertex of the quadrilateral.



(i) Semi perimeter $s=\frac{a+b+c+d}{2}$

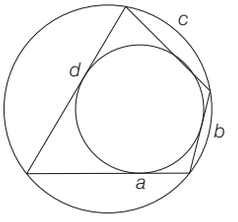
(ii) Area $A=\sqrt{(s-a)(s-b)(s-c)(s-d)}$

(iii) Area $A=\frac{\sqrt{(ab+cd)(ac+bd)(ad+bc)}}{4R}$

(iv) Circumradius $R=\frac{1}{4}\sqrt{\frac{(ab+cd)(ac+bd)(ad+bc)}{(s-a)(s-b)(s-c)(s-d)}}$

Bicentric Quadrilateral

A quadrilateral is said to be bicentric if it is cyclic and tangential.



(i) If the sides be a, b, c, d the area of a bicentric quadrilateral is $A=\sqrt{abcd}$

(ii) Inradius, $r=\frac{2\sqrt{abcd}}{a+b+c+d}=\frac{\sqrt{abcd}}{s}$

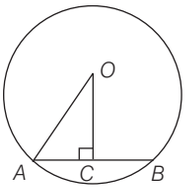
(iii) Circumradius, $R=\frac{1}{4}\sqrt{\frac{(ab+cd)(ac+bd)(ad+bc)}{abcd}}$

(iv) In a bicyclic quadrilateral, the distance x between the incentre and circumcentre is given by

$$\frac{1}{(R-x)^2}+\frac{1}{(R+x)^2}=\frac{1}{(r)^2}$$

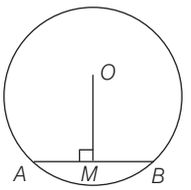
Introductory *Exercise 12.5*

1. In the given figure, O is the centre of the circle. Radius of the circle is 17 cm.If $OC = 8$ cm, then the length of the chord AB is :



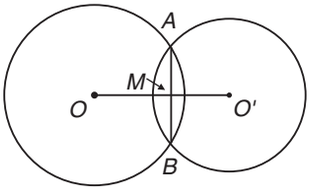
(a) 35 cm (b) 30 cm (c) 15 cm (d) 18 cm

2. In the given figure $OM \perp AB$, radius of the circle is 5 cm and length of the chord $AB = 8$ cm. Find the measure of OM.



(a) 3 cm (b) 2.5 cm (c) 2 cm (d) 6 cm

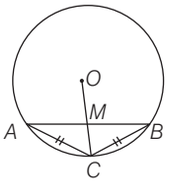
3. In the given figure, two circles with their respective centres intersect each other at A and B and AB intersects OO' at M, then $m\angle OMA$ is :



(a) 60° (b) 80°
(c) 90° (d) can't be determined

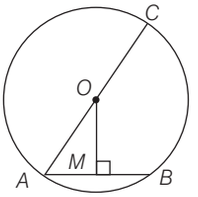
4. In the above question (no. 3) what is the ratio of $AM : BM$?
(a) 5 : 6 (b) 3 : 2
(c) 1 : 1 (d) can't be determined

5. In the given figure the two chords AC and BC are equal. The radius OC intersect AB at M, then $AM : BM$ is :



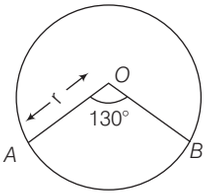
(a) 1 : 1 (b) $\sqrt{2} : 3$
(c) $3 : \sqrt{2}$ (d) none of these

6. In the adjoining figure, O is the centre of circle and diameter $AC = 26$ cm. If chord $AB = 10$ cm, then the distance between chord AB and centre O of the circle is :



(a) 24 cm (b) 16 cm
(c) 12 cm (d) none of these

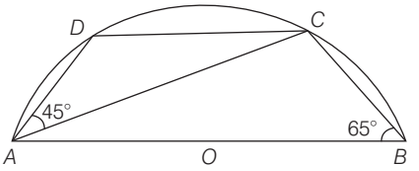
7. In the adjoining circle $C(0, r)$ the degree measure of minor arc $AB = 130°$. Find the degree measure of major arc.



(a) 230° (b) 260°
(c) 310° (d) none of these

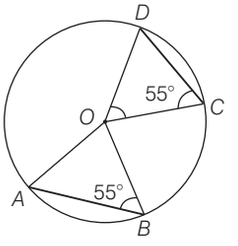
8. If the diagonals of a cyclic quadrilateral are equal, then the quadrilateral is :
(a) rhombus (b) square
(c) rectangle (d) none of these

9. In the given figure, AB is diameter of the circle. C and D lie on the semicircle. $\angle ABC = 65°$ and $\angle CAD = 45°$. Find $m\angle DCA$.



(a) 45° (b) 25°
(c) 20° (d) none of these

10. In the given figure, chords AB and CD are equal. If $\angle OBA = 55°$, then $m\angle COD$ is :

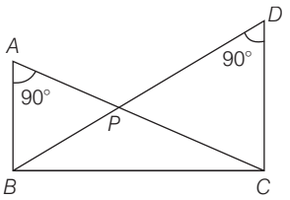


(a) 65° (b) 55° (c) 70° (d) 50°

11. The quadrilateral formed by angle bisectors of a cyclic quadrilateral is a :

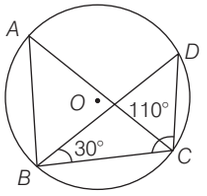
(a) rectangle (b) square
(c) parallelogram (d) cyclic quadrilateral

12. ΔABC and ΔDBC have a common base and drawn towards one sides. $\angle BAC = \angle BDC = 90°$. If AC and DB intersect at P, then :



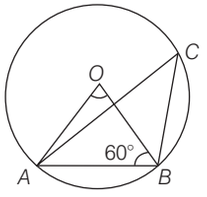
(a) $AP \times PC = BP \times PD$
(b) $AP \times BP = PC \times PD$
(c) $AP \times PD = PC \times BP$
(d) none of the above

13. In the given figure, $\angle BAC$ and $\angle BDC$ are the angles of same segments. $\angle DBC = 30°$ and $\angle BCD = 110°$. Find $m\ \angle BAC$.



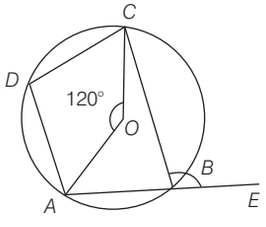
(a) 35° (b) 40°
(c) 55° (d) 60°

14. In the given figure, O is the centre of the circle, $\angle ABO = 60°$. Find the value of $\angle ACB$.



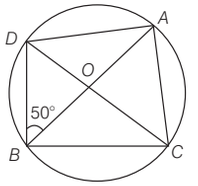
(a) 40° (b) 60°
(c) 50° (d) 30°

15. In the given figure, $\angle AOC = 120°$. Find $m\ \angle CBE$, where O is the centre.



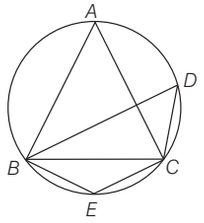
(a) 60° (b) 100° (c) 120° (d) 150°

16. In the adjoining figure, O is the centre of the circle and $\angle OBD = 50°$. Find the $m\ \angle BAD$.



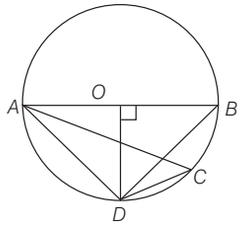
(a) 60° (b) 40° (c) 80° (d) 45°

17. In the given figure, ΔABC is an equilateral triangle. Find $m\ \angle BEC$.



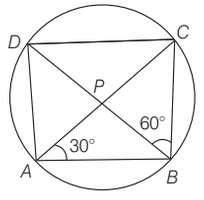
(a) 120° (b) 60°
(c) 80° (d) none of these

18. In the given figure, AB is the diameter of the circle. Find the value of $\angle ACD$.



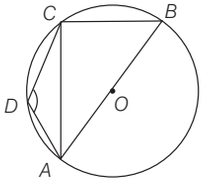
(a) 30° (b) 60° (c) 45° (d) 25°

19. In the given figure, $ABCD$ is a cyclic quadrilateral and diagonals bisect each other at P. If $\angle DBC = 60°$ and $\angle BAC = 30°$, then $\angle BCD$ is :



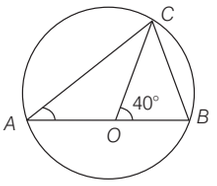
(a) 90° (b) 60°
(c) 80° (d) none of these

20. In the given figure, $ABCD$ is a cyclic quadrilateral and AB is the diameter. $\angle ADC = 140°$, then find $m\ \angle BAC$.



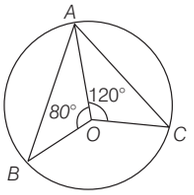
(a) 45° (b) 40° (c) 50° (d) none of these

21. In the given figure, $\angle COB = 40°$, AB is the diameter of the circle. Find $m\ \angle CAB$.



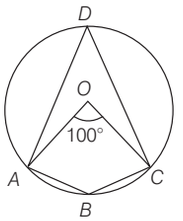
(a) 40° (b) 20° (c) 30° (d) none of these

22. In the given figure, O is the centre of circle. $\angle AOB = 80°$ and $\angle AOC = 120°$. Find $m\ \angle BAC$.



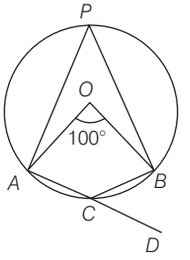
(a) 120° (b) 80° (c) 100° (d) none of these

23. In the given figure, O is the centre of the circle and $\angle AOC = 100°$. Find the ratio of $m\ \angle ADC : m\ \angle ABC$.



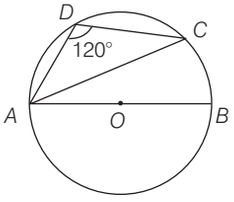
(a) 5 : 6 (b) 1 : 2
(c) 5 : 13 (d) none of these

24. In the given figure, O is the centre of circle, $\angle AOB = 100°$. Find $m\ \angle BCD$.



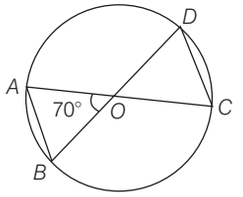
(a) 80° (b) 60° (c) 50° (d) 40°

25. In the given figure, AB is the diameter of the circle. $\angle ADC = 120°$. Find $m\ \angle CAB$.



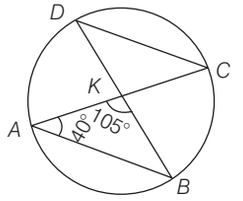
(a) 20° (b) 30°
(c) 40° (d) can't be determined

26. In the given figure, O is the centre of the circle. $\angle AOB = 70°$, find $m\ \angle OCD$.



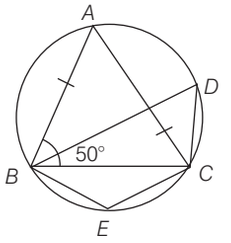
(a) 70° (b) 55°
(c) 65° (d) 110°

27. In the given figure, $\angle CAB = 40°$ and $\angle AKB = 105°$. Find $\angle KCD$.



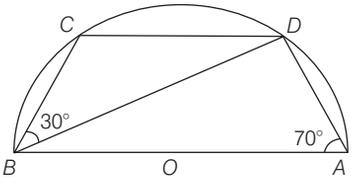
(a) 65° (b) 35° (c) 40° (d) 72°

28. In the given figure, ABC is an isosceles triangle in which $AB = AC$ and $m\ \angle ABC = 50°$. Find $m\ \angle BDC$.



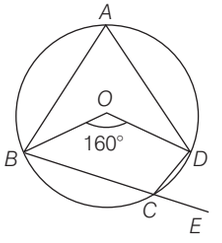
(a) 80° (b) 60° (c) 65° (d) 100°

29. In the given figure, AB is the diameter. $m\ \angle BAD = 70°$ and $m\ \angle DBC = 30°$. Find $m\ \angle BDC$.



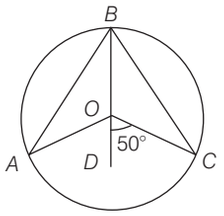
(a) 25° (b) 30° (c) 40° (d) 60°

30. Find the value of $\angle DCE$.



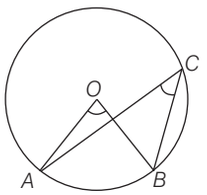
(a) 100° (b) 80°
(c) 90° (d) 75°

31. '*O*' is the centre of the circle, line segment *BOD* is the angle bisector of $\angle AOC$, $m\angle COD = 50°$.
Find $m\angle ABC$.



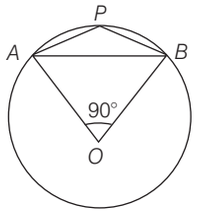
(a) 25° (b) 50°
(c) 100° (d) 120°

32. In the given figure, *O* is the centre of the circle and $\angle ACB = 25°$. Find $\angle AOB$.



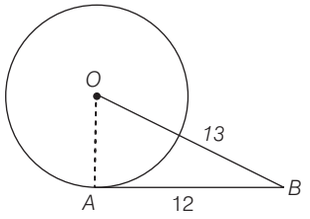
(a) 25° (b) 50°
(c) 75° (d) 60°

33. In the given figure, *O* is the centre of the circle.
$\angle AOB = 90°$. Find $m\angle APB$.



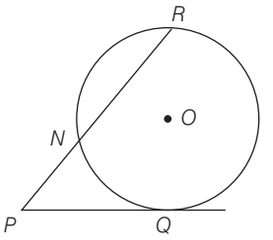
(a) 130°
(b) 150°
(c) 135°
(d) can't be determined

34. In the given figure, *O* is the centre of the circle. *AB* is tangent. *AB* = 12 cm and *OB* = 13 cm. Find *OA*.



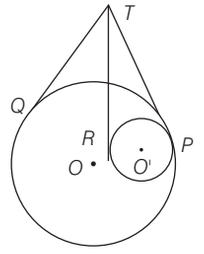
(a) 6.5 cm
(b) 6 cm
(c) 5 cm
(d) none of the above

35. In the given figure, *PQ* is the tangent of the circle. Line segment *PR* intersects the circle at *N* and *R*.
PQ = 15 cm, *PR* = 25 cm, find *PN*.



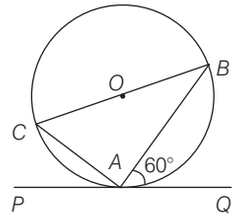
(a) 15 cm (b) 10 cm (c) 9 cm (d) 6 cm

36. In the given figure, there are two circles with the centres *O* and *O'* touching each other internally at *P*. Tangents *TQ* and *TP* are drawn to the larger circle and tangents *TP* and *TR* are drawn to the smaller circle. Find *TQ* : *TR*.



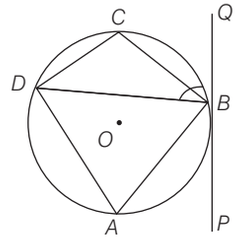
(a) 8 : 7 (b) 7 : 8
(c) 5 : 4 (d) 1 : 1

37. In the given figure, *PAQ* is the tangent. *BC* is the diameter of the circle. $m\angle BAQ = 60°$, find $m\angle ABC$.



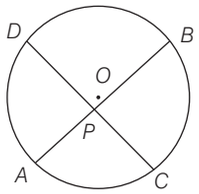
(a) 25° (b) 30° (c) 45° (d) 60°

38. *ABCD* is a cyclic quadrilateral *PQ* is a tangent at *B*. If $\angle DBQ = 65°$, then $\angle BCD$ is :



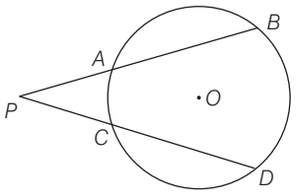
(a) 35° (b) 85° (c) 115° (d) 90°

39. In the given figure,$AP = 2$ cm, $BP = 6$ cm and $CP = 3$ cm. Find DP.



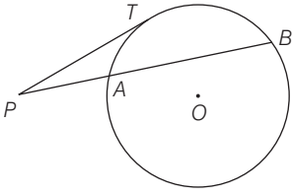
(a) 6 cm (b) 4 cm
(c) 2 cm (d) 3 cm

40. In the given figure, $AP = 3$ cm, $BA = 5$ cm and $CP = 2$ cm. Find CD.



(a) 12 cm (b) 10 cm
(c) 9 cm (d) 6 cm

41. In the given figure, tangent $PT = 5$ cm, $PA = 4$ cm, find AB.

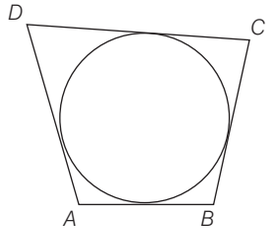


(a) $\frac{7}{4}$ cm
(b) $\frac{11}{4}$ cm
(c) $\frac{9}{4}$ cm
(d) can't be determined

42. Two circles of radii 13 cm and 5 cm touch internally each other. Find the distance between their centres.
(a) 18 cm (b) 12 cm
(c) 9 cm (d) 8 cm

43. Three circles touch each other externally. The distance between their centre is 5 cm, 6 cm and 7 cm. Find the radii of the circles.
(a) 3 cm, 2 cm, 4 cm
(b) 3 cm, 4 cm, 1 cm
(c) 1cm, 2.5 cm, 3.5 cm
(d) 1 cm, 2 cm, 4 cm

44. A circle touches a quadrilateral $ABCD$. Find the true statement

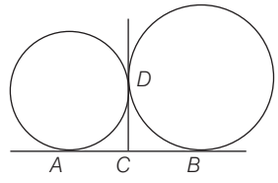


(a) $AB + BC = CD + AD$ (b) $AB + CD = BC + AD$
(c) $BD = AC$ (d) none of these

45. O and O' are the centres of two circles which touch each other externally at P. AB is a common tangent. Find $\angle APO$.
(a) 90° (b) 120°
(c) 60° (d) data insufficient

46. If AB is a chord of a circle, P and Q are two points on the circle different from A and B, then :
(a) the angle subtended by AB at P and Q are either equal or supplementary.
(b) the sum of the angles subtended by AB at P and Q is always equal two right angles.
(c) the angles subtended at P and Q by AB are always equal.
(d) the sum of the angles subtended at P and Q is equal to four right angles.

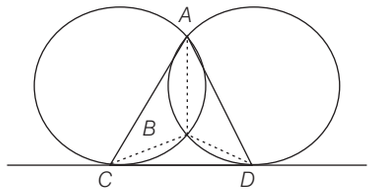
47. In the given figure, AB and CD are two common tangents to the two touching circle. If $CD = 6$ cm, then AB is equal to :



(a) 9 cm (b) 15 cm
(c) 12 cm (d) none of these

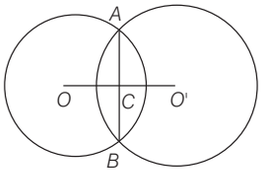
48. In the given figure, CD is a direct common tangent to two circles intersecting each other at A and B, then :

$\angle CAD + \angle CBD = ?$



(a) 120° (b) 90°
(c) 360° (d) 180°

49. O and O' are the centres of circle of radii 20 cm and 37 cm. AB = 24 cm. What is the distance OO' ?



(a) 51 cm (b) 45 cm
(c) 35 cm (d) 48 cm

50. In a circle of radius 5 cm, AB and AC are the two chords such that $AB = AC = 6$ cm. Find the length of the chord BC.
(a) 4.8 cm (b) 10.8 cm
(c) 9.6 cm (d) none of these

51. In a circle of radius 17 cm, two parallel chords are drawn on opposite sides of a diameter. The distance between the chords is 23 cm. If the length of one chord is 16 cm, then the length of the other is :
(a) 23 cm (b) 30 cm
(c) 15 cm (d) none of these

52. If two circles are such that the centre of one lies on the circumference of the other, then the ratio of the common chord of two circles to the radius of any of the circles is :
(a) $\sqrt{3} : 2$
(b) $\sqrt{3} : 1$
(c) $\sqrt{5} : 1$
(d) none of the above

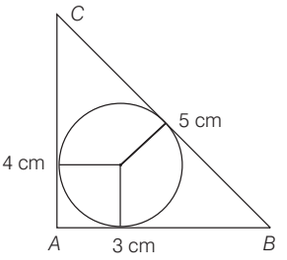
53. Two circles touch each other internally. Their radii are 2 cm and 3 cm. The biggest chord of the other circle which is outside the inner circle, is of length :
(a) $2\sqrt{2}$ cm (b) $3\sqrt{2}$ cm
(c) $2\sqrt{3}$ cm (d) $4\sqrt{2}$ cm

54. Through any given set of four points P, Q, R, S it is possible to draw :
(a) atmost one circle
(b) exactly one circle
(c) exactly two circles
(d) exactly three circles

55. The distance between the centres of equal circles each of radius 3 cm is 10 cm. The length of a transverse tangent is :
(a) 4 cm (b) 6 cm (c) 8 cm (d) 10 cm

56. The number of common tangents that can be drawn to two given circles is at the most :
(a) 1 (b) 2 (c) 3 (d) 4

57. ABC is a right angled triangle AB = 3 cm, BC = 5 cm and AC = 4 cm, then the inradius of the circle is :



(a) 1 cm (b) 1.25 cm
(c) 1.5 cm (d) none of these

58. A circle has two parallel chords of lengths 6 cm and 8 cm. If the chords are 1 cm apart and the centre is on the same side of the chords, then a diameter of the circle is of length :
(a) 5 cm (b) 6 cm
(c) 8 cm (d) 10 cm

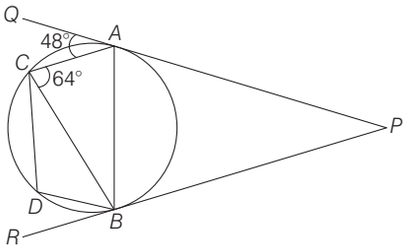
59. Three equal circles of unit radius touch each other. Then, the area of the circle circumscribing the three circles is :
(a) $6\pi\ (2 + \sqrt{3})^2$ (b) $\frac{\pi}{6}(2 + \sqrt{3})^2$
(c) $\frac{\pi}{3}(2 + \sqrt{3})^2$ (d) $3\pi\ (2 + \sqrt{3})^2$

60. The radius of a circle is 20 cm. The radii (in cm) of three concentric circles drawn in such a manner that the whole area is divided into four equal parts, are :
(a) $20\sqrt{2}, 20\sqrt{3}, 20$
(b) $\frac{10\sqrt{3}}{3}, \frac{10\sqrt{2}}{3}, \frac{10}{3}$
(c) $10\sqrt{3}, 10\sqrt{2}, 10$
(d) 17, 14, 9

61. Points A, B, C and D are concyclic. BC is the diameter and O is the centre of the circle, $\angle BAO = 69°$, find $\angle DAO + \angle DCO$.
(a) 138 (b) 111
(c) 121 (d) none of these

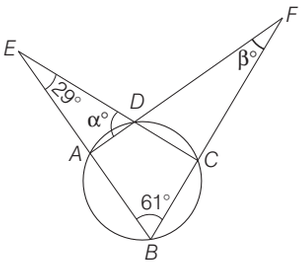
62. An isosceles right triangle ABC has an incircle with centre O, which touches the sides AB, BC and AC at D, E and F respectively. If the longest side AC is $\sqrt{2}$ unit, find DE.
(a) $\sqrt{2} - 1$ cm (b) $\sqrt{2} - \frac{1}{\sqrt{2}}$ cm
(c) $1 - \frac{1}{\sqrt{2}}$ cm (d) none of these

63. Consider the following diagram. In this diagram, A, B, D and C are cyclic. QP and RP are the tangents at A and B respectively and they meet at P. $\angle CAQ = 48°$ and $ACB = 64°$. Find the value of $\angle BDC + \angle CBP + \angle APB$.



(a) 248° (b) 276°
(c) 360° (d) none of these

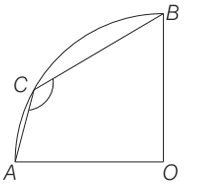
64. In the following figure A, B, C and D are cyclic. BE, CE, AF and BF are straight lines



Find the value of $\alpha - \beta$.
(a) 28° (b) 41°
(c) 32° (d) none of these

65. In a circle with centre O, there are two chords AB and BC, such that $\angle OAB = 24°$ and $\angle OCB = 42°$. Find the measure of $\angle AOC$.
(a) 36° (b) 63°
(c) 228° (d) either (a) or (c)

66. In the following figure, $AOBC$ is a quadrilateral inscribed in a quadrant of a circle such that $\angle AOB$ is a right angle and point C falls on the arc of the quadrant. Find $\angle ACB$.



(a) 120° (b) 135°
(c) 150° (d) data insufficient

67. The sides of a triangle ΔABC are 15 cm, 41 cm and 52 cm. Find the diameter of the circumcircle of the ΔABC.
(a) $\frac{205}{3}$ cm (b) $\frac{208}{3}$ cm
(c) 69 cm (d) 70 cm

68. The radius of a circle is 2 cm, what is its curvature?
(a) 1 cm (b) 4 cm
(c) 0.5 cm (d) 1.414 cm

69. The curvatures of two externally tangent circles are 0.5 and 2, what is the distance between their centers?
(a) 2.5 (b) 1
(c) 4 (d) 8

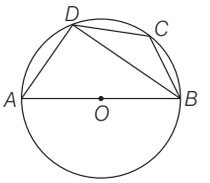
70. An equilateral triangle ABC is inscribed in a circle and a chord AD is connected to two other chords BD and CD, whereas point D is on the arc BC. If the side of the triangle is 30 cm and the chord AD is 32 cm, find $BD + CD$.
(a) 31 cm (b) 32 cm
(c) 225/8 cm (d) 256/15 cm

CAT-Test

Questions Helping you bell the CAT

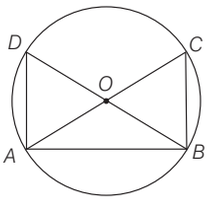
LEVEL 01 › BASIC LEVEL EXERCISE

1 In the adjoining figure AB is a diameter of the circle and $\angle BCD = 130°$. What is the value of $\angle ABD$?



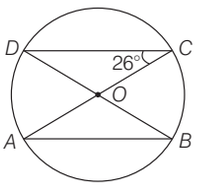
(a) 30°
(b) 50°
(c) 40°
(d) none of the above

2 In the given figure O is the centre of the circle and $\angle BAC = 25°$, then the value of $\angle ADB$ is :



(a) 40°
(b) 55°
(c) 50°
(d) 65°

3 In the given figure O is the centre of the circle and $\angle OCD = 26°$, find $\angle AOD$.

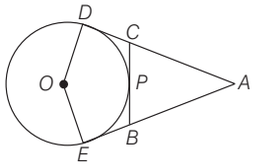


(a) 52°
(b) 154°
(c) 128°
(d) data insufficient

4 Three sides of a triangle ABC are a, b, c. $a = 4700$ cm, $b = 4935$ cm and $c = 6815$ cm. The internal bisector of $\angle A$ meets BC at P, and the bisector passes through incentre O. What is the ratio of $PO : OA$?

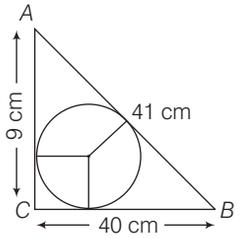
(a) 3 : 2
(b) 2 : 3
(c) 2 : 5
(d) can't be determined

5 In the given circle O is the centre of the circle and AD, AE are the two tangents. BC is also a tangent, then :



(a) $AC + AB = BC$
(b) $3AE = AB + BC + AC$
(c) $AB + BC + AC = 4AE$
(d) $2AE = AB + BC + AC$

6 What is the inradius of the incircle shown in the figure?

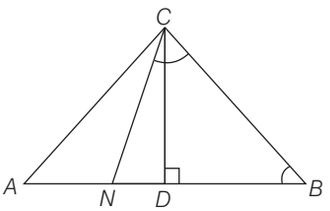


(a) 9 cm (b) 4 cm
(c) can't be determined
(d) none of the above

7 One of the diagonal of a parallelogram is 18 cm, whose adjacent sides are 16 cm and 20 cm respectively. What is the length of other diagonal?

(a) $2\sqrt{247}$ cm (b) 13 cm
(c) 15.2 cm (d) 28.5 cm

8 In the adjoining figure CD is perpendicular on AB. CN is the angle bisector of $\angle ACB$. $\angle ACN = 50°$, then the angle NCD is :



(a) $\frac{1}{3}\angle ACB$
(b) $\angle CAB - \angle CBA$
(c) $\frac{1}{2}(\angle CBA \sim \angle BAC)$
(d) can't be determined

9 In a ΔPQR, points M and N are on the sides PQ and PR respectively such that $PM = 0.6.\,PQ$ and $NR = 0.4\,PR$. What percentage of the area of the triangle PQR does that of triangle PMN form?

(a) 60% (b) 50% (c) 36% (d) 55%

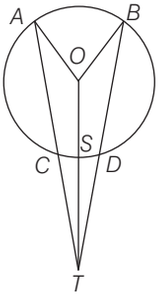
10 In a trapezium $ABCD$, the diagonals AC and BD intersect each other at O such that $OB : OD = 3 : 1$ then the ratio of areas of $\Delta AOB : \Delta COD$ is :

(a) 3 : 1 (b) 1 : 4
(c) 9 : 1 (d) can't be determined

11 Three cities Fatehpur, Barabanki and Lucknow are very famous. Fatehpur is 42 km, away from Barabanki and the distance between Fatehpur and Lucknow is 66 km. Which of the following cannot be the distance between Barabanki and Lucknow?

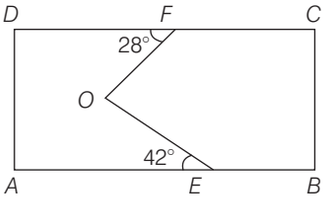
(a) 28 km (b) 98 km (c) 32 km (d) 24 km

12 In the adjoining figure 'O' is the centre of circle AC and BD are the two chords of circle which meets at T outside the circle. OT bisects CD, $OA = OB = 8$ cm and $OT = 17$ cm. What is the ratio of distance of AC and BD from the centre of the circle?



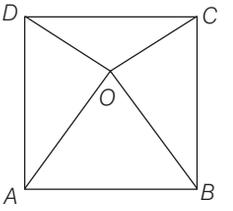
(a) 15 : 17
(b) 8 : 15
(c) 8 : 9
(d) none of the above

13 In the adjoining figure $ABCD$ is a rectangle and $DF = CF$ also, $AE = 3BE$. What is the value of $\angle EOF$, if $\angle DFO = 28°$ and $\angle AEO = 42°$?



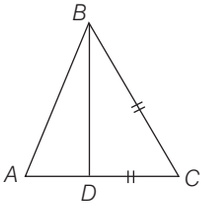
(a) 14° (b) 42°
(c) 70° (d) 90°

14 $ABCD$ is a square and AOB is an equilateral triangle. What is the value of $\angle DOC$?



(a) 120°
(b) 150°
(c) 125°
(d) can't be determined

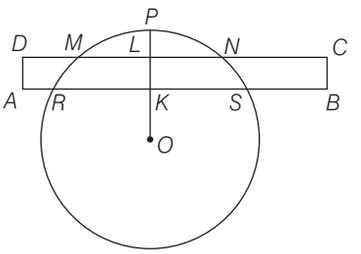
15 In the triangle ABC, $BC = CD$ and $(\angle ABC - \angle BAC) = 30°$. The measure of $\angle ABD$ is :



(a) 30°
(b) 45°
(c) 15°
(d) can't be determined

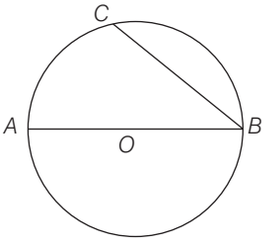
16 In a trapezium $ABCD$, AB is a parallel to CD. BD is perpendicular to AD. AC is perpendicular to BC. If $AD = BC = 15$ cm and $AB = 25$ cm , then the area of the trapezium is :
(a) 192 cm^2
(b) 232 cm^2
(c) 172 cm^2
(d) none of the above

17 In the adjoining figure O is the centre of the circle. The radius OP bisects a rectangle $ABCD$, at right angle. $DM = NC = 2$ cm and $AR = SB = 1$ cm and $KS = 4$ cm and $OP = 5$ cm.



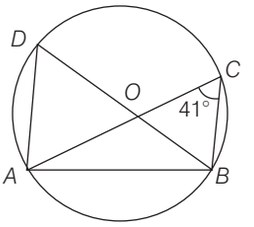
What is the area of the rectangle?
(a) 8 cm^2 (b) 10 cm^2
(c) 12 cm^2 (d) none of these

18 In the given figure of circle AB is the diameter with length 20 cm and BC is 16 cm, then find the length of CO when CO is perpendicular on AB.



(a) 9.6 cm
(b) 8.4 cm
(c) 10 cm
(d) data insufficient

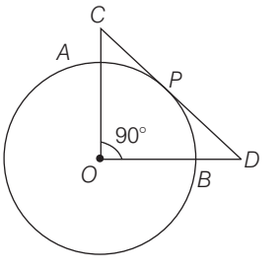
19 In the adjoining figure BD is the diameter of the circle and $\angle BCA = 41°$. Find $\angle ABD$.



(a) 41°
(b) 49°
(c) 22.5°
(d) 20.5°

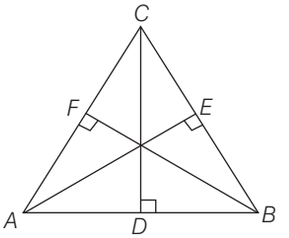
20 Each interior angle of a regular polygon exceeds its exterior angle by 132°. How many sides does the polygon have ?
(a) 9
(b) 15
(c) 12
(d) none of the above

21 In a circle O is the centre and $\angle COD$ is right angle. $AC = BD$ and CD is the tangent at P. What is the value of $AC + CP$, if the radius of the circle is 1 metre?



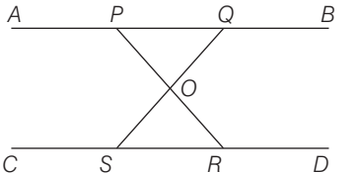
(a) 105 cm
(b) 141.4 cm
(c) 138.6 cm
(d) can't be determined

22 In the given triangle ABC, CD, BF and AE are the altitudes. If the ratio of $CD : AE : BF = 2 : 3 : 4$, then the ratio of $AB : BC : CA$ is :



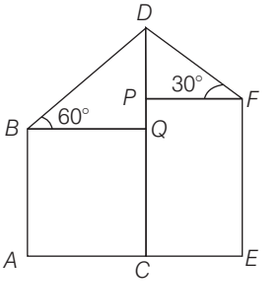
(a) 4 : 3 : 2
(b) 2 : 3 : 4
(c) 4 : 9 : 16
(d) 6 : 4 : 3

23 In the adjoining figure $AB \,||\, CD$ and $PQ = SR$, then :



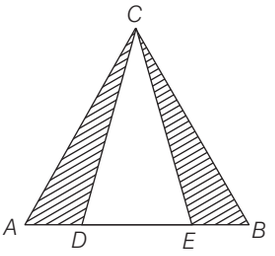
(a) $PQ = PS$
(b) $SR = RP$
(c) $PS = QR$
(d) $AP = RD$

24 In the given figure AB, CD and EF are three towers. The angle of elevation of the top of the tower CD from the top of the tower AB is 60° and that from EF is 30°. $BD = 2\sqrt{3}$ m, $CD : EF = 5 : 4$ and $DF = 4$ m. What is the height of the tower AB ?



(a) 6 m (b) 12 m
(c) 7 m (d) none of these

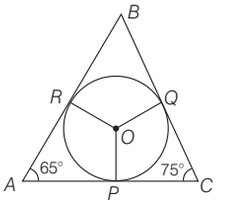
25 In the equilateral triangle ABC, $AD = DE = BE$, D and E lies on the AB. If each side of the triangle (*i.e.,* AB, BC and AC) be 6 cm, then the area of the shaded region is :



(a) 9 cm^2
(b) $6\sqrt{3}$ cm^2
(c) $5\sqrt{3}$ cm^2
(d) none of the above

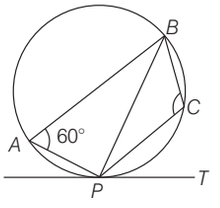
26 In the above question (number 25) what is the perimeter of triangle CDE ?
(a) $(3 + 2\sqrt{5})$ cm
(b) $2(1 + 2\sqrt{7})$ cm
(c) $2(1 + 3\sqrt{7})$ cm
(d) none of the above

27 In a triangle ABC, O is the centre of incircle PQR, $\angle BAC = 65°$, $\angle BCA = 75°$, find $\angle ROQ$.



(a) 80°
(b) 120°
(c) 140°
(d) can't be determined

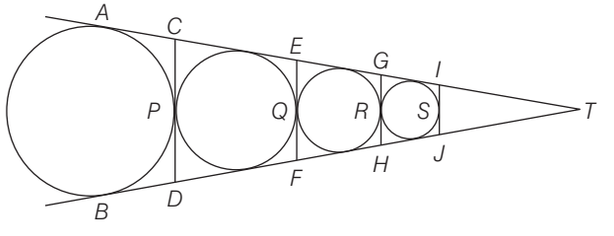
28 In the given figure, PT is a tangent at P and $ABCP$ is a quadrilateral. $\angle BAP$ is 60°, then the value of $\angle PCB$ is :



(a) 60°
(b) 90°
(c) 120°
(d) data insufficient

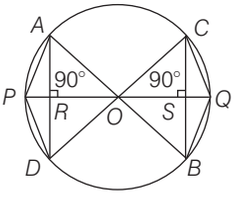
29 In the above question (number 28), what is the value of $\angle TPC$?
(a) 30° (b) 60°
(c) 90° (d) can't be determined

30 In the adjoining figure AT and BT are two tangents at A and B respectively CD is also a tangent at P. There are some more circles touching each other and the tangents AT and BT also. Which one of the following is true?



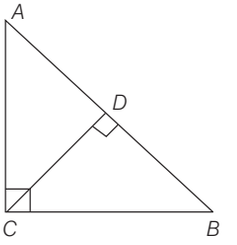
(a) $PC + CT = PD + DT$
(b) $RG + GT = RH + HT$
(c) $PC + QE = CE$
(d) all of these

31 In the adjoining figure O is the centre of the circle.
$\angle AOD = 120°$. If the radius of the circle be 'r', then find the sum of the areas of quadrilaterals $AODP$ and $OBQC$.



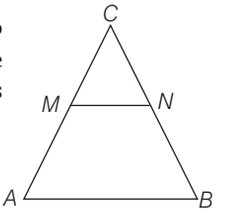
(a) $\frac{\sqrt{3}}{2}r^2$
(b) $3\sqrt{3}r^2$
(c) $\sqrt{3}r^2$
(d) none of the above

32 In a right angled triangle ABC, CD is the perpendicular on the hypotenuse AB. Which of the following is correct?



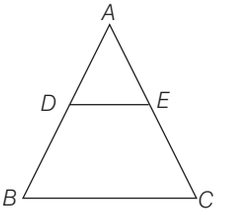
(a) $CD = \frac{AC \times BC}{AB}$
(b) $AD = \frac{AC \times AC}{AB}$
(c) $BD = \frac{BC \times BC}{AB}$
(d) all of the above

33 In the triangle ABC, MN is parallel to AB. Area of trapezium $ABNM$ is twice the area of triangle CMN. What is ratio of $CM : AM$?



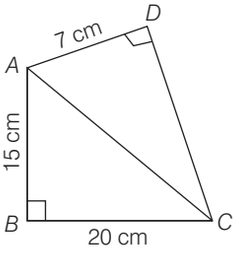
(a) $\frac{1}{\sqrt{3}+1}$
(b) $\frac{\sqrt{3}-1}{2}$
(c) $\frac{\sqrt{3}+1}{2}$
(d) none of the above

34 In the given figure $AD = AE$, $\angle BDE = 100°$, then what is the value of $\angle DBC + \angle BCE$?



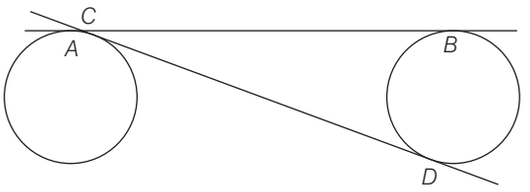
(a) 200°
(b) 160°
(c) 80°
(d) can't be determined

35 In the given quadrilateral $ABCD$, $AB = 15$ cm, $BC = 20$ cm and $AD = 7$ cm, $\angle ABC = \angle ADC = 90°$. Find the length of side CD.



(a) 12 cm
(b) 18 cm
(c) 24 cm
(c) none of the above

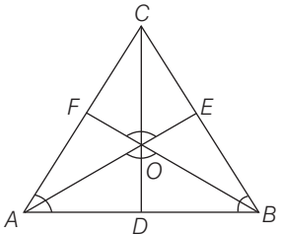
36 There are two circles each with radius 5 cm. Tangent AB is 26 cm. The length of tangent CD is :



(a) 15 cm (b) 21 cm
(c) 24 cm (d) can't be determined

37 One of diagonal of a parallelogram is 10 cm and an angle of the parallelogram is $\pi/4$. If its height be 8 cm, then find the area of the parallelogram.
(a) 112 cm^2 (b) 88 cm^2 (c) 92 cm^2 (d) 104 cm^2

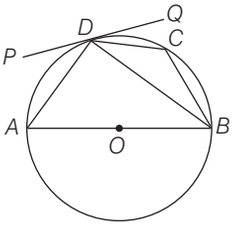
38 ABC is a triangle in which $\angle CAB = 80°$ and $\angle ABC = 50°$, AE, BF and CD are the altitudes and O is the orthocentre. What is the value of $\angle AOB$?



(a) 65° (b) 70° (c) 50° (d) 130°

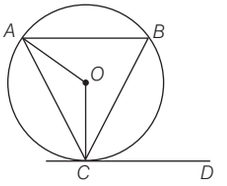
39 ABC is a triangle in which 35 times the smallest angle is equal to the 26 times largest angle. What is the measure of the second largest angle?
(a) 63° (b) 58° (c) 70° (d) 42°

40 In the adjoining figure O is the centre of the circle and AB is the diameter. Tangent PQ touches the circle at D. $\angle BDQ = 48°$. Find the ratio of $\angle DBA : \angle DCB$.



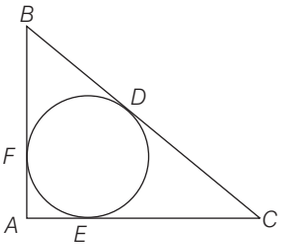
(a) $\frac{22}{7}$
(b) $\frac{7}{22}$
(c) $\frac{7}{12}$
(d) can't be determined

41 In the given diagram O is the centre of the circle and CD is a tangent. $\angle CAB$ and $\angle ACD$ are supplementary to each other $\angle OAC = 30°$. Find the value of $\angle OCB$.



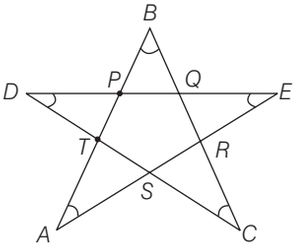
(a) 30° (b) 20°
(c) 60° (d) none of these

42 In the given diagram an incircle DEF is circumscribed by the right angled triangle in which $AF = 6$ cm and $EC = 15$ cm. Find the difference between CD and BD.



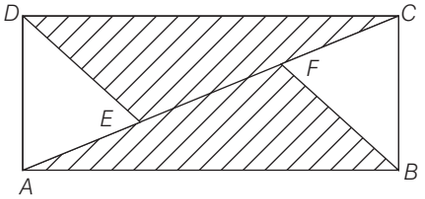
(a) 1 cm
(b) 3 cm
(c) 4 cm
(d) can't be determined

43 In the adjoining figure, a star is shown. What is the sum of the angles A, B, C, D and E?



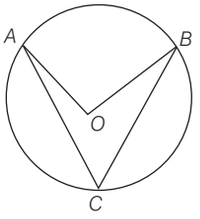
(a) 120°
(b) 180°
(c) 240°
(d) can't be determined

44 $ABCD$ is a rectangle of dimensions 6 cm × 8 cm. DE and BF are the perpendiculars drawn on the diagonal of the rectangle. What is the ratio of the shaded to that of unshaded region?



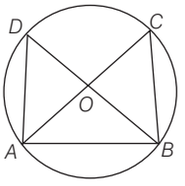
(a) 7 : 3
(b) 16 : 9
(c) $4 : 3\sqrt{2}$
(d) data insufficient

45 In the adjoining figure 'O' is the centre of circle. $\angle CAO = 25°$ and $\angle CBO = 35°$. What is the value of $\angle AOB$?



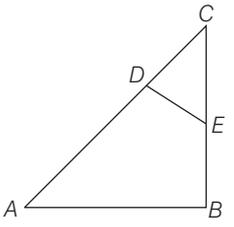
(a) 55°
(b) 110°
(c) 120°
(d) data insufficient

46 In the given diagram $ABCD$ is a cyclic quadrilateral $\angle OCB = 50°$ and $\angle BOC = 110°$. Find the value of $\angle DAO$.



(a) 20°
(b) 30°
(c) 50°
(d) can't be determined

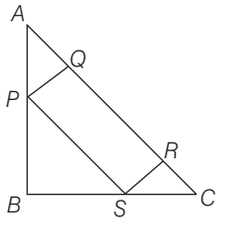
47 ABC and CDE are right angled triangle. $\angle ABC = \angle CDE = 90°$, D lies on AC and E lies on BC. $AB = 24$ cm, $BC = 60$ cm. If $DE = 10$ cm, then CD is :



(a) 28 cm (b) 35 cm
(c) 25 cm (d) can't be determined

48 In the above question (number 48) what is the ratio of $CE : BE$?
(a) $\sqrt{29} : (12 - \sqrt{29})$ (b) $12 : \sqrt{29}$
(c) $7 : \sqrt{21}$ (d) none of these

49 In the given diagram ΔABC is an isosceles right angled triangle, in which a rectangle is inscribed in such a way that the length of the rectangle in twice of breadth. Q and R lie on the hypotenuse and P, S lie on the two different smaller sides of the triangle. What is the ratio of the areas of the rectangle and that of triangle?

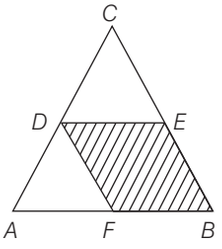


(a) $\sqrt{2} : 1$ (b) $1 : \sqrt{2}$
(c) $1 : 2$ (d) $\sqrt{3} : 2$

50 An n sided polygon has 'n' diagonals, then the value of n is :
(a) 4 (b) 6
(c) 7 (d) 5

51 How many distinct equilateral triangles can be formed in a regular nonagon having at two of their vertices as the vertices of nonagon?
(a) 72 (b) 36
(c) 66 (d) none of these

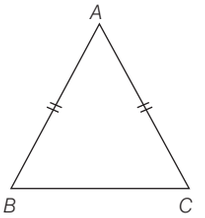
52 ABC is a triangle in which D, E and F are the mid-points of the sides AC, BC and AB respectively. What is the ratio of the area of the shaded to the unshaded region in the triangle?



(a) 1 : 1 (b) 3 : 4
(c) 4 : 5 (d) none of these

53 Three circles each of units radius intersects each other at P, Q and R. P, Q and R are the centres of the three circles. What is the sum of length of the arcs PQ, QR and PR?
(a) $\sqrt{3}\pi$ (b) $2\sqrt{2}\pi$
(c) π (d) none of these

54 ABC is an isosceles triangle in which $AB = AC$ and $(\angle A) = 2(\angle B)$. $AB = 4$ cm. What is the ratio of inradius to the circumradius?



(a) 1 : 2 (b) $(\sqrt{2} - 1) : 1$
(b) $1 : (2\sqrt{2} - 1)$ (c) none of these

55 In a triangle ABC, the two sides AB and AC are 36 cm and 30 cm, and the radius of its circumcircle is 45 cm. What's the length of perpendicular drawn from its vertex A on the sides BC?
(a) 12 cm (b) 18 cm
(c) 15 cm (d) 33 cm

56 The sides of a triangle are in the ratio $1 : \sqrt{3} : 2$, then the angles of the triangle are in the ratio
(a) 1 : 3 : 5 (b) 2 : 3 : 4
(c) 3 : 2 : 1 (d) 1 : 2 : 3

57 If the angles of a triangles are in the ratio 4 : 1 : 1, then the ratio of the longest sides to the perimeter is
(a) $\sqrt{3} : (2 + \sqrt{3})$ (b) 1 : 6
(c) $1 : (2 + \sqrt{3})$ (d) 2 : 3

58 Let ABC and ABC' be two non-congruent triangles with sides $AB = 4$, $AC = AC' = 2\sqrt{2}$ and $\angle B = 30°$. The absolute value of the difference between the areas of these triangles is
(a) 2 (b) $2\sqrt{2}$
(c) 4 (d) $3\sqrt{2}$

59 The sides of triangle ABC are 5, 5, 6 and the sides of triangle PQR are 5, 5, 8. Find the correct relation between the areas of two triangles.
(a) $\Delta ABC > \Delta PQR$ (b) $\Delta ABC < \Delta PQR$
(c) $\Delta ABC = \Delta PQR$ (d) can't be determined

60 The sides AC, BC and AB of a triangle ABC are tangents to its incircle at D, E and F, respectively. Point D lies on the hypotenuse AC such that D is the circumcentre of the triangle ABC. Find $EF : AC$.
(a) $\dfrac{1}{2\sqrt{2}}$ (b) $\dfrac{1}{2 + \sqrt{2}}$
(c) $\dfrac{1}{2 - \sqrt{2}}$ (d) none of these

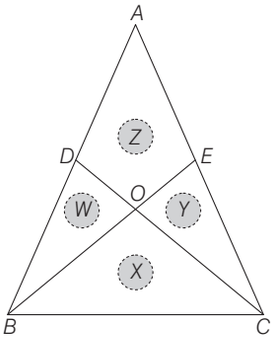
61 The inradius and circumradius of a right angle triangle are 6 cm and 16 cm. Find the area (in sq. cm) of the triangle.
(a) 304 (b) 228
(c) 288 (d) none of these

62 A circle is the circumcircle for the triangle DEF and the incircle for the triangle ABC. If the angles of ΔDEF are 76°, 56° and 48°, find the values of internal angles of ΔABC.
(a) 32, 46, 92 (b) 28, 68, 84
(c) 38, 48, 74 (d) data insufficient

63 In a ΔABC, a perpendicular OD is drawn on the side AC from the mid-point of the side AB. If $BC = 4\sqrt{3}$ cm, find the length of OD.
(a) 2 cm (b) 3 cm
(c) 4 cm (d) none of these

64 The hypotenuse AC of a right angle triangle ABC is 42 cm. This triangle has the maximum possible area with the given hypotenuse. A rectangle $EFGH$ is formed in such a way that the two vertices G and H lie on the hypotenuse AC while the vertices E and F lie on BC and AB, respectively. If $EH = 14$ cm, find the area of the largest possible circle that can be inscribed in the rectangle $EFGH$.
(a) 155 sq cm (b) 140 sq cm
(c) 154 sq cm (d) data insufficient

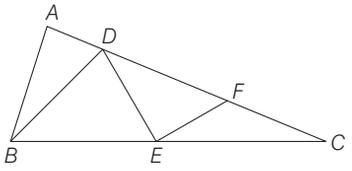
65 In an isosceles triangle ABC, side BC is distinct from rest of the two sides. CD and BE are the medians on AB and AC, respectively. If W, X, Y and Z represents distinct areas in the triangle, find the ratio of $W : X : Y : Z$.



(a) 1 : 2 : 1 : 3 (b) 1 : 3 : 1 : 4
(c) 1 : 2 : 1 : 2 (d) 2 : 3 : 2 : 3

66 The perimeter of an isosceles triangle is 20 cm and if b is the length of the third side which is distinct from the other two equal sides, find b.
(a) $\left(1, \frac{20}{3}\right) \cup \left(\frac{20}{3}, 10\right)$
(b) $\left(0, \frac{20}{3}\right) \cup \left(\frac{20}{3}, 10\right)$
(c) $0 < b < a$
(d) $5 < b < 10$

67 In the following isosceles triangle, in which $AC = BC$ and $AB = BD = DE = EF = FC = 6$ cm, find BE.

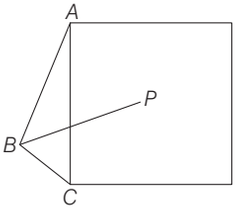


(a) 9 (b) 4.5
(c) 7.5 (d) none of these

68 A fox, camouflaged in the bush, observes from the ground, that it takes 2 minutes for the angle of elevation of the squirrel to change from 30° to 60°. If the speed of fox is $\sqrt{3}$ times that of the squirrel, find the time taken by fox to reach the tree from the bush.
(a) 1 minute (b) $\sqrt{3}$ minute
(c) 3 minutes (d) $4/\sqrt{3}$ minutes

69 In an isosceles triangle ABC base $AB = 6$ cm and each lateral side is 5 cm. Find the circumcentre of the triangle ABC.
(a) $\frac{22}{7}$ cm (b) $\frac{25}{8}$ cm (c) $\frac{21}{8}$ cm (d) $\frac{23}{7}$ cm

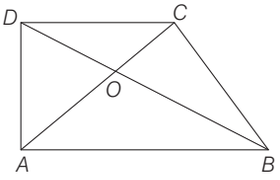
70 Let P be the centre of the square constructed on hypotenuse AC of the right angle triangle ABC. If $\angle BCA - \angle BAC = 20°$. Find the value of $\angle ABP - \angle CBP$.



(a) 10° (b) 20°
(c) 5°
(d) none of these

71 In a quadrilateral $ABCD$, $\angle B = \angle C = 60°$ and $\angle D = 90°$. Find the length of CD, if $AD = 3\sqrt{3}$ cm and $BC = 6\sqrt{3}$ cm.
(a) $3(2\sqrt{3} - 1)$ cm (b) $6(\sqrt{3} - 1)$ cm
(c) $2(3\sqrt{3} - 1)$ cm (d) $\sqrt{3}(2\sqrt{3} - 1)$ cm

72 In a trapezium $ABCD$, where $AB \,||\, CD$ and diagonals AC intersects the other diagonal BD at O. Which of the following statements are always correct?
(i) $\Delta AOB \sim \Delta COD$
(ii) $\Delta DOA \sim \Delta COB$
(iii) Area ΔDOA = Area ΔCOB
(iv) Area ΔAOB = Area ΔCOD



(a) only (i), (ii) and (iii) (b) only (i), (ii), (iv)
(c) only (i) and (iii) (d) only (i)

73 In an isosceles ΔABC, where, $AC = BC$. A line segment DE is drawn parallel to the side AB, where D and E are midpoints of AC and BC, respectively. The diagonals AE and DB of the trapezium $ABED$ intersect each other at O. Which of the following are necessarily true?

(i) Area ΔDOA = Area ΔEOB

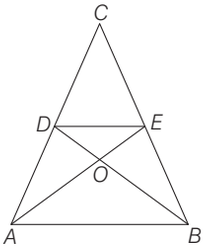
(ii) Area $\Delta AOB = 4$(Area ΔDOE)

(iii) Area $\Delta CDE = 9$(Area ΔDOE)

(a) (i), (ii) and (iii) (b) (ii) and (iii)

(c) (i) and (iii) (d) (i) and (ii)

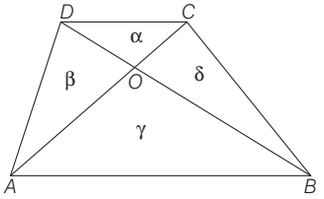
74 In an isosceles triangle ABC, such that $AC = BC$ and $DE \parallel AB$, where D and E lie on the side AC and BC, respectively. The area of $DOE = 40$ cm^2 and area of $\Delta AOB = 250$ cm^2, find the area (in cm^2) of AOD and area of ΔACB, respectively.



(a) 100 and 700 (b) 150 and 600

(c) 175 and 600 (d) none of these

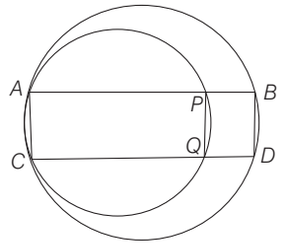
75 In a trapezium $ABCD$, $AB \parallel CD$. AD and BC are not necessarily equal. If $\alpha = 4$ cm^2 and $\gamma = 9$ cm^2. Find the value of $\dfrac{(\beta + \delta)}{(\alpha + \beta + \gamma + \delta)}$.



(a) $\dfrac{9}{16}$ (b) $\dfrac{12}{25}$

(c) $\dfrac{3}{5}$ (d) none of these

76 In the following figure quadrilaterals $ABDC$ and $APQC$ are concyclic ones. If AB and CD are two parallel lines, then $PBDQ$ is necessarily -



(a) a square (b) a rectangle

(c) a parallelogram (d) none of these

77 A circle is circumscribed by an isosceles trapezium in which one of the parallel sides is 49/16 times the other parallel side. If the area of the trapezium is 3640 sq. cm, find the area of the circle.

(a) 1890 sq. cm (b) 2464 sq. cm

(c) 2884 sq. cm (d) 1694 sq. cm

78 If the opposite sides of a cyclic quadrilateral are equal and the sum of two of the adjacent sides is 10 cm, find the maximum possible area of the quadrilateral (in sq. cm).

(a) 100 (b) 25

(c) 24 (d) data insufficient

Directions (for Q. Nos. 79 and 80) *: Answer the following questions based on the information given below.*

In a kite, the shorter diagonal intersects the longer diagonal in the ratio of 6 : 7. And, the longer diagonal of the kite is 52 cm and perimeter of the kite is 208 cm.

79 Find the area of the circle inscribed in this kite.

(a) 2080 sq. cm (b) 1263 sq. cm

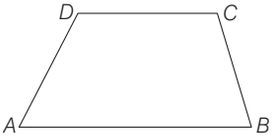
(c) 1591 sq. cm (d) 2340 sq. cm

80 If there are four non-overlapping circles inscribed in each of the four triangles formed due to the intersection of two perpendicular diagonals of the kite, find the perimeter of the quadrilateral that is formed by joining the centers of these four circles.

(a) 76 cm (b) $2(19 + \sqrt{362})$ cm

(c) $2(19 + \sqrt{360})$ cm (d) $4\sqrt{362}$ cm

81 In the following diagram, $ABCD$ is a trapezium, whereas $AD = DC = BC = 1$ unit and $\angle ADC = \angle BCD = 108°$. Find the value of line segment AB.



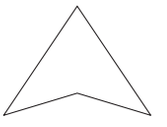
(a) 2 (b) $\sqrt{3}$

(c) $\sqrt{5} - 1$ (d) none of these

82 In a dart the reflex angle is 216° and the angle opposite the reflex angle is 72°. If each of the shorter sides of the dart is 1 cm, find the perimeter of the dart, in cm.

(a) $3 + \sqrt{5}$ (b) $3 + \sqrt{6}$ (c) $4 + \sqrt{3}$ (d) $5 + \sqrt{3}$

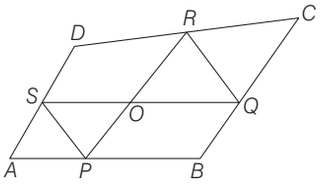
83 In the following figure, the only reflex angle of the dart is 216° and the second largest angle is 72°. If each of the two smaller sides is 1 cm and each of the two larger sides is $\dfrac{(1 + \sqrt{5})}{2}$, find the area of the dart, in sq. cm.



(a) $2\sqrt{5 - \sqrt{5}}$ (b) $\dfrac{\sqrt{5 - \sqrt{5}}}{\sqrt{2}}$

(c) $\dfrac{\sqrt{5 + \sqrt{5}}}{2\sqrt{2}}$ (d) $\dfrac{3\sqrt{5 + \sqrt{5}}}{7\sqrt{2}}$

84 In the following quadrilateral $ABCD$, the four mid-points P, Q, R, S are joined in such a way that the quadrilateral is divided into six parts.



The ratio of the quadrilaterals $\square ASOP$, $\square POQB$, $\square ORCQ$, $\square SDRO$ is 4 : 5 : 7 : 6 and the ratio of ΔASP and ΔRCQ is 2 : 5. If S is joined to R and P is joined to Q, find the ratio of $\square PQRS$ and $\square ABCD$.

(a) 1 : 2 (b) 5 : 11
(c) 4 : 11 (d) none of these

85 In a rhombus $ABCD$, $\angle ADC : \angle BCD = 1 : 2$ and $EF : BD = 1 : 3$, where E and F lie on the diagonal BD, inside the rhombus, such that $\square AECF$ is a quadrilateral. Find the ratio of areas of $\square AECF : \square ABCD$.

(a) 1 : 4 (b) 2 : 5
(c) 3 : 14 (d) none of these

86 An isosceles trapezium whose parallel sides are in the ratio 1 : 4. It inscribes a circle that touches all the sides of the trapezium. If the sum of the two parallel sides is 70 cm, find the circumference of the inscribed circle.

(a) 616 cm (b) 14π cm
(c) 140 cm (d) none of these

87 A 7×24 rectangular thin wall has a 2×2 square shaped window in such a way that the intersection of diagonals of rectangle and the intersection of diagonals of square coincide with each other. Which one of the following is correct?

(a) Diagonals of rectangle and that of square will be the same.
(b) The diagonals of wall will intersect the vertical sides of the window.
(c) The diagonals of wall will intersect the horizontal sides of the window.
(d) none of the above

88 A trapezium inscribes a circle that touches all its sides and the line connecting the mid-points of the non-parallel sides of the trapezium divides the trapezium in such a way that the area of one part is half the area of the other part. If the lengths of the non-parallel sides be 8 cm and 16 cm, find the length of the shortest side of the trapezium.

(a) 4 (b) 6
(c) 9 (d) none of these

89 A point O lies inside a square $ABCD$ such that $OA = 3$, $OB = 4$ and $OD = 5$, find the value of OC.

(a) $3\sqrt{3}$ (b) 6.67
(c) $3\sqrt{2}$ (d) $4\sqrt{2}$

90 In a ΔABC, CP and BQ intersect each other at R inside the triangle, where P and Q lie on the sides AB and AC respectively. $\angle BAC = 50°$, $\angle ABC = 70°$, $\angle ACB = \angle APQ$ and $PC = BC$. Find $\angle PBQ$.

(a) 10° (b) 15°
(c) 20° (d) none of these

91 Which of the following statements is/are correct?

(i) A kite always has two axes of symmetry
(ii) A square is both a kite and an isosceles trapezium
(iii) Every kite is an orthodiagonal
(iv) An isosceles trapezium can have a circumcircle
(v) A kite can always have an incircle
(vi) If the sum of two opposite sides is not the same as the sum of the other pair of opposite sides, it can never be a circumscribing quadrilateral.

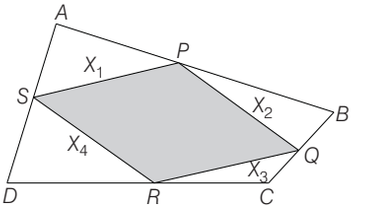
(a) all, except (ii) and (iv)
(b) only (ii), (iii) and (v)
(c) only (i), (iii), (v)
(d) all, except (i)

92 Which of the following statements is/are correct?

(i) The intersections of the angle bisectors of the quadrilateral are the vertices of the cyclic quadrilateral.
(ii) If diagonals of a cyclic quadrilateral perpendicularly intersect at point P, then the line through P perpendicular to any side bisects the opposite side.
(iii) The product of the lengths of the two diagonals of a cyclic quadrilateral is equal to the sum of the products of opposite sides.

(a) (i) and (ii) (b) (ii) and (iii)
(c) (i) and (iii) (d) all of these

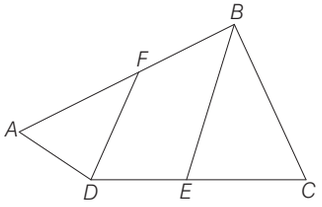
93 Which of the following is correct, considering the given figure, in which P, Q, R and S are the mid-points of AB, BC, CD and AD, respectively?



(i) The perimeter of the parallelogram $PQRS$ is equal to the sum of the diagonals of the quadrilateral $ABCD$
(ii) $X_1 + X_3 = X_2 + X_4$
(iii) $A(PQRS) = \frac{1}{2} A(ABCD)$

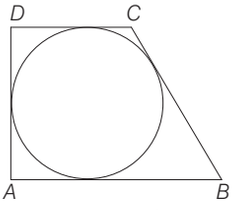
(a) Only (i) and (iii) (b) only (ii) and (iii)
(c) All three are correct (d) none of the above

94 In the following quadrilateral $ABCD$, E and F are the mid-points of DC and AB, respectively. If the area of ΔADF is 9 cm^2 and that of ΔEBC is 18 cm^2, what is the area of quadrilateral $ABCD$?



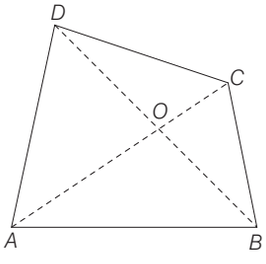
(a) 45 cm^2 (b) 27 cm^2
(c) data insufficient (d) none of these

95 A trapezium $ABCD$ inscribes a circle. The two sides AB and CD are parallel and the diameter of the circle is equal to the length of side AD. If $DC = 5$ cm, find the perimeter of the trapezium $ABCD$.



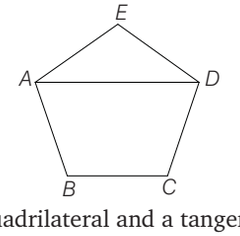
(a) 45 cm (b) 50 cm^2
(c) 80 cm (d) none of these

96 In the following quadrilateral AC and BD are the diagonals intersecting at a point O inside the quadrilateral. The area of ΔAOD is 32 cm^2 and area of ΔBOC is 18 cm^2. What is the minimum possible area of the quadrilateral $ABCD$?



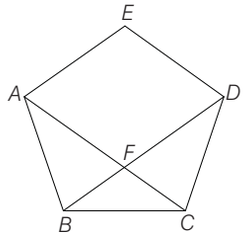
(a) 144 cm^2 (b) 100 cm^2 (c) 98 cm^2 (d) 96 cm^2

97 In the following figure if $ABCDE$ is a regular pentagon, then $ABCD$ is necessarily



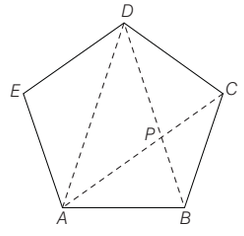
(a) a cyclic quadrilateral and a tangential quadrilateral as well
(b) a tangential quadrilateral and a trapezium as well
(c) a trapezium and a cyclic quadrilateral as well
(d) all (a), (b) and (c)

98 In the following figure if $ABCDE$ is a regular pentagon, then $AEDF$ is always



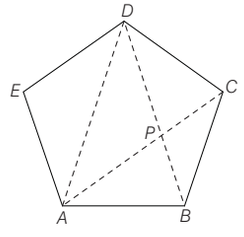
(a) a cyclic quadrilateral and a parallelogram
(b) a tangential quadrilateral and a cyclic quadrilateral as well
(c) a rhombus and a kite but not a tangential quadrilateral
(d) a tangential quadrilateral as well as a rhombus

99 In the following figure, $ABCDE$ is a regular pentagon. If $AB = 2$ cm, find the perimeter of the quadrilateral $APDE$.



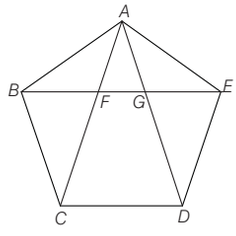
(a) $4(\sqrt{5}-1)$ cm (b) $8(\sqrt{3}-1)$ cm
(c) $10(2-\sqrt{3})$ cm (d) none of these

100 In the following figure, $ABCDE$ is a regular pentagon. If $AB = 2$ cm, find PC.



(a) $\sqrt{5}-1$ cm (b) $\sqrt{3}-1$ cm
(c) $2-\sqrt{3}$ cm (d) 1.67 cm

101 In the following diagram, $ABCDE$ is a pentagon such that each side is of unit length, how many of the following relations is/are correct?



(i) $BE \parallel CD$ and $AC \parallel ED$ and $AD \parallel BC$
(ii) $\Delta BCF \sim \Delta FAG$
(iii) $\Delta AFB \sim \Delta BAE \sim \Delta ABC$
(iv) $BF^2 = GF$
(v) $\Delta BCF : \Delta FAG = 1 : FG$

(a) 4 (b) 3
(c) 2 (d) 5

102 If each side of a regular pentagon is 1 cm, find the length of its diagonal.

(a) $\frac{5\sqrt{2}-3}{2}$ (b) $\frac{-1+\sqrt{5}}{2}$

(c) $\frac{1+\sqrt{5}}{2}$ (d) data insufficient

103 If the side of a regular pentagon be 2 cm, find the apothem of the pentagon, in cm.

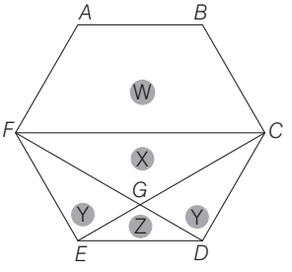
(a) $\sqrt{\frac{5+2\sqrt{5}}{5}}$ (b) $\sqrt{\frac{5+2\sqrt{5}}{10}}$

(c) $\sqrt{\frac{5+4\sqrt{5}}{2}}$ (d) $\sqrt{\frac{10+\sqrt{5}}{4}}$

104 Let $A_0A_1A_2A_3A_4A_5$ be a regular hexagon inscribed in a circle of unit radius. Then the product of the lengths of the line segments A_0A_1, A_0A_2, A_0A_4 is

(a) $\frac{3}{4}$ (b) $3\sqrt{3}$ (c) 3 (d) $\frac{3\sqrt{3}}{2}$

105 In the following figure, a regular hexagon is divided into various parts. The area of respective part is indicated by W, X, Y, Z. Find $W : X : Y : Z$.



(a) 7 : 4 : 2 : 1 (b) 8 : 3 : 2 : 1

(c) 13 : 6 : 3 : 1 (d) 9 : 4 : 2 : 1

106 A circle intersects a hexagon such that the area of hexagon outside the circle is same as the area of circle outside the hexagon. If each side of the hexagon is a, what is the area of circle?

(a) $\frac{3\sqrt{2}}{\pi}a^2$ (b) $\frac{3\sqrt{3}}{2}a^2$

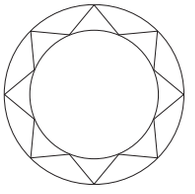
(c) $\frac{3\sqrt{3}\,\pi}{2}a^2$ (d) none of these

107 A regular dodecagon (a polygon with 12 sides) is inscribed in a circle. How many diagonals of this dodecagon would not pass through the centre of the circumscribing circle?

(a) 24 (b) 36

(c) 42 (d) none of these

108 There are two congruent squares placed in such a way that the sides of one square are parallel to the diagonals of the other square, whereas the point of intersection of diagonals of one square coincides with that of the diagonals of the other.



There is a circle passing through the points of intersection of sides of the two square. And there is another circle passing through the vertices of the two squares. If each side of the square is $2+\sqrt{2}$ unit, find the ratio of the area of the smaller circle to that of the larger circle.

(a) $\frac{2+\sqrt{2}}{3+2\sqrt{2}}$ (b) $\frac{3+\sqrt{2}}{6+4\sqrt{2}}$

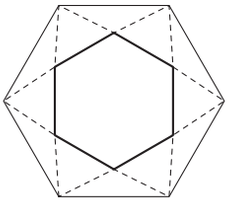
(c) $\frac{2+\sqrt{2}}{3+\sqrt{2}}$ (d) none of these

109 If the apothem of a regular hexagon is a, find each side of the hexagon.

(a) $\frac{3a}{\sqrt{2}}$ (b) $\sqrt{3}\,a$

(c) $0.67\,a$ (d) $\frac{2}{\sqrt{3}}a$

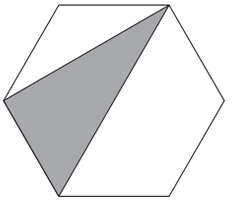
110 In the following figure find the ratio of the area of the internal hexagon to that of the external regular hexagon.



(a) 1 : 3 (b) $\sqrt{6} : \sqrt{2}$

(c) 7 : 2 (d) 4 : 1

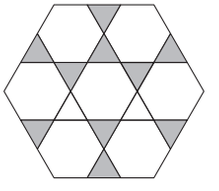
111 In the following figure find the ratio of the shaded triangular area to that of the remaining area of the regular hexagon.



(a) 2 : 5 (b) $2 : 3\sqrt{7}$

(c) 3 : 8 (d) 1 : 2

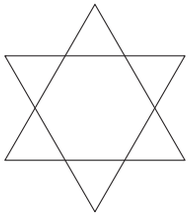
112 In the following diagram, as shown below, a regular hexagon of side 3 cm inscribes 7 smaller regular hexagons. Find the area of the shaded region (of the triangles) within the larger hexagon.



(a) 6 sq. cm (b) $4\sqrt{3}$ sq. cm

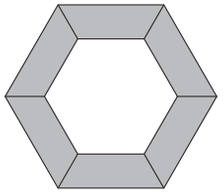
(c) $3\sqrt{3}$ sq. cm (d) none of these

113 In the following figure a hexagram consists of a hexagon and six equilateral triangles outside the hexagon. If a circle is inscribed in the hexagon and the area of the inscribed circle is 3π sq. cm, find the area of the circumscribed circle of the regular hexagram.



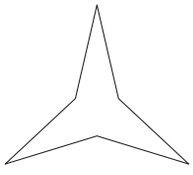
(a) 12π sq. cm (b) 9π sq. cm
(c) $6\sqrt{3}$ sq. cm (d) none of these

114 In the following hexagonal ring the area of shaded region is 3 times the area of the un-shaded region. Find the ratio of perimeter of the outer hexagon to that of the inner hexagon.



(a) 3 : 1 (b) $\sqrt{3}$: 1
(c) 1 : 2 (d) none of these

115 The following figure shows a concave hexagon. Out of six internal angles it has each of the three acute angles equal to 36° and remaining three angles are reflex. If each side of the symmetrical concave hexagon is $1+\sqrt{5}$ mm, find the total area of this hexagon, in sq. mm.

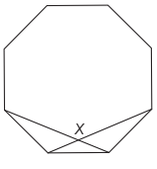


(a) $\sqrt{3}+3(\sqrt{5+2\sqrt{5}})$ (b) $3\sqrt{3}+3(\sqrt{5+2\sqrt{5}})$
(c) $\sqrt{3}+3(\sqrt{10-2\sqrt{5}})$ (d) $2\sqrt{5}+3(\sqrt{10-2\sqrt{5}})$

116 If the side of an square is a, then find the side of the regular octagon that can be inscribed in this square.

(a) $\frac{a(1+\sqrt{2})}{\sqrt{2}}$ (b) $\frac{a}{3}$
(c) $\frac{a}{2+\sqrt{2}}$ (d) none of these

117 Find the value of angle x in a regular octagon as shown below



(a) 145° (b) 125°
(c) 136° (d) none of these

118 If each side of the octagon be a, then find the shortest diagonal of the octagon.

(a) $(\sqrt{2+\sqrt{2}})a$ (b) $(1+\sqrt{2})a$
(c) $2(1+\sqrt{2})a$ (d) $(\sqrt{4+2\sqrt{2}})a$

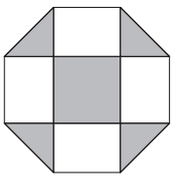
119 If each side of the octagon be a, then find the longest diagonal of the octagon.

(a) $(\sqrt{2+\sqrt{2}})a$ (b) $(1+\sqrt{2})a$
(c) $2(1+\sqrt{2})a$ (d) $(\sqrt{4+2\sqrt{2}})a$

120 If d_1, d_2, d_3 be the three distinct diagonals of a regular octagon, such that $d_1 < d_2 < d_3$, find the ratio of the inradius to the circumradius of the octagon.

(a) $\frac{d_1}{d_3}$ (b) $\sqrt{\frac{d_2}{d_3}}$ (c) $\frac{d_2}{d_3}$ (d) $\frac{d_1 d_3}{(d_2)^2}$

121 In the following figure the regular octagon has some shaded area and some unshaded area. Find the ratio of the shaded area to the unshaded area.



(a) 1 : 1 (b) $\sqrt{2}:\sqrt{3}$ (c) $1:\sqrt{2}$ (d) $\sqrt{2}:1$

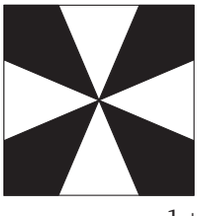
122 The midpoints of alternating sides of a regular octagon are joined to form a square. If each side of the octagon is a, find each side of the square.

(a) $\frac{(2+\sqrt{2})a}{2}$ (b) $\frac{(4+\sqrt{2})a}{2}$
(c) $\frac{2(1+\sqrt{2})a}{\sqrt{2}}$ (d) $(2+\sqrt{2})a$

123 If each side of the octagon is a, find the area of the octagon.

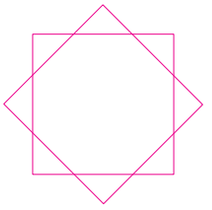
(a) $2(\sqrt{2}-1)a^2$ (b) $4(1+\sqrt{2})a^2$
(c) $2(2+\sqrt{2})a^2$ (d) $2(1+\sqrt{2})a^2$

124 In the following figure a square inscribes 4 congruent kites and 4 congruent isosceles triangles. The area of each kite is same as the area of each triangle. Find the ratio of the longer diagonal to the shorter diagonal of each kite



(a) $\frac{2}{1}$ (b) $\frac{1+\sqrt{2}}{\sqrt{2}}$
(c) $\frac{\sqrt{2}}{1}$ (d) data insufficient

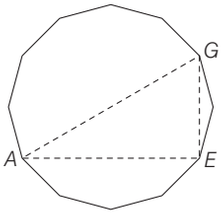
125 In the following figure two congruent squares are placed in such a way that the diagonals of one square are parallel to the sides of the other square and all the four diagonals intersect at the same point. If the area of the shaded region is 4 cm^2, find the area of the common region.



(a) $\sqrt{4+2\sqrt{2}}\ cm^2$ (b) $4(1+\sqrt{2})\ cm^2$

(c) $\sqrt{2+\sqrt{2}}\ cm^2$ (d) none of these

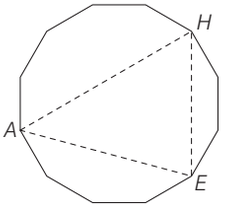
126 Find the angle *AGE* in the regular dodecagon shown below.



(a) 30° (b) 45°

(c) 75° (d) none of these

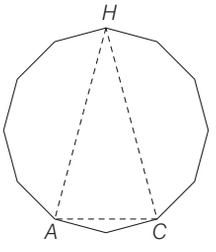
127 Find the angle *AHE* in the regular dodecagon shown below.



(a) 45° (b) 50°

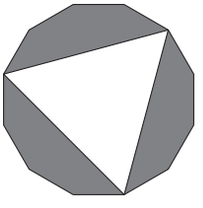
(c) 55° (d) none of these

128 Find the angle *AHC* in the regular dodecagon shown below.



(a) 15° (b) 22.5° (c) 30° (d) 45°

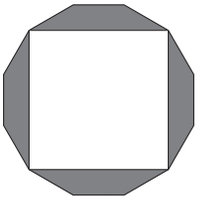
129 In the following figure the three equispaced vertices of a regular dodecagon are connected in such a way that they create a triangle, as shown below. If each side of the triangle is $\sqrt{3}\sqrt{2+\sqrt{3}}$ cm, find the circumradius of the dodecagon.



(a) $\sqrt{6+\sqrt{3}}$ cm (b) $\sqrt{3+2\sqrt{3}}$ cm

(c) $\sqrt{2+\sqrt{3}}$ cm (d) none of these

130 In the following figure the four equispaced vertices of a regular dodecagon are connected in such a way that they create a quadrilateral, as shown below. If each side of the quadrilateral is $\sqrt{3}+1$ cm, find the circumradius of the dodecagon.



(a) $\frac{(\sqrt{3}+1)}{\sqrt{2}}$ cm (b) $\frac{2(\sqrt{6}+1)}{\sqrt{3}}$ cm

(c) $\frac{(\sqrt{12}+1)}{\sqrt{5}}$ cm (d) none of these

131 A regular dodecagon is inscribed in a circle of radius 1 cm. Find the area of the dodecagon

(a) 3 sq. cm (b) $3\sqrt{2}$ sq. cm

(c) $2\sqrt{3}$ sq. cm (d) none of these

132 Three circles with radii 3, 4 and 5 touch each other externally. If *P* is the only point of intersection of tangents to these circles, find the distance of *P* from the points of contact.

(a) $\sqrt{5}$ (b) $\sqrt{6}$ (c) $\sqrt{7}$ (d) 3

133 Three points *X*, *Y* and *Z* are concyclic to the larger circle with radius 15 cm and there is another concentric circle with radius 8 cm such that *XY* and *XZ* are tangents to the smaller circle. At how many points does *YZ* intersect the larger circle?

(a) 0 (b) 1

(c) 2 (d) can't say

Directions (for Q. Nos. 134 and 135)*: Answer the following questions based on the information given below.*

A circle with centre O and radius 2 cm inscribes a triangle ABC. Two tangents AD and BD are drawn from a point D outside the circle and $\angle ABD = 60°$.

134 Find the area of $\square OADB$, in cm^2.

(a) $4\sqrt{3}$ (b) $3\sqrt{3}$

(c) 4 (d) none of these

135 Find the maximum possible area of $\square ACBD$, in cm^2.

(a) $6\sqrt{3}$ (b) $8\sqrt{3}$

(c) $\frac{14}{\sqrt{3}}$ (d) none of these

136 Triangle *ABC* inscribes a circle with centre *O* and inradius $\sqrt{6}$ cm. The inradius *OD* divides side *BC* at *D*, such that *BD* = 2 cm and *DC* = 8 cm. Find the ratio *AB* : *AC*.

(a) 4 : 7 (b) 5 : 7

(c) 4 : 5 (d) cannot be determined

137 A circle with radius 12 cm has two perpendicular chords *AB* and *CD* intersecting at a point *R*, other than the centre *O*, where *RD* = 6 cm and *RB* = 18 cm. Find the length of *AR*.

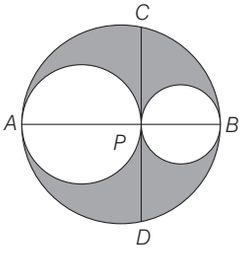
(a) $6\sqrt{\frac{3}{5}}$ (b) $4\sqrt{\frac{3}{5}}$

(c) $4\sqrt{5}$ (d) Data inconsistent

138 There are two tangents AT and BT on a circle of radius 30 cm. A line OT (= 50 cm) connects the centre O with the external point T. Another tangent CD touches the circle at P such that C and D lie on the line segments AT and BT, respectively. Points P and T lie on the same side of the circle. Find the maximum possible area (in sq. cm) of the circle inscribed in the triangle CDT.

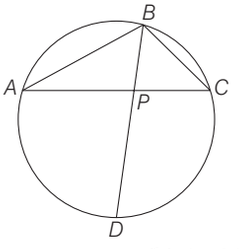
(a) 56.25π (b) 49π
(c) 42.25π (d) none of these

139 In the following figure there are two smaller circles inscribed in a larger circle touching each other. The centres of all the three circles fall on AB, and CD is tangent to both the interior circles. If $CD = 16$ cm, find the area of the shaded region.



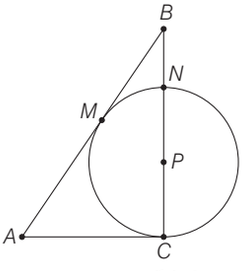
(a) 35π sq. cm (b) 28π sq. cm
(c) 32π sq. cm (d) data insufficient

140 In the following figure $AB = 21$ cm, $BC = 15$ cm, $AC = 24$ cm. Point P is the mid-point of arc AC, and chord BD bisects chord AC at P. Find the ratio BP/PD.



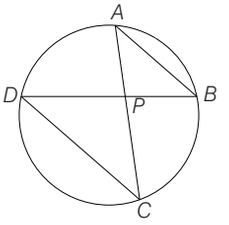
(a) 1 : 16 (b) 1 : 21
(c) $1 : \sqrt{21}$ (d) none of these

141 In the following figure one side of the ΔABC passes through the centre P of the circle and the other two sides of this triangle are tangents to this circle. If $BN = 2$ cm and $AC = 6$ cm, find the radius of the circle.



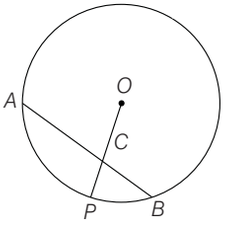
(a) 4 cm (b) 2 cm
(c) 2.5 cm (d) none of these

142 In the following figure there are four chords AB, CD, AC, BD in a circle. If $AB = 6$, $AP = 2$, $BP = 5$, $DP = 3$, find CD.



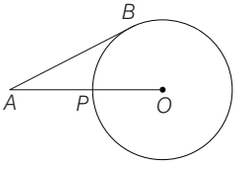
(a) 4 (b) 5
(c) 9 (d) none of these

143 In a circle, its radius OP is intersected by a chord AB at C, where O is the centre of the circle, such that $AC = 7$, $BC = 5$ and $PC = 1$, find the radius of the circle.



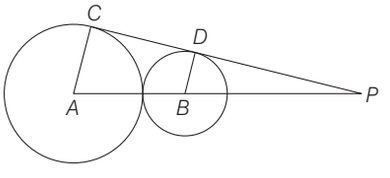
(a) 12
(b) 15
(c) data insufficient
(d) none of the above

144 In a circle, its radius OP is extended to meet a point A outside the circle and a line segment AB is drawn from A to a point B on the circle. If O is the centre of the circle and $AP = 7$, $AB = 14$, find the circumference of the circle.



(a) 66 (b) 67
(c) 70 (d) none of these

145 In the following diagram, there are two circles externally tangent to each other and there is a common tangent CP touch the circles at C and D. AC and BD are the radii of the two circles. If $AC = 15$ and $BD = 6$, find the distance between C and D.



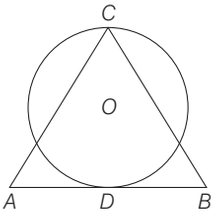
(a) 12 cm (b) 18 cm
(c) 21 cm (d) $6\sqrt{10}$

146 A circle has its total area A. There are four equal circles tangent to this circle passing through the centre of this circle and tangent to this circle. The area of each such circle is B. The area of each region that is created by overlapping of any two of these circles is D and the area of each region that is not covered by these circles within the larger circle is C. If $D = \frac{\pi}{25}$, find the value of C.

(a) $\frac{2\pi}{25}$ (b) $\frac{\pi}{5\sqrt{5}}$

(c) $\frac{\pi}{49}$ (d) none of these

147 An equilateral triangle ABC is tangent to a circle, with centre O, at the midpoint D. If C lies on the circumference of the circle and its radius is 6 cm, find the area of the overlapping region.

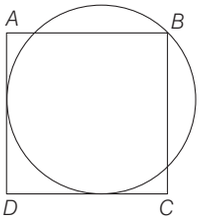


(a) $12\pi + 21\sqrt{2}$ sq. cm (b) $12\pi + 16\sqrt{3}$ sq. cm

(c) $12\pi + 18\sqrt{3}$ sq. cm (d) none of these

Directions (for Q. Nos. 148 and 149) *Answer the following questions based on the information given below.*

In the following figure the two non-parallel sides AD and CD of a square ABCD are tangent to a circle of radius 1 cm in such a way that the vertex B lies on the circumference of the circle.



148 Find the side of the square.

(a) $\frac{2+\sqrt{2}}{2}$ cm (b) $\frac{2\sqrt{2}-1}{\sqrt{2}}$ cm

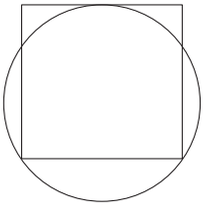
(c) $\frac{1+\sqrt{2}}{\sqrt{2}}$ cm (d) data insufficient

149 Find the common area between the circle and the square.

(a) $\frac{3\pi-2}{3}$ sq. cm (b) $\frac{\pi+2}{2}$ sq. cm

(c) $\frac{3(\pi-2)}{4}$ sq. cm (d) data insufficient

150 In the following figure one side of a square is tangent to the circle, as shown here. If each side of the square be 24 cm, what would be the radius of the circle?



(a) 12 cm (b) 16 cm

(c) can't be determined (d) none of these

LEVEL 02 › HIGHER LEVEL EXERCISE

1 The semiperimeter of a right angled triangle is 126 cm and the shortest median is 53 cm. What is the area of a triangle which has the largest median as its longest side?

(a) 1560 cm^2 (b) 1260 cm^2

(c) 1060 cm^2 (d) none of these

2 In an isosceles right angled triangle ABC, $\angle B$ is right angle. Angle bisector of $\angle BAC$ is AN cut at M to the median BO. Point O lies on the hypotenuse. OM is 20 cm, then the value of AB is :

(a) 38.96 cm

(b) 24.18 cm

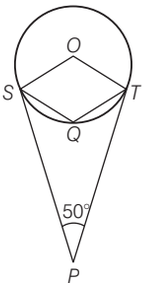
(c) 34.134 cm

(d) none of the above

3 In a right angled triangle $\angle B$ and $\angle A$ are acute angles. If $\angle A - \angle B = k$, where A and B are integers, then how many integer values can k take?

(a) 80 (b) 88 (c) 45 (d) 89

4 In the given figure O is the centre of the circle, SP and TP are the two tangents at S and T respectively. $\angle SPT$ is 50°, the value of $\angle SQT$ is :



(a) 125° (b) 65°

(c) 115°

(d) none of the above

5 A 6.5 m long ladder is standing against a wall and the difference between the base of the ladder and wall is 5.2 m. If the top of the ladder now slips by 1.4 m, then by how much will the foot of the ladder slip?

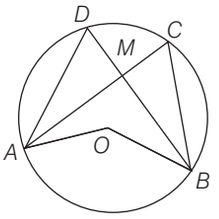
(a) 1.2 m (b) 0.8 m

(c) 0.75 (d) can't be determined

6 In a triangle all the three angles A, B, C are in integers, then the number of values that A, B and C can take :

(a) 89 (b) 90 (c) 178 (d) 180

7 In the given figure of circle, 'O' is the centre of the circle and $\angle AOB = 130°$. What is the value of $\angle DMC$?



(a) 65°
(b) 125°
(c) 85°
(d) can't be determined

8 In a right angled triangle ABC, $\angle B$ is right angle, side AB is half of the hypotenuse. AE is parallel to median BD and CE is parallel to BA. What is the ratio of length of BC to that of EC?

(a) $\sqrt{2} : 1$ (b) $\sqrt{3} : 2$
(c) $\sqrt{5} : \sqrt{3}$ (d) can't be determined

9 In an equilateral triangle ABC, AO, BO and CO are the angle bisectors meet at the incentre 'O'. D, E and F are the mid- points of AO, BO and CO respectively. A circle with centre O passes through D, E and F. Area of the circle is 3π cm^2. What is the perimeter of triangles (Δ) ABC?

(a) $12\sqrt{3}$ cm (b) 18 cm
(c) $6\sqrt{3}$ cm (d) none of these

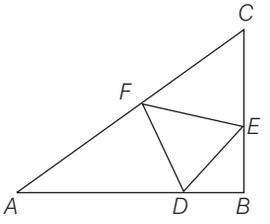
10 Two trains Punjab mail and Lucknow mail starts simultaneously from Patiala and Lakhimpur respectively towards each other with the speed of 40 km/h and 60 km/h respectively on the same track Lakhimpur is 500 km due east of Patiala. A plane starts flying at 200 km/h at the same time from Patiala to Jalandhar. Jalandhar is 100 km due north of Patiala. After travelling sometime two trains Punjab mail and Lucknow mail colide with each other. The plane moves continuously to and fro between Patiala to Jalandhar till the collision of the trains. How far would the plane have travelled?

(a) 100 km (b) 1000 km
(c) 2000 km (d) can't be determined

11 In the above question (number 10) what is the distance between the place of accident and the plane at the moment of accident of two trains?

(a) 200 km (b) 250 km
(c) 400 km (d) data insufficient

12 In the given figure $\angle B$ is right angle. $AD : BD = 3 : 2$ and $CE : BE = 5 : 2$ and $AF : FC = 1 : 1$. What is the area of ΔABC, if the area of ΔBDE is 20 cm^2?

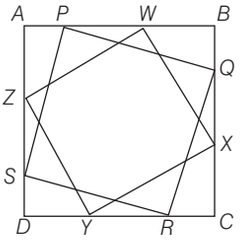


(a) 40 cm^2
(b) 35 cm^2
(c) 52.5 cm^2 (d) none of the above

13 In a triangle ABC with side $AB = AC$ and $\angle BAC = 20°$, D is a point on side AC and $BC = AD$. Find $\angle DBC$.

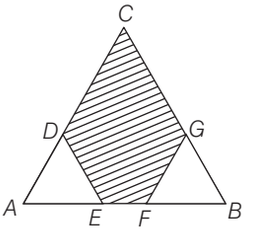
(a) 50° (b) 45° (c) 65° (d) 70°

14 In the adjoining figure $ABCD$, $PQRS$ and $WXYZ$ are three squares. Find number of triangles and quadrilaterals in the figure.



(a) 24 and 16
(b) 28 and 15
(c) 27 and 16
(d) none of the above

15 In the given figure ABC is a triangle in which $CDEFG$ is a pentagon. Triangles ADE and BFG are equilateral triangles each with side 2 cm and $EF = 2$ cm. Find the area of the pentagon.

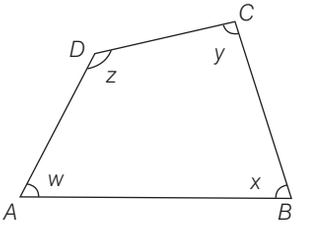


(a) $8\sqrt{3}$cm^2 (b) $7\sqrt{3}$ cm^2
(c) $15\sqrt{3}$ cm^2 (d) 11.28 cm^2

16 $PQRS$ is a quadrilateral which is formed by joining the mid-points of a quadrilateral $ABCD$, such that $\angle A = 75°$, $\angle B = 95°$, $\angle C = 110°$.
If $\angle PQR = 90°$, what is the value of $\angle PSR$?

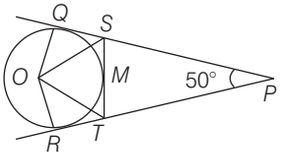
(a) 90° (b) 110°
(c) 60° (d) 75°

17 $ABCD$ is a quadrilateral in which $\frac{z}{y} = \frac{y}{x} = \frac{x}{w} = r$ and k is an integer. Also $\{w, x\} < 90$ and $\{y, z\} > 90$, then the difference between the greatest angle and smallest angle (*i.e.*, $z - w$) is



(a) 168° (b) 172°
(c) 128° (d) 212°

18 In the adjoining figure, O is the centre of the circle and PQ, PR and ST are the three tangents. $\angle QPR = 50°$, then the value of $\angle SOT$ is :

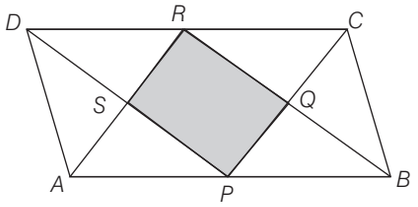


(a) 30°
(b) 75°
(c) 65°
(d) can't be determined

19 The number of points of intersection of the diagonals of a regular hexagon is :

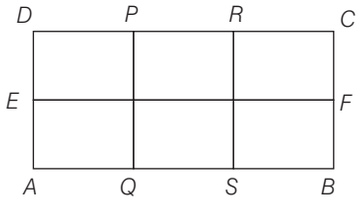
(a) 10 (b) 15
(c) 18 (d) 19

20 In the adjoining figure $ABCD$, P and R are the mid-points of the sides AB and CD. $ABCD$ is a parallelogram. What is the ratio of the shaded to the unshaded region?



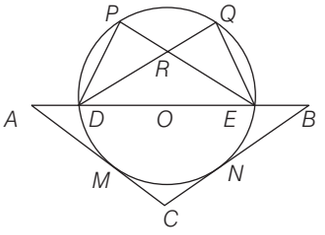
(a) 1/2 (b) 1/3
(c) 1/4 (d) none of these

21 In the adjoining figure $ABCD$ is a rectangle. Find the maximum number of rectangles including the largest possible rectangle.



(a) 16 (b) 7 (c) 18 (d) 24

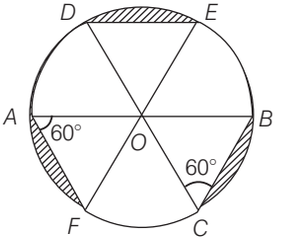
22 ABC is an isosceles triangle and AC and BC are the tangents at M and N respectively. DE is the diameter of the circle. $\angle ADP = \angle BEQ = 100°$. What is value of $\angle PRD$?



(a) 60°
(b) 50°
(c) 20° (d) can't be determined

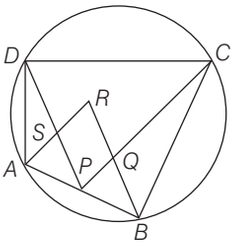
23 In the above question if OC is half of the AB, the value of $\angle ACB$ is :
(a) 60° (b) 90°
(c) 80° (d) can't be determined

24 In the adjoining figure, O is the centre of the circle with radius r. AB, CD and EF are the diameters of the circle. $\angle OAF = \angle OCB = 60°$. What is the area of the shaded region?



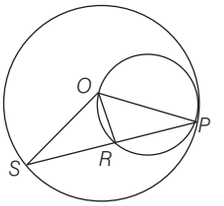
(a) $\frac{r^2}{2}\left(\pi - \frac{3\sqrt{3}}{2}\right)$
(b) $\frac{r^2}{2}\left(\pi - \frac{3\sqrt{3}}{4}\right)$
(c) $\frac{r^2}{3}\left(\pi - \frac{2\sqrt{3}}{3}\right)$
(d) data insufficient

25 $ABCD$ is a cyclic quadrilateral. The angle bisector of $\angle A$, $\angle B$, $\angle C$ and $\angle D$ intersect at P, Q, R and S as shown in the figure. These four points form a quadrilateral $PQRS$. Quadrilateral $PQRS$ is a :



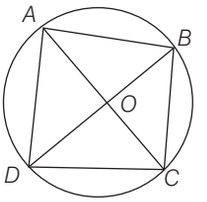
(a) square (b) rhombus
(c) rectangle
(d) cyclic quadrilateral

26 In the adjoining figure the diameter of the larger circle is 10 cm and the smaller circle touches internally the lager circle at P and passes through O, the centre of the larger circle. Chord SP cuts the smaller circle at R and OR is equal to 4 cm. What is the length of the chord SP?



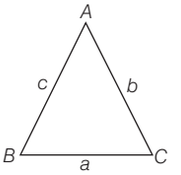
(a) 9 cm (b) 12 cm (c) 6 cm (d) $8\sqrt{2}$ cm

27 In the given figure $ABCD$ is a cyclic quadrilateral, $DO = 8$ cm and $CO = 4$ cm. AC is the angle bisector of $\angle BAD$. The length of AD is equal to the length of AB. DB intersects diagonal AC at O, what is the length of the diagonal AC ?



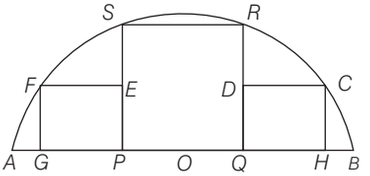
(a) 20 cm (b) 24 cm
(c) 16 cm (d) none of these

28 In the given triangle ABC, the length of sides AB and AC is same (*i.e.*, $b = c$) and $60° < A < 90°$, then the possible length of BC is :



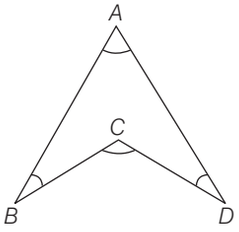
(a) $b < a < 2b$
(b) $\frac{c}{3} < a < 3a$
(c) $b < a < b\sqrt{3}$
(d) $c < a < c\sqrt{2}$

29 In the following figure there is a semicircle with centre 'O' and diameter AB $(= 2r)$. $PQRS$ is a square of maximum possible area. P and Q lie on the diameter AB and R, S lie on the arc of the semicircle. There are two more squares of maximum possible area $EFGP$ and $CDQH$. What is the sum of lengths of RC and FS?



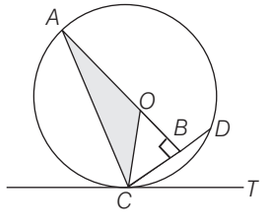
(a) $\sqrt{\frac{2}{5}}(2r)$ (b) $\frac{2\sqrt{2}r}{5}$
(c) $\frac{\sqrt{2}}{5}r$ (d) none of these

30 In the adjoining figure $\angle BAD = a$, $\angle ABC = b$ and $\angle BCD = c$ and $\angle ADC = d$, find the value of $\angle ABC$ in terms of a, c and d.



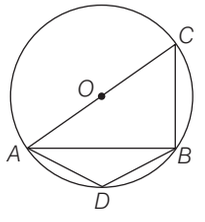
(a) $c-(a+d)$ (b) $a-(c+d)$
(c) $b-(c+d)$ (d) none of these

31 In the given diagram CT is tangent at C, making an angle of $\frac{\pi}{4}$ with CD. O is the centre of the circle. $CD = 10$ cm. What is the perimeter of the shaded region (ΔAOC) approximately?



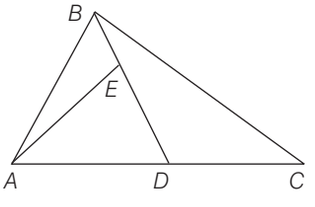
(a) 27 cm (b) 30 cm
(c) 25 cm (d) 31 cm

32 In the given diagram, O is the centre of the circle and AC is the diameter. $\angle ADB$ is 120°. Radius of the circle is 6 cm, what is the area of the triangle ABC?



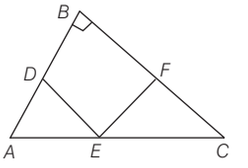
(a) $18\sqrt{3}$ cm^2 (b) $24\sqrt{3}$ cm^2
(c) 27 cm^2 (d) data insufficient

33 In the given figure ABC is a triangle in which $3AD = CD$ and E lies on BD, $DE = 2BE$. What is the ratio of area of ΔABE and area of ΔABC ?



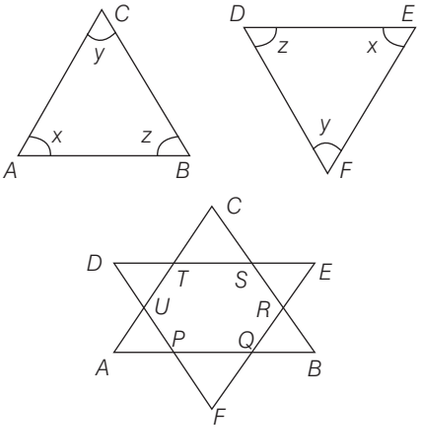
(a) 1/12 (b) 1/3
(c) 1/2 (d) none of these

34 In the adjoining figure ABC is a right angle triangle, $BDEF$ is a square, $AE = 7.5$ cm and $AC = 18$ cm. What is the area of triangle ABC?



(a) 76.621 cm^2 (b) 70.054 cm^2
(c) 83.25 cm^2 (d) 90.90 cm^2

35 There are two congruent triangles each with area 198 cm^2. Triangle DEF is placed over triangle ABC in such a way that the centroids of both the triangles coincide with each other and $AB \parallel DE$, as shown in figure, thus forming a star . What is the area of the common region $PQRSTU$?



(a) 99 cm^2 (b) 132 cm^2
(c) 148 cm^2 (d) can't be determined

36 What is the sum of all the angles of a 9 pointed star (*i.e.*, $\angle 1 + \angle 2 + \angle 3 + \ldots \angle 8 + \angle 9$)?

(a) 909° (b) 900°
(c) 720° (d) 540°

37 A circle is circumscribed by a rhombus which in turn is produced by joining the mid-points of a rectangle whose sides are 12 cm and16 cm, respectively. What is the area of the circle?

(a) $\frac{625}{26}\pi$ (b) $\frac{676}{25}\pi$
(c) $\frac{576}{25}\pi$ (d) can't be determined

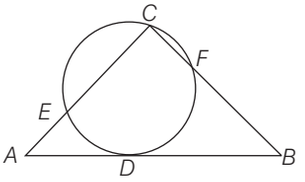
38 There are n rectangles each with area 200 cm^2. If the dimensions of each n rectangles are in integers then the value of n is :

(a) 4 (b) 6
(c) 12 (d) none of these

39 There are 8 points on a plane, out of which 4 points lie on the circumference of the same circle and rest 4 points do not lie on a single circumference of a circle and also they are non-collinear. Maximum how many circles can be drawn such that each contains at least three of the given points?

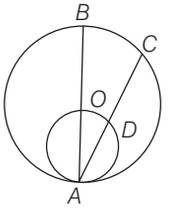
(a) 53 (b) 32 (c) 35 (d) 56

40 ABC is an isosceles triangle a circle is such that it passes through vertex C and AB acts as a tangent at D for the same circle. AC and BC intersects the circle at E and F respectively $AC = BC = 4$ cm and $AB = 6$ cm. Also D is the mid-point of AB. What is the ratio of $EC : (AE + AD)$?



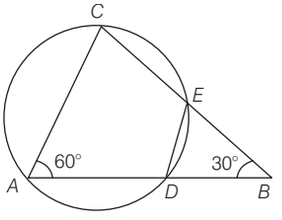
(a) 1 : 2 (b) 1 : 3
(c) 2 : 5 (d) none of these

41 A smaller circle touches internally to a larger circle at A and passes through the centre of the larger circle. O is the centre of the larger circle and BA, OA are the diameters of the larger and smaller circles, respectively. Chord AC intersects the smaller circle at a point D. If $AC = 12$ cm, then AD is :



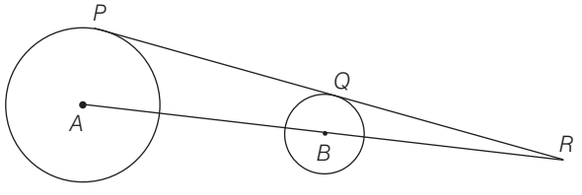
(a) 4 cm (b) 6 cm
(c) 5.6 cm (d) data insufficient

42 In the given figure $ADEC$ is a cyclic quadrilateral, CE and AD are extended to meet at B. $\angle CAD = 60°$ and $\angle CBA = 30°$. $BD = 6$ cm and $CE = 5\sqrt{3}$ cm, What is the ratio of $AC : AD$?



(a) $\frac{3}{4}$
(b) $\frac{4}{5}$
(c) $\frac{2\sqrt{3}}{5}$
(d) cant' be determined

Directions (for Q. Nos. 43 and 44) *In the following diagram A and B are the centres of the two different circles. PQR is a common tangent. Points A, B, and R lie on the straight line. Distance between A and B is 25 cm and the distance between P and Q is 24 cm. Diameter of the larger circle is 24 cm.*



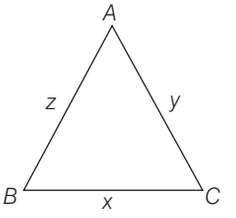
43 What is the ratio of $AB : BR$?

(a) 7 : 5
(b) 7 : 6
(c) 7 : 10
(d) data insufficient

44 What is the ratio of area of ΔAPR and ΔBQR ?

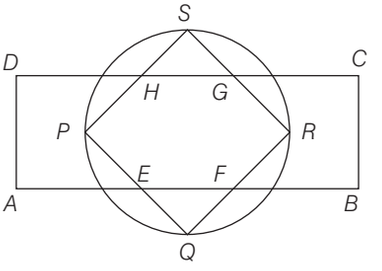
(a) 169 : 36
(b) 144 : 25
(c) 625 : 144
(d) can't be determined

45 If $x^2 + y^2 + z^2 = xy + yz + zx$, then the triangle is :



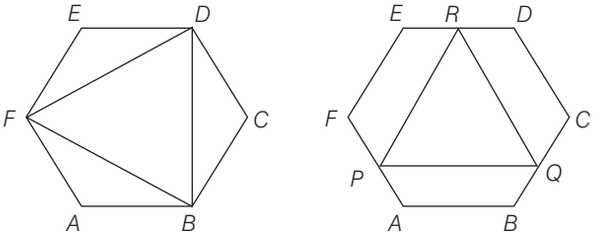
(a) isosceles (b) right angled
(c) equilateral (d) scalene

46 In the adjoining figure $ABCD$ is a rectangle in which length is twice of breadth. H and G divide the line CD into three equal parts. Similarly points E and F trisect the line AB. A circle $PQRS$ is circumscribed by a square $PQRS$ which passes through the points E, F, G and H. What is the ratio of areas of circle to that of rectangle?



(a) $3\pi : 7$ (b) $3 : 4$
(c) $25\pi : 72$ (d) $32\pi : 115$

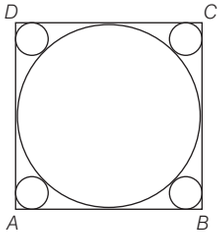
47 In the adjoining figure there are two congruent regular hexagons each with side 6 cm.



What is the ratio of area of ΔBDF and ΔPQR, if P, Q and R are the mid-points of side AF, BC and DE ?

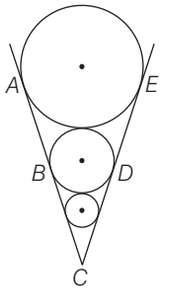
(a) 6 : 5 (b) 7 : 6
(c) 4 : 3 (d) 1 : 1

48 $ABCD$ is a square, in which a circle is inscribed touching all the sides of a square. In the four corners of square 4 smaller circles of equal radii are drawn, containing maximum possible area. What is the ratio of the area of larger circle to that of sum of the areas of four smaller circles ?



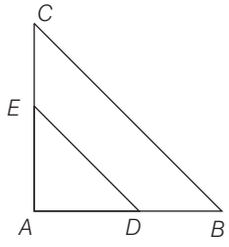
(a) $1:(68-48\sqrt{2})$ (b) $1:17\sqrt{2}$
(c) $3:(34-12\sqrt{2})$ (d) none of these

49 In the adjoining figure $\angle ACE$ is a right angle. There are three circles which just touch each other where AC and EC are the tangents to all the three circles. What is the ratio of radii of the largest circle to that of the smallest circle?



(a) $17:12\sqrt{2}$ (b) $1:(17-12\sqrt{2})$
(c) $12:17\sqrt{2}$ (d) none of these

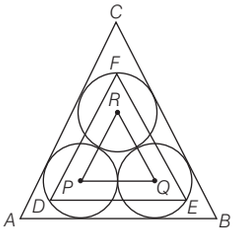
50 In a right angle triangle ABC, $\angle A$ is right angle, DE is parallel to the hypotenuse BC and the length of DE is 65% the length of BC, what is the area of ΔADE, if the area of ΔABC is 68 cm^2 ?



(a) 27.83 cm^2 (b) 41.6 cm^2
(c) 28.73 cm^2 (d) none of these

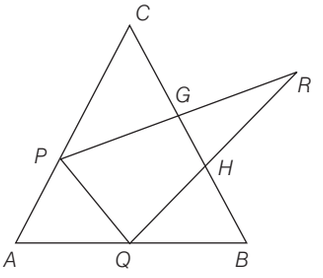
51 In the adjoining figure three congruent circles are touching each other. Triangle ABC circumscribes all the three circles. Triangle PQR is formed by joining the centres of the circle. There is a third triangle DEF. Points A, D, P and B, E, Q and C, F, R lie in the same straight lines respectively.

What is the ratio of perimeters of $\Delta ABC : \Delta DEF : \Delta PQR$?



(a) $3\sqrt{2}:2\sqrt{2}:1$
(b) $2(4+\sqrt{3}):(2+\sqrt{3}):\sqrt{3}$
(c) $2(1+\sqrt{3}):(2+\sqrt{3}):2$
(d) $2(1+\sqrt{3}):2\sqrt{3}:\sqrt{3}$

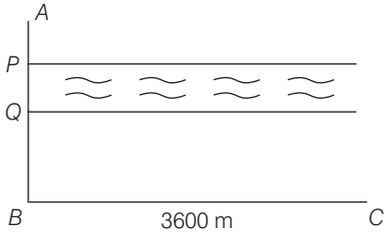
52 In the given figure, P and Q are the mid-points of AC and AB. Also, $PG = GR$ and $HQ = HR$.
What is the ratio of area of ΔPQR : area of ΔABC?



(a) 1/2 (b) 2/3
(c) 3/5 (d) none of these

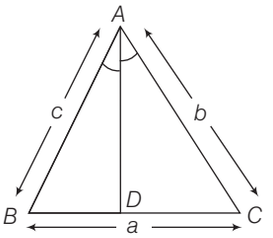
53 A trapezium $PQRS$ inscribes a circle which touches the circle at M, A, N and B. Radius of circle is 10 cm. The length of each non-parallel side is 21 cm. What is the perimeter of the trapezium?
(a) 82 cm (b) 84 cm
(c) 85.5 cm (d) can't be determined

54 In the given diagram, river PQ is just perpendicular to the national highway AB. At a point B highway just turns at right angle and reaches to C. $PA = 500$ m and $BQ = 700$ m and width of the uniformly wide river (*i.e., PQ*) is 300m. Also $BC = 3600$ m. A bridge has to be constructed across the river perpendicular to its stream in such a way that a person can reach from A to C via bridge covering least possible distance. What is the minimum possible required distance from A to C including the length of the bridge?



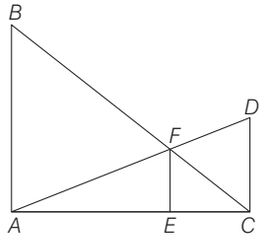
(a) 4100 m (b) 3900 m
(c) $3000\sqrt{2}$ m (d) none of these

55 In a triangle ABC, AD is the angle bisector of $\angle BAC$ and $\angle BAD = 60°$. What is the length of AD ?



(a) $\frac{b+c}{bc}$ (b) $\frac{bc}{b+c}$ (c) $\sqrt{b^2+c^2}$ (d) $\frac{(b+c)^2}{bc}$

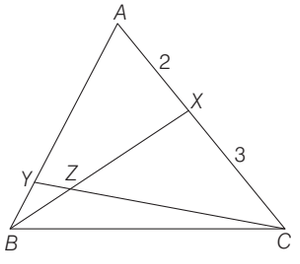
56 The top of the two parallel towers AB and CD can be accessed through two ladders $BC = 210$ m and $AD = 174$ m such that the foot of each ladder touches the foot of the other building. If there is a tree $EF = 70$ m somewhere between the points A and C, such that the peak of the tree F is the point of cross section of the two ladders, wherein points A, E and C are collinear, find the horizontal distance AC between the two towers.



(a) 125 (b) 126 (c) 127 (d) 135

Directions (for Q. Nos. 57 and 58) *Answer the following questions based on the information given below.*

In the following triangle ΔABC, $AX : XC = 2 : 3$ and the weight at the point Z is 9.



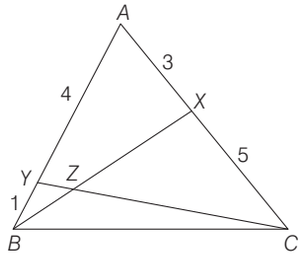
57 Find the weight at point B.

(a) 1 (b) 3 (c) 4 (d) 5

58 Find the value of $AY : BY$.

(a) 5 : 2 (b) 4 : 3 (c) 5 : 2 (d) 3 : 2

59 In the following triangle ΔABC, $AY : BY = 4 : 1$ and $AX : CX = 3 : 5$, where X lies on AC and Y lies on AB and Z is the point of intersection of BX and CY. Find the value of $BZ : CZ$.

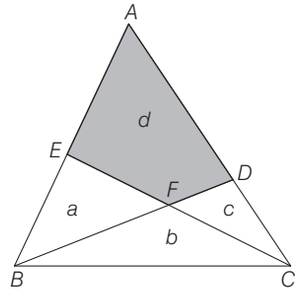


(a) 8 : 25 (b) 9 : 25
(c) 9 : 64 (d) none of these

60 In a triangle ABC point D and E lie on the sides AB and AC, respectively. Line segments DC and BE intersect inside the triangle at O. The area of $\Delta BOC = 8$ sq. cm, $\Delta BDO = 7$ sq. cm and $\Delta CEO = 4$ sq. cm. Find the area of quadrilateral $ADOE$.

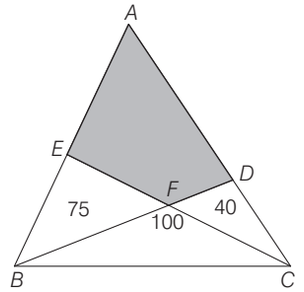
(a) 21 sq. cm (b) 28 sq. cm
(c) 25 sq. cm (d) 19 sq. cm

61 In a triangle ABC, the vertex B is connected to a point D on AC and the vertex C is connected to a point E on AB. The line segments BD and EC intersect at a point F inside the ΔABC, as shown in the diagram. If the area of ΔBEF, ΔBCF and ΔCDF are a, b and c respectively. What is the area of quadrilateral $AEFD$ in terms of a, b, c?



(a) $\frac{ac(a+2b+c)}{b^2-ac}$ (b) $\frac{2b(a+2b+c)}{b^2-ac}$
(c) $\frac{2b(a+b+c)}{b^2-ac}$ (d) $\frac{abc(a+b+c)}{b^2-ac}$

62 In the following triangle ABC, the area of smaller ΔBEF is 75 units, ΔBCF is 100 units and ΔFDC is 40 units. Find the area of quadrilateral $AEFD$.



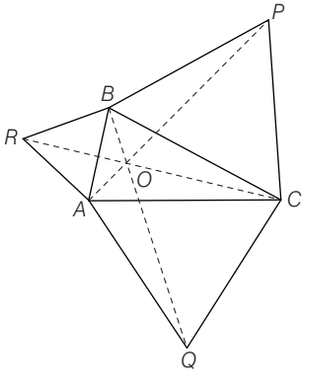
(a) 125 (b) 135 (c) 145 (d) 90

63 Consider a triangle ABC and let a, b and c denote the lengths of the sides opposite the vertices A, B and C respectively, where $a = 6, b = 10$ and the area of the triangle is $15\sqrt{3}$. If $\angle ACB$ is obtuse and r denotes the radius of the incircle of the triangle, then r^2 is equal to
(a) $\sqrt{3}$ (b) $2\sqrt{3}$ (c) 3 (d) 4.5

64 Given an isosceles triangle, whose one angle is 120° and radius of its incircle $(r) = \sqrt{3}$. Then the area of the triangle in sq. units is
(a) $7 + 12\sqrt{3}$ (b) $12 - 7\sqrt{3}$ (c) $12 + 7\sqrt{3}$ (d) 4π

65 Let ABC be an arbitrary triangle, and P be any point inside. Let d_1, d_2 and d_3 denote the perpendicular distances from P to the sides BC, CA and AB, respectively. Let h_1, h_2 and h_3 denote, respectively, the length of the altitude from A, B and C to the opposite sides of the triangle, then $\frac{d_1}{h_1} + \frac{d_2}{h_2} + \frac{d_3}{h_3}$ is
(a) $\sqrt{3}$ (b) 3 (c) 1 (d) π

66 On each side of an arbitrary triangle ABC, an equilateral triangle is constructed (protruding outside) as shown below. These equilateral triangles are ABR, BCP and ACQ. Then, which one of the following is CORRECT?



(a) $\overline{AP} + \overline{BQ} + \overline{CR} = 2(\overline{AB} + \overline{BC} + \overline{CA})$
(b) $\overline{AP} = \overline{BQ} = \overline{CR}$
(c) Both (a) and (b)
(d) none of the above

67 In a ΔABC, the points X, Y and Z are on the lines BC, CA and AB. P is a point inside the triangle such that AX, BY and CZ are concurrent at P if and only if
(a) $\left(\frac{AZ}{BZ}\right)\left(\frac{BX}{CX}\right)\left(\frac{CY}{AY}\right) = 1$ (b) $\left(\frac{AZ}{AY}\right)\left(\frac{BZ}{BX}\right)\left(\frac{CY}{CX}\right) = 1$
(c) $\left(\frac{AY}{AZ}\right)\left(\frac{BZ}{BX}\right)\left(\frac{CY}{CX}\right) = 1$ (d) none of these

68 In an isosceles right angle triangle the legs AB and BC have length $l = \sqrt{a + b\sqrt{2}}$; where a and b are natural numbers. Point O is inside the triangle such that $OA = 1$, $OB = 2$ and $OC = 3$. Find the value of $\frac{a}{b}$?
(a) 2.5 (b) 2.33
(c) 2.66 (d) none of these

69 In a triangle PQR, S and T lie on PQ and PR, respectively, such that $\angle QSR = \angle PRQ$ and $\angle QTR = \angle PQR$. And, $PQ = 12$, $QR = 9$, $PR = 15$. Find the value of $PS \times PT$.
(a) 50.4 (b) 52.64
(c) 49.75 (d) none of these

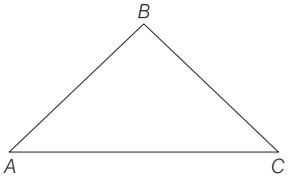
70 In a ΔABC, AP is the median that intersects QR at O, where Q and R lie on the AB and AC, respectively. $2AQ = 3BQ$ and $3AR = 4CR$. Find the ratio of area of ΔQOP to that of ΔROP.
(a) 21 : 20 (b) 9 : 8 (c) 2 : 1 (d) 16 : 15

71 If $\varphi = \frac{1 + \sqrt{5}}{2}$ and the three sides of a triangle are 1, $\sqrt{\varphi}$, φ, which one of the following statements is true about this triangle?
(a) no such triangle exists (b) it's a right angle triangle
(c) it's an isosceles triangle (d) nothing can be said

72 In an isosceles triangle ABC, the acute angle BAC is 36°. Point D lies on $\overline{AC}$ such that $\overline{BD}$ is the angle bisector of $\angle ABC$. Find $\frac{\overline{AB}}{\overline{BC}}$.
(a) $\sqrt{5} : 2$ (b) $\frac{\sqrt{5} - 1}{2}$
(c) $\frac{1 + \sqrt{5}}{2}$ (d) none of these

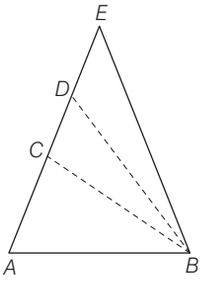
73 In the following diagram, ΔABC is an isosceles triangle whereas $\angle B = 72°$ and $AB = BC = 1$ unit. If $\varphi = \frac{1 + \sqrt{5}}{2}$, which one of following choices is correct for the value of AC in terms of φ.

(i) $\sqrt{3 - \varphi}$ (ii) $\frac{\sqrt{\varphi} - 1}{2}$
(iii) $\sqrt{4 - \varphi^2}$

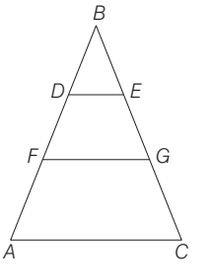


(a) all (i), (ii) and (iii) (b) none of (i), (ii) and (iii)
(c) not all but more than one
(d) data insufficient

74 In the following diagram ΔAEB is an isosceles triangle, whereas $\angle AEB = 36°$, $\angle ADB = 54°$, $\angle ACB = 72°$. If $\varphi = \frac{1 + \sqrt{5}}{2}$ and $AB = \varphi$, find the ratio of $AC : CD : DE$.
(a) $1 : \sqrt{\varphi} : 1$
(b) $1 : (\varphi - 1) : 2$
(c) $1 : \varphi : \varphi^2$
(d) $\varphi : 1 : \varphi$

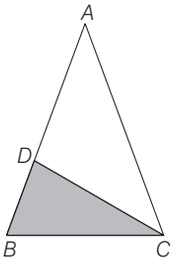


75 In an isosceles triangle ABC, line segments DE and FG are parallel to the base AC intersecting the other two sides AB and BC. Also given that $BD = BE = \varphi$ and $\angle ABC = 36°$. If $DE = EG$ and $FG = GC$, find AC in terms of φ, where $\varphi = \dfrac{1+\sqrt{5}}{2}$.



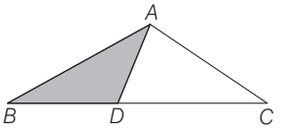
(a) $(\varphi + 1)^2$ (b) $\varphi^2 + 1$
(c) $\varphi^2 - 1$ (d) $\varphi + 1$

76 In the following figure, $AB = AC$, $BC = CD$ and $\angle BAC = 36°$. If $AD = 1 + \sqrt{5}$ cm, find the area of the shaded region (in sq. cm).



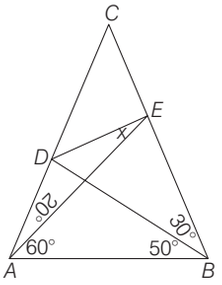
(a) $\sqrt{5 + 2\sqrt{5}}$ (b) $2\sqrt{3 + \sqrt{5}}$
(c) $2\sqrt{7 - 2\sqrt{5}}$ (d) none of these

77 In the following figure ΔBAC and ΔBAD are isosceles triangles, such that $AB = AC$ and $AD = BD$. If $\angle ABC = 36°$ and $BD = (\sqrt{5} - 1)$ cm, find the area of the ΔABD (in sq. cm).



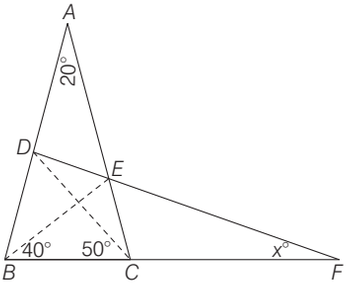
(a) $\sqrt{5 - 2\sqrt{5}}$ (b) $2\sqrt{3 - \sqrt{5}}$
(c) $\dfrac{1}{2}\sqrt{7 - 2\sqrt{5}}$ (d) none of these

78 In the following diagram find the value of $\angle DEA$. Please note that the diagram is not drawn to scale. However, the measure of angles stated there are absolutely correct.



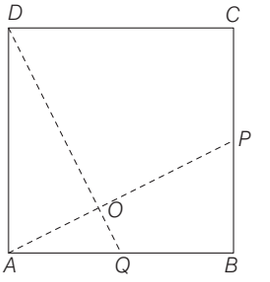
(a) 10 (b) 20
(c) 30 (d) data insufficient

79 In an isosceles triangle ΔABC, $\angle A = 20°$ and $AB = AC \neq BC$. Line segment BC is extended to a point F such that point D, point E and point F are collinear, whereas point D lies on AB and point E lies on AC. If $\angle EBC = 40°$ and $\angle DCB = 50°$, find the value of x as shown in the diagram.



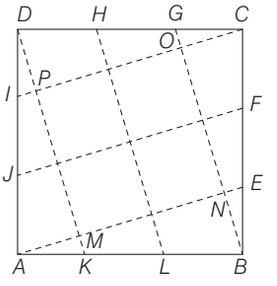
(a) 30 (b) 20 (c) 15 (d) 10

80 In a square $ABCD$, a quadrilateral, P is the midpoint at BC and Q is the midpoint at AB. Line segments AP and DQ intersect each other at O. Find the ratio of the areas of two quadrilaterals $QBPO$ and $OPCD$.



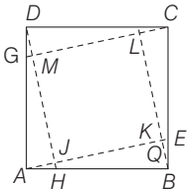
(a) 9 : 25 (b) 4 : 9
(c) 4 : 11 (d) 16 : 25

81 In the following diagram, each side of the square $ABCD$ is trisected such that $DK \parallel HL \parallel GB$ and $IC \parallel JF \parallel AE$, where all the parallel lines are equispaced. If the area of the smallest triangle such as ΔDIP is 1 unit, what is the area of quadrilateral $MNOP$?



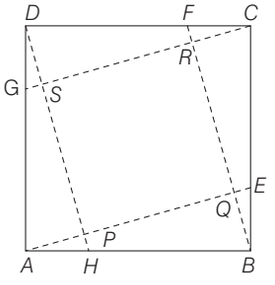
(a) 21 units (b) 24 units
(c) 27 units (d) 32 units

82 Each side of a square *ABCD* is divided in the ratio 1 : 4, as shown in the following diagram. What is the ratio of area of square *JKLM* to that of square *ABCD*?



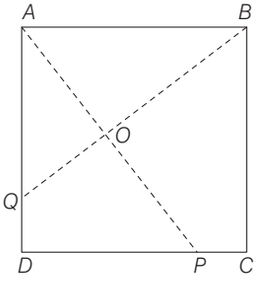
(a) 8 : 13 (b) 16 : 25
(c) 8 : 15 (d) 11 : 20

83 In the following figure, each side of the square is divided in the ratio 2 : 3, such that $\frac{DG}{GA} = \frac{AH}{HB} = \frac{BE}{EC} = \frac{CF}{FD} = \frac{2}{3}$. Find the ratio of the area of square *PQRS* to that of square *ABCD*.



(a) 4 : 9 (b) 9 : 25
(c) 9 : 29 (d) 32 : 73

84 In the given square *ABCD*, $\frac{AQ}{QD} = \frac{DP}{PC} = \frac{4}{1}$. Find the ratio of area of triangle *AOQ* to that of quadrilateral *OBCP*.



(a) 16 : 25 (b) 16 : 41
(c) 24 : 75 (d) 32 : 73

85 A quadrilateral has one vertex on each side of a square of side-length 1. If the lengths of the quadrilateral are *a*, *b*, *c*, *d*, then

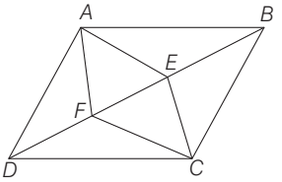
(a) $2 \le a^2 + b^2 + c^2 + d^2 \le 4$

(b) $1 \le a^2 + b^2 + c^2 + d^2 \le 4$

(c) $\sqrt{2} \le a^2 + b^2 + c^2 + d^2 \le 4$

(d) $2\sqrt{2} \le a^2 + b^2 + c^2 + d^2 \le 4$

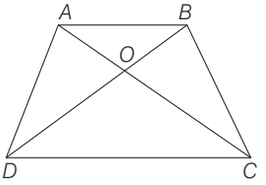
86 Consider the following diagram in which $\square ABCD$ is a rhombus and $AF = EF = EC$. A circle is inscribed in quadrilateral *AECF* and a circle is inscribed in quadrilateral *ABCD*. Each of the circles is of the largest possible area.



Find the ratio of the area of circle that lies in $\square AECF$ to the area of the circle inscribed in $\square ABCD$.

(a) 1 : 2 (b) 2 : 3
(c) 1 : 4 (d) data insufficient

87 Area of the trapezium *ABCD* is 350 sq. cm and $AB = 21$ cm, $CD = 49$ cm. The two diagonals bisect each other at *O*, find the area of ΔAOD.

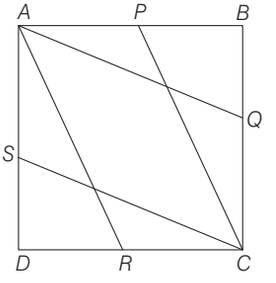


(a) 75 sq. cm (b) 73.5 sq. cm
(c) 72.5 sq. cm (d) data insufficient

88 Let *ABCD* be a quadrilateral with area 18, with side *AB* parallel to the side *CD* and $AB = 2CD$. Let *AD* be perpendicular to *AB* and *CD*. If a circle is drawn inside the quadrilateral *ABCD* touching all the four sides, then its radius is :

(a) 3 (b) 2
(c) $\frac{3}{2}$ (d) 1

89 In the following diagram *ABCD* is a square. The mid-points *P*, *Q*, *R*, *S* are connected in such a way that two congruent kites *SAPC* and *CRAQ* are formed. Area of each kite is 200 sq. cm. Find the area of common region contained by the two kites.



(a) 100 sq. cm (b) 96 sq. cm
(c) $\frac{400}{3}$ sq. cm (d) none of these

90 Each of the sides of a quadrilateral is a natural number and the perimeter of the quadrilateral is always 12 units. Find the number of combinations of various lengths of the sides of the quadrilateral.

(a) 8 (b) 10

(c) 5 (d) none of these

91 If the side of a regular pentagon be 2 cm, find the circumradius of the pentagon, in cm.

(a) $\frac{3+\sqrt{5}}{\sqrt{5+2\sqrt{5}}}$ (b) $\frac{3+\sqrt{5}}{\sqrt{10-2\sqrt{5}}}$

(c) $\frac{3-\sqrt{5}}{\sqrt{10-2\sqrt{5}}}$ (d) $\frac{3+2\sqrt{5}}{\sqrt{5+2\sqrt{5}}}$

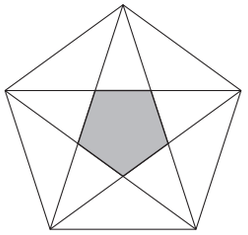
92 In a regular pentagon the side measures 6 cm and sum of the inradius and circumradius is 9 cm. Find the sum of the area of the circumcircle and the area of the incircle of the pentagon.

(a) 41π cm^2 (b) 45π cm^2

(c) 53π cm^2 (d) data insufficient

Directions (for Q. Nos. 93 and 94) *Answer the following questions based on the information given below.*

In the following diagram the larger pentagon constitutes a smaller pentagon at the centre. Each side of the larger pentagon is known to be S.



93 What would be the side of the smaller pentagon?

(a) $(6-2\sqrt{5})S$ (b) $\frac{(3-\sqrt{5})}{2}S$

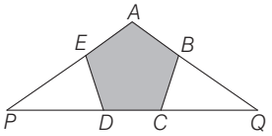
(c) $\frac{(5-2\sqrt{5})}{2}S$ (d) none of these

94 What would be the diagonal of the smaller pentagon?

(a) $(7-2\sqrt{5})S$ (b) $\frac{3(\sqrt{5}-2)}{2}S$

(c) $\frac{(\sqrt{5}-1)}{2}S$ (d) none of these

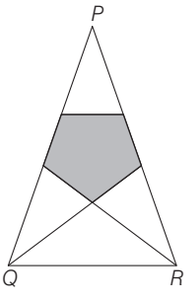
95 A few of the sides of a regular pentagon are extended in such a way that it forms an isosceles triangle as shown in the given diagram. If the perimeter of the pentagon is 10 cm, what is the perimeter of the isosceles triangle *APQ* ?



(a) $10 + 4\sqrt{5}$ cm (b) $12 + 5\sqrt{5}$ cm

(c) 16 cm (d) $14 + 4\sqrt{5}$ cm

96 A few of the sides of a regular pentagon are extended in such a way that it forms an isosceles triangle as shown in the given diagram. If the perimeter of the pentagon is 10 cm, what is the perimeter of the isosceles triangle *PQR*?



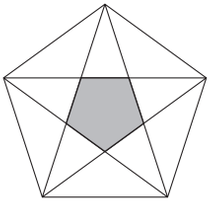
(a) $7 + 5\sqrt{5}$ cm

(b) $11 + 5\sqrt{5}$ cm

(c) 16 cm

(d) $16 + 3\sqrt{5}$ cm

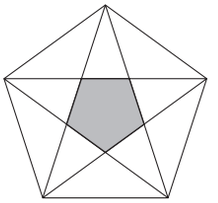
97 In the following figure, if the area of the shaded region (the smaller pentagon) is $\left(\frac{7-3\sqrt{5}}{2}\right)$ sq. cm, find the area of the larger regular pentagon.



(a) 1 sq. cm (b) $\left(\frac{47-21\sqrt{5}}{2}\right)$ sq. cm

(c) $\left(\frac{7+3\sqrt{5}}{2}\right)$ sq. cm (d) none of these

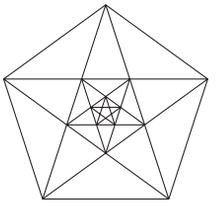
98 In the following figure when all the five diagonals of a regular pentagon are drawn they form another small pentagon at the centre which is shown as a shaded region. If each side of the larger (original) pentagon measures 1 inch, and $\varphi = \frac{\sqrt{5}+1}{2}$, find the ratio of the area of larger pentagon to the area of smaller pentagram in terms of φ.



(a) $\varphi^2 : 1$ (b) $\varphi^4 : 1$

(c) $1 : \sqrt{\varphi}$ (d) $2 : \sqrt{\varphi}$

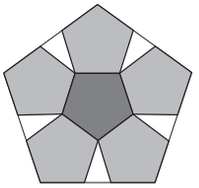
99 In the given figure the diagonals of a pentagon form another pentagon, and the diagonals of this pentagon form another pentagon, and then once again the diagonals of this pentagon form another pentagon at the centre. If the each side of the smallest pentagon is 1 unit and $\varphi = \frac{1+\sqrt{5}}{2}$, find each side of the largest (original) pentagon in terms of φ.



(a) $4\varphi^4$ (b) φ^4

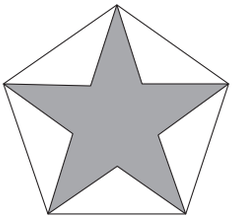
(c) φ^8 (d) φ^6

100 A larger regular pentagon contains 6 smaller pentagons of the same size, as shown in the following diagram. If each side of each of the congruent pentagons is 1 cm, find the total area A (in sq. cm) covered by the larger pentagon.



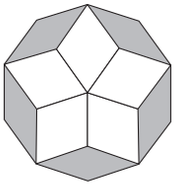
(a) $10 < A < 11$ (b) $11 < A < 12$
(c) $12 < A < 13$ (d) $13 < A < 14$

101 In the following figure a regular pentagon inscribes a regular pentagram. If each side of the pentagon measures 1 mm, and $\varphi = \frac{\sqrt{5}+1}{2}$, find the area of pentagram in terms of φ.



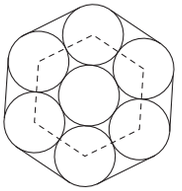
(a) $\frac{1}{2}(2-\varphi)^{3/2}$ sq. mm (b) $\frac{1}{4}(2-\varphi)^{3/2}$ sq. mm
(c) $\frac{1}{2}(3-\varphi)^{3/2}$ sq. mm (d) $\frac{3}{2}(3-\varphi)^{3/2}$ sq. mm

102 In the following diagram a regular decagon consists of 10 parallelograms, out of which 5 parallelograms that are meeting at the centre are congruent to each other and other 5 parallelograms at the edges of the decagon are congruent to each other. If each side of the decagon is $1+\sqrt{5}$ cm, find total area of the 5 parallelograms that are connected to the centre of the decagon.



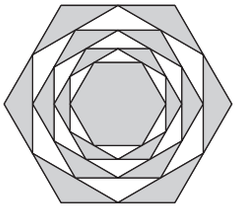
(a) $5(1+\sqrt{5})(\sqrt{25-2\sqrt{5}})$ sq. cm
(b) $15(\sqrt{25+4\sqrt{5}})$ sq. cm
(c) $5(1+\sqrt{5})(\sqrt{5+2\sqrt{5}})$ sq. cm
(d) $5(6+2\sqrt{5})(\sqrt{1+\sqrt{5}})$ sq. cm

103 Take seven circles and close-pack them together in a hexagonal arrangement, as shown below. Then a rubber band is wrapped around the seven circles. Find the perimeter of this arrangement, if the radius of each circle is r cm.



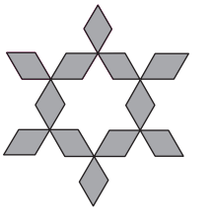
(a) $2(6+\pi)r$ (b) $3(4+\pi)r$
(c) $6(2+\pi)r$ (d) none of these

104 In the given diagram, there are total seven regular hexagons. Let's call the outermost (or the largest) hexagon as H_1 and so call the innermost (or the smallest) hexagon as H_7. The hexagon H_2 is formed by joining the mid-points of the adjacent sides of H_1. Similarly, H_3, H_4, H_5, H_6 and H_7 are formed by joining the mid-point of the adjacent sides of the H_2, H_3, H_4, H_5 and H_6, respectively. If each side of the H_1 is 64 cm, find the each side of the H_7.



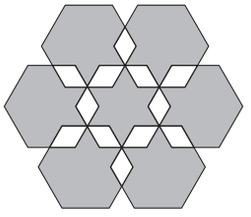
(a) 27 cm (b) $9\sqrt{3}$ cm
(c) $18\sqrt{3}$ cm (d) none of these

105 In the given figure there are twelve rhombi placed in such a way that they form a regular hexagram at the centre and this hexagram is inscribed within a regular hexagon. If the area of the hexagon is 84 sq. cm, find the total area of all the twelve rhombi.



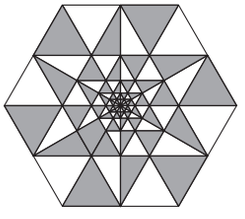
(a) 56 sq. cm (b) 72 sq. cm
(c) 104 sq. cm (d) none of these

106 As shown in the given figure, there are total seven regular hexagons; six of them are placed around the seventh hexagon, partially overlapping, and then some rhombi are cut out of the whole arrangement. If the area of the unshaded region represented by the 12 rhombi is 84 sq. cm, find the area of the shaded region.



(a) 420 sq. cm
(b) 484 sq. cm
(c) 488 sq. cm
(d) none of the above

107 If the area of all the shaded equilateral triangles of the largest possible size, as shown along the periphery of the regular hexagon, is $6\sqrt{3}$ sq cm, then find the total area of the shaded region of the whole figure.

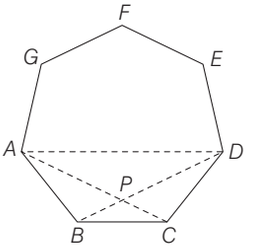


(a) $18\sqrt{3}$ sq. cm
(b) 36 sq. cm
(c) $24\sqrt{3}$ sq. cm
(d) none of the above

108 There are seven concentric regular hexagons depicted in the adjacent figure such that they form a six alternating black and white hexagonal rings around a black hexagon. If the area of each hexagonal ring is same and equal to the black hexagon at the centre, find the ratio of the sides of the largest hexagon to that of the smallest hexagon of this arrangement.

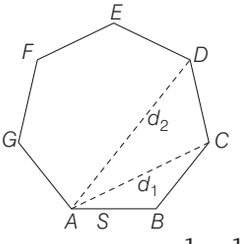
(a) 7 : 1 (b) $1 : \sqrt{7}$
(c) 6 : 1 (d) none of these

109 In the following diagram, if the two shorter diagonals *AC* and *BD* intersect at *P* inside the regular heptagon and *AD* is one of the longer diagonals, which one of the following is correct?



(a) $2(AB + AP) = 3AD$ (b) $AB + BP = AD$
(c) $AB + BD = AD + BP$ (d) $3(AB + AP) = 2AD$

110 In the following diagram, d_1, d_2 are the two distinct diagonals and s is the side of the regular polygon *ABCDEFG*. Find the correct relation among the side and the two diagonals.

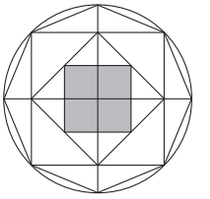


(a) $\frac{d_2}{s} = \frac{s}{d_1}$ (b) $\frac{1}{s} = \frac{1}{d_2} - \frac{1}{d_1}$
(c) $\frac{d_2}{d_1} = \frac{d_1}{s}$ (d) $\frac{1}{s} = \frac{1}{d_1} + \frac{1}{d_2}$

111 Neither it's the longest one nor it's the shortest one of the lengths of the diagonal of an octagon you know is d and each side of the same octagon is s, find the area of the octagon in terms of the side and the known diagonal of the regular octagon.

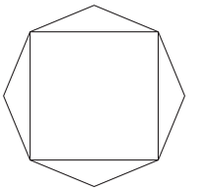
(a) $3d^2 - \sqrt{3}s^2$
(b) $d^2 - s^2$
(c) $2ds$
(d) both (b) and (c)

112 In the given diagram, a regular octagon is inscribed in a circle in which four diagonals are connecting the opposite vertices of the octagon. After that a square is formed by connecting the alternate vertices of the octagon then another square is formed by joining the mid-points of the first square and then finally another square is formed by joining the mid-points of the previous square. This square is shown as the shaded region. If the area of the shaded region is 1 sq. cm, find the difference between the area of the circle and area of the octagon.



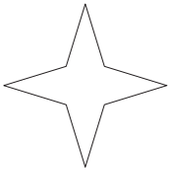
(a) $2(\pi - 2\sqrt{2})$ sq. cm (b) $(2\pi - 3\sqrt{2})$ sq. cm
(c) $(3\pi - 4\sqrt{2})$ sq. cm (d) $4(\pi - 2\sqrt{2})$ sq. cm

113 In the given figure a quadrilateral is formed by joining the alternate vertices of a regular octagon. If the area of the octagon be $2(\sqrt{2} - 1)$ sq cm, find the area of the square.



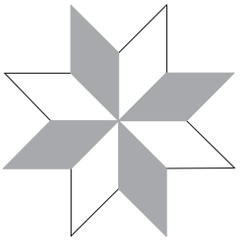
(a) $\frac{2 + \sqrt{2}}{3 - 2\sqrt{2}}$ (b) $\frac{\sqrt{2 + \sqrt{2}}}{\sqrt{2} + 1}$
(c) $3 - 2\sqrt{2}$ (d) $\sqrt{2}(\sqrt{2} - 1)$

114 In the given figure, a concave equilateral octagon has each of its four acute internal angles equal to 30° and each of the two longer diagonals is 20 cm. Find the area of the octagon, if the diagonals connecting the opposite vertices are perpendicular and bisect each other.



(a) $\frac{200}{\sqrt{3}}(\sqrt{3} - 1)$ (b) $\frac{100}{\sqrt{3}}(\sqrt{3} - 1)$
(c) $\frac{200}{\sqrt{3}}(\sqrt{3} - 2)$ (d) $\frac{200}{\sqrt{3}}(3 - \sqrt{3})$

115 In the given figure, there are 4 black and four white rhombi connected in such a way that one of their vertices is common and they share two of their sides with the rhombi of the either side without any overlapping. Each of the eight rhombi is congruent to each other. The total area of all the black rhombi (or shaded region) is 8 sq cm, find the area of the smallest possible octagon in which the following figure can be inscribed as it is.



(a) $8(2 + \sqrt{2})\,\text{cm}^2$ (b) $8(\sqrt{4 - \sqrt{2}})\,\text{cm}^2$
(c) $8(4 - \sqrt{2})\,\text{cm}^2$ (d) $8(\sqrt{2 + \sqrt{2}})\,\text{cm}^2$

Directions (for Q. Nos. 116 to 121) *Answer the following questions based on the information given below.*

The side of a regular decagon is 2 cm.

116 Find the circumradius of the decagon.
(a) $1+\sqrt{5}$ cm (b) $-1+\sqrt{5}$ cm
(c) $2+\sqrt{3}$ cm (d) none of these

117 Find the apothem of the decagon.
(a) $\sqrt{5+2\sqrt{5}}$ cm (b) $2\sqrt{5-\sqrt{5}}$ cm
(c) $2\sqrt{5+\sqrt{5}}$ cm (d) $\sqrt{1+\sqrt{5}}$ cm

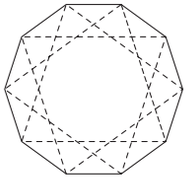
118 Find the longest possible diagonal of the decagon.
(a) $4(1+\sqrt{5})$ cm (b) $2(1-\sqrt{5})$ cm
(c) $2(2+\sqrt{5})$ cm (d) $2(1+\sqrt{5})$ cm

119 Find the second longest diagonal of the decagon.
(a) $\sqrt{5+2\sqrt{5}}$ cm (b) $2\sqrt{5+2\sqrt{5}}$ cm
(c) $\sqrt{4+2\sqrt{5}}$ cm (d) $\sqrt{10+4\sqrt{5}}$ cm

120 Find the third longest diagonal of the decagon.
(a) $2+\sqrt{5}$ cm (b) $6-\sqrt{5}$ cm
(c) $3+\sqrt{5}$ cm (d) $9-2\sqrt{5}$ cm

121 Find the third shortest diagonal of the decagon.
(a) $\sqrt{10+2\sqrt{5}}$ cm (b) $\sqrt{12\sqrt{5}}$ cm
(c) $\sqrt{5+4\sqrt{5}}$ cm (d) $\sqrt{15-2\sqrt{5}}$ cm

122 In the given diagram, some diagonals of a regular decagon are intersecting such that they form another small decagon inside the original decagon. If each side of the larger decagon be 2 cm, find the side of the smaller decagon.



(a) $\frac{2\sqrt{5}}{3}$ cm (b) $2\sqrt{5}-3$ cm
(c) $\sqrt{5}-1$ cm (d) 1 cm

123 If each side of a regular dodecagon is 1 cm, find the area of the dodecagon.
(a) 12 sq. cm (b) $6+3\sqrt{3}$ sq. cm
(c) $12\sqrt{3}$ sq. cm (d) none of these

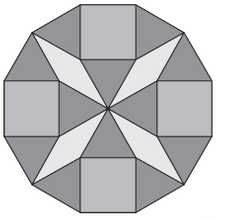
124 If each side of a regular dodecagon is 1 cm, find the second smallest diagonal of the dodecagon.
(a) $3\sqrt{2}-2$ sq. cm (b) $\sqrt{3}+1$ sq. cm
(c) $2\sqrt{3}+1$ sq. cm (d) none of these

125 If each side of a regular dodecagon is 1 cm, find the circumradius of the dodecagon.
(a) $\sqrt{2+\sqrt{3}}$ cm (b) $3\sqrt{3}$ cm
(c) $1+2\sqrt{3}$ cm (d) none of these

126 If each side of a regular dodecagon is 1 cm, find the smallest diagonal of the dodecagon.
(a) $\sqrt{2+\sqrt{3}}$ cm (b) $6-3\sqrt{3}$ cm
(c) $2\sqrt{3}-\sqrt{2}$ cm (d) $\sqrt{3+\sqrt{2}}$ cm

127 If each side of a regular dodecagon is 1 cm, find the third smallest diagonal of the dodecagon.
(a) $\sqrt{2+\sqrt{3}}+\sqrt{2}$ cm (b) $\sqrt{3}\sqrt{2+\sqrt{3}}$ cm
(c) $2\sqrt{3}-\sqrt{2}$ cm (d) both (a) and (b)

128 In the following figure of regular dodecagon find the area of all the four kites, where each of the four kites has two unequal diagonals and the side of each square, each triangle and each kite is 1 cm.

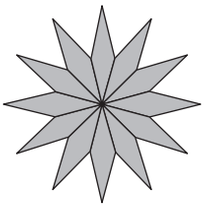


(a) 2 sq. cm (b) $2\sqrt{2}$ sq. cm
(c) $\sqrt{2+\sqrt{3}}$ sq. cm (d) none of these

129 If each side of a regular dodecagon is 1 cm, find the second longest diagonal of the dodecagon.
(a) $\sqrt{2+\sqrt{3}}+\sqrt{3}$ cm (b) $\sqrt{2+\sqrt{3}}$ cm
(c) $2+\sqrt{3}$ cm (d) both (a) and (c)

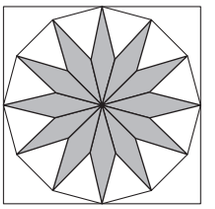
130 If each side of a regular dodecagon is 1 cm, find the longest diagonal of the dodecagon.
(a) $2\sqrt{2+\sqrt{3}}$ cm (b) $6-3\sqrt{3}$ cm
(c) $2\sqrt{3}-\sqrt{2}$ cm (d) $\sqrt{3+\sqrt{2}}$ cm

131 In the following figure 12 rhombi are joined in such a way that they have a common vertex, without overlapping each other, and every rhombus shares two of its sides with the adjacent rhombi, as shown below. Find the area of the following figure, if its perimeter is 24 cm.



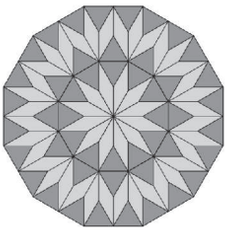
(a) 6 sq. cm (b) 4 sq. cm
(c) 8 sq. cm (d) data insufficient

132 In the given figure, a square inscribes a dodecagon and each side of the regular dodecagon is 1 cm. The dodecagon consists of 12 equilateral triangles and 12 rhombi. What is the ratio of area of dodecagon and the area of square?



(a) $\frac{3}{4}$ (b) $\frac{13}{16}$
(c) $\frac{7}{8}$ (d) $\frac{7}{10}$

133 The following figure consists of two concentric dodecagons. Find the ratio of area of smaller (interior) dodecagon to that of larger (exterior) dodecagon.



(a) 1 : 3 (b) 1 : 4
(c) 1 : 6 (d) none of these

134 You have a regular hexagonal paper sheet and you are asked to make a regular dodecagon by cutting off the corners of the hexagonal sheet. If each side of the regular hexagonal sheet is 1 ft, minimum how much area of the sheet you would have to cut off?

(a) $\left(\frac{63\sqrt{3}}{2} - 36\right)$ ft (b) $\left(\frac{21\sqrt{3}}{2} - 18\right)$ ft
(c) $\left(\frac{25\sqrt{3}}{4} - 6\right)$ ft (d) none of these

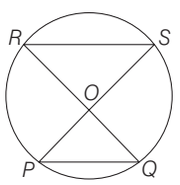
135 Two parallel chords of a circle of radius 2 are at a distance $\sqrt{3} + 1$ apart. If the chords subtend, at the center, angles of $\frac{\pi}{k}$ and $\frac{2\pi}{k}$, where $k > 0$. If $\lfloor k \rfloor$ denotes the largest integer less than or equal to k, the values of $\lfloor k \rfloor$ is

(a) 1 (b) 2
(c) 3 (d) 6

136 The centers of two circles C_1 and C_2, each of unit radii, are at a distance of 6 units from each other. Let P be the mid-point of the line segment joining the centers of C_1 and C_2. A third circle C is drawn such that it is externally tangent to both the circles C_1 and C_2 at the same points where the lines passing through P are tangent to the circles C_1 and C_2. The radius of the circle C is

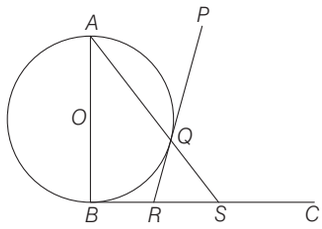
(a) 8 (b) 6
(c) $6\sqrt{2}$ (d) $4\sqrt{2}$

137 In the given diagram PQ is parallel to RS. For $PQ > OP$, when $\angle POQ$ and $\angle OPQ$ have integral values, find the greatest possible value of OPQ.



(a) 119 (b) 61
(c) 59 (d) 58

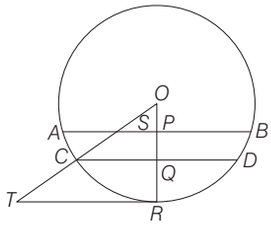
138 In the following figure, BC and RP are tangents to the same circle with centre O and its diameter AB. Points R and S are the points on the tangent BC, such that AS passes through Q, where RP touches the circle.



Which of the following is necessarily a correct relations?

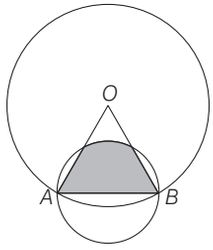
(a) $RS = QS$ (b) $BR = RS$
(c) $AB = 2AQ$ (d) none of these

139 In the concerned diagrams, chords AB and CD are parallel and radius OR bisects the chord AB at P and CD at Q. Radius OC when extended to a point T in order to meet the tangent TR it intersects the chord AB at S. If $OP : OS = 8 : 17$, find $OC : OT$



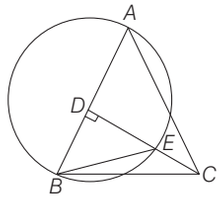
(a) 9 : 17 (b) 8 : 15
(c) 17 : 23 (d) none of these

140 Consider the following figure in which $OA = OB = AB$. Chord AB is the longest possible chord of the smaller circle and O is the centre of the larger circle. Find the area of the shaded region, if the radius of the smaller circle is 6 cm.



(a) $6(\pi + 3\sqrt{3})$ sq. cm (b) $4(\pi + 3\sqrt{3}$ sq. cm
(c) $6(\pi + 2\sqrt{3})$ sq. cm (d) can't be determined

141 In the following figure ΔABC is an isosceles triangle, where $AB = AC$ and $BC = 2\sqrt{2}$ cm. CD is perpendicular on the diameter AB which intersects the circle at E. Find BE.

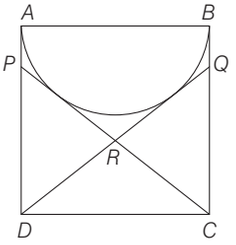


(a) 2 cm (b) $\frac{5}{\sqrt{2}}$ cm (c) 2.16 cm (d) 1.67 cm

142 Two parallel chords in a circle have lengths 12 and 24, and the distance between them is 18. The chord parallel to these chords and midway between them is of length $\sqrt{a}$ where a is

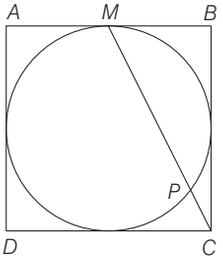
(a) 676 (b) 756
(c) 576 (d) 720

143 $ABCD$ is a square of area 16 sq. cm and AB is the diameter of the semicircle. The line segments CP and DQ intersect at R and touch the semicircle. Find the area of ΔDRC.



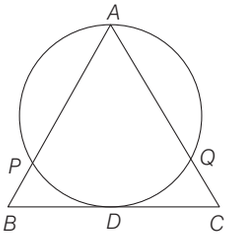
(a) 3 sq. cm (b) 2 sq. cm
(c) 2.5 sq. cm (d) 5 sq. cm

144 In the following figure, a circle of radius 40 mm is inscribed in a square $ABCD$ in which M is the mid-point ofAB. If the line segment MC intersects the circle at P, find PC.



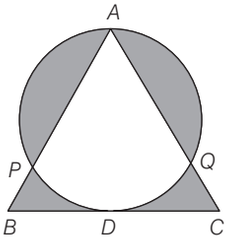
(a) $8\sqrt{5}$ mm (b) $8\sqrt{10}$ mm
(c) $6\sqrt{5}$ mm (d) $\frac{16}{\sqrt{5}}$ mm

145 In the given figure, the perpendicular bisector AD of the equilateral triangle ABC is same as the diameter of the circle O, and the circle intersects the sides AB and AC at P and Q, respectively.
If the heigh of the triangle be $10\sqrt{2}$ cm, find CQ.



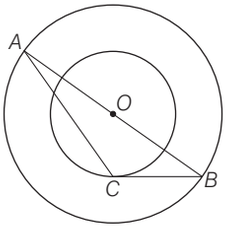
(a) 3 cm (b) 6 cm
(c) 4 cm (d) 5 cm

146 In the given figure, the perpendicular bisector AD of the equilateral triangle ABC is same as the diameter of the circle O, and the circle intersects the sides AB and AC at P and Q, respectively. If the height of the triangle be $12\sqrt{2}$ cm, find CQ.



(a) $24(\pi + \sqrt{3})$ sq. cm (b) $12(2\pi + 3\sqrt{3})$ sq. cm
(c) $12(4\pi + 5\sqrt{3})$ sq. cm (d) none of these

147 There are two concentric circles centered at O. Their radii are 21 cm and 29 cm. AB is the diameter of the larger circle and BC is the tangent to the smaller circle at C. Find AC.



(a) 49.66 cm
(b) 46.52 cm
(c) 54.54 cm
(d) can't be determined

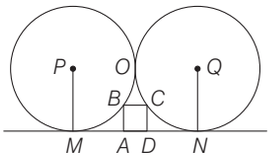
148 Let there be a circle with centre O and radius r, such that the four points A, B, C and D are cyclic while AC and BD are the two chords intersecting each other perpendicularly at a point P somewhere inside the circle. If A, B, C and D are variable points and $OP = d$, find the maximum and minimum area of the quadrilateral $ABCD$.

(a) $4r^2$ and $2r\sqrt{r^2 - d^2}$
(b) $4d^2$ and $r^2\sqrt{r^2 - d^2}$
(c) $2r^2$ and $r^2\sqrt{r^2 - d^2}$
(d) $2r^2$ and $2r\sqrt{r^2 - d^2}$

149 There are two circles C_1 and C_2 of radii r_1 and r_2, respectively. They are mutually tangent to each other and to a line as well. There is one more circle of radius r_3 which is tangent to this line and the first two circles C_1 and C_2. What is the relation between the three radii r_1, r_2 and r_3?

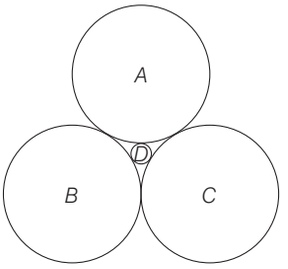
(a) $\frac{1}{\sqrt{r_1}} - \frac{1}{\sqrt{r_2}} = \frac{1}{\sqrt{r_3}}$ (b) $\frac{\sqrt{r_1}}{\sqrt{r_2}} + \frac{\sqrt{r_2}}{\sqrt{r_1}} = \frac{1}{\sqrt{r_3}}$
(c) $\frac{1}{\sqrt{r_3}} = \frac{1}{\sqrt{r_1}} + \frac{1}{\sqrt{r_2}}$ (d) none of these

150 Two equal circles with centers P and Q are tangent at O. A common line is tangent to both the circles at M and N respectively. Point B lies on the arc OM and point C lies on the arc ON. Points A and D lie on the tangent MN. If the radius of each circle is r and each side of the square $ABCD$ is x, find x.



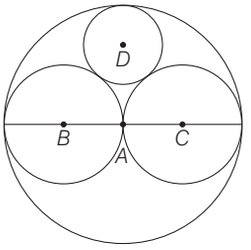
(a) $0.25r$ (b) $0.3r$
(c) $0.33r$ (d) none of these

151 In the following diagram four circles are tangent to every other circle. The radius of each of the circles A, B and C is 1. Find the radius of circle D, which is tangent to all the three given circles and lies at the centre.



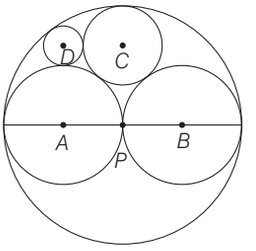
(a) $\frac{1}{3+2\sqrt{3}}$ (b) $\frac{1}{3-2\sqrt{3}}$ (c) $2\sqrt{3}-3$ (d) $\frac{1}{3-2\sqrt{2}}$

152 In the following diagram there are three circles packed in another circle, such that each circle is tangent to all other circles in this arrangement. The radius of the circumscribing circle A is 1 cm; and circle B and circle C are congruent. Find the radius of the circle D.



(a) $\frac{1}{4}$ cm (b) $\frac{1}{3}$ cm (c) $\frac{2}{5}$ cm (d) $\frac{3}{10}$ cm

153 In the following diagram there are four circles A, B, C and D packed in a circle P. The radius of the circumscribing circle P is 1 cm. Circles A and B are tangent at P, the centre of the circumscribing circle. Circle D is tangent to circles A, C and P. Find the radius of the circle D.

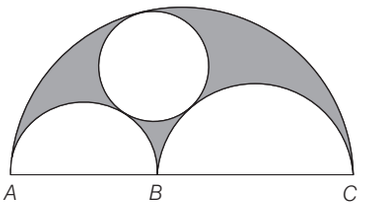


(a) $\frac{1}{6}$ cm (b) $\frac{1}{2}$ cm
(c) $\frac{2}{15}$ cm (d) $\frac{1}{8}$ cm

154 There are three circles, with radii 1 cm, 2 cm and 3 cm, tangent to each other. Find the radius of the fourth circle, which is tangent to all the existing circles.

(a) 6 cm (b) $\frac{23}{6}$ cm
(c) $\frac{6}{23}$ cm (d) both (a) and (c)

155 In the following diagram, a semicircle of radius r inscribes two semicircles, which are tangent to each other at a point B on the diameter AC of the larger semicircle. Then there is a full circle inscribed in the remaining area, which is tangent to all the three existing semicircles. Find the radius of this full circle, if the diameter $AB = \frac{1}{3}$ cm and $BC = \frac{2}{3}$ cm.



(a) $\frac{1}{7}$ cm
(b) $\frac{1}{9}$ cm
(c) $\frac{2}{15}$ cm
(d) none of these

TEST OF LEARNING

1 Let ABC be a triangle such that $\angle ACB = \frac{\pi}{6}$ and let a, b and c denote the lengths of sides opposite A, B and C respectively. Find the values of x for which $a = (x^2 + x + 1)$, $b = (x^2 - 1)$ and $c = (2x + 1)$.

(a) $-(2+\sqrt{3}), (2+\sqrt{3})$
(b) $-(2+\sqrt{3}), (2-\sqrt{3})$
(c) $(-2+\sqrt{3}), (1+\sqrt{3})$
(d) $-(2+\sqrt{3}), (1+\sqrt{3})$

2 Let a, b and c be the sides of a triangle. No two of them are equal and $\lambda \in R$. If the roots of the equation

$$x^2 + 2(a + b + c)x + 3\lambda(ab + bc + ca) = 0$$

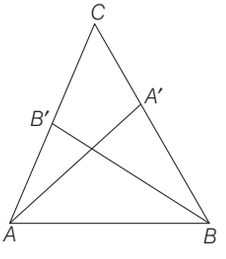
are real, then

(a) $\lambda < \frac{4}{3}$ (b) $\lambda > \frac{5}{3}$
(c) $\frac{1}{3} < \lambda < \frac{5}{3}$ (d) $\frac{4}{3} < \lambda < \frac{5}{3}$

3 Which of the following best describes the value of k, if a, b and c are the lengths of the sides of the triangle and $k = \frac{a^2 + b^2 + c^2}{ab + bc + ca}$?

(a) $1 \le k < 2$ (b) $0 \le k < 2$
(c) $0 < k < \frac{9}{8}$ (d) $1 \le k \le 2$

4 In a triangle ABC, the median AA' and BB' are perpendicular to each other. Let $BC = a$, $AC = b$ and $AB = c$, which of the following is/are true?



(a) $5c^2 = a^2 + b^2$
(b) $\frac{a}{2} < b < 2a$
(c) $a < b < 2a$
(d) both (a) and (b)

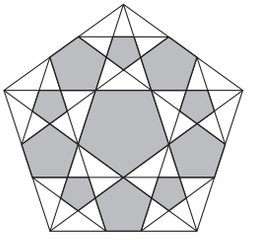
5 In a right angle triangle, x and y are the perpendicular sides and z is the hypotenuse. Find the minimum value of $\frac{z}{x} + \frac{z}{y}$.

(a) $2+\sqrt{2}$ (b) $\frac{1}{2\sqrt{2}}$ (c) $3\sqrt{2} - 2\sqrt{3}$ (d) $2\sqrt{2}$

6 In a triangle ABC, the median BD yields $\angle BDC = 45°$ and $\angle ABD = \angle BCD = x°$. Find the value of x.

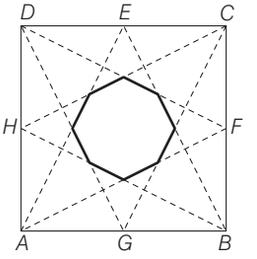
(a) 45° (b) 30°
(c) 60° (d) none of these

7 In the following diagram a regular pentagon is intersected by various diagonals forming another pentagon at the center, then by drawing parallel lines to the sides of the original pentagon while making them pass through the vertices of the newly created central pentagon we form another set of 10 pentagons. Thus we can see there are four sizes of pentagons – one is the original size, second one is at the centre, the third ones are sharing the respective edges of the original pentagon and the fourth ones are the smallest in size. If each edge of the smallest shaded pentagon is 2 cm, what is the total area of all the shaded pentagonal regions?



(a) $(\sqrt{5(5+2\sqrt{5})})(16+4\sqrt{5})\,\text{cm}^2$
(b) $(\sqrt{5(5-2\sqrt{5})})(4+15\sqrt{5})\,\text{cm}^2$
(c) $(\sqrt{5(5+2\sqrt{5})})(4+15\sqrt{5})\,\text{cm}^2$
(d) none of the above

8 In the following figure A, B, C and D are the four vertices of the square and E, F, G and H are the four mid-points of the sides of the square $ABCD$. If each side of the square be a, then how many of the following statements are correct about the octagon formed at the centre by joining the mid-points with the opposite vertices?



(i) It's an equiangular octagon
(ii) It's an equilateral octagon
(iii) It's a regular octagon
(iv) It's each side is $\frac{\sqrt{5}a}{12}$
(v) It's each side is $\frac{a}{2(\sqrt{4+2\sqrt{2}})}$

(a) 1 (b) 2 (c) 3 (d) 4

9 A straight line through the vertex of a triangle PQR intersects the side QR at the point S and the circumcircle of the triangle PQR at the point T. If S is not the centre of the circumcircle, then

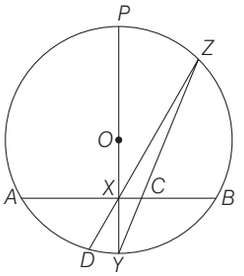
(i) $\frac{1}{PS} + \frac{1}{ST} < \frac{2}{\sqrt{QS \times SR}}$ (ii) $\frac{1}{PS} + \frac{1}{ST} > \frac{2}{\sqrt{QS \times SR}}$
(iii) $\frac{1}{PS} + \frac{1}{ST} < \frac{4}{QS}$ (iv) $\frac{1}{PS} + \frac{1}{ST} > \frac{4}{QR}$

(a) (i) and (iii) (b) (ii) and (iv)
(c) (i) and (iv) (d) (ii) and (iii)

10 Let $ABCD$ be a square of side length 2 units. Let C_1 be the incircle and C_2 be the circumcircle of the square $ABCD$. If P is a point on C_1 and Q is a point on C_2, the value of $\frac{PA^2 + PB^2 + PC^2 + PD^2}{QA^2 + QB^2 + QC^2 + QD^2}$ is

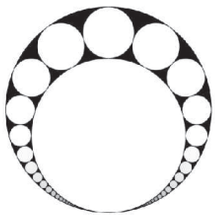
(a) 0.75 (b) 1.25 (c) 1 (d) 0.5

11 In a circle with centre O, the diameter PY is perpendicular to chord AB, as shown in the following figure. Find the correct relation between $\overline{DX}$ and $\overline{CY}$.



(a) $\overline{XD} \geq \overline{CY}$ (b) $\overline{XD} \leq \overline{CY}$
(c) $\overline{XD} = \overline{CY}$ (d) Can't be determined

12 In the following diagram, a circle of radius 1/3 unit is internally tangent to another circle of radius 1/4 unit. The region between these two circles is shaded in black. Within the shaded region there are numerous circles inscribed in such a way that each such triangle is tangent to at least 3 other triangles. If there are total 25 circles drawn in the shaded region, while maintaining the symmetricity, find the sum of curvatures of all the 25 circles.

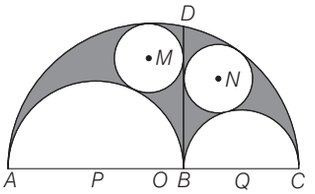


(a) 2500 (b) 1600 (c) 1444 (d) 1786

13 A circle C_1 with diameter 1/25 cm is tangent to X-axis at (2/5, 0) and the other circle with diameter 1/49 cm is tangent to X-axis at (3/7, 0). Moreover, these two circles are on the same side of X-axis and tangent to each other. There is another circle C_3 which is tangent to both of these circles and tangent to X-axis. Find, the distance between the Y-axis and the point of tangent of the circle C_3 on X-axis.

(a) $\frac{26}{35}$ (b) $\frac{57}{144}$ (c) $\frac{17}{36}$ (d) $\frac{35}{84}$

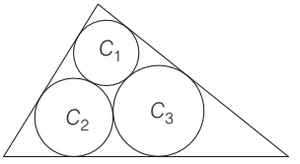
14 In the following diagram a semicircle with centre O inscribes two semicircles with centers P and Q, which are tangent to each other at a point B on the diameter AC of the larger semicircle. $AB = p$ and $BC = q$ are the diameters of the inscribed semicircles, respectively. A perpendicular BD is drawn from D to B. D is a point on the largest semicircle. There are two circles with centre M and N inscribed on the different sides of BD such that these circles are tangent to BD as well as tangent to an inscribed semicircle and the largest semicircle. If the radii of these circles M and N be m and n, respectively, which of the followings is/are correct?



(i) $m > n$ (ii) $m = n$
(iii) $m < n$ (iv) $m + n = \frac{2pq}{p+q}$

(a) only (i) is correct (b) only (iii) is correct
(c) (ii) and (iv) are correct (d) none of these

15 There are three circles inscribed in a triangle such that each circle is tangent to the other two circles and the two sides of the triangle. Let r_1, r_2 and r_3 be the radii or circles C_1, C_2 and C_3, find the inradius of the triangle inscribing these three circles.



(a) $\frac{\sqrt{r_1 r_2 r_3}}{r_1 + r_2 + r_3 - 2\sqrt{r_1 + r_2 + r_3}}$

(b) $\frac{2\sqrt{r_1 r_2 r_3}}{r_1 + r_2 + r_3 - \sqrt{3}\sqrt{r_1 + r_2 + r_3}}$

(c) $\frac{2\sqrt{r_1 r_2 r_3}}{r_1 + r_2 + r_3 - \sqrt{r_1 + r_2 + r_3}}$

(d) none of the above

Hints & Solutions

☑ Introductory Exercise 12.1

1 $4x + 5x = 180° \Rightarrow x = 20°$
($4x$ and $5x$ are linear pair angles)

2 $(5x + 12) + 3x = 180° \Rightarrow x = 21°$

3 $105 + 3x = 180 \Rightarrow x = 25$
and $y + 90 + 2x = 180° \Rightarrow y = 40°$
$\therefore x + y = 65°$

4 $2x + 2y = 180 \Rightarrow x + y = 90°$
$\therefore \angle COD = 90°$

5 $\angle DOE = 180 - (40 + 31) = 109°$
and $\angle BOF = 40°$ $(\because \angle AOE = \angle BOF)$
$\therefore \angle BOC = \angle BOF + \angle FOC$
$= 40 + 109$ $(\because \angle FOC = \angle DOE)$
$= 149°$

6 $2y + 3x = 180 \Rightarrow y = 36°$ $(\because x = 36°)$
or $x + 4y = 180° \Rightarrow y = 36°$ $(\because x = 36°)$

7 $(2x + 17) + (x + 4) = 90°$
$\Rightarrow 3x + 21 = 90° \Rightarrow x = 23°$

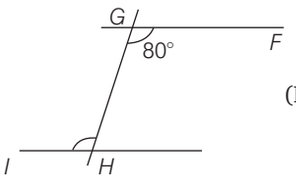
8 $(5y + 62)° + (22° + y) = 180$
$\Rightarrow 6y + 84 = 180 \Rightarrow y = 16°$

9 $13x + 5x = 180° \Rightarrow x = 10°$
$\therefore 13x = 130°$

10 Let the angle be x, then its complementary angle be $(90 - x)$
$\therefore x - \frac{(90 - x)}{2} = 30 \Rightarrow x = 50$

Alternatively The best way is to solve through options.

11



(Pair of alternate angles)

12 $\frac{AG}{BH} = \frac{CE}{DF}$
$\frac{120}{100} = \frac{30}{DF} \Rightarrow DF = 25\,\text{cm}$

13 $65°50' + x = 90° = 89° 60'$ $(1° = 60')$
$\Rightarrow x = 89°60' - 65°50' = 24° 10'$

14 $123°45' + x = 180° = 179°60'$ $(1° = 60')$
$\Rightarrow x = 179° 60' - 123° 45'$
$\Rightarrow x = 56° 15'$

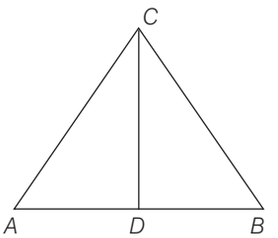
15 Since $x > 0$ and $y > 0$
Also, $x + y = 90°$
Therefore, $0 < x < 90$ and $0 < y < 90°$

16 Let the angle be x, then its supplement be $(180° - x)$.
$\therefore x = \frac{1}{5}(180° - x) \Rightarrow x = 30°$

Alternatively Go through options.
$30 = \frac{1}{5}(180° - 30°)$

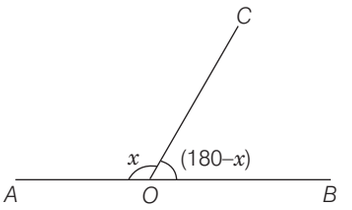
17 $a > \frac{90°}{6} \Rightarrow a > 15°$
$\because a + b = 180°$
$\therefore b < 165°$ $(\because a > 15°)$

18 $\because AC = BC$ and $AD = BD$



and CD is common
$\therefore \Delta CDA$ is similar to ΔCDB and AB is a straight line
$\therefore \angle CDA = \angle CDB = 90°$

20



21 $\angle ABP = \angle CDR = 100°$
$\therefore y = 80°$ $(\because \angle CDR + \angle CDS = 180°)$

22 $\angle APO = 42°$ and $\angle CQO = 38°$
$\angle POQ = \angle PON + \angle NOQ$
$= \angle APO + \angle OQC = 42° + 38° = 80°$

23 $\angle XYB = \angle YBC$ and $\angle XYB = \angle BYC$
$\Rightarrow \angle YBC = \angle BYC$

24 $\angle PGH = 80° \Rightarrow \angle QGH = 100°$
$\angle QHD = 120° \Rightarrow \angle CHQ = 60°$
$\therefore \angle x + 100 + 60 = 180° \Rightarrow x = 20°$

25 $\angle z = 180° - 110 = 70°$ $(\because \angle QAC = \angle BCA)$

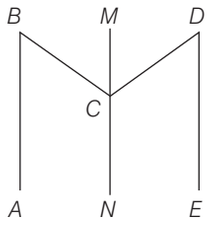
and $60° + y° + z° = 180°$

$\therefore$ $y = 180° - (70° + 60°)$

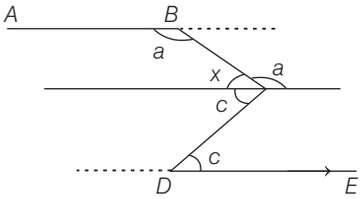
$y = 50°$

26 $\angle BCD = \angle BCM + \angle DCM$

$= \angle ABC + \angle EDC = 67° + 23° = 90°$



27 $a + x = 180°$; $c + x = b \Rightarrow x = b - c$



$\therefore$ $a + (b - c) = 180° \Rightarrow a + b - c = 180°$

28 $\angle x = \angle ABC = \angle CDG = 180° - 138° = 42°$

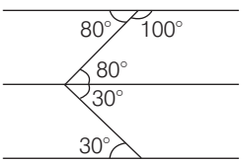
29 Use the same method as in question number 27.

i.e., $(a + b - c) = 180°$

$\Rightarrow$ $100° + (x + 10°) - 30° = 180°$

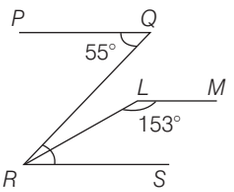
$\Rightarrow$ $x = 100°$

Alternatively



$\therefore$ $x + 10° = 80° + 30° \Rightarrow x = 100°$

30



$\angle PQR = \angle QRS$

$55° = \angle QRS \Rightarrow 55° = \angle QRL + \angle LRS$

$55° = 30° + \angle LRS \Rightarrow \angle LRS = 25°$

31 $\angle ABC = 180° - (40° + 65°)$

$\angle ABC = 75°$ and $\angle DCF = \angle ABC = 75°$

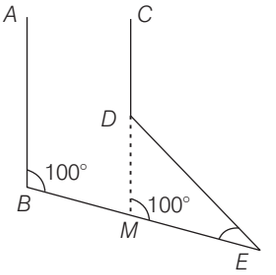
$\therefore$ $\angle EDC = 180° - \angle DCF = 105°$

32 Extend CD to M, then

$\angle DME = \angle ABE = 100° \Rightarrow \angle MED = 25°$

$\therefore$ $\angle MDE = 180° - (100° + 25°) = 55°$

$\therefore$ $\angle CDE = 180° - 55° = 125°$



33 $\angle CEF = \angle ABF = 70°$

$\therefore$ $\angle FED = 180° - 70° = 110°$

$\angle EDF + \angle DFE + \angle FED = 180°$

$\therefore$ $\angle FDE = 180° - (110° + 20°)$

$= 50°$

34 $\angle BAO = 180° - (60° + 35°) = 85°$

$\angle AOB = 180° - (85° + 20°) = 75°$

35 $\angle AEP = \angle CDP = 34°$

$\angle AEP + \angle BEF + \angle DEF = 180°$

$34° + 78° + \angle DEF = 180°$

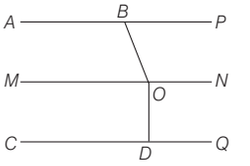
$\Rightarrow$ $\angle DEF = 68°$

36 $\angle AKH = \angle KHD = 25°$

$\angle EGH = \angle AKL = 180° - 60° = 120°$

$\therefore$ $\angle HKL = 120° + 25° = 145°$

38



$\angle ABO = 118°$

$\therefore$ $MOB = 180° - 118° = 62°$

$\therefore$ $\angle MOD = 152° - 62° = 90°$

$\therefore$ $\angle ODC = 180° - 90° = 90°$

39 Let $\angle BMN = 2x$

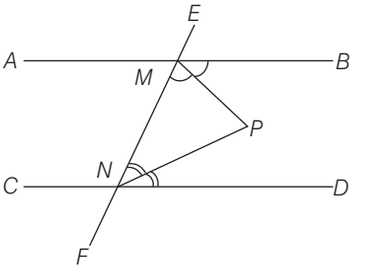
and $\angle DNM = 2y$

$\therefore$ $2x + 2y = 180°$

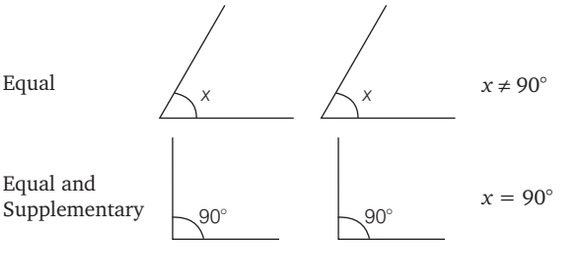
$\Rightarrow$ $x + y = 90°$

$\therefore \angle MPN = 180° - 90°$

$= 90°$



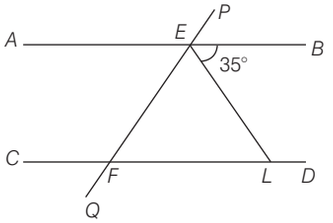
40



41 $\angle BEF = 2\angle BEL = 70°$

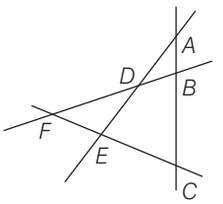
$\therefore \quad \angle CFQ = \angle EFL = 180° - 70°$

$= 110°$



44 ${}^4C_3 = \frac{4!}{3!1!} = \frac{4 \cdot 3 \cdot 2 \cdot 1}{3 \cdot 2 \cdot 1 \cdot 1} = 4$

45 ${}^4C_2 = \frac{4!}{2!2!} = \frac{4 \cdot 3 \cdot 2 \cdot 1}{(2 \cdot 1) \cdot (2 \cdot 1)} = 6$



☑ Introductory Exercise 12.2

1 The sum of the smaller sides cannot be equal to or less than the largest side.

2 $12^2 > 8^2 + 6^2 \quad \Rightarrow$ obtuse triangle

3 Sum of exterior angles = 360°

4 $\angle ACD = \angle CBA + \angle BAC = 70° + 40° = 110°$

5 $\angle ABC + \angle ACB < 90°$

6 $x + 4x + 7x = 180°$

$\Rightarrow \quad x = 15°$

$\therefore \quad 7x = 105°$

7 $\angle OBC + \angle OCB = \frac{70}{2} + \frac{30}{2} = 50°$

$\therefore \quad \angle BOC = 180° - 50° = 130°$

8 $\angle BFC = 90° - \frac{1}{2}(\angle A)$

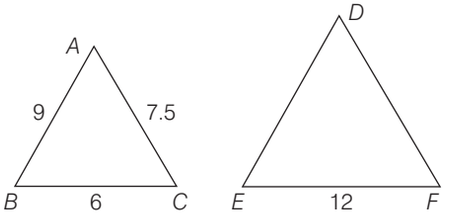
$= 90° - \frac{1}{2}[180° - (80° + 30°)]$

$= 55°$

10 Prove with the help of similarity.

11 Prove with the help of the similarity.

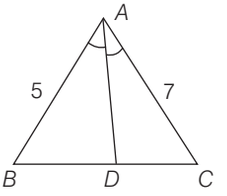
12 $\Delta ABC \sim \Delta DEF$



$\therefore \quad \frac{AB}{BC} = \frac{DE}{EF}$

$\Rightarrow \quad \frac{9}{6} = \frac{DE}{12} \Rightarrow DE = 18$ cm

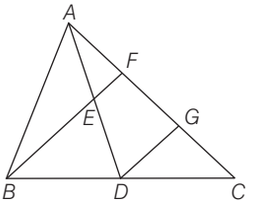
13 $\frac{AB}{AC} = \frac{BD}{CD} = \frac{5}{7}$ (By angle bisector theorem)



14 Let's draw a line segment DG, which is parallel to the line segment BF, such that G lies on AC.

Now look at the ΔADG, where $EF \parallel DG$, so we have

$$\frac{AF}{FG} = \frac{AE}{DE} = \frac{1}{1}$$



Now, let's have a look at the ΔBFC, where $BF \parallel DG$, so we have

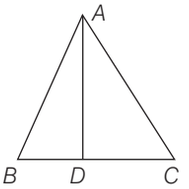
$$\frac{FG}{GC} = \frac{BD}{BC} = \frac{1}{1}$$

Thus we can say that $AF : FG : GC = 1 : 1 : 1$

Therefore, $AF : FC = 1 : 2$

15 AB is hypotenuse and AD is perpendicular in ΔABD,

$\therefore \quad AB > AD$

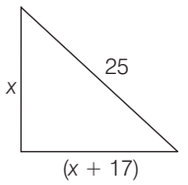


16 $x^2 + (x-17)^2 = 25^2$

(Using Pythagoras theorem)

$\therefore \quad x = 24$ cm

$\therefore$ Altitude + Base = 24 + 7 = 31 cm



17 Go back to the basics.

18 $\angle ACB = 180° - 100° = 80°$

and $\angle BAC + \angle ABC = 180° - 80° = 100°$

$\therefore \quad \angle ABC = 50° \quad (\because \angle BAC = \angle ABC)$

20 $\cos A = \dfrac{b^2 + c^2 - a^2}{2bc}$ (cosine rule)

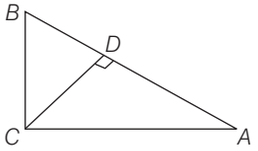
$\dfrac{1}{2} = \dfrac{b^2 + c^2 - a^2}{2bc} \quad (\because \cos 60° = 1/2)$

$\therefore \quad a^2 = b^2 + c^2 - bc$

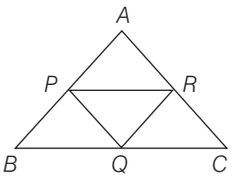
21 $\cos C = \dfrac{a^2 + b^2 - c^2}{2ab}$

$-\dfrac{1}{2} = \dfrac{a^2 + b^2 - c^2}{2ab} \Rightarrow c^2 = a^2 + b^2 + ab$

22 $\dfrac{1}{p^2} = \dfrac{1}{a^2} + \dfrac{1}{b^2}$ (Apply similarity of triangles)

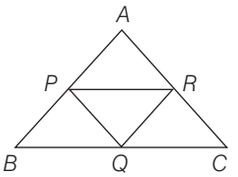


27



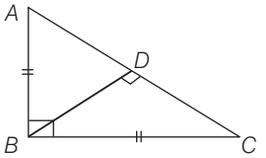
33 There are 4 congruent triangles.

Hence, $A(\Delta ABC) = 6 \times 4 = 24\ \text{cm}^2$



34 $BD = \dfrac{AB \times BC}{AC}$

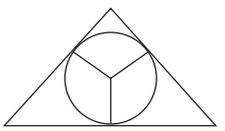
$= \dfrac{6 \times 6}{6\sqrt{2}} = 3\sqrt{2}$ cm



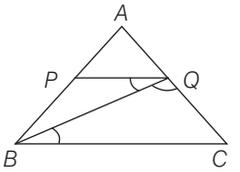
36 $\angle BOC = 90° + \dfrac{1}{2}\angle A$

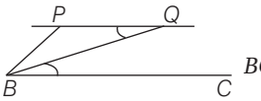
$= 90° + 40° = 130°$

37



42



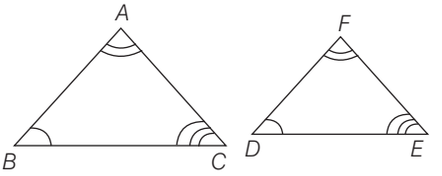


i.e., BQ is a transversal of PQ and BC.

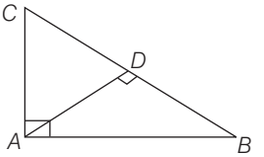
45 Apply Pythagoras theorem.

46 Apply Pythagoras theorem.

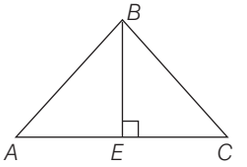
47



48 $\dfrac{BD}{CD} = \dfrac{(AB)^2}{(AC)^2}$



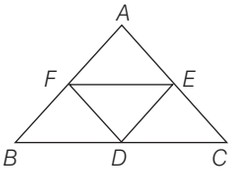
49 Apply Pythagoras theorem



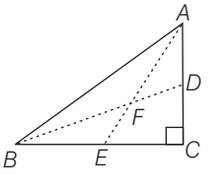
50 $EF = 3$ cm $\quad \therefore BC = 6$ cm

$FD = 4$ cm $\quad \therefore AC = 8$ cm

$AB = 10$ cm $\quad \therefore DE = 5$ cm



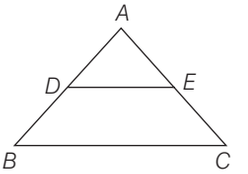
51



52 $\dfrac{AB}{AC} = \dfrac{AD}{AE}$

$\dfrac{3.6}{2.4} = \dfrac{2.1}{AE}$

$\Rightarrow \quad AE = 1.4$ cm



54 $\angle EAB = \angle OAB = 60°$

$\angle ABD = 45°$

$\therefore \quad \angle AOB = 180° - (60° + 45°) = 75°$

55 $\angle LBN = \angle BAC = \angle BCA = 70°$

$\therefore \quad \angle ABC = 180° - (70° + 70°) = 40°$

56 $\angle ECB = 60° + 90° = 150°$

$\therefore \quad \angle CEB + \angle EBC = 180° - 150° = 30°$

$\therefore \quad \angle BEC = 15° \qquad (\because \angle BEC = \angle EBC)$

$\therefore \quad \angle DEC = 60°$

$\therefore \quad \angle DEM = 60° - 15° = 45°$

57 $\angle ABQ = \angle EAY$

$\Rightarrow \quad 20 + y = 60 \Rightarrow y = 40°$

Now, $\angle BAD = 180 - (60 - 35) = 85°$

$\therefore \quad \angle ADB = 180 - (\angle BAD + \angle ABD)$

$\Rightarrow \quad \angle ADB = 180 - 105 = 75°$

58 $\angle ACB = 42° = \angle ECD$

$\therefore \quad \angle CED = 180° - (58° + 42°) = 80° = \angle FEG$

$\therefore \quad \angle FGE = 180° - (66° + 80°) = 34°$

59 $\angle BAD = 70°$

$\therefore \quad \angle BDA = 180° - (70° + 50°) = 60°$

60 $\dfrac{2x}{x} = \dfrac{3y + 8}{2y} \Rightarrow y = 8$

$\therefore \quad x = 2y = 16$

61 $\angle BCD = 27°$

$\angle BDC = 180° - (27° + 27°) = 126°$

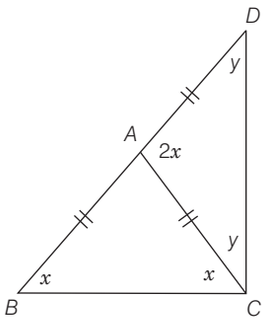
$\therefore \quad \angle ADC = 54° = \angle DAC$

$\therefore \quad \angle ACD = 180° - (54° + 54°) = 72°$

62 Let us consider that $\angle ABC = x$, therefore $\angle ACB = x$

Since $\angle CAD$ is the external angle of ΔABC, therefore, $\angle CAD = 2x$

Now, we know that $AC = AD$, therefore $\angle ACD = \angle ADC = y$



But, since sum of al the angles of $\Delta ACD = 180°$, therefore $2x + y + y = 180°$

$\Rightarrow \quad x + y = 90°$

Thus, we have $\angle BCD = \angle ACB + \angle ACD$

$\Rightarrow \quad \angle BCD = x + y = 90°$

63 By mid point theorem, we can say that

$$\frac{AE}{AC} = \frac{AD}{AB} \Rightarrow \frac{AE}{AC} = \frac{AD}{(AD + BD)}$$

$\Rightarrow \quad \dfrac{AE}{5} = \dfrac{3}{10}$

$\Rightarrow \quad AE = 1.5$

64 $\dfrac{PB}{BR} = \dfrac{AP}{AQ}$

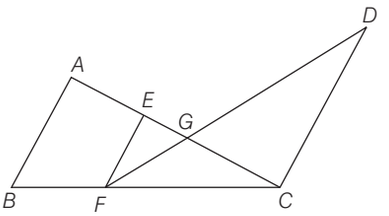
$\Rightarrow \quad \dfrac{PB}{BR} = \dfrac{2\sqrt{2}}{3\sqrt{2}} = \dfrac{2}{3}$

$\because \quad \dfrac{PB}{BR} = \dfrac{2x}{3x} \therefore BR = 6 \text{ cm}$

65 Since $EF \parallel DC$, so we have

$$\frac{EF}{DC} = \frac{EG}{CG} = \frac{FG}{DG} \Rightarrow \frac{EF}{18} = \frac{5}{10}$$

$\Rightarrow \quad EF = 9$



Now, since ΔABC and ΔEFC are similar triangles, therefore $\dfrac{AC}{AB} = \dfrac{EC}{EF}$

$\Rightarrow \quad \dfrac{AC}{15} = \dfrac{15}{9}$

$\Rightarrow \quad AC = 25$

66 Since ΔPQD and ΔABD are similar, therefore

$$\frac{QD}{BD} = \frac{PQ}{AB} \qquad \ldots(i)$$

Similarly, ΔBPQ and ΔBCD are similar, therefore

$$\frac{BQ}{BD} = \frac{PQ}{CD} \qquad \ldots(ii)$$

By adding equations (i) and (ii), we will have

$$\frac{BD}{BD} = PQ\left(\frac{1}{AB} + \frac{1}{CD}\right)$$

$\Rightarrow \quad \dfrac{1}{PQ} = \dfrac{AB + CD}{AB \times CD}$

$\Rightarrow \quad PQ = \dfrac{AB \times CD}{AB + CD} = \dfrac{xy}{x + y}$

Hence, choice (c) is the correct one.

Alternatively Consider $AB = CD = 2$, then by ladder theorem $PQ = 1$. Now substitute the values of x, y, z in the given options, you will see that only choice (d) is valid. In this question, z plays no role, so it's irrelevant.

Alternatively Apply cross Ladder Theorem, we have

$$\frac{1}{PQ} = \frac{1}{AB} + \frac{1}{CD}$$

$$= \frac{1}{x} + \frac{1}{y} = \frac{xy}{x + y}$$

Hence choice (c) is the correct one.

67 Apply similarity of triangles, $\Delta ADB \sim \Delta CDA$

$$\frac{AD}{BD} = \frac{CD}{AD}$$

$$\Rightarrow \quad \frac{3}{4} = \frac{CD}{3}$$

$$\Rightarrow \quad CD = 2.25$$

70 Since, $CF \parallel AD$, so we have,

$\angle FCA = \angle DAC = x$ and $\angle AFC = \angle MAD = x$.

Therefore, $\angle AFC = \angle FCA = x$

Thus, we can conclude that in the ΔAFC the two sides are equal.

That is $AF = AC$.

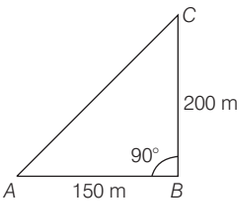
Again, since $CF \parallel AD$, so we have,

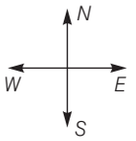
$$\frac{AB}{AF} = \frac{BD}{CD}$$

$$\Rightarrow \quad \frac{AB}{AC} = \frac{BD}{CD} \qquad (\because AF = FC)$$

71 $\Delta ABD \cong \Delta CBD$

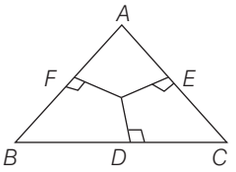
73





$$AC = \sqrt{AB^2 + BC^2}$$

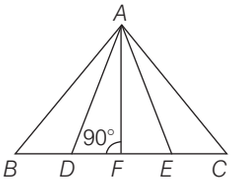
74



75 $BD = 2DF$

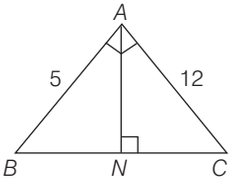
$AB^2 = BF^2 + AF^2$

and $AD^2 = DF^2 + AF^2$

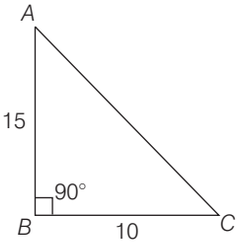


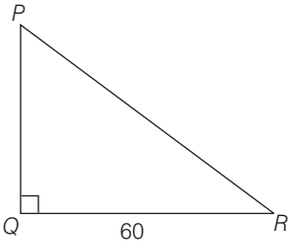
76 $$\frac{A(\Delta ANC)}{A(\Delta ANB)} = \frac{\frac{AN \times NC}{2}}{\frac{AN \times BN}{2}}$$

$$= \frac{NC}{NB} = \frac{\frac{(12 \times 12)}{13}}{\frac{5 \times 5}{13}} = \frac{144}{25}$$



77 $$\frac{AB}{BC} = \frac{PQ}{QR} \Rightarrow \frac{15}{10} = \frac{PQ}{60}$$





78 16 : 81

79 $$\frac{BC}{PQ} = \frac{AC}{AP} = \frac{AB}{AQ}$$

80 $$\frac{3}{x-3} = \frac{x-5}{3x-19} \Rightarrow x = 8 \text{ or } 9$$

81 $$h = \frac{\sqrt{3}}{2}\text{ side} = \frac{\sqrt{3}}{2} \times 2a = a\sqrt{3}$$

82 $$\frac{AB}{AC} = \frac{BD}{CD} \Rightarrow \frac{5}{AC} = \frac{2}{3} \Rightarrow AC = 7.5\text{ cm}$$

83 $$\frac{AB}{QR} = \frac{PB}{PR} \Rightarrow \frac{3}{9} = \frac{PB}{6} \Rightarrow PB = 2\text{ cm}$$

84 $$\frac{AO}{BO} = \frac{AQ}{BP}$$

$$\frac{10}{6} = \frac{AQ}{9} \Rightarrow AQ = 15\text{ cm}$$

85 $$\frac{AB}{AC} = \frac{AD}{AE} \Rightarrow \frac{12}{15} = \frac{6}{AE}$$

$$\therefore \quad AE = 7.5\text{ cm}$$

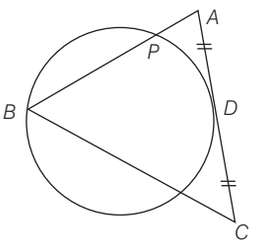
86 $AB = AC$ and $AD = CD$

$\therefore \quad AB = 2AD$

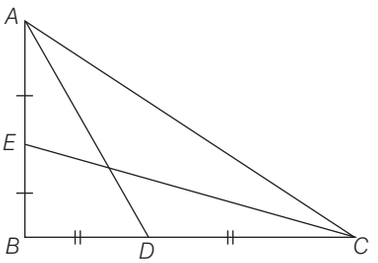
Now, since AD is a tangent

$\therefore \quad AD^2 = AP \times AB$

$$\left(\frac{AB}{2}\right)^2 = AP \times AB \Rightarrow AB = 4AP$$



87 $AC = 5\text{ cm} \Rightarrow AD = \frac{3\sqrt{5}}{2}\text{ cm}$



$AE = BE$ and $BD = CD$

$AB^2 = AC^2 - BC^2 = 25 - BC^2$ …(i)

and $AB^2 = AD^2 - BD^2 = \left(\frac{3\sqrt{5}}{2}\right)^2 - BD^2$

$= \frac{45}{4} - \frac{BC^2}{4}$ …(ii)

From eq. (i) and (ii)

$BC^2 = \frac{55}{3}$

Now, from eq. (i)

$AB^2 = 25 - \frac{55}{3} = \frac{20}{3}$

Also $CE^2 = BE^2 + BC^2 = \left(\frac{1}{2}AB\right)^2 + BC^2$

$= \frac{AB^2}{4} + BC^2 = CE^2 = \frac{5}{3} + \frac{55}{3} = \frac{60}{3} = 20$

$\therefore$ $CE = 2\sqrt{5}$ cm

88 By Apollonius theorem

$AB^2 + AC^2 = 2(AD^2 + BD^2)$ $(BD = CD)$

$100 + 196 = 2(AD^2 + 36)$

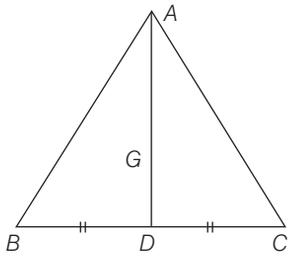
$\Rightarrow$ $AD^2 = 112$

$\therefore$ $AD = 4\sqrt{7}$

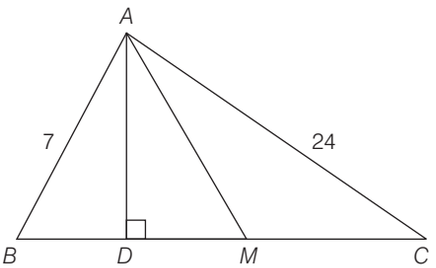
Now, since $\frac{AG}{GD} = \frac{2}{1}$

$\Rightarrow$ $AG = \frac{2}{3}AD$

$\therefore AG = \frac{2}{3} \times 4\sqrt{7} = \frac{8}{3}\sqrt{7}$ cm



89 Since AM is the median of a right angled triangle.



$\therefore$ $AM = \frac{BC}{2} = \frac{25}{2}$ and $AD = \frac{AB \times AC}{BC} = \frac{7 \times 24}{25}$

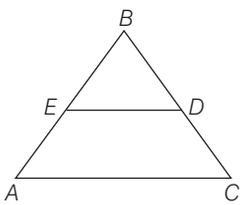
$\therefore$ $\frac{AD}{AM} = \frac{7 \times 24 \times 2}{25 \times 25} = \frac{336}{625}$

90 $\Delta BED \sim \Delta BAC$

$\therefore$ $\frac{BE}{BA} = \frac{ED}{AC} = \frac{BD}{BC} = \frac{1}{2}$

$\therefore$ $\frac{A(\Delta BED)}{A(\Delta BAC)} = \left(\frac{1}{2}\right)^2 = \frac{1}{4}$

$\therefore$ $A(\Delta BDE) = 7.5\,\text{cm}^2$



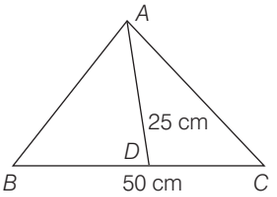
91 Apply Pythagoras theorem.

NOTE The sides given in option (d) cannot form any type of triangle.

92 $\frac{AB}{BD} = \frac{AC}{CD} \Rightarrow \frac{12}{BC + CD} = \frac{8}{CD}$

$\frac{12}{4 + CD} = \frac{8}{CD}$ $\Rightarrow$ $CD = 8$ cm

93 $AB^2 + AC^2 = 2\left[AD^2 + \left(\frac{BC}{2}\right)^2\right]$ (Appollonius theorem)



$2500 = 2\left[625 + \left(\frac{BC}{2}\right)^2\right] \Rightarrow BC = 50$ cm

94 $\angle BAC = 15°$

$\therefore$ $\angle BCA = 15°$ $(\because AB = BC)$

$\therefore$ $\angle ABC = 180° - (15° + 15°) = 150°$

$\therefore$ $\angle ABD = 30°$ $(180° - 150°)$

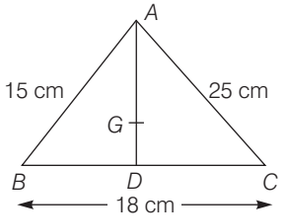
$\therefore$ $\sin 30° = \frac{AD}{AB}$

$\frac{1}{2} = \frac{AD}{AB}$ $\Rightarrow$ $AD = 5$ cm $(\because AB = 10$ cm$)$

$\therefore$ Area of $\Delta ABC = \frac{1}{2} \times BC \times AD$

$= \frac{1}{2} \times 10 \times 5 = 25\,\text{cm}^2$

95 $AB^2 + AC^2 = 2(AD^2 + BD^2)$



$\therefore$ $225 + 625 = 2(AD^2 + 81)$

$\Rightarrow$ $AD^2 = 344$

$\Rightarrow$ $AD = 2\sqrt{86}$ and $GD = \frac{1}{3}AD$

$\therefore$ $GD = \frac{2}{3}\sqrt{86}$ cm

96 $\angle BDE = 115°$

$\therefore$ $\angle ADE = 65°$ and $\angle AED = 75°$

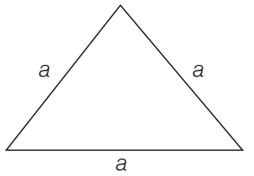
$\therefore$ $\Delta AED \sim \Delta ABC$

$\therefore \quad \frac{DE}{BC} = \frac{AE}{AB} = \frac{AD}{AC}$

$\therefore \quad \frac{2}{3} = \frac{10}{AB}$

$\Rightarrow \quad AB = 15\,\text{cm}$

97 For the given perimeter of a triangle the maximum area is enclosed by an equilateral triangle.



$\therefore \quad 3a = 24\,\text{cm}$

$\Rightarrow \quad a = 8\,\text{cm}$

$\therefore \quad \text{Area} = \frac{\sqrt{3}}{4}a^2 = \frac{\sqrt{3}}{4} \times (8)^2 = 16\sqrt{3}\ \text{cm}^2$

98 $\Delta ADE \sim \Delta ACB$ (A-A-A property)

$\therefore \quad \frac{AE}{AB} = \frac{AD}{AC}$

$\frac{10}{20} = \frac{12}{AC}$

$\Rightarrow \quad AC = 24\,\text{cm}$

$EC = AC - AE = 24 - 10 = 14\,\text{cm}$

99 $\angle ACD = \angle ADC = x$

$\therefore \quad \angle CAD = (180° - 2x)$

$\angle ABC = \angle BAC = \frac{x}{2}$

$(\because \angle ABC + \angle BAC = \angle ACD = x)$

$\therefore \quad \angle BAC + \angle CAD + 81° = 180°$

$\therefore \quad \frac{x}{2} + (180° - 2x) + 81° = 180°$

$\therefore \quad \frac{3}{2}x = 81°$

$\Rightarrow \quad x = 54°$

Alternatively Applying the same process go through options.

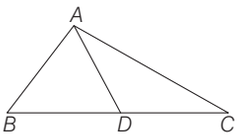
100 It is value (side) dependent *i.e.,* it is different for different triangles unlike the case of equilateral triangle.

101 Let $\angle ACB = x$

$\Rightarrow \quad \angle CAD = x$

$\Rightarrow \quad \angle ADB = 2x$

$\Rightarrow \quad \angle ABD = 2x$



But since $\angle BAC = \angle ABC$

$\Rightarrow \quad \angle BAC = 2x$

$\Rightarrow \quad \angle BAD = x$

$\therefore \angle BAC + \angle ABC + \angle ACB = 180°$

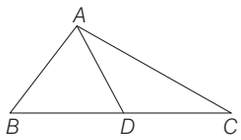
$\Rightarrow \quad 2x + x + x = 180°$

$\Rightarrow \quad x = 36°$

Hence choice (c) is the correct one.

102 As AD is the angle bisector, so

$\frac{AB}{AC} = \frac{BD}{DC}$



Further, since AD is the median, so

$BD = CD = k$ (say)

$\therefore \quad \frac{AB}{AC} = \frac{BD}{DC} = \frac{k}{k} = 1$

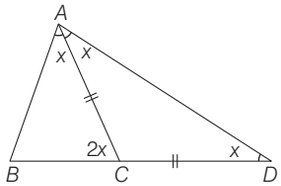
$\Rightarrow \quad AB = AC = 15\,\text{cm}$

Hence choice (c) is the correct one.

103 Let $\angle BAC = x$, then $\angle ACB = 2x$. Now, extend BC till a point D such that when A and D are connected $\angle CAD$ becomes equal to $\angle BAC$.

But since $\angle ADC + \angle DAC = \angle ACB$

$\Rightarrow \quad \angle ADC = x$



Therefore, $AC = DC = 4$ cm. And,

so $BD = BC + CD = 10$ cm

Now you can see that ΔBAC and ΔBDA are similar triangles.

Therefore,

$\frac{AB}{BC} = \frac{BD}{AB}$

$\Rightarrow \quad \frac{AB}{6} = \frac{10}{AB}$

$\Rightarrow \quad AB = \sqrt{60} = 2\sqrt{15}\,\text{cm}$

Hence choice (d) is the correct one.

104 Since BD is the angle bisector of $\angle ABC$, therefore

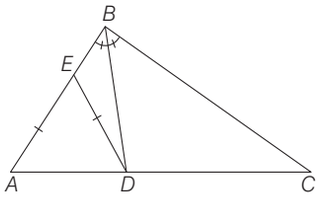
$\frac{AB}{BC} = \frac{AD}{CD} \Leftrightarrow AD = \frac{(AB)(CD)}{BC}$

But, it is given that

$\frac{(BD)(BC)}{CD} = \frac{(BE)(AB)}{AE}$

$\Rightarrow \quad \frac{(BD)(BC)}{(CD)(AB)} = \frac{BE}{AE}$

$$\Rightarrow \quad \frac{BD}{AD} = \frac{BE}{AE}$$



It implies that DE is the angle bisector of $\angle ADB$.

$\therefore \quad \angle BDE = \angle EDA = \angle EAD = x°$ (say)

$\therefore \quad \angle BDA + \angle DAB + \angle ABD = 2x + x + 66 = 180°$

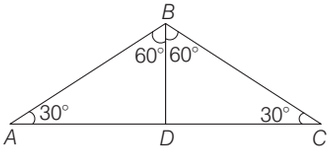
$\Rightarrow \quad x = 38°$

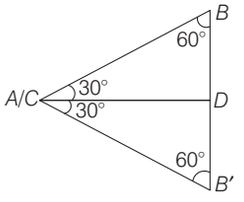
$\Rightarrow \quad \angle BAD = 38°$ and $\angle ACB = 28°$

$\therefore \quad \angle BAD - \angle ACB = 10°$

Hence choice (a) is the correct one.

105 Consider the following figures. If you cut the first figure from the mid-point of its base along its altitude BD and then rotate it clockwise about the point D by 180°, then you will get an equilateral triangle, in which points A and C will overlap. Now it would become very easy to find the area of the given triangle as even though the shape of the triangle changes but its area remains the same.





The area of the equilateral triangle $= \frac{\sqrt{3}}{4} \times a^2 = \frac{\sqrt{3}}{4}$

$(\because a = 1)$

Hence choice (a) is the correct one.

Alternatively Consider the first figure. Since the triangle is an isosceles one, so the sides AB and AC would be of same length. And so the two angles BAC and BCA would be 30° each.

As the triangle ABC is an isosceles one, so the perpendicular dropped from the angle B on the opposite side AC will bisect the side AC as well as the angle ABC.

Then there will be two congruent triangles ABD and CBD. Now using 30-60-90 degree theorem (or trigonometric ratios) we can find the base $AD = DC = \frac{\sqrt{3}}{2}$ and altitude $BD = \frac{1}{2}$.

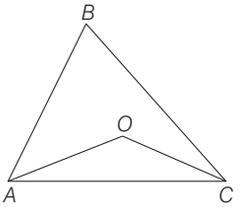
Therefore area of $\Delta ABC = \frac{1}{2} \times AC \times BD$

$$= \frac{1}{2} \times \sqrt{3} \times \frac{1}{2} = \frac{\sqrt{3}}{4}$$

Alternatively Consider the first figure. Using 30-30-120 degree theorem or Cosine rule/Sine rule, we will have $AC = \sqrt{3}$ unit. After this we can use the formula for area of a triangle $\sqrt{s(s-a)(s-b)(s-c)}$, where s is the semiperimeter of the triangle and a, b, c are the sides of it.

106 $\angle AOC = 180 - \frac{1}{2}(\angle BAC + \angle BCA)$

$\Rightarrow \quad (\angle BAC + \angle BCA) = 112°$

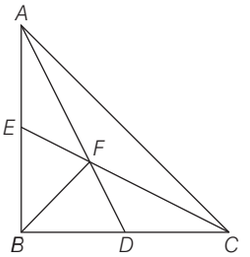


and $\quad \angle ABC = 180° - (\angle BAC + \angle BCA)$

$\Rightarrow \quad \angle ABC = 180° - 112 = 68°$

Hence choice (c) is the correct one.

107 First of all, let's connect B to F. Now, we can easily figure out that the area of $\Delta BFD = \Delta CFD = x$, as the base and height of these two triangles are same. Similarly, we can find out that area of $\Delta AEF = \Delta BFE = y$.



But, we know that area of $\Delta ABD = \Delta EBC$.

Therefore, $2x + y = x + 2y$

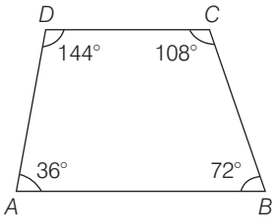
$\Rightarrow \quad x = y$

Therefore, area of $\Delta AEF = x$ and area of quadrilateral $BEFD = 2x$.

Hence choice (c) is the correct one.

☑ Introductory Exercise 12.3

1 $x + 2x + 3x + 4x = 360 \Rightarrow x = 36$



$\therefore$ The angles of quadrilateral (in order) are

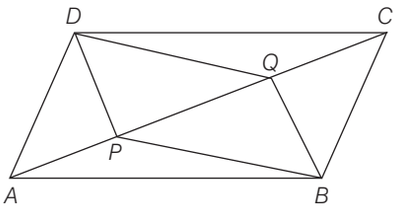
$36°, 72°, 108°, 144°$

Since opposite angles are supplementary, therefore $AB \| CD$. Hence it is a trapezium.

2 $3x + 4x + 5x + 6x = 360° \Rightarrow x = 20 \quad \therefore \quad 6x = 120°$

Hence, the largest angle of a quadrilateral is 120°.

3

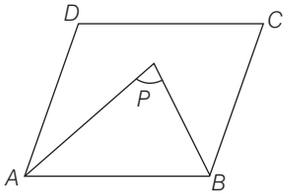


4 $\angle DAB = 2x \Rightarrow \angle ABC = 2y$

$2x + 2y = 180 \Rightarrow x + y = 90°$

i.e., $\angle PAB + \angle PBA = 90°$

$\therefore \quad \angle APB = 90°$



5 Prove that opposite sides are parallel, and diagonals are equal. Also all the interior angles are right angle.

6 $\angle BCE = 102°$ and $\angle ECD = 60°$

$\therefore \angle BCD = 102° + 60° = 162°$

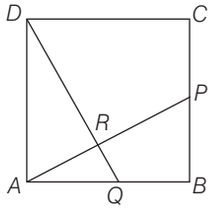
7 $\because \quad \Delta ADQ \cong \Delta BAP$

and $\angle DCP = 90°$

$\angle CDR$ and $\angle CPR$ are supplementary

$\therefore \quad \angle DCP + \angle DRP = 180°$

$\therefore \quad \angle DRP = 90°$

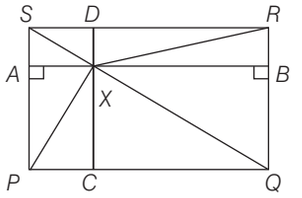


8 Area of $\Delta SXP = \dfrac{(SP)\times(AX)}{2}$

$A(\Delta RXQ) = \dfrac{(RQ)\times(BX)}{2}$

$A(\Delta SXR) = \dfrac{(SR)\times(DX)}{2}$

$A(\Delta PXQ) = \dfrac{(PQ)\times(CX)}{2}$



Area of $\Delta SXP + RXQ = \dfrac{SP \times AX}{2} + \dfrac{RQ \times BX}{2}$

$= \dfrac{1}{2}(l \times b)$ …(i)

where $SP = RQ = b$ and $PQ = SR = l$

and $AX + BX = AB = PQ = SR = l$

and Area of $\Delta SXR + PXQ = \dfrac{(SR)\times(DX)}{2} + \dfrac{(PQ \times CX)}{2}$

$= \dfrac{(SR)\times(DX)}{2} + \dfrac{(SR)\times(CX)}{2}$

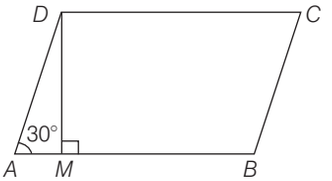
$= \dfrac{SR}{2}(DX + CX)$

$= \dfrac{l}{2} \times b = \dfrac{lb}{2}$ …(ii)

From eqs. (i) and (ii), we find that option (c) is correct.

9 $AD = BC = 20$ cm

$AB = 20$



In ΔADM, $\dfrac{DM}{AD} = \sin 30° = \dfrac{1}{2}$

$\therefore \quad DM = \dfrac{1}{2}AD = 10$ cm

$\therefore$ Area of parallelogram = base × height

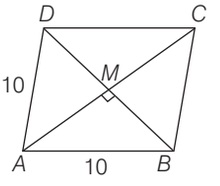
$= 20 \times 10 = 200 \text{ cm}^2$

10 Let $DB = 12$ m

$\therefore \quad BM = 6$ m

$\therefore \quad AM = \sqrt{10^2 - 6^2}$

$AM = 8$ m



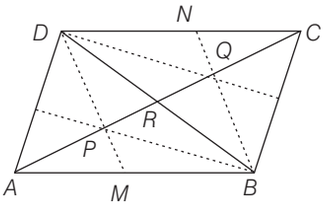
(**Remember:** Diagonals bisects each other at right angles)

(**Bisect:** Divide equally into two parts)

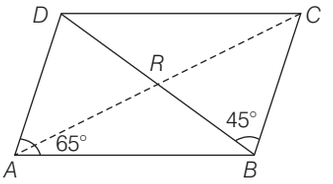
$\therefore \quad AC = 8 \times 2 = 16$ m

11 $\angle BCD = \angle DAB = 65°$

$\therefore$ $CDB = 180° - (65° + 45°) = 70°$



12 Let AC and BD bisects each other at R, then $AP = 2PR$ and $QC = 2RQ$



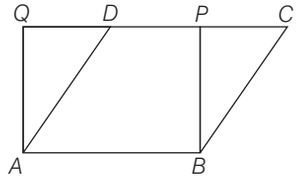
($\because$ AR and CR are the medians of ΔADB and ΔBDC)

and $AP = QC$ and $PR = RQ$ ($\because \Delta DAB \cong \Delta BCD$)

$\therefore$ $AP = PQ$

13 Since their base and perpendicular heights are same.

14 $ABCD$ is a parallelogram and $ABPQ$ is a rectangle having same base and equal perpendicular height. Therefore the area of both is same.



Now, since $AD > AQ$

and $BC > BP$

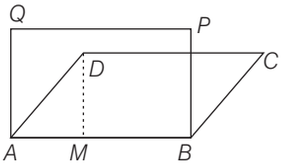
$\therefore$ $2(AB + BC) > 2(AB + BP)$

$\therefore$ Perimeter of parallelogram > perimeter of rectangle.

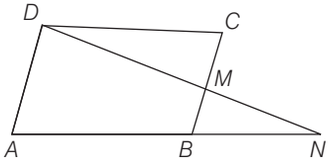
15 $AB = CD = PQ = l$

and $AQ = BP = AD = CB = b$

Bases of rectangle $ABPQ$ and parallelogram $ABCD$ is same, but perpendicular heights of parallelogram is less than that of rectangle. Therefore area of parallelogram is less than that of rectangle.



16 $AD = 2BM$ and $AD \parallel BM$

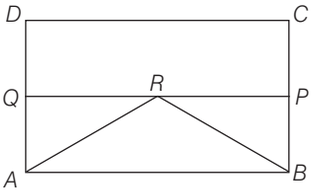


$\therefore$ From mid-point theorem

$\therefore$ $\dfrac{NM}{ND} = \dfrac{NB}{NA} = \dfrac{BM}{AD} = \dfrac{1}{2}$

$\therefore$ $AN = 2AB$

17 $A(\square ABPQ) = \dfrac{1}{2} A(\square ABCD)$

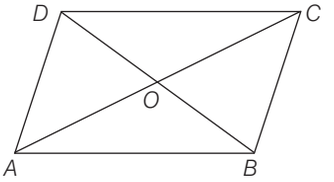


and $A(\Delta ARB) = \dfrac{1}{2} A(\square ABPQ)$

$\therefore$ $A(\Delta ARB) = \dfrac{1}{4} A(\square ABCD)\left[A(\Delta ARB) = \dfrac{1}{2} \times AB \times BP\right]$

18 Let $BD = 6$ m and $AC = 8$ m

$\therefore$ $AO = 4$ m and $BO = 3$ m



Let $AB = 5$ m $\quad \therefore \angle AOB = 90°$

$\Rightarrow$ $\angle BOC = \angle AOD = \angle DOC = 90°$

$\therefore$ BC is also 5 m.

Hence, $ABCD$ is a rhombus

$\therefore$ Area of rhombus $ABCD = \dfrac{AC \times BD}{2} = \dfrac{6 \times 8}{2} = 24\ \text{m}^2$

19 $BD = \sqrt{15^2 + 20^2} = 25$ cm

(ΔABD is right angled triangle)

$\therefore \Delta BCD$ is equilateral triangle.

$\therefore$ Area of $ABCD$ = Area of ΔABD + Area of ΔBCD

$= \dfrac{1}{2} \times 15 \times 20 + \dfrac{\sqrt{3}}{4} \times (25)^2 = \dfrac{25}{4}(24 + 25\sqrt{3})\ \text{cm}^2$

20. $\dfrac{BE}{AB} = \sin 30° = \dfrac{1}{2}$

$\therefore$ $BE = \dfrac{1}{2} \times AB = 6\ \text{cm} = CF$

and $\dfrac{CF}{DF} = \tan 45° = 1$

$\therefore$ $DF = CF = 6$ cm

and $\dfrac{AE}{AB} = \cos 30° = \dfrac{\sqrt{3}}{2}$

$\therefore$ $AE = 6\sqrt{3}$ cm

$\therefore$ $AD = AE + EF + FD = 6\sqrt{3} + 6 + 6$

$= 6(2 + \sqrt{3})\ \text{cm}^2$

Area of trapezium $ADCB = \dfrac{1}{2} \times (AD + BC) \times BE$

$= \dfrac{1}{2} \times [6(2 + \sqrt{3}) + 6] \times 6$

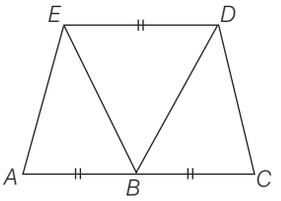
$= \dfrac{6}{2}(2 + \sqrt{3} + 1) \times 6 = 18 \times (3 + \sqrt{3}) = 18(3 + \sqrt{3})\ \text{cm}^2$

21 $A(\Delta ABE) = A(\Delta BDE)$

$= A(\Delta BCE)$

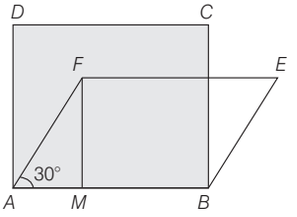
$A(\Delta ABC) = \frac{1}{3} A(\square ACDE)$

$= \frac{1}{3} \times 36 = 12\,\text{cm}^2$



22 $ABCD$ is a square and $ABEF$ is a rhombus.

$$\frac{FM}{AF} = \sin 30° = \frac{1}{2} \Rightarrow FM = \frac{AF}{2}, \quad AF = AB$$



Area of square $= a^2$ $\quad (AB = AD = a)$

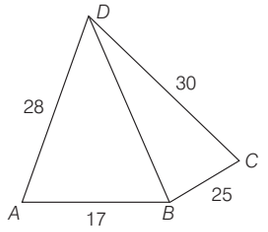
Area of rhombus $= \frac{a \times a}{2}$ $\quad \left(FM = \frac{a}{2}\right)$

(Area of rhombus = base × height)

$\therefore$ $\frac{\text{Area of square}}{\text{Area of rhombus}} = \frac{2}{1}$

23 Area of quadrilateral = Area of ΔABD + Area of ΔBCD

where $BD = 26$ cm



Hint Apply Hero's formula :

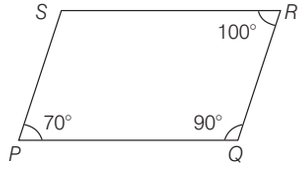
$$\text{Area of } \Delta = \sqrt{s(s-a)(s-b)(s-c)}$$

where $s = \frac{a+b+c}{2}$

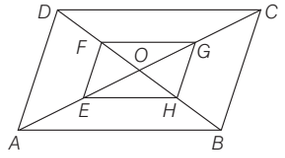
24 It is not possible.

$\because \angle P + \angle R = 170° \neq 180°$

$\therefore$ The given quadrilateral is not cyclic so there is no any point in the given plane which is equidistant from its vertices.



25 By mid-point theorem,

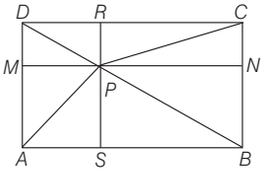


$$\frac{EF}{AD} = \frac{FG}{DC} = \frac{GH}{BC} = \frac{EH}{AB} = \frac{1}{2}$$

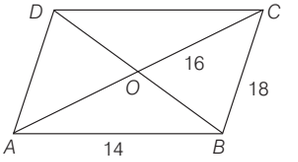
26 Since diagonals bisect each other at right angles and all sides are equal.

Apply Pythagoras theorem or Apollonius theorem.

27 Use Pythagoras theorem



28 Apply Apollonius theorem.



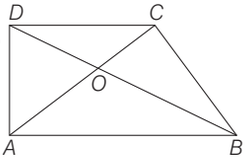
$$AB^2 + BC^2 = 2(BO^2 + AO^2)$$

$\Rightarrow$ $AB^2 + BC^2 = 2(BO^2 + 64)$

$\Rightarrow$ $196 + 324 = 2(BO^2 + 64)$

$\therefore$ $BO^2 = 196 \Rightarrow BO = 14\,\text{cm} \Rightarrow BD = 2BO = 28\,\text{cm}$

29 Consider the following diagram, where AB is parallel to CD and AC and BD act as transversal lines.



$\angle AOB = \angle COD$ (Opposite angles)

$\angle OAB = \angle OCD$ (Alternate angles)

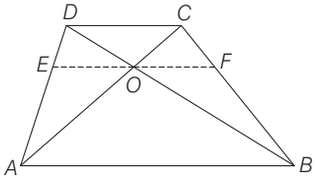
$\angle ABO = \angle CDO$ (Alternate angles)

$\therefore$ $\Delta AOB \sim \Delta COD$ (AAA similarity)

Therefore $\frac{AB}{CD} = \frac{AO}{OC} = \frac{BO}{OD}$

Hence choice (d) is correct.

30 Let us consider the following diagram. Where $AB \,||\, CD \,||\, EF$. Further, let us consider $AB = m$ and $CD = n$, we have, $\frac{OA}{OC} = \frac{m}{n}$ and $\frac{OB}{OD} = \frac{m}{n}$.



But, $EF = \frac{(AB)n + (CD)m}{m+n} = \frac{(m)n + (n)m}{(m+n)}$

$= \frac{2mn}{m+n} = \frac{2(AB)(CD)}{(AB+CD)}$

Therefore, $EF = \frac{2(AB)(CD)}{(AB+CD)}$

$= \frac{2(6 \times 2)}{6+2} = 3\,\text{cm}$

Hence choice (a) is the correct one.

☑ Introductory Exercise 12.4

1 Each interior angle $= 140°$

$\therefore$ Exterior angle $= 180° - 140° = 40°$

$\therefore$ Number of sides $= \dfrac{360°}{\text{Exterior angle}} = \dfrac{360°}{40°} = 9$

Alternatively It can be checked easily through options.

2 Exterior angle of a regular hexagon $= \dfrac{360°}{6} = 60°$

$\therefore$ Interior angle $= 180° - 60° = 120°$

3 $\therefore$ Interior angle of pentagon $= 180° - \dfrac{360°}{5} = 108°$

$\therefore$ Interior angle of required polygon $= 5 / 6 \times 108° = 90°$

$\therefore$ Each exterior angle of the requird polygon

$= 180° - 90° = 90°$

$\therefore$ Number of sides $= \dfrac{360°}{\text{Exterior angle}} = \dfrac{360°}{90°} = 4$

Alternatively Best way is to go through options.

4 Sum of all the interior angles $= (n - 2)\,180°$

$1260° = (n - 2)\,180°$

$\Rightarrow \quad n = 9 \quad (n \rightarrow$ number of sides)

5 Interior angle $= 3 \times$ exterior angle

$$180° - \frac{360°}{n} = 3 \times \left(\frac{360}{n}\right) \Rightarrow n = 8$$

Alternatively Best way is to go through options.

6 Go through option. Exterior angle $= \dfrac{360°}{6} = 60°$

Interior angle $= 180° - 60° = 120°$

Difference between interior angle and exterior angle

$= 120° - 60° = 60°$

7 $\dfrac{n\ (n-3)}{2} = 54° \quad \Rightarrow \quad n^2 - 3n = 108° \quad \Rightarrow \quad n = 12$

Alternatively Put the value of n from the choices given below.

8 Go through options. Let us consider the correct option (d).

Number of sides	5	:	10
Exterior angle =	72°		36°
Interior angle =	$180° - 72°$		$180° - 36°$
	$(= 108°)$		$(= 144°)$
	3	:	4

Hence, option (d) is correct.

9 Go through options

Alternatively Sum of al exterior angles $= 360°$

$\therefore$ Sum of interior angles $= 4 \times 360° = 1440°$

$\therefore \quad 1440° = (n - 2)\,180°$

$\Rightarrow \quad n = 10$ (no. of sides)

10 Exterior angle $= \dfrac{360°}{9} = 40°$

Interior angle $= 180° - 40° = 140°$

$\therefore$ Interior angle : exterior angle $= 140° : 40 = 7 : 2$

11 Let us consider a square which has 4 sides ans 2 diagonals and each interior angle 90°. So it has $k = \dfrac{1}{2}$.

If you put $\theta = 90°$ in choice (c) you will get $k = \dfrac{1}{2}$, but in other choices k would not be equal to $\dfrac{1}{2}$.

Else, you can assume another polygon say a regular hexagon which has 6 sides and 9 diagonals and each interior angle 120°. So it has $k = \dfrac{3}{2}$.

So, if you put $\theta = 120°$ in choice (c) you will get $k = \dfrac{3}{2}$, but in other choices you won't get $k = \dfrac{3}{2}$.

These two tests suggest that choice (c) is the correct answer.

Hence choice (c) is the correct answer.

Alternatively In an n-sided polygon the number of diagonals $= \dfrac{n(n-3)}{2}$

Therefore, $\quad nk = \dfrac{n(n-3)}{2}$

$\Rightarrow \quad k = \dfrac{(n-3)}{2}$

But, number of sides,

$$n = \frac{(n-2)\pi}{\theta} \Rightarrow \frac{2\pi}{\pi - \theta}$$

Therefore, $\quad k = \dfrac{(n-3)}{2}$

$$= \frac{\left(\dfrac{2\pi}{\pi - \theta}\right) - 3}{2} \Rightarrow k = \frac{3\theta - \pi}{2(\pi - \theta)}$$

12 In ΔEAD, $\angle AED = 108°$ and $EA = ED$,

$\therefore \quad \angle EAD = \angle EDA = 36°$

It implies that $\angle DAB = 108 - 36 = 72°$

Similarly, in ΔDCB, $\angle DCB = 108°$

and $\quad CD = CB$,

$\therefore \quad \angle CDB = \angle CBD = 36°$

It implies that $\angle DBA = 108 - 36 = 72°$

$\therefore \quad \angle ADB = 180 - (72 + 72) = 36°$

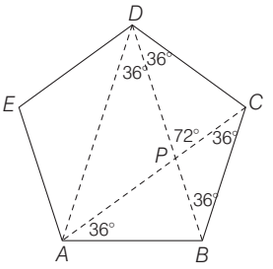
Hence choice (a) is the correct one.

13 In ΔACB, $\angle ABC = 108°$ and $AB = BC$,

$\therefore \quad \angle BAC = \angle BCA = 36°$

Similarly, in ΔDCB, $\angle DCB = 108°$ and $CD = CB$,

$\therefore \ \angle CDB = \angle CBD = 36°$



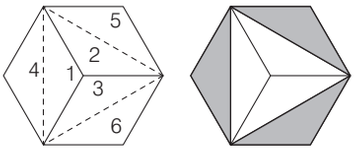
Now, in ΔBPC, $\angle PBC = \angle PCB = 36°$,

$\therefore \quad \angle BPC = 180 - (36 + 36) = 108°$

Thus, $\angle DPC = 180 - \angle BPC = 180 - 108 = 72°$

Hence choice (b) is the correct one.

14 Connect the centre of the hexagon with the three vertices of the given triangle, as shown below. Due to symmetricity there are now total 6 congruent triangles, with 30-30-120 degree angles. Out of 6 such triangles exactly 3 triangles are comprised in the given triangle.



So the required ratio $= \frac{3}{6} = \frac{1}{2}$

Hence choice (d) is the correct one.

☑ Introductory Exercise 12.5

1 $AC = \sqrt{OA^2 - OC^2} = \sqrt{(17)^2 - (8^2)} = 15\,\text{cm}$

$\therefore \quad AB = 2AC = 30\,\text{cm} \qquad (\because AC = BC)$

2 $AB = 8\,\text{cm}$

$\therefore \quad AM = 4\,\text{cm}$

and $\quad OA = 5\,\text{cm}$

$\therefore \quad OM = \sqrt{(OA)^2 - (AM)^2} = \sqrt{25 - 16} = 3\,\text{cm}$

3 $\because AB$ is the perpendicular bisector of OO'.

$\therefore \quad \angle OMA = 90°$

4 $AM : BM : 1 : 1$

5 $\angle AOC = \angle BOC \qquad (\because AC = BC)$

$\therefore OC$ is the perpendicular bisector of AB.

$\therefore \quad AM = BM$

6 $OA = 13\,\text{cm} \Rightarrow AM = 5\,\text{cm}$

$\therefore \quad OM = \sqrt{(13)^2 - (5)^2} = 12\,\text{cm}$

7 Degree measure of major arc $= 360° - 130° = 230°$

8 It is necessarily a rectangle.

9 $\angle ADC = 180° - 65° = 115°$

$\therefore \quad \angle DCA = 180° - (115° + 45°) = 20°$

($ADCB$ is a cyclic quadrilateral)

10 $\angle OBA = \angle OAB = 55°$

$\therefore \quad \angle AOB = 180° - (55° + 55°) = 70°$

and $\quad \angle AOB = \angle COD = 70°$

12 $\Delta BAP \sim \Delta CDP \quad (\because \angle A = \angle D$ and $\angle APB = \angle DPC)$

$\therefore \quad \frac{AB}{CD} = \frac{AP}{DP} = \frac{BP}{CP}$

$\therefore \quad AP \times PC = BP \times DP$

13 $\angle BDC = 180° - (110° + 30°) = 40°$

and $\quad \angle BAC = \angle BDC = 40°$ (angles of the same segment)

14 $\angle ABO = 60° = \angle BAO \ (\because AO = BO$, radii of the circle)

$\therefore \quad \angle AOB = 180° - (60° + 60°) = 60°$

$\therefore \quad \angle ACB = \frac{1}{2} \angle AOB = 30°$

15 $\angle CBA = \frac{1}{2} \angle COA = 60°$

$\therefore \quad \angle CBE = 180° - \angle CBA$

$180° - 60° = 120°$

16 $\angle BDA = 90° \Rightarrow \angle DBA = 50°$

$\therefore \quad \angle DAB = 180° - (90° + 50°) = 40°$

17 $\angle BAC = 60°$

$\therefore \quad \angle BEC = 180° - 60° = 120°$

18 $\angle ABD = 45° \quad \therefore \ \angle ACD = 45°$

19 $\angle BDC = \angle BAC = 30°$

$\therefore \ \angle BCD + \angle BDC + \angle DBC = 180°$

$\therefore \quad \angle BCD = 180° - (30° + 60°)$

$\angle BCD = 90°$

20 $\angle ADC = 140°$

$\therefore \quad \angle ABC = 40° \Rightarrow \angle ACB = 90°$

$\therefore \quad \angle BAC = 180° - (90° + 40°) = 50°$

21 $\angle CAB = \frac{1}{2} \angle BOC = \frac{1}{2} \times 40° = 20°$

22 $\angle OBA = \angle OAB = \left(\frac{180° - 80°}{2}\right) = 50°$

and $\quad \angle OCA = \angle OAC = \left(\frac{180° - 120°}{2}\right) = 30°$

$\therefore \quad \angle BAC = \angle BAO + \angle OAC = 50° + 30° = 80°$

23 $\angle ADC = \frac{100°}{2} = 50°$

$\therefore \quad \angle ABC = 180° - 50° = 130°$

$\therefore \quad \frac{m\angle ADC}{m\angle ABC} = \frac{50°}{130°} = \frac{5}{13}$

24 $\angle APB = 50^\circ \quad \left(\because m\angle APB = \frac{1}{2} m\angle AOB\right)$

$\therefore \quad \angle ACB = 180^\circ - 50^\circ = 130^\circ$

$\therefore \quad \angle BCD = 180^\circ - 130^\circ = 50^\circ$

25 $\angle ABC = 180^\circ - 120^\circ = 60^\circ$

$\angle ACB = 90^\circ$

$\therefore \quad \angle CAB = 180^\circ - (90^\circ + 60^\circ) = 30^\circ$

26 $\angle COD = \angle AOB = 70^\circ$

$\therefore \quad \angle OCD = \frac{180^\circ - 70^\circ}{2} = 55^\circ$

27 $\angle ABK = 180^\circ - (105^\circ + 40^\circ) = 35^\circ$

$\therefore \quad \angle ACD = \angle ABD = 35^\circ$

28 $\angle BAC = 80^\circ \quad (\because \angle ABC = \angle ACB = 50^\circ)$

$\therefore \quad \angle BDC = \angle BAC = 80^\circ$

29 $\angle ADB = 90^\circ$

$\therefore \quad \angle DBA = 20^\circ \quad [180^\circ - (90^\circ + 70^\circ)]$

$\therefore \quad \angle CBA = 30^\circ + 20^\circ = 50^\circ$

$\therefore \quad \angle CDA = 180^\circ - 50^\circ = 130^\circ$

$\therefore \quad \angle CDB = 130^\circ - 90^\circ = 40^\circ$

30 $\angle BAD = 80^\circ \ \therefore \ \angle DCE = 80^\circ$

31 $\angle AOC = 2 \times 50 = 100^\circ$

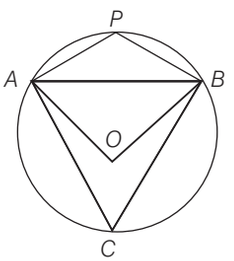
$\therefore \quad \angle ABC = \frac{100}{2} = 50^\circ$

NOTE There are some more ways to solve it. Find them.

32 $\angle AOB = 2\angle ACB = 2 \times 25 = 50^\circ$

33 $\angle APB = 180^\circ - \frac{1}{2} \times 90^\circ = 135^\circ$

$\left[\because \angle ACB = 45^\circ = \left(\frac{1}{2} \times 90^\circ\right) \right.$
$\left. \text{and } \angle APB + \angle ACB = 180^\circ \right]$



34 $OA = \sqrt{(OB)^2 - (AB)^2}$

$\therefore \quad OA = \sqrt{169 - 144} = 5\text{ cm}$

35 $PN \times PR = PQ^2 \Rightarrow PN \times 25 = (15)^2$

$\therefore \quad PN = 9\text{ cm}$

36 $TQ = TP \quad \text{and} \quad TP = TR$

$\therefore \quad TQ = TP = TR$

37 $\angle BAC = 90^\circ$

$\angle BCA = 60^\circ \quad (\because \angle BCA = BAQ)$

$\therefore \quad \angle ABC = 180^\circ - (90^\circ + 60^\circ)$

$\angle ABC = 30^\circ$

38 $\angle DBQ = 65^\circ$

$\therefore \quad \angle DAB = 65^\circ$

$\therefore \quad \angle DCB = 180^\circ - 65^\circ = 115^\circ$

39 $AP \times BP = DP \times CP$

$2 \times 6 = DP \times 3$

$\Rightarrow \quad DP = 4\text{ cm}$

40 $PA \times PB = PC \times PD$

$3 \times (3 + 5) = 2 \times PD$

$\therefore \quad PD = 12\text{ cm}$

$\therefore \quad CD = PD - PC = 12 - 2 = 10\text{ cm}$

41 $PT^2 = PA \times PB$

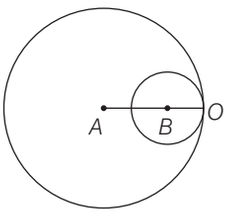
$5 \times 5 = 4 \times (4 + x)$

$\Rightarrow \quad x = \frac{9}{4}\text{ cm}, \qquad \text{where } AB = x$

42 Let they touch eachother at O and A, B be the centres of the two circles, then $OA = 13\text{ cm}$

and $OB = 5\text{ cm}$

$\therefore \quad AB = OA - OB = 8\text{ cm}$



43 $AB = 5\text{ cm} = x + y$

$BC = 6\text{ cm} = y + z$

$AC = 7\text{ cm} = z + x$

$\therefore \quad 2(x + y + z) = 5 + 6 + 7 = 18\text{ cm}$

$\Rightarrow \quad x + y + z = 9\text{ cm}$

$\Rightarrow x = (x + y + z) - (y + z) = 9 - 6 = 3\text{ cm}$

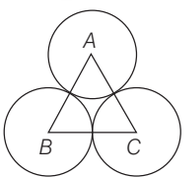
$\therefore \quad x + y = 5\text{ cm}$

$\therefore \quad y = 5 - x = 5 - 3 = 2\text{ cm}$

$\therefore \quad z = 6 - y = 6 - 2 = 4\text{ cm}$

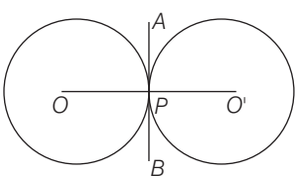
$\therefore \quad x = 3\text{ cm}$

$y = 2\text{ cm} \text{ and } z = 4\text{ cm}$



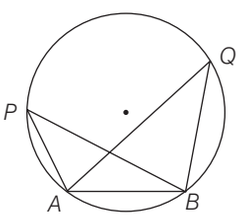
44 Prove with the help of property of tangents : "Tangents drawn from the same point on a circle are always equal."

45 Tangent is always perpendicular to the radius.



46 $\angle APB = \angle AQB$

when $\angle APB = \angle AQB = 90^\circ$



then they are supplementary. Also they are supplementary when they are in different segments.

47 $CD = 6$ cm

$\therefore$ $AC = 6$ cm and $BC = 6$ cm

($\because AC = CD$ and $BC = CD$. Two tangents from the same point are always equal.)

$\therefore$ $AB = 12$ cm

48 $\angle CAB = \angle BCD$

and $\angle DAB = \angle BDC$

$\therefore$ $\angle CAD = \angle CAB + \angle DAB = \angle BCD + \angle BDC$

$\Rightarrow$ $\angle CAD = \angle BCD + \angle BDC$

$\therefore$ $\angle CAD + \angle CBD = \angle BCD + \angle BDC + \angle CBD = 180°$

49 $AB = 24$ cm

$\therefore$ $AC = BC = 12$ cm

$OA = 20$ cm

$\therefore$ $OC = \sqrt{(OA)^2 - (AC)^2}$

$= \sqrt{400 - 144} = 16$ cm

and $O'A = 37$ cm

$\therefore$ $O'C = \sqrt{(O'A)^2 - (AC)^2}$

$= \sqrt{(37)^2 - (12)^2} = 35$ cm

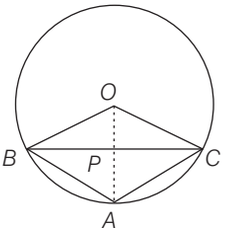
$\therefore$ $OO' = OC + CO' = 16 + 35 = 51$ cm

50 $AB = AC$, $OB = OC$

and BC is common and OA is common

also $\angle BOA = \angle COA$

$\therefore$ $\Delta BOA \cong \Delta COA$



$\therefore$ BC and OA are perpendicular bisector to each other

[Area of $\Delta = \sqrt{s(s-a)(s-b)(s-c)}$]

$$s = \frac{a+b+c}{2} = \frac{5+5+6}{2} = 8 \text{ cm}$$

Area of $\Delta BOA = \sqrt{8 \times 3 \times 3 \times 2} = 12 \text{ cm}^2$

Again area of $\Delta BOA = \frac{1}{2} OA \times BP = \frac{1}{2} \times 5 \times BP$

$$12 = \frac{1}{2} \times 5 \times BP$$

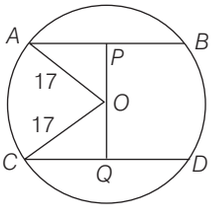
$\Rightarrow$ $BP = 4.8$ cm

$\therefore$ $BC = 2BP = 2 \times 4.8 = 9.6$ cm

51 $OA = OC = 17$ cm

$$AP = \frac{1}{2} AB = \frac{1}{2} \times 16 = 8 \text{ cm}$$

$\therefore$ $OP = \sqrt{OA^2 - AP^2} = 15$ cm



Now, $PQ = OP + OQ = 23$ cm

$\therefore$ $15 + OQ = 23$ cm

$\therefore$ $OQ = 8$ cm

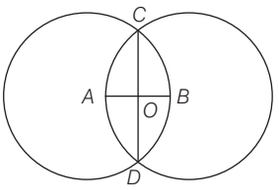
Again, $CQ = \sqrt{(OC)^2 - (OQ)^2} \Rightarrow CQ = \sqrt{(17)^2 - (8)^2}$

$\therefore$ $CQ = 15$ cm

$\therefore$ $CD = 2CQ = 30$ cm

52 $AB = r$ (say) then $AC = BC = r$, also

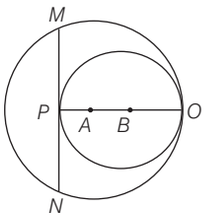
$\therefore$ $OA = OB = r/2$ (CD is a common chord)



$$\therefore OC = \sqrt{(AC)^2 - (OA)^2} = \sqrt{r^2 - \left(\frac{r}{2}\right)^2} = \sqrt{\frac{3r^2}{4}} = \frac{\sqrt{3}}{2} r$$

$$\therefore CD = 2CO = 2 \times \frac{\sqrt{3}}{2} r = \sqrt{3} r \therefore \frac{l(CD)}{l(AC)} = \frac{\sqrt{3} r}{r} = \frac{\sqrt{3}}{1}$$

53 Let A be the centre of larger circle and B be the centre of the smaller circle.



$OA = 3$ cm and $BO = 2$ cm

and $AB = (OA - OB) = 1$ cm

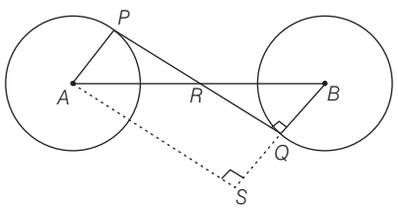
also $BP = 2$ cm $\therefore$ $AP = 1$ cm

P is the point of contact of tangent MN.

$\therefore$ $MP = \sqrt{AM^2 - AP^2} = \sqrt{3^2 - 1^2} = 2\sqrt{2}$ cm

$\therefore$ $MN = 2MP = 4\sqrt{2}$ cm

55. $PQ = AS$ (PQ is a transverse common tangent)



and $BS = BQ + SQ = BQ + AP$

$BS = 2BQ$ ($BQ = AP$ = radius)

$BS = 6$ cm

$\therefore$ $AS = \sqrt{(AB)^2 - (BS)^2} = \sqrt{(10)^2 - (6)^2} = 8$ cm

$\therefore$ $AS = 8$ cm $\therefore$ $PQ = 8$ cm

Alternatively The length of transverse common tangent

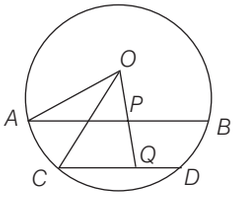
$= \sqrt{(\text{distance beween the centres})^2 - (r_1 + r_2)^2}$

$= \sqrt{(10)^2 - (3+3)^2} = 8$ cm

57 Inradius of an incircle of right angled triangle

$$= \frac{\text{Base} + \text{Altitude} - \text{Hypotenuse}}{2}$$

$$= \frac{4 + 3 - 5}{2} = 1 \text{ cm}$$



Alternatively

$$\text{Inradius} = \frac{\text{Area of triangle}}{\text{Semiperimeter of triangle}}$$

$$= \frac{(3 \times 4)/2}{(3 + 4 + 5)/2} = \frac{6}{6} = 1 \text{ cm}$$

58 Let AB and CD be the two chords, then $AB = 8$ cm and $CD = 6$ cm.

$\therefore$ $AP = 4$ cm and $CQ = 3$ cm and $PQ = 1$ cm (given)

Let $OP = x$

$\therefore$ $AO^2 = AP^2 + OP^2$

$\therefore$ $AO^2 = 4^2 + x^2 = 16 + x^2$ …(i)

and $OC^2 = CQ^2 + OQ^2$

$= CQ^2 + (OP + PQ)^2 = (3)^2 + (x + 1)^2$

$OC^2 = 9 + x^2 + 1 + 2x$ …(ii)

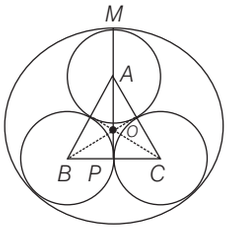
But $OA = OC$, are the radii of the same circle.

$\therefore$ $16 + x^2 = 9 + x^2 + 1 + 2x \Rightarrow x = 3$ cm

$\therefore$ $OA^2 = 16 + x^2 = 16 + 9 = 25$

$\therefore$ $OA = 5$ cm

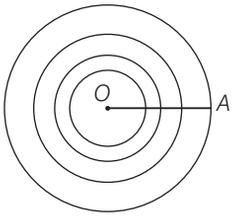
$\therefore$ Diameter of the circle $= 2(OA) = 10$ cm



59 $AB = BC = AC = 2$ cm

($\because$ radius of each circle = 1 cm)

$\therefore AP = \frac{\sqrt{3}}{2} \times 2 \Rightarrow AP = \sqrt{3}$ cm



Let O be the centroid, then

$$OA = \frac{2}{3} \times \sqrt{3} = \frac{2}{\sqrt{3}} \text{ cm}$$

and $AM = 1$ cm

$\therefore$ $OM = (2/\sqrt{3}) + 1 = 2 + \sqrt{3}/\sqrt{3}$ cm

OM is the radius of the larger circle.

$\therefore$ Area of the circumscribing circle

$$= \pi R^2 = \pi \times \left(\frac{2+\sqrt{3}}{\sqrt{3}}\right)^2 = \frac{\pi}{3}(2+\sqrt{3})^2$$

60 OA is the radius of the largest circle and O is the centroid of the all concentric circles. Let r_1, r_2, r_3 and r_4 be the radii of the concentric circles in increasing order then

Total area of given circle $= \pi \times (20)^2 = 400\pi$

Area of each region $= \frac{1}{4} \times 400\,\pi = 100\pi$

$\therefore$ Area of central region $= 100\pi = \pi r_1^2$

$\Rightarrow$ $r_1 = 10$ cm

Similarly, area of second region $= 100\pi = \pi\,(r_2^2 - r_1^2)$

$100\pi = \pi\,(r_2^2 - 100)$

$\Rightarrow$ $r_2 = 10\sqrt{2}$ cm

Again, area of third region $= 100\pi = \pi\,(r_3^2 - r_2^2)$

$100\pi = \pi\,(r_3^2 - 200) \Rightarrow r_3^2 = 10\sqrt{3}$cm

$\therefore$ The required radii are 10, $10\sqrt{2}$ and $10\sqrt{3}$.

61 $\angle DAB + \angle DCB = 180°$

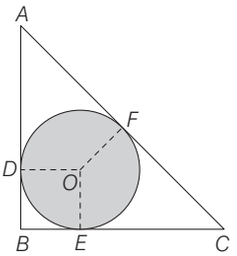
$\angle BAO + \angle OAD + \angle DCO = 180°$

$\angle 69° + (\angle OAD + \angle DCO) = 180°$

$\angle OAD + \angle DCO = 111°$

Hence choice (b) is the correct one.

62 $AC = \sqrt{2}$ cm, so $AB = BC = 1$ cm.



The inradius $OD = OE = OF$

$$= \frac{AB + BC - AC}{2} = \frac{2 - \sqrt{2}}{2} \text{ cm}$$

Therefore $DE = \sqrt{2}\left(\frac{2-\sqrt{2}}{2}\right)$

$= \sqrt{2} - 1$ cm

Hence choice (a) is the correct one.

63 Using Alternate segment theorem, we get

$\angle ABC = \angle QAC = 48°$

$\angle BAP = \angle ACB = 64°$

$\angle ABP = \angle ACB = 64°$

$\therefore \angle APB = 180 - (\angle BAP + \angle ABP) = 52°$

And $BAC = 180 - (\angle ACB + \angle ABC) = 68°$

Opposite angles of a cyclic quadrilateral are always supplementary, therefore

$\angle BDC = 180 - \angle BAC = 112°$

Now, $\angle CBP = \angle ABC + \angle ABP = 48° + 64° = 112°$

Thus, $\angle BDC + \angle CBP + \angle APB$

$= 112° + 112° + 52° = 276°$

Hence choice (b) is the correct answer.

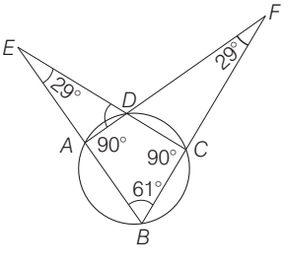
64 $\angle ECB = 180° - (\angle CEB + \angle EBC) = 90°$

But since A, B, C, D are cyclic, so $\angle DAB + \angle DCB$

$= 180° \Rightarrow \angle DAB = 90°$

Again, $\angle AFB = 180° - (\angle FAB + \angle FBA) = 29°$

Since, $\angle EAD = 180° - \angle BAD = 90°$



and $\angle EDA = 180° - (\angle DEA + \angle EAD) = 61°$

$\therefore$ $\alpha - \beta = 61 - 29 = 32°$

Hence choice (c) is the correct one.

Alternatively

$\alpha = \angle ADE = \angle ABC = 61°$

(As $\angle ADE + \angle ADC = \angle ABC + \angle ADC = 180°$)

$\therefore$ $\angle CDF = 61°$

and $\angle ACF = \angle BEC + \angle EBC = 90°$

($\angle ACE$ is an external angle of ΔEBC)

$\therefore \quad \beta = \angle CFD = 180° - (\angle CDF + \angle DCF)$

$= 180° - (61° + 90°) = 29°$

$\therefore \quad \alpha - \beta = 61° - 29° = 32°$

65 **Case I :** $\angle OBC = \angle OCB = 42°$

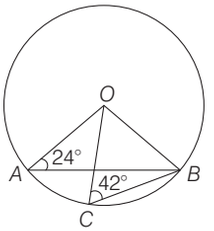
$\therefore \quad \angle BOC = 180 - 2(42°) = 96°$

and $\angle OBA = \angle OAB = 24°$

$\therefore \quad \angle AOB = 180 - 2(24°) = 132°$

Thus, $\angle AOC = \angle AOB - \angle BOC$

$\Rightarrow \quad \angle AOC = 132 - 96° = 36°$



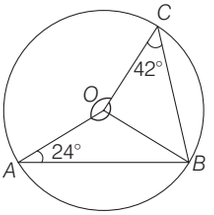
Case II : $\angle AOB = 180 - 2(24) = 132°$

and $\angle BOC = 180° - 2(42) = 96°$

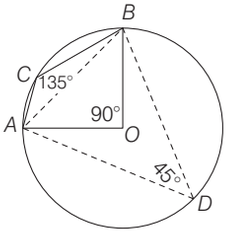
Thus, $\angle AOC = \angle AOB + \angle BOC$

$\Rightarrow \quad \angle AOC = 132 + 96 = 228°$

Hence choice (d) is the correct one.



66 First of all complete the circle as shown below. Draw the chord AB and consider an arbitrary point D lying on the major arc of the circle.



Now, central angle $AOB = 90°$, so the angle in the major segment due to the same chord AB is angle $ADB = 45°$.

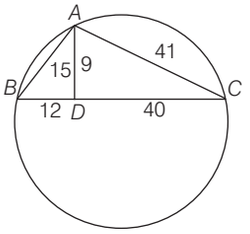
But since the quadrilateral $ADBC$ is a cyclic one, therefore

$\angle ACB + \angle ADB = 180°$

$\Rightarrow \quad \angle ACB + 45° = 180° \Rightarrow \angle ACB = 135°$

Hence choice (b) is the correct one.

67 Let's drop a perpendicular AD on BC, we will have two right angled triangles ΔADB and ΔADC.



By using Pythagoras theorem we can determine AD, BD and CD, as follows

$AD^2 = AB^2 - BD^2$

$= AB^2 - (BC - CD)^2$

$= 15^2 - (52 - CD)^2 \quad \ldots(i)$

Also, $AD^2 = AC^2 - CD^2$

$= 41^2 - CD^2$

Comparing eq. (i) and eq. (ii), we get

$CD = 40$ cm, $BD = 12$ cm and $AD = 9$ cm

Now, the area of triangle $ABC = \frac{1}{2} \times AD \times BC$

$= \frac{1}{2} \times 9 \times 52 = 234$ sq cm

Let us consider that the circumradius of the triangle is R and area is A, then we have

$A = \frac{abc}{4R}$

$\Rightarrow \quad 234 = \frac{15 \times 41 \times 52}{4R}$

$\Rightarrow \quad R = \frac{205}{6}$ cm

Therefore, the diameter of the circumcircle $= \frac{205}{3}$ cm

Hence choice (a) is the correct one.

68 Curvature of a circle

$= \frac{1}{\text{radius of the circle}} = \frac{1}{2} = 0.5$ cm

Hence choice (c) is the correct one.

69 Since the radius of a circle

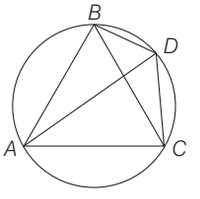
$= \frac{1}{\text{curvature of the circle}}$

Therefore, radii of the circles are $\frac{1}{0.5} = 2$ and $\frac{1}{2} = 0.5$

Thus the required distance between the centers of the circles $= 2 + 0.5 = 2.5$

Hence choice (a) is the correct one.

70 Draw the following diagram and you will find that $ABDC$ is a cyclic quadrilateral. However, the Ptolemy's theorem states that, "If a quadrilateral is inscribable in a circle then the product of the measures of its diagonals is equal to the sum of the products of the measures of the pairs of opposite sides."



Therefore, $AB \cdot CD + AC \cdot BD = BC \cdot AD$

$\Rightarrow \quad 30(CD) + 30(BD) = 30(AD)$

$\Rightarrow \quad CD + BD = AD$

$\Rightarrow \quad CD + BD = 32$ cm

Hence choice (b) is the correct one.

☑ Level 01 *Basic Level Exercise*

1 $\angle BAD = 180° - 130° = 50°$ ($\because$ $\square ABCD$ is cyclic)

and $\angle ADB = 90°$ (angle of semicircle)

$\therefore$ $\angle ABD = 180 - (90 + 50) = 40°$

2 $\angle ACB = 180 - (90 + 25) = 65°$ ($\because \angle ABC = 90°$)

But since $\angle ADB = \angle ACB$

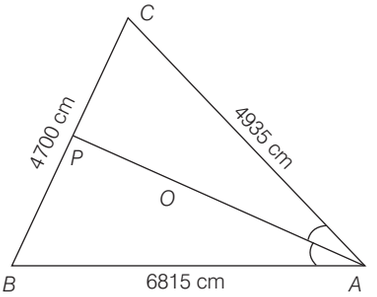
$\therefore$ $\angle ADB = 65°$

3 $\angle AOD = \angle ODC + \angle OCD$ ($\because \angle AOD$ is an external angle)

$= 52°$ ($\angle ODC = \angle OCD = 26°$)

($\because OD = OC$)

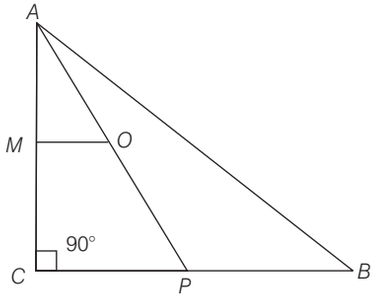
4 Note that $4700 : 4935 : 6815 = 20 : 21 : 29$



$\therefore \Delta ACB$ is right angled triangle and $\angle ACB$ is a right angle.

$\therefore$ The inradius of the right angled triangle

$$= \frac{20 + 21 - 29}{2} = 6 \text{ cm}$$



$\therefore$ $MO = MC = 6$ cm

$\therefore$ $AM = 21 - 6 = 15$ cm

$\therefore$ $\frac{AM}{MC} = \frac{AO}{OP} = \frac{15}{6} = \frac{5}{2} \Rightarrow \frac{PO}{AO} = \frac{2}{5}$

5 $CD = CP$ and $BE = BP$, since tangent from the same point are always same.

$\therefore$ $AE = AD$

Now, $AD = AC + CD = AC + CP$

and $AE = AB + BE = AB + BP$

$\therefore$ $AE + AD = AC + CP + AB + BP$

$2AE = AC + AB + (CP + BP)$

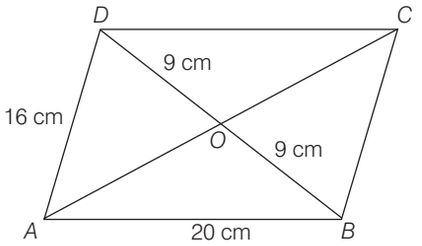
$2AE = AB + AC + BC$

Hence option (d) is correct.

6 Inradius of a right angled triangle $= \frac{AC + BC - AB}{2}$

$= \frac{9 + 40 - 41}{2} = 4$ cm

7 Let $AD = 16$ cm



then $AB = 20$ cm and $BD = 18$ cm

$\therefore$ $DO = BO = 9$ cm

NOTE In a parallelogram the two diagonal bisect each other, therefore by Appollonious theorem

$\therefore$ $16^2 + 20^2 = 2(9^2 + AO^2)$

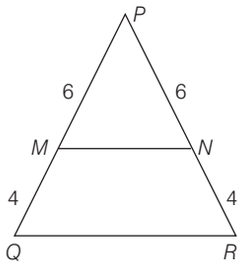
$\Rightarrow$ $AO = \sqrt{247}$

$\therefore$ $AC = 2\sqrt{247}$ cm

8 Go back to the basics

9 It is clear that

$$\frac{PM}{MQ} = \frac{PN}{NR} = \frac{6}{4} = \frac{3}{2}$$



Therefore ΔPMN and ΔPQR are similar

Now Ratio of areas of $\Delta PMN : \Delta PQR$

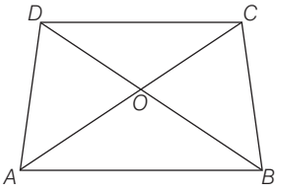
$= 3 \times 3 : 5 \times 5 = 9 : 25$

$\therefore$ Percentage of area of ΔPMN over

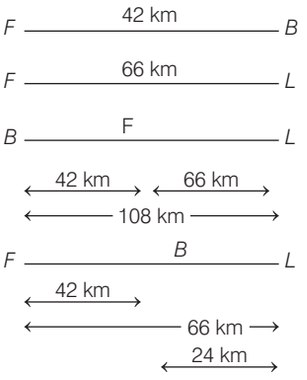
$$\Delta PQR = \frac{9}{25} \times 100 = 36\%$$

10 Since, ΔAOB is similar to ΔCOD.

$\therefore$ Ratio of areas of $\frac{\Delta AOB}{\Delta COD} = \left(\frac{3}{1}\right)^2 = \frac{9}{1}$



11 The maximum possible distance between Barabanki and Lucknow is 108 km and minimum possible distance between Barabanki and Lucknow is 24 km. Hence (d) is the correct option.

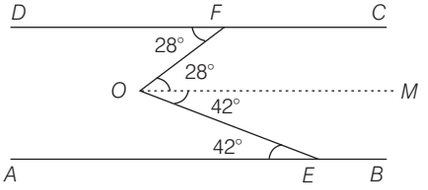


12 Since $CS = SD$

$\therefore$ The two chords must be equidistant from the centre 'O'. Thus, the required ratio is 1 : 1

13 $\angle DFO = \angle FOM$

and $\angle AEO = \angle EOM$ (since $CD \,||\, AB$)



$\therefore$ $\angle FOE = (28° + 42°) = 70°$

14 $\angle AOB = 60°$

and $\angle AOD = \angle ADO = \dfrac{(180° - 30°)}{2} = 75°$

Also $\angle BOC = 75°$

$\therefore$ $\angle COD = 360° - (75° + 60° + 75°) = 150°$

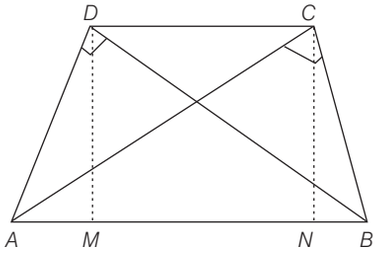
15 $\angle ABD = \angle ABC - \angle DBC$

$= \angle ABC - \angle BDC = \angle ABC - (\angle ABD + \angle BAD)$

$\therefore$ $2(\angle ABD) = \angle ABC - \angle BAD = 30°$

$\therefore$ $\angle ABD = 15°$ $(\because \angle BAD = \angle BAC)$

16 $BD = AC = 20$ cm (by Pythagorus theorem)



$\therefore$ $DM = \dfrac{AD \times BD}{AB}$

$\therefore$ $DM = \dfrac{15 \times 20}{25} = 12\,\text{cm}$, also $CN = DM$

$\therefore$ $AM = \dfrac{AD^2}{AB}$

$\therefore$ $AM = \dfrac{15 \times 15}{25} = 9\,\text{cm}$, also $AM = BN$

$\therefore$ $MN = AB - (AM + BN) = 25 - (18) = 7$ cm

but $MN = CD = 7$ cm

$\therefore$ Area of trapezium $= \dfrac{1}{2} \times (CD + AB) \times DM$

$= \dfrac{1}{2} \times 32 \times 12 = 192\,\text{cm}^2$

17 $(OS)^2 = (OK)^2 + (KS)^2$

$25 = OK^2 + 16 \Rightarrow OK = 3$

and $(OS)^2 = (OL)^2 + (LN)^2$

$25 = (OL)^2 + 9 \Rightarrow OL = 4$ cm

$\therefore$ $KL = OL - OK = 1$ cm

$\therefore$ Area of rectangle $= 1 \times 10 = 10\,\text{cm}^2$

18 $\angle ACB = 90°$

$\therefore$ $AC = 12$ cm

Now, since CO is perpendicular on AB

$\therefore$ $CO = \dfrac{AC \times BC}{AB} = \dfrac{16 \times 12}{20} = 9.6$ cm

19 $\angle ADB = \angle ACB = 41°$ (angles of the same segment)

$\therefore \angle ABD = 180 - (\angle ADB + 90) = 49°$ $(\angle DAB = 90°)$

20 Go through options for quicker answer

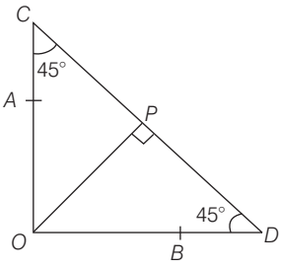
Exterior angle $= \dfrac{360}{15} = 24°$ (for $n = 15$)

$\therefore$ Interior angle $= 180 - 24° = 156°$

$\therefore$ Interior – Exterior $= 156 - 24 = 132°$

Hence, option (b) is correct.

21 $OC = OD$ and $OA = OP = OB$



$OP = 1$ m

$\therefore$ $PC = 1$ m $\Rightarrow OC = \sqrt{2}$ m

$\therefore$ $AC = OC - OA = (\sqrt{2} - 1)$ m

and $AC + CP = (\sqrt{2} - 1) + 1$

$= \sqrt{2}$ m $= 1.414$ m

$= 141.4$ cm

22 $AB : BC : CA = \frac{1}{CD} : \frac{1}{AE} : \frac{1}{BF} = \frac{1}{2} : \frac{1}{3} : \frac{1}{4} = 6 : 4 : 3$

23 ΔPOQ and ΔROS are similar

$\therefore \quad PS = QR$

Option *a*, *b* and *d* are irrelevent.

24 $\frac{DQ}{BD} = \sin 60° \Rightarrow DQ = BD \times \frac{\sqrt{3}}{2} = 3\,\text{m}$

and $\frac{DP}{DF} = \sin 30° = \frac{1}{2}$

$\therefore \quad DP = 2\,\text{m} \qquad (\because DF = 4\,\text{m})$

$\therefore \quad PQ = 3 - 2 = 1\,\text{m}$

Let $AB = CQ = x\,\text{m}$

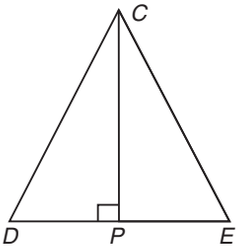
$\therefore \quad \frac{CD}{EF} = \frac{5}{4}$

$\frac{x+3}{x+1} = \frac{5}{4} \Rightarrow x = 7\,\text{m}.$

25 Area of equilateral triangle $ABC = \frac{\sqrt{3}}{4} \times (6)^2 = 9\sqrt{3}\,\text{cm}^2$

Area of $\Delta ADE = \frac{1}{2} \times DE \times CP$

$= \frac{1}{2} \times 2 \times \frac{\sqrt{3}}{2} \times 6 = 3\sqrt{3}\,\text{cm}^2$



$\therefore$ Area of shaded region $= 9\sqrt{3} - 3\sqrt{3} = 6\sqrt{3}\,\text{cm}^2$

26 $CD = CP^2 + DP^2 = (3\sqrt{3})^2 + (1)^2 = 2\sqrt{7}\,\text{cm}$

and $CE = CD = 2\sqrt{7}$ and $DE = 2\,\text{cm}$

$\therefore$ Perimeter of $\Delta CDE = 2(2\sqrt{7}) + 2$

$= 2(2\sqrt{7} + 1)\,\text{cm}$

27 $\angle ABC = 180 - (65 + 75) = 40°$

$\angle ORB = \angle OQB = 90°$

$\therefore \quad \angle ROQ = 360 - (90 + 90 - 40)$

$\therefore \quad \angle ROQ = 140°$

28 $\angle BAP + \angle BCP = 180°$ ($\square ABCP$ is a cyclic quadrilateral)

$\therefore \quad \angle BCP = 180 - 60° = 120°$

29 Since we don't have the requisite information.

30 $\because \quad AT = BT,$

($\because$ Tangents on the same circle from a fixed point is equal)

$AC = PC$ and $BD = PD$

$\therefore \quad AT = BT$

$\Rightarrow \quad AC + CT = BD + DT$

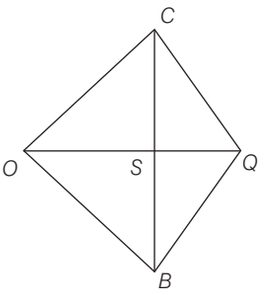
$PC + CT = PD + DT$

Similarly, all the relations can be verified.

31 $OQ = OB = OC = r$ (say); $\angle AOD = \angle BOC = 120°$

$\therefore \quad \angle BOQ = \angle COQ = 60°$

$\therefore \quad \frac{SB}{OB} = \sin 60° = \frac{\sqrt{3}}{2} \Rightarrow SB = \frac{r\sqrt{3}}{2}$



$\therefore \quad BC = 2SB = r\sqrt{3}$

$\therefore$ Area of quadrilateral $BQCO$

$= \frac{1}{2} \times BC \times OQ$

$= \frac{1}{2} \times r\sqrt{3} \times r = \frac{r^2\sqrt{3}}{2}\,\text{cm}^2$

$\therefore$ Area of both the quadrilateral $= 2\left(\frac{r^2\sqrt{3}}{2}\right) = r^2\sqrt{3}\,\text{cm}^2$

32 Go back to the basics and apply similarity of triangle

33 $\frac{(A)\,\Delta CMN}{(A)\,\square ABNM} = \frac{1}{2}$

$\therefore \quad \frac{(A)\,\Delta CMN}{(A)\,\Delta CAB} = \frac{1}{3}$

$\Rightarrow \quad \frac{MN}{AB} = \frac{CM}{CA} = \frac{1}{\sqrt{3}}$

$\Rightarrow \quad \frac{CM}{MA} = \frac{1}{\sqrt{3}-1} = \frac{\sqrt{3}+1}{2} \qquad MA = (CA - CM)$

34 $\angle ADE = \angle AED = 80°$

$\therefore \quad \angle BDE = \angle CED = 100°$

$\therefore \quad \angle DBC + \angle BCE = 360° - (100° + 100°) = 160°$

35 $AC = \sqrt{(15)^2 + (20)^2} = 25\,\text{cm}$

$CD = \sqrt{(25)^2 - (7)^2} = 24\,\text{cm}$

36 $AB = PQ = 26\,\text{cm}$

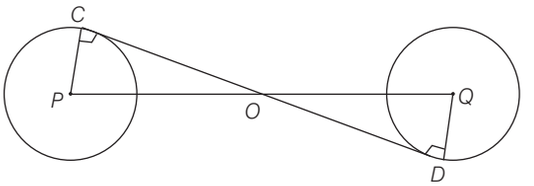
and $PO = OQ = 13\,\text{cm}$

$CO = \sqrt{(PO)^2 - (PC)^2}$

$CO = \sqrt{(13)^2 - (5)^2}$

$CO = 12\ \text{cm}$

$\therefore \quad CD = 2CO = 24\,\text{cm}$

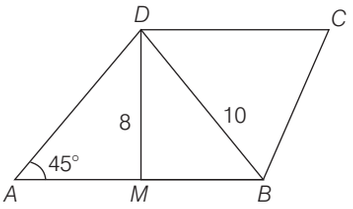


Alternatively Solve by using the formula of tangents.

37 $\angle DAM = 45°$

and $DM = 8$ cm

and $BD = 10$ cm



$\therefore$ $BM = 6$ cm $\quad (BM = \sqrt{BD^2 - DM^2})$

and $\dfrac{AM}{DM} = \tan 45° = 1$

$\therefore$ $AM = 8$ cm

and $AB = AM + MB = 8 + 6 = 14$ cm

$\therefore$ Area of parallelogram $ABCD = AB \times MD$

$= 14 \times 8 = 112\,\text{cm}^2$

38 $\angle ACB = 50° \quad (\because \angle A + \angle B + \angle C = 180°)$

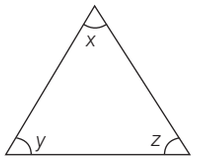
$\angle CFO = \angle CEO = 90°$

$\therefore$ $\angle FOE = 360° - (90° + 90° + 50°) = 130°$

but $\angle AOB = \angle FOE = 130°$

39 $35x = 26y \Rightarrow \dfrac{x}{y} = \dfrac{26k}{35k}$

$\therefore$ $x + y = 61k$



if $x = 1$, then $z = 119°$

But $x < z < y$

again consider $k = 2$, then

$x = 52°$ and $y = 70°$

$\therefore$ $z = 180° - (70° + 52°) = 58°$

40 $\angle DAB = \angle BDQ = 48°$

$\therefore$ $\angle DBA = 180° - (90° + 48°) = 42° \quad (\because \angle ADB = 90°)$

$\angle DCB = 180° - \angle DAB = 132°$

$\therefore$ $\dfrac{\angle DBA}{\angle DCB} = \dfrac{42}{132} = \dfrac{7}{22}$

41 $\angle OCD = 90° \Rightarrow \angle OAC = \angle OCA = 30°$

$\angle ACD = \angle ACO + \angle OCD = 30° + 90° = 120°$

$\therefore$ $\angle BAC = 180° - 120° = 60°$

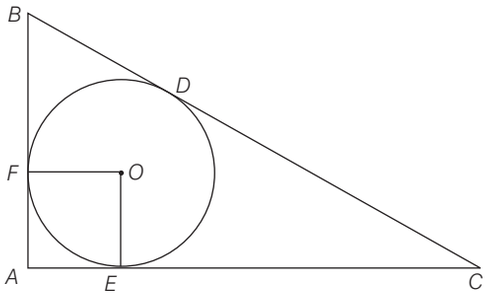
$\Rightarrow$ $\angle BCD = 60° \quad (\angle BCD = \angle BAC)$

$\Rightarrow$ $\angle OCB = \angle OCD - \angle BCD$

$= 90° - 60° = 30°$

42 $OE = OF$ (inradius)

$BF = BD$



and $EC = DC = 15$ cm

Let $BF = x$ cm

then $AB = (6 + x)$ cm

and $AC = 6 + 15 = 21$ cm

$\therefore$ $(BC)^2 = (AB)^2 + (BC)^2$

$(x + 15)^2 = (6 + x)^2 + (21)^2 \quad (\because BC = BD + CD)$

$\Rightarrow$ $x = 14$ cm

$\Rightarrow$ $BD = 14$ cm

$\therefore$ $CD - BD = 15 - 14 = 1$ cm

43 $(\angle BPQ + \angle BQP) + (\angle EQR + \angle ERQ)$

$+ (\angle CRS + \angle CSR) + (\angle TSA + \angle ATS)$

$+ (\angle DTP + \angle DPT) = 2 \times 360$

$\angle A + \angle D + \angle B + \angle E + \angle C = 5 \times 180° - 2 \times 360° = 180°$

44 $\dfrac{\text{Area of } \Delta DAE}{\text{Area of } \Delta DEC} = \dfrac{\frac{1}{2} \times DE \times AE}{\frac{1}{2} \times DE \times CE}$

$= \dfrac{AE}{CE} = \dfrac{(AD)^2}{(DC)^2} = \left(\dfrac{6}{8}\right)^2 = \dfrac{9}{16}$

Similarly , in ΔABC,

$\dfrac{\text{Area of } \Delta BCF}{\text{Area of } \Delta BFA} = \dfrac{9}{16}$

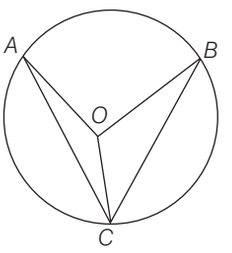
$\therefore$ The area of shaded to unshaded region $= \dfrac{16}{9}$

45 $\angle OCA = \angle OAC = 25°$

and $\angle OCB = \angle OBC = 35°$

$\therefore$ $\angle ACB = \angle ACO + \angle BCO = 25° + 35° = 60°$

$\therefore$ $\angle AOB = 2\angle ACB = 120°$



46 $\angle DOA = 110°$

and $\angle ADB = 50°$

$\therefore \quad \angle DAO = 180 - (110° + 50°) = 20°$

47 ΔABC is similar to ΔEDC

$\therefore \quad \dfrac{AB}{ED} = \dfrac{BC}{DC} = \dfrac{AC}{EC}$

$\therefore \quad \dfrac{AB}{DE} = \dfrac{BC}{DC} \Rightarrow \dfrac{24}{10} = \dfrac{60}{DC}$

$\Rightarrow \quad DC = 25\,\text{cm}$

48 $AC = \sqrt{(24)^2 + (60)^2} \quad (\because AC^2 = AB^2 + BC^2)$

$AC = 12\sqrt{29}$

$\therefore \quad \dfrac{BC}{DC} = \dfrac{AC}{EC} \Rightarrow \dfrac{60}{25} = \dfrac{12\sqrt{29}}{EC}$

$\Rightarrow \quad EC = 5\sqrt{29}$

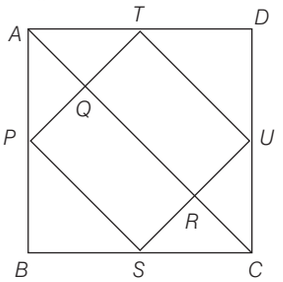
$\therefore \quad BE = BC - EC = 60 - 5\sqrt{29}$

$\Rightarrow \quad BE = 5(12 - \sqrt{29})$

$\therefore \quad \dfrac{CE}{BE} = \dfrac{5\sqrt{29}}{5(12 - \sqrt{29})} = \dfrac{\sqrt{29}}{(12 - \sqrt{29})}$

49 *PTUS* is a square inscribed by a square *ABCD*.
Let each side of the square *ABCD* be '*a*', then
Area of square $ABCD = a^2$

also $PU = ST = a$



$\therefore$ Area of square $PTUS = \dfrac{a^2}{2}$

$\therefore \quad \dfrac{\text{Area of } PTUS}{\text{Area of } ABCD} = \dfrac{a^2/2}{a^2} = \dfrac{1}{2}$

$\therefore \quad \dfrac{\text{Area of } \square PQRS}{\text{Area of } \Delta ABC} = \dfrac{1}{2}$

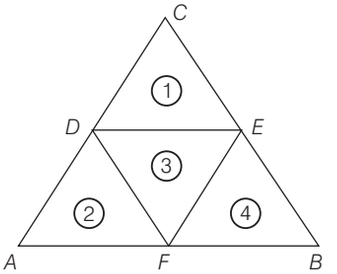
50 Go through options. It is a pentagon.

Alternatively ${}^nC_2 - n = n \Rightarrow {}^nC_2 = 2n$

$\Rightarrow \quad \dfrac{n(n-1)}{2} = 2n \Rightarrow n = 5$

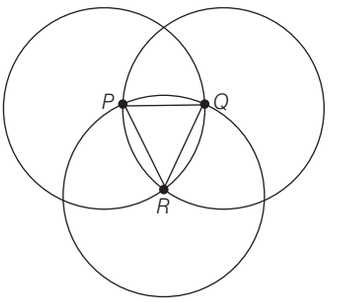
51 Let $P_1, P_2, P_3, P_4, \ldots, P_9$ be the vertices of the regular nonagon then, we can select two vertices out of 9 vertices in ${}^9C_2$ ways and ${}^9C_2 = 36$ ways and number of equilateral triangles formed $= 36 \times 2 = 72$. But the three triangles $\{P_1, P_4, P_7\}$, $\{P_2, P_5, P_8\}$ and $\{P_3, P_6, P_9\}$ are each counted 3 times *i.e.,* counted as 9 triangles instead by 3 triangles.
So, net number of equilateral triangles = 72 – 6 = 66.

52 There are 4 triangles (smaller) are congruent.
So, out of these 4 triangles 2 triangles are taken thus the ratio of the shaded to the unshaded region is 1 : 1 (since two triangles are shaded and 2 are unshaded).



53 ΔPQR is an equilateral triangle *i.e.,* all the three angles are 60° each.

$\therefore \quad PQ = QR = PR$

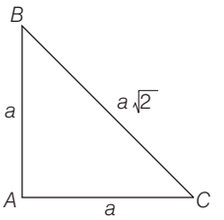


Now, arc $PQ = 2\pi \times (1) \times \dfrac{60}{360} = \dfrac{\pi}{3}$

$\therefore \quad$ Sum of all three arcs $= 3 \times \dfrac{\pi}{3} = \pi$

54 $\angle A = 90°$ and $\angle B = \angle C = 45°$

$$\text{Inradius} = \frac{(a + a) - a\sqrt{2}}{2} = \frac{a(2 - \sqrt{2})}{2}$$



and $\text{Circumradius} = \dfrac{a\sqrt{2}}{2}$

$$\therefore \quad \frac{\text{Inradius}}{\text{Circumradius}} = \frac{a(2 - \sqrt{2})/2}{(a\sqrt{2})/2} = \frac{2 - \sqrt{2}}{\sqrt{2}}$$

$$= \frac{\sqrt{2}(\sqrt{2} - 1)}{\sqrt{2}}$$

$$= \frac{(\sqrt{2} - 1)}{1}$$

55 Let the perpendicular be AD and circumradius be R, then

$$\Delta ABC = \frac{1}{2} \times BC \times AD = \frac{AB \times BC \times AC}{4R}$$

$$\frac{1}{2} \times BC \times AD = \frac{36 \times BC \times 30}{4 \times 45} \Rightarrow AD = 12\,\text{cm}.$$

Hence choice (a) is the correct one.

56 If you remember 30-60-90 degree theorem, it does not require any efforts to solve this problem.

Hence choice (d) is the correct one.

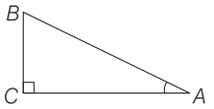
Alternatively

$1^2 + (\sqrt{3})^2 = 2^2$. It implies that one angle is 90°.

Choice (b) : 1 : 3 : 5 means the angles are 20, 60, 100.

Choice (c) : 2 : 3 : 4 means the angles are 40, 60, 80.

It implies that choices (a) and (b) are not valid, as they do not have 90 degree angle.



Mind that if one angle is 90°, then the sum of the remaining two angles will also be 90°.

Now since we know that the angle opposite the longest side is the greatest and vice-versa, so if the order of sides is increasing one, the order of angles should also be the increasing one.

It implies that the order of the corresponding angles should be $1 < 2 < 3$.

Thus out of the remaining two choices (c) and (d), choice (d) is the valid one.

Alternatively Let $a = x$, $b = \sqrt{3}x$, $c = 2x$. Then we see that $(x)^2 + (\sqrt{3}x)^2 = (2x)^2$.

It implies that $\angle C = 90°$. Then, $\tan A = \frac{1}{\sqrt{3}}$

$\Rightarrow \quad \angle A = 30°.$

Consequently, $\angle B = 60°.$

Thus, $A : B : C = 1 : 2 : 3$

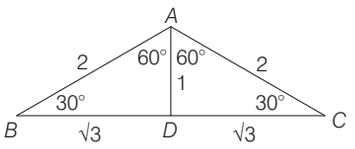
Alternatively Using the Cosine rule you will get,

$$\cos A = \frac{b^2 + c^2 - a^2}{2bc}$$

$$\Rightarrow \quad \cos A = \frac{\sqrt{3}}{2} \Rightarrow A = 30°$$

Similarly, $B = 60°$ and $C = 90°$.

57 $4x + x + x = 180° \Rightarrow x = 30°$. Therefore, the respective angles are 120°, 30° and 30°.



Drop a perpendicular AD on BC. Then AD will act as the median as well as angular bisector.

Let us consider $AD = p$, then using 30-60-90 degree theorem, we get $AB = AC = 2$ and $BD = CD = \sqrt{3}$.

Therefore, the required ratio $= BC : (AB + AC + BC)$

$$= 2\sqrt{3} : (4 + 2\sqrt{3})$$

$$= \sqrt{3} : (2 + \sqrt{3})$$

Hence choice (a) is the correct one.

Alternatively Let's go through the given choices.

Choice (a) : $\sqrt{3} : (2 + \sqrt{3})$

$\Rightarrow \sqrt{3} : (1 + 1 + \sqrt{3})$, seems possible.

Choice (b) : $1 : 6 \Rightarrow 1 : (2.5 + 2.5 + 1)$

$\Rightarrow 2 : (5 + 5 + 2)$; NOT possible, as the largest side (2 unit) is smaller than the smaller side (5 unit).

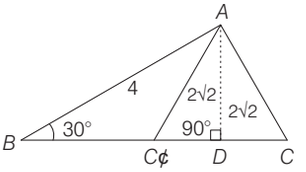
Choice (c) : $1 : (2 + \sqrt{3}) \Rightarrow 1 : (1 + 1 + \sqrt{3})$, which is not possible, as there are multiple inconsistencies and contradictions, as far as the existence of a triangle is concerned.

Choice (d) : $2 : 3 \Rightarrow 2 : (0.5 + 0.5 + 2)$

$\Rightarrow 4 : (1 + 1 + 4)$, NOT impossible, as it does not follows the definition of a triangle which says that sum of any two sides of a triangle must be greater than the third side.

Hence choice (a) is the correct one.

58 Consider the following diagram consisting of triangles ABC ABC'. Now draw a perpendicular AD on BC.



Thus using 30-60-90 degree theorem in the right angle ΔADB, we get $AD = 2$.

And, by using Pythagoras theorem in right angle $\Delta ADC'$, we get $DC' = 2$.

Or, if you could notice that there exists as 45-45-90 degree relation in the $\Delta ADC'$, as $\left(\frac{AD}{AC} = \frac{1}{\sqrt{2}}\right)$

AD bisects $C'C$, as AD is a perpendicular in the isosceles triangle $C'AC$.

So, $C'C = 2(C'D) = 4$.

Therefore the difference in the areas of ΔABC and $\Delta ABC'$

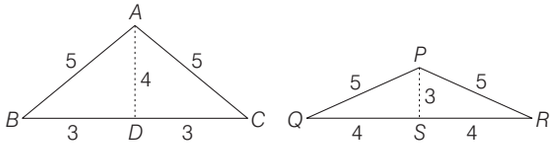
$$= ACC' = \frac{1}{2}(AD \times CC')$$

$$= \frac{1}{2}(2 \times 4) = 4 \text{ sq. unit}$$

Hence, choice (c) is the correct one.

Hint : The 30-60-90 degree theorem states that the sides opposite 30°, 60°, 90° angles will be in the ratio of $1 : \sqrt{3} : 2$. So, $AD : BD : AB = 2 : 2\sqrt{3} : 4$.

59 Simply drop the perpendiculars and use the Pythagoras theorem, you will find that these two triangles have the same area.



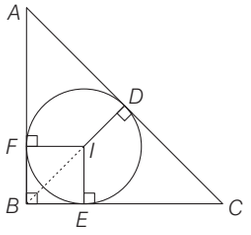
Hence choice (c) is the correct one.

60 Since AC is a hypotenuse, it means triangle ABC is a right angle triangle and $\angle B = 90°$. Let I be the incentre of the triangle, then ID, IE, and IF will be perpendiculars on the AC, BC and AB, respectively.

Let the inradius be 1 unit, then

$$ID = IE = IF = BE = BF = IF = 1$$

Therefore, $BI = EF = \sqrt{2}$, as BI and EF are the diagonals of square $BEIF$.



Now, $BD = BI + ID = \sqrt{2} + 1$

But, since D is the circumcentre of the triangle, so $BD = CD = AD$

Therefore, $AC = 2(BD) = 2(\sqrt{2} + 1)$

Thus the required ratio $= \dfrac{EF}{AC}$

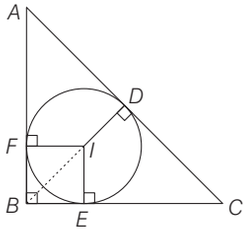
$$= \frac{\sqrt{2}}{2(\sqrt{2}+1)} = \frac{1}{2+\sqrt{2}}$$

Hence choice (b) is the correct one.

NOTE You can assume any value or you can simply consider r, as inradius. The method would remain the same.

61 If r and R denote the inradius and circumradius of a right angled triangle, the perimeter of the triangle

$$(2r + 4R) = (12 + 64) = 76 \text{ cm}$$



If s denotes the semi-perimeter of a triangle, the area of the triangle $= r \times s = 6 \times 38 = 228$ sq cm.

Hence choice (b) is the correct one.

Hint : The perimeter of the triangle

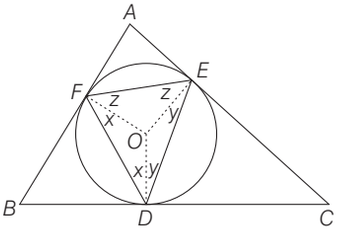
$$= AF + AD + DC + CE + BE + BF$$
$$= 2AD + 2CD + 2BE$$
$$= 2(AD + CD) + 2BE$$
$$= 2(AC) + 2BE = 2(2R) + 2r$$
$$= 2r + 4R$$

62 As we know that each radius of the same circle is equal, so we can find the following relations between angles.

In ΔFOD, $OF = OD$, so $\angle OFD = \angle ODF = x$ (say)

In ΔEOD, $OE = OD$, so $\angle OED = \angle ODE = y$ (say)

In ΔEOF, $OF = OE$, so $\angle OFE = \angle OEF = z$ (say)



Then from the diagram we have,

$$\angle DFE = x + z = 76,\ \angle FDE = x + y$$

and $\angle DEF = y + z.$

But $(x + y) + (y + z) + (z + x) = 180°$

$\Rightarrow$ $x + y + z = 90°$

Now, $\angle DFE = 76$

$\Rightarrow$ $\angle DOE = 2(\angle DFE) = 152$

$\therefore$ $\angle DCE = 180 - \angle DOE = 28°$

Similarly, $\angle FED = 56$

$\Rightarrow$ $\angle FOD = 2(\angle FED) = 112$

$\therefore$ $\angle FBD = 180 - \angle DOE = 68°$

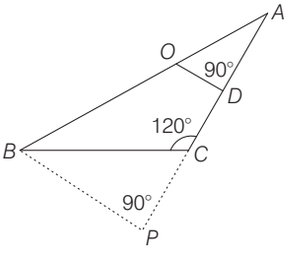
Similarly, $\angle FDE = 48$

$\Rightarrow$ $\angle FOE = 2(\angle FDE) = 96$

$\therefore$ $\angle FAE = 180 - \angle FOE = 84°.$

Hence choice (b) is the correct one.

63 Extend AC to a point P such that BP is a perpendicular on AP, as shown in the figure.



Since, OD and BP are parallel and O is the mid-point of AB, so D will be the mid-point of AP.

Now, in the ΔPBC, $\angle PCB = 60°$ and $\angle PBC = 30°$. Using 30-60-90 degree theorem in this triangle, we get $BP = 6$ cm, as $BC = 4\sqrt{3}$ cm.

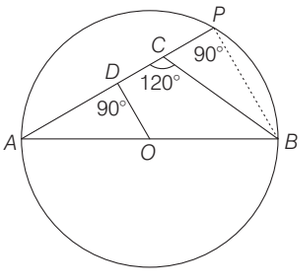
As ΔAOD and ABP are similar triangles, so we can use the mid-point theorem and then we will get

$$\frac{AO}{AB}=\frac{AD}{AP}=\frac{OD}{BP}=\frac{1}{2}$$

Therefore, $OD = 3$ cm

Hence choice (b) is the correct one.

Alternatively Since O is the mid-point of AB, so considering O as the centre you can draw a circle. Now, if you extend AC to the circumference and then connect AP and BP as shown in figure, then angle APB will be a right angle.



The rest of the solution will be similar to the above one.

64 A right angled triangle can have the largest possible area only when it is an isosceles one. That is $AB = BC$, so $\angle BAC = \angle ACB = 45$.

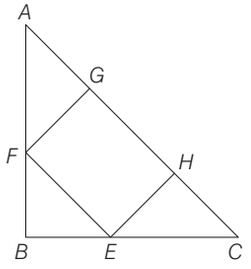
In ΔEHC, $\angle EHC = 90°$ and $\angle HCE = \angle HEC = 45°$,

So, $HC = EH = 14$ cm

And, then, we have $AG = FG = EH = 14$ cm

Therefore, $EF = GH = AC - (AG + HC) = 14$ cm

It implies that $EFGH$ is a square with each side 14 cm.



Therefore, we can have a largest possible circle of radius 7 cm in the square $EFGH$.

And the area of this circle would be $\pi(7^2) = 154$ sq. cm.

Hence choice (c) is the correct one.

65 By mid-point theorem,

When CD is a median,

$$W + X = Y + Z \qquad \ldots(i)$$

And, when BE is a median

$$X + Y = W + Z \qquad \ldots(ii)$$

Subtracting the equation (ii) from (i), we get

$$W - Y = Y - W$$

$$\Rightarrow \quad W = Y$$

Therefore, from eqn. (i) or (ii)

$$X = Z$$

Again, since $BC = 2DE$, therefore

$$X = 2W = 2Y$$

Thus, $W : X : Y : Z = 1 : 2 : 1 : 2$

Hence choice (c) is the correct answer.

Hint To understand the ratios join DE and then apply mid point theorem in ΔADE and ΔABC. Then, you see that $\frac{DE}{BC}=\frac{DO}{OC}=\frac{EO}{OB}=\frac{1}{2}$. In ΔBOD and ΔBOC the altitude is same, but $\frac{OD}{OC}=\frac{1}{2}$, therefore $\frac{\Delta BOD}{\Delta BOC}=\frac{1}{2}$.

It implies $X = 2W$. Similarly, $X = 2Y$

Hence choice (c) is the correct one.

Alternatively Apply Mass-Point Geometry, you get

wt. $(A) = wt.(B) = 1$ and $wt(D) = 2$.

Similarly, $wt.(A) = wt.(C) = 1$ and $wt.(E) = 2$.

Since, $\frac{wt.(D)}{wt.(C)}=\frac{CO}{DO}=\frac{2}{1}$

Therefore, $\frac{\text{area}(\Delta X)}{\text{area}(\Delta W)}=\frac{2}{1}$

Therefore, $\frac{\text{area}(\Delta X)}{\text{area}(\Delta Y)}=\frac{2}{1}$

But, we also know that are (ΔW) + area (ΔX)

$$= \text{area}(\Delta Y) + \text{area}(\Delta Z).$$

Therefore, $(\Delta W) : (\Delta X) : (\Delta Y) : (\Delta Z) = 1 : 2 : 1 : 2$

66 Let the other two sides be a, then $2a + b = 20$.

We know that, for any triangle, the sum of any two sides must be greater than the third side. That is $2a > b$ and $a + b > a$.

(i) When $2a > b$

$$\Rightarrow \quad 20 - b > b \qquad (\because 2a = 20 - b)$$

$$\Rightarrow \quad b < 10$$

(ii) When $a + b > a$

$$\Rightarrow \quad b > 0$$

Also, when $a \neq b$

$$\Rightarrow \quad 2a + b = 20$$

$$\Rightarrow \quad b \neq \frac{20}{3}$$

Thus, $b = (0, 10) - \left\{\frac{20}{3}\right\}$

Or $b = \left(0, \frac{20}{3}\right) \cup \left(\frac{20}{3}, 10\right)$

Hence choice (b) is the correct one.

67 Let $\angle FCE = x$, then $\angle FEC = x$

$$\Rightarrow \quad \angle EFC = 180 - 2x$$

$$\Rightarrow \quad \angle DFE = 2x \Rightarrow \angle EDF = 2x$$

$$\Rightarrow \quad \angle DEF = 180 - 4x$$

$\Rightarrow$ $\angle DEB = 3x$

$(\because \angle DEB + \angle DEF + \angle FEC = 180°)$

$\Rightarrow$ $\angle DBE = 3x$

$\Rightarrow$ $\angle BDE = 180° - 6x$

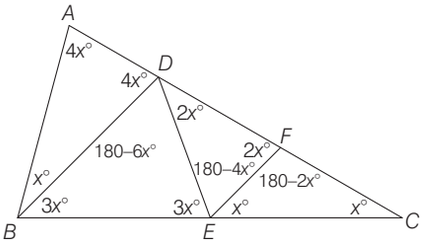
$\Rightarrow$ $\angle ADB = 4x$

$(\because \angle ADB + \angle BDE + \angle EDF = 180°)$

$\Rightarrow$ $\angle DAB = 4x$

$\Rightarrow$ $\angle ABD = x$

$(\because \angle ABD + \angle DBE = 4x$, as $\angle ABC = \angle BAC)$



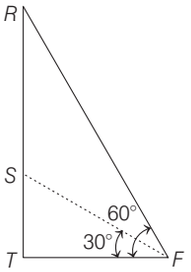
$\therefore$ $4x + 4x + x = 180°$

$\Rightarrow$ $x = 20°$

$\Rightarrow$ $\angle DBE = 60°$ and $\angle DEB = 60°$

It implies that ΔBDE is an equilateral triangle. Therefore $\overline{BE} = 6$ cm . Hence choice (d) is the correct one.

68 Let TR be the tree. F is the initial position of fox, S be the initial position of squirrel and R be the final position of squirrel.



Let $TF = x$, then from 30-60-90 degree theorem,

$$ST = \frac{x}{\sqrt{3}} \text{ and } RT = x\sqrt{3}.$$

Therefore, $RS = RT - ST$

$$= x\sqrt{3} - \frac{x}{\sqrt{3}} = \frac{2x}{\sqrt{3}}$$

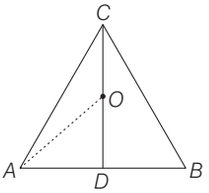
For the distance $\frac{2x}{\sqrt{3}}$ squirrel takes 2 minutes.

Therefore, for the distance $\frac{2x}{\sqrt{3}}$ fox will take $\frac{2}{\sqrt{3}}$ minutes.

And thus for the distance x fox will take 1 minute.

Hence choice (a) is the correct one.

69 Drop a perpendicular bisector CD from the vertex C on the base AB. Now consider a point O on CD such that $CO = AO = R$, where R is the circumradius of the triangle ABC.



Now $CD^2 = AC^2 - AD^2 = 25 - 9 = 16$

$\Rightarrow CD = 4$ cm.

Again, in ΔAOD, $AO^2 = OD^2 + AD^2 = (CD - CO)^2 + AD^2$

$$= (4 - CO)^2 + 9$$

$\Rightarrow$ $R^2 = (4 - R)^2 + 9$

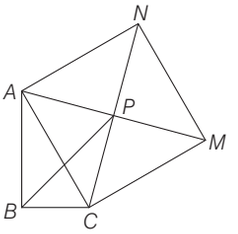
$\Rightarrow$ $R = \frac{25}{8}$ cm

Hence choice (b) is the correct one.

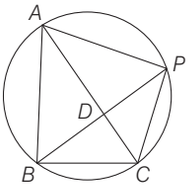
70 Follow the construction given below. Triangle ABC is a right angled triangle and $ACMN$ is a square. Point $P$is the intersection of diagonals of the square.

In the right angle ΔAPC, $AP = CP$, so the

$$\angle ACP = \angle CAP = 45°.$$



Now, you can see that $\angle ABC = 90°$ and $\angle APC = 90°$. It implies that AC is the diameter of the circle such that $\angle ABC$ and $\angle APC$ are the angles of the semicircles, as shown below.



Now, using the concept of "angles in the same segment of a circle are equal" we can attain the following results.

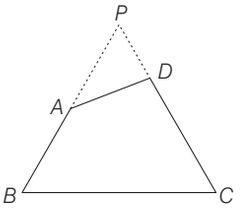
$$\angle ABP = \angle ACP = 45°$$

and $$\angle CBP = \angle CAP = 45°.$$

Hence choice (d) is the correct one.

71 Extend the sides BA and CD so as to meet at P. Now it will form an equilateral triangle BPC.

Therefore, $BP = PC = BC = 6\sqrt{3}$ m.



Further the triangle APD is a right angle triangle, where $\angle ADP = 90°$, $\angle APD = 60°$, $\angle PAD = 30°$. So using 30-60-90 degree theorem in ΔAPD, we have $PD = 3$ and $AP = 6$.

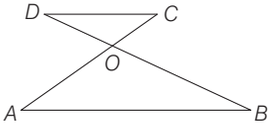
Therefore, $CD = PC - PD = 6\sqrt{3} - 3$

$$= 3(2\sqrt{3} - 1) \text{ cm}$$

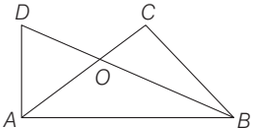
Hence choice (a) is the correct one.

72 Since, AB is parallel to CD, therefore $\angle CDO = \angle ABO$ and $\angle DCO = \angle BAO$.

Also, $\angle DOC = \angle AOB$. Therefore, $\Delta AOB \sim \Delta COD$.



However, we cannot say that ΔDOA is similar to ΔCOB unless we have some necessary and exact information to prove the similarity. The area of ΔDOA will be same as the area of ΔCOB , when the trapezium $ABCD$ is a regular trapezium. That is when $AD = BC$.



Now, Area ΔDOA = Area ΔDAB − Area ΔAOB.

Similarly, Area ΔCOB = Area ΔCBA − Area ΔAOB.

But, since the base and height of ΔDAB and ΔCBA are same, area of ΔDAB is same as the area of ΔCBA. Thus Area ΔDOA = Area ΔCOB.

Now, we know that irrespective of the shape of the trapezium, ΔAOB is always similar to ΔCOD. But, it is not necessary that the area of ΔAOB is always same as that area of ΔCOD. The area of ΔAOB will be same as the area of ΔCOD, only when the trapezium $ABCD$ is a parallelogram. That is when $AB = CD$ and $AD = BC$.

Therefore choice (c) is correct.

73 If you drop the perpendiculars on AB from point D and point E, they will be of equal length, as DE is parallel to AB. Now, in both the triangles base AB is common. Therefore, we can say that the area of ΔADB and area of ΔAEB is same. Further, since ΔAOB is common in both the triangles ΔADB and ΔAEB, so it is clear that area of ΔDOA is same as area of ΔEOB. Since, DE is parallel to AB and

$$\frac{CD}{AC} = \frac{CE}{BC} = \frac{DE}{AB} = \frac{1}{2}$$

Further, due to AAA property of similarity, we know that $\Delta EOD \sim \Delta AOB$. But,

Since $$\frac{DE}{AB} = \frac{DO}{OB} = \frac{EO}{OA} = \frac{1}{2},$$

Therefore $$\frac{\text{area } \Delta DOE}{\text{area } \Delta AOB} = \left(\frac{1}{2}\right)^2 = \frac{1}{4}.$$

That is area of $\Delta AOB = 4$(area of ΔDOE).

Now, (height of ΔDOE)

$$= \frac{1}{2}\text{(height of } \Delta AOB) = \frac{1}{3}\text{(height of } \Delta ADB \text{ or } \Delta AEB)$$

And, height of ΔCDE

= height of ΔADB = 3(height of ΔDOE)

And, base of ΔCDE = base of ΔDOE

Then, we have $$\frac{\text{Area } \Delta CDE}{\text{Area } \Delta DOE} = \frac{\frac{1}{2}(3h \times b)}{\frac{1}{2}(h \times b)} = \frac{3}{1}$$

$\therefore$ Area ΔCDE = 3(Area ΔDOE)

Hence choice (d) is the correct one.

74 $$\frac{\text{Area } \Delta DOE}{\text{Area } \Delta AOB} = \frac{40}{250} = \left(\frac{2}{5}\right)^2$$

$$\Rightarrow \quad \frac{DE}{AB} = \frac{2}{5} = \frac{\text{height of } \Delta DOE}{\text{height of } \Delta AOB}$$

$$\Rightarrow \quad \frac{\text{height of } \Delta ADB}{\text{height of } \Delta AOB} = \frac{2+5}{5} = \frac{7}{5}$$

But since the base of ΔADB = base of ΔAOB, therefore,

$$\frac{\text{area of } \Delta ADB}{\text{area of } \Delta AOB} = \frac{\frac{1}{2}(b \times 7h)}{\frac{1}{2}(b \times 5h)} = \frac{7}{5} = \frac{350}{250}$$

Thus the area of $\Delta AOD = 350 - 250 = 100 \text{ cm}^2$

Now, since the base of both the triangles ΔACB and ΔADB are same, but the height of ΔACB is twice the heigh of ΔADB, therefore the area of ΔACB = 2 (area of ΔADB) = 700 cm^2.

Hence choice (a) is the correct one.

Alternatively Area of region $\beta = \sqrt{\alpha} \cdot \sqrt{\gamma}$

$$= \sqrt{40} \times \sqrt{250} = 100 \text{ cm}^2$$

And, area of $\Delta ADB = 100 + 250 = 350$

Therefore area of $\Delta ACB = 2(350) = 700 \text{ cm}^2$

75 $\beta = \delta = \sqrt{\alpha} \times \sqrt{\gamma} = \sqrt{4} \times \sqrt{9} = 6 \text{ cm}^2$

$\therefore \alpha + \beta + \gamma + \delta = 4 + 6 + 9 + 6 = 25 \text{ cm}^2$

Thus, $$\frac{(\beta + \delta)}{(\alpha + \beta + \gamma + \delta)} = \frac{12}{25}$$

Hence, choice (b) is correct one.

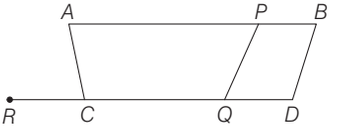
Alternatively $\sqrt{(\alpha + \beta + \gamma + \delta)} = \sqrt{\alpha} + \sqrt{\gamma} = \sqrt{4} + \sqrt{9} = 5$

$\therefore \quad \alpha + \beta + \gamma + \delta = (5)^2 = 25 \text{ cm}^2$

Thus $$\frac{(\beta + \delta)}{(\alpha + \beta + \gamma + \delta)} = \frac{25 - (4 + 9)}{25} = \frac{12}{25}$$

76 Extend DC till a point R.

Now, $\angle ACR = \angle APQ = \angle ABD$



Therefore, $PQ \parallel BD$

But, given that $AB \parallel CD$

Thus it is proven that $PBDQ$ is definitely a parallelogram.

Hence choice (c) is the correct one.

77 Let's connect the mid-points P and M then the line PM will pass through the centre O of the circle, as the trapezium is symmetric. In fact, PM will act as a diameter of the circle and it will be perpendicular to the parallel sides AB and CD. Now, drop another perpendicular BN from B.

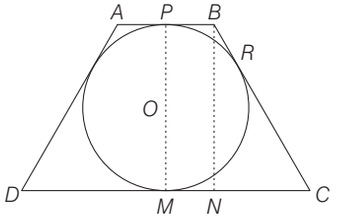
Let $PB = 16x$, then $BR = 16x$, as PB and BR are the two tangents from the same point.

And $MN = 16x$, as PM and BN are parallel.

As $PB = 16x$, then $MC = 49x$. It implies that $RC = 49x$ as MC and RC are two tangents from the same point.

Therefore, $NC = MC - MN = 49x - 16x = 33x$

And $BC = BR + RC = 16x + 49x = 65x$



Now, by using Pythagoras theorem in ΔBNC, we have,

$$BN = \sqrt{BC^2 - NC^2} = \sqrt{(65x)^2 - (33x)^2} = 56x$$

$\therefore$ $BN = PM = 56x$

Now, the area of trapezium $ABCD = \frac{1}{2} \times (AB + CD) \times PM$

$\Rightarrow$ $3640 = \frac{1}{2} \times [2(PB) + 2(MC)] \times PM$

$\Rightarrow$ $3640 = \frac{1}{2} \times (32x + 98x) \times 56x$

$\Rightarrow$ $3640 = 3640x \Rightarrow x = 1$

Thus the radius $= OP = OM = 28$ cm

And, therefore the area of circle $= \pi \times 28^2 = 2464$ sq. cm

Hence choice (b) is the correct one.

78 Since, opposite sides are equal, it means it is a parallelogram.

Since, it's parallelogram, opposite angles are equal. And since it is a cyclic, so opposite angles are supplementary. Therefore, a parallelogram inscribed in a circle is a rectangle.

Now, the area of a rectangle can be greatest only when all the four sides of the rectangle are same. Thus each side of the square = 5 cm.

Therefore required area = 25 sq. cm

Hence choice (b) is the correct one.

Solutions (for Q. Nos. 79 and 80)

79 Since, $\frac{DP}{BP} = \frac{6}{7}$, therefore, $DP = 24$ cm and $BP = 28$ cm.

Let $AD = CD = x$ and $AB = BC = y$

$\because$ $2(x + y) = 208$ cm

$\therefore$ $x + y = 104$ cm

$\Rightarrow$ $y = (104 - x)$ cm

Now, $AP^2 = AD^2 - DP^2$

$= x^2 - 24^2$ …(i)

Similarly, $AP^2 = AB^2 - BP^2$

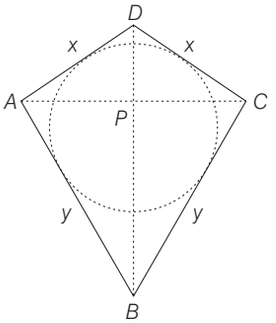
$= y^2 - 28^2$

$= (104 - x)^2 - 28^2$ …(ii)

From the eqs. (i) and (ii), we have $x = 51$ and $y = 53$

$\therefore$ $AP = PC = 45$ cm

$\Rightarrow$ $AC = 90$ cm



Area of kite $= \frac{1}{2} \times AC \times DB$

$= 90 \times 52 = 2340$ sq. cm

And semi-perimeter of kite $= \frac{208}{2} = 104$ cm

As you know that a kite is always a tangential quadrilateral that is each the four sides touch the circle inscribed in it.

Now, you know that in a kite (or a tangential quadrilateral) the inradius

$$r = \frac{\text{area of kite}}{\text{semiperimeter of kite}} = \frac{2340}{104} = 22.5$$

Therefore area of circle $= \pi(22.5)^2$

$= 1591.07 \approx 1591$ sq cm

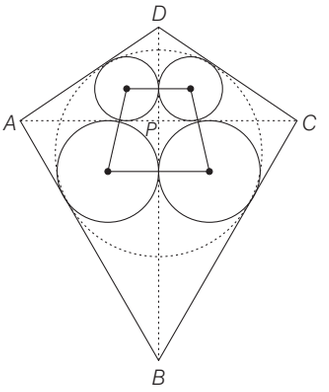
Hence choice (c) is the correct one.

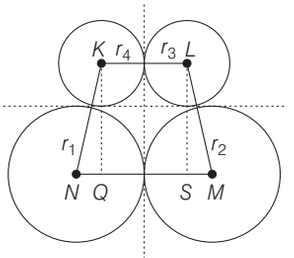
80 In the right triangle APB, $AP = 45$, $BP = 28$ and $AB = 53$.

Then the inradius of the incircle inscribed in the ΔAPB is $r_1 = 10$ cm

But, $r_1 = r_2 = 10$ cm

Similarly, $r_3 = r_4 = 9$ cm





Now, $NM = r_1 + r_2 = 20$ cm

and $KL = r_3 + r_4 = 18$ cm

Let us drop the perpendiculars KQ and LS on NM from K and L, respectively.

Then we have, $QS = 18$ cm,

and $NQ = SM = 1$ cm

But, $KQ = LS = (r_1 + r_4) = (r_3 + r_4) = 19$ cm

Let us consider right triangle KQN, we have

$$KN^2 = NQ^2 + KQ^2 = 1 + 361 = 362$$

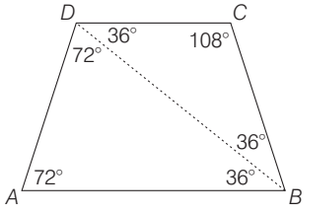
$$\Rightarrow \quad KN = \sqrt{362} = LM$$

Therefore, perimeter of the quadrilateral

$$\begin{aligned} KLMN &= KL + LM + MN + KN \\ &= 18 + \sqrt{362} + 20 + \sqrt{362} \\ &= 38 + 2\sqrt{362} \\ &= 2(19 + \sqrt{362})\text{ cm} \end{aligned}$$

Hence choice (b) is the correct one.

81 First of all draw a diagonal, say BD. Since $BC = CD$, it gives us $\angle CDB = \angle CBD = 36°$ and $\angle ADB = 72°$ and $\angle ABD = 36°$.



Now, in ΔABD, since $AD = 1$, so $AB = BD = \dfrac{\sqrt{5}+1}{2}$

Hence choice (d) is the correct one.

82 Let $ABCD$ be the dart with the given specifications (angles and sides). Extend BD to P such that when you connect PA and PC a kite $ADCP$ gets formed with each of its smaller angles equal to 36° and each of its larger angles equal to 144°.

Now, you can see that both the triangles ABP and PBC are two isosceles and congruent triangles. Let us consider ΔABP in which $BA = BP$ and $AP = AD = BD$.

As the two triangles ΔPAD and ΔABP are similar ones,

$$\frac{BP}{AP} = \frac{AP}{DP}$$

$$\Rightarrow \quad \frac{BP}{BD} = \frac{BD}{DP}$$

$$\Rightarrow \quad \frac{BP}{BD} = \frac{BD}{BP - BD}$$

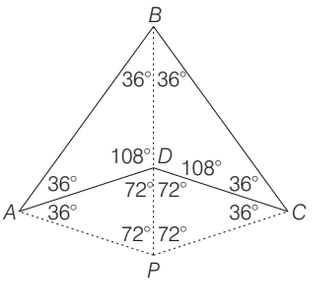
$$\Rightarrow \quad \frac{BP}{BD} = \frac{\dfrac{BD}{BD}}{\dfrac{BP}{BD} - \dfrac{BD}{BD}}$$

$$\Rightarrow \quad \frac{BP}{BD} = \frac{1}{\dfrac{BP}{BD} - 1}$$

$$\Rightarrow \quad x = \frac{1}{x - 1}$$

$$\Rightarrow \quad x^2 - x - 1 = 0$$

$$\Rightarrow \quad x = \frac{1 + \sqrt{5}}{2}$$



$$\Rightarrow \quad \frac{BP}{AP} = \frac{1 + \sqrt{5}}{2}$$

$$\Rightarrow \quad \frac{AB}{AD} = \frac{1 + \sqrt{5}}{2}$$

$$\because \quad AD = CD = 1$$

$$\therefore \quad AB = BC = \frac{1 + \sqrt{5}}{2}$$

$$\therefore \quad AB + BC + CD + AD = 2\left(\frac{1 + \sqrt{5}}{2}\right) + 2(1)$$

$$= 3 + \sqrt{5}$$

Thus the perimeter of the dart is $3 + \sqrt{5}$ cm.

Hence choice (a) is the correct one.

83 Since the dart is a sort of a kite, though it's a conclave kite with a conclave (or reflex) angle, so it's also symmetric about the diagonal DB. That's why DB acts as an angle bisector. Thus we can determine every angle of the dart ABC as shown in the diagram.

$$\angle ADB = \angle CDB = \frac{1}{2}(216°) = 108°$$

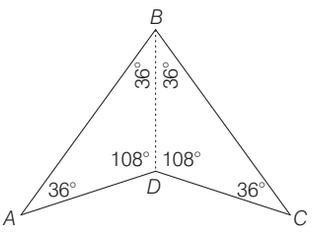
And $\angle ABD = \angle CBD = \dfrac{1}{2}(72°) = 36°$

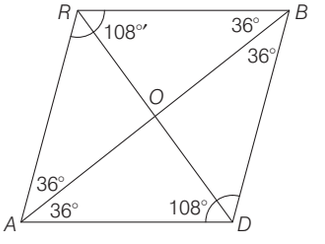
$\therefore \quad \angle BAD = 180 - (108 + 36) = 36°$

Similarly, $\angle BCD = 36°$

It shows that ΔABD and ΔBCD are isosceles triangles.

Then, $AD = BD = CD = 1$ cm





Now cut the dart along the symmetric line BD, and then join the two congruent triangles as shown in the second diagram. What I have done is that keeping the ΔADB as it is I have rotated the ΔBDC about the vertex B, and then I have attached it with the ΔADB. Now the vertices C and

A coincide, and the vertex D of ΔBDC has become the vertex R. Thus we get a rhombus of side 1 cm and its longer diagonal is $\frac{1+\sqrt{5}}{2}$.

As we know that the diagonals of a rhombus perpendicularly bisect each other, so we can determine the shorter diagonal by using Pythagoras theorem, as discussed below.

$$RO^2 = AR^2 - AO^2$$

$$RO^2 = 1^2 - \left(\frac{1+\sqrt{5}}{4}\right)^2 = \frac{5-\sqrt{5}}{8}$$

$$\Rightarrow \quad RO = \sqrt{\frac{5-\sqrt{5}}{8}}$$

$$\Rightarrow \quad RD = 2\sqrt{\frac{5-\sqrt{5}}{8}} = \sqrt{\frac{5-\sqrt{5}}{2}}$$

Therefore, area of rhombus

$$= \frac{1}{2} \times \frac{1+\sqrt{5}}{2} \times \sqrt{\frac{5-\sqrt{5}}{2}} = \frac{\sqrt{5+\sqrt{5}}}{2\sqrt{2}}$$

Hence choice (c) is the correct one.

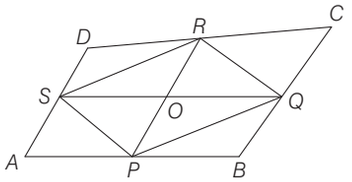
Alternatively The area of dart will be less than 1 sq cm, as the second figure suggests that it is a rhombus with each side 1 cm. Had it been a square with each side 1 cm, the area of the second figure would have been maximum which is actually 1 sq. cm. Now, calculating the approximate value of all the choices, we see that only choice (c) is the valid one, as all other values are greater than 1.

84 You know that by joining the mid-points of any quadrilateral a parallelogram is formed. And you also know that the diagonals divide the parallelogram into four equal areas. That is area of $\Delta POQ = \Delta SOP = \Delta ORQ$

$$= \Delta SRO = k \text{ (say)}$$

Let area of quadrilaterals $\square ASOP$, $\square POQB$, $\square ORCQ$, $\square SDRO$ be $4x : 5x : 7x : 6x$, then we have,

$$\frac{\Delta ASP}{\Delta RCQ} = \frac{4x-k}{7x-k} = \frac{2}{5} \Rightarrow k = 2x$$



$$\therefore \quad \frac{\text{Area } (\square PQRS)}{\text{Area } (\square ABCD)} = \frac{2x + x + 2x + 2x}{4x + 5x + 6x + 7x} = \frac{4}{11}$$

Hence choice (c) is the correct one.

NOTE As in any parallelogram the diagonals bisect each other, so they will act as medians and thus the parallelogram is divided into four triangles of equal areas.

85 Since $\angle ADC : \angle BCD = 1 : 2$ and $\angle ADC + \angle BCD = 180°$.

Therefore $\angle ADC = 60°$ and $\angle BCD = 120°$.

But as you know that AC and DB are the angle bisectors, so ΔDAC and ΔABC are equilateral triangles.

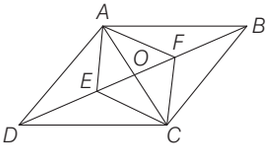
Let us consider $AB = BC = CD = DA = AC = 6$, then $DO = OB = 3\sqrt{3}$, as DO and OB are the altitudes of equilateral triangles ΔDAC and ΔABC. Therefore,

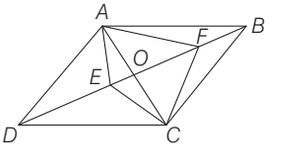
$BD = 6\sqrt{3}$ and $EF = \frac{6\sqrt{3}}{3} = 2\sqrt{3}$.

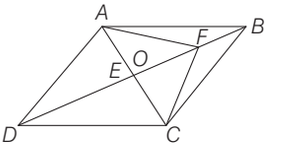
Further, as you know that the diagonals of a rhombus always bisect each other perpendicularly, so the quadrilateral formed by the points A, F, C, E is either a parallelogram or a kite or an isosceles triangle. But in all such cases the area of the figure drawn using the four points

$$A, F, C, E = \frac{1}{2} \times AC \times EF = \frac{1}{2} \times 6 \times 2\sqrt{3} = 6\sqrt{3}$$

And the area of quadrilateral $ABCD = 2 \times \frac{\sqrt{3}}{4} \times 6^2 = 18\sqrt{3}$







Therefore the require ratio of area $= 6\sqrt{3} : 18\sqrt{3} = 1 : 3$

Hence choice (d) is the correct one.

86 Let $CD = 2a$, so $AB = 8a$

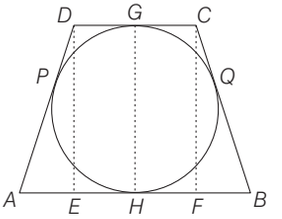
Thus, $\quad AB + CD = 10a = 70$

$\Rightarrow \quad a = 7$ cm

$\Rightarrow AB = 56$ cm and $CD = 14$ cm.

Now, we have $DG = CG = 7$ cm. But, since DG and DP are two tangents from the same point on the same circle, so they must be equal.

$\therefore \quad DG = DP = 7$ cm. Similarly, $CG = CQ = 7$ cm.



Further, $EH = DG = 7$ cm and $HF = CG = 7$ cm. Now, $AH = BH = 28$ cm.

But $AP = AH = 28$ cm, as both are the tangents drawn from the same point on the same circle.

Now, $BQ = BH = 28$ cm.

Thus we have, $AE = AH - EH = 21$ cm

and $DA = DP + AP = 7 + 28 = 35$ cm.

Now, using Pythagoras theorem in triangle ADE, we have

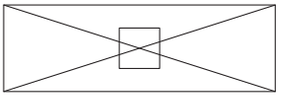
$DE = \sqrt{(DA)^2 - (AE)^2} = 28$ cm

Therefore circumference of the inscribed circle

$$= 2\pi r = 2r(\pi) = 28\left(\frac{22}{7}\right) = 88 \text{ cm}.$$

Hence choice (d) is the correct one.

87 First of all we must understand that the square window will be at the centre of the rectangular wall, otherwise the diagonals of window and diagonals of wall won't intersect at the same point. Now, look at the figure or draw a proper diagram and you see that since the length of the wall is greater than its height, so the diagonal will have an acute angle with the base of the wall. Therefore the diagonals of the wall will intersect the vertical sides of the window.

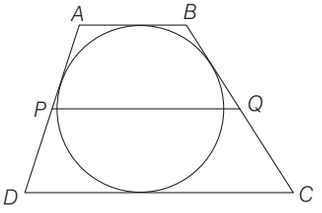


Hence choice (b) is the correct one.

88 Let $AB = 2x$ and $CD = 2y$, then $PQ = \frac{1}{2}(AB + CD) = x + y$.

$$\frac{\text{Area of trapezium } ABQP}{\text{Area of trapezium } PQCD} = \frac{\frac{1}{2} \times h \times (2x + x + y)}{\frac{1}{2} \times h \times (2y + x + y)}$$

$$= \frac{3x + y}{x + 3y} = \frac{1}{2} \Rightarrow \frac{x}{y} = \frac{1}{5}$$



Since $ABCD$ is a circumscribing trapezium,

So, $AB + CD = BC + DA$

$\Rightarrow$ $AB + CD = 24$ cm

$\Rightarrow$ $AB = 2x = 4$ cm,

$BC = 2y = 20$ cm

Hence choice (a) is the correct one.

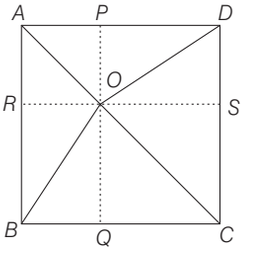
89 Given that $OA = 3, OB = 4, OD = 5$, then

$$OA^2 = AP^2 + OP^2 \quad \ldots(\text{i})$$

$$OD^2 = PD^2 + OP^2 \quad \ldots(\text{ii})$$

$$OB^2 = BR^2 + OR^2 = BR^2 + AP^2 \quad \ldots(\text{iii})$$

$$OC^2 = SC^2 + OS^2 = BR^2 + PD^2 \quad \ldots(\text{iv})$$



Adding eqs. (i) and (iv), we get

$$OA^2 + OC^2 = AP^2 + OP^2 + BR^2 + PD^2 \quad \ldots(\text{v})$$

Adding eqs. (ii) and (iii), we get

$$OD^2 + OB^2 = PD^2 + OP^2 + BR^2 + AP^2 \quad \ldots(\text{vi})$$

From eqs. (v) and (vi), we get

$$OA^2 + OC^2 = OD^2 + OB^2$$

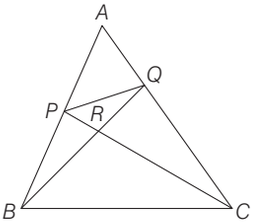
$$3^2 + OC^2 = 5^2 + 4^2$$

$\Rightarrow$ $OC = 4\sqrt{2}$

Hence choice (d) is the correct one.

90 $\angle APQ = \angle ACB = 60° = 180° - (\angle BAC + \angle ABC)$

$\therefore \angle AQP = 70° = 180 - (\angle PAQ + \angle APQ)$



Now, you can see that $\angle BPQ = 120°$ and $\angle PQC = 110°$.

Thus you have, $\angle BPQ + BCQ = 180°$

and $\angle PBC + \angle PQC = 180°$.

It implies that the quadrilateral $PQCB$ is a cyclic one.

Therefore, $\angle PBQ = \angle QCP = \angle ACB - \angle PCB$

$= 60° - 40° = 20°$

Hence Choice (c) is the correct one.

Hint $\angle PCB = 180° - (\angle PBC + \angle BPC)$.

And $\angle PBC = \angle BPC$, as $BC = PC$

91 Statement (i) is incorrect. In the following diagram, you see that the kite diagram is symmetrical about only one axis KM.

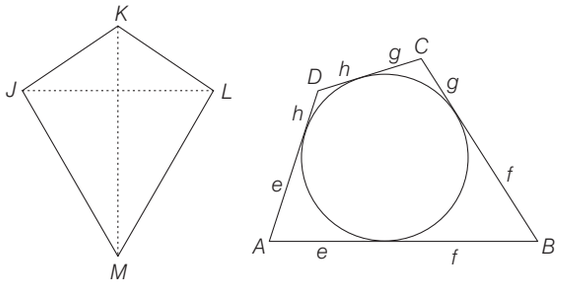
Statement (ii) is correct. Whenever the length of both the diagonals of a kite becomes equal, the kite becomes a square. Whenever all the angles of an isosceles trapezium become equal, the trapezium becomes a square.

Statement (iii) is correct, as the diagonals of a kite bisect each other at 90°.

Statement (iv) is correct. The are numerous possibilities.

Statement (v) is correct.

Statement (vi) is correct. A circumscribing quadrilateral has each of its sides tangent to a circle. Therefore, $AB + CD = AD + BC$.



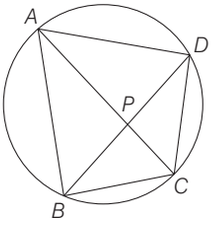
Hence choice (d) is the correct one.

92 Statement (i) is correct.

Statement (ii) is incorrect. When the cyclic quadrilateral is a kite whose main axis is the diameter of the circle, the two diagonals of the kite intersect each other perpendicularly, however, it is not necessary that the perpendicular line drawn through the point of intersection bisects the side of the cyclic quadrilateral. It is true only when the cyclic quadrilateral is a square.

Statement (iii) is correct.

$AC \times BD = (AD \times BC) + (AB \times CD)$



Hence choice (c) is the correct one.

93 Statement (i) is correct.

$$AC = 2PQ = 2SR \text{ and } BD = 2PS = 2QR$$

Statement (ii) is correct.

Area of ΔRCQ + Area of ΔSAP = Area of ΔSDR + Area of ΔPBQ

$$\Rightarrow \frac{1}{4}(\text{Area of } \Delta DCB) + \frac{1}{4}(\text{Area of } \Delta DAB) = \frac{1}{4}(\text{Area of } \Delta ADC) + \frac{1}{4}(\text{Area of } \Delta ABC)$$

$$\Rightarrow \frac{1}{4}(\Delta DCB + \Delta DAB) = \frac{1}{4}(\Delta ADC + \Delta ABC)$$

$$\Rightarrow \frac{1}{4}(\square ABCD) = \frac{1}{4}(\square ABCD)$$

Statement (iii) is correct.

$$\text{Area of } X_1 + X_2 + X_3 + X_4 = \frac{1}{2}(ABCD)$$

$$\Rightarrow \square PQRS = \frac{1}{2}(\square ABCD)$$

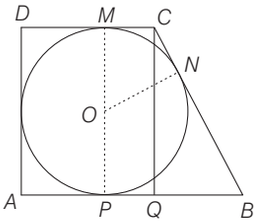
Hence choice (c) is the correct one.

94 Area of $\square ABCD = \Delta ABD + \Delta CBD$

$$= 2(\Delta AFD) + 2(\Delta CBE)$$
$$= 2(9) + 2(18) = 54 \text{ cm}^2$$

Hence choice (d) is the correct one.

95 First of all draw two lines MP and CQ parallel to DA and join the centre of circle O with N.



$$OP = OM = ON = 4 \text{ cm}$$

(Radii of same circle)

$$MP = CQ = DA = 8 \text{ cm}.$$

Since, CM and CN are tangents from the same point on the same circle, so $CM = CN$.

But, $CM = DC - DM = 5 - 4 = 1$ cm,

therefore, $PQ = CM = CN = 1$ cm.

Now, since BP and BN are tangents from the same point on the same circle, so $BP = BN$.

Let us consider $BP = BN = x$, we have

$$BQ^2 + CQ^2 = BC^2$$

$$\Rightarrow (x-1)^2 + 8^2 = (x+1)^2 \Rightarrow x = 16$$

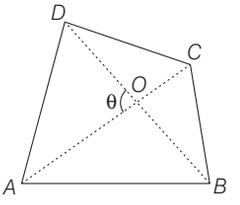
Thus the perimeter of the trapezium

$$ABCD = AB + BC + CD + DA$$
$$= 20 + 17 + 5 + 8 = 50 \text{ cm}$$

Since the unit of perimeter should be cm not the cm^2. So choice (b) is incorrect.

Hence Choice (d) is the correct one.

96 We know that if the diagonals of a quadrilateral intersect each other, the product of areas of opposite triangles thus formed is equal.



$$\text{Area of } \Delta AOD = \frac{1}{2}(AO)(OD)\sin\theta$$

$$\text{Area of } \Delta COD = \frac{1}{2}(CO)(OD)\sin\theta$$

$$\text{Area of } \Delta BOC = \frac{1}{2}(BO)(OC)\sin\theta$$

$$\text{Area of } \Delta AOB = \frac{1}{2}(AO)(OB)\sin\theta$$

$$\therefore \frac{1}{2}(AO)(OD)\sin\theta \times \frac{1}{2}(BO)(OC)\sin\theta$$

$$= \frac{1}{2}(CO)(OD)\sin\theta \times \frac{1}{2}(AO)(OB)\sin\theta$$

$\Rightarrow$ area of $\Delta AOD \times$ Area of ΔBOC

$$= \text{Area of } \Delta COD \times \text{Area of } \Delta AOB$$

$$\Rightarrow \qquad 32 \times 18 = x \times y$$

We know that $x + y$ will be minimum when $x = y$

Therefore, $32 \times 18 = x \times x = x^2$

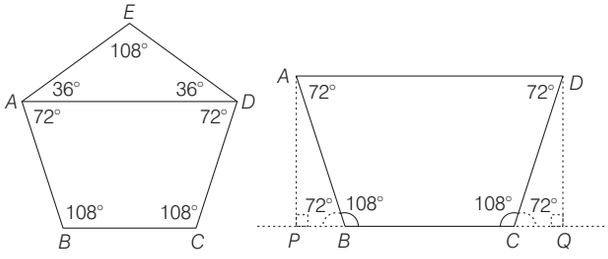
$$\Rightarrow \qquad x = 24$$

Thus the minimum area of quadrilateral

$ABCD = 32 + 24 + 18 + 24 = 98 \text{ cm}^2$

Hence Choice (c) is the correct one.

97 Extend the line segment BC on both the sides and drop the perpendiculars AP and DQ on the extended line PQ. The triangles ABP and DCQ are congruent, as $AB = DC$, and all the three angles in both the triangles, ABP and DCQ, are same. Therefore, $AP = DQ$. That is the distance between AD and PQ is constant. It shows that the line segments AD and PQ are parallel. Thus the quadrilateral $ABCD$ is a trapezium.



Now, you can see that in the quadrilateral $ABCD$ opposite angles are supplementary. Thus in any quadrilaterals if the opposite angles are supplementary, the quadrilateral is a cyclic one. Therefore $ABCD$ is a cyclic quadrilateral.

Now, it is obvious that $AB = BC = CD$, but $AD > BC$ so $AD + BC > AB + CD$. It proves that the sum of opposite sides is not equal, so it is not a tangential quadrilateral.

Hence choice (c) is the correct one.

98 In a regular pentagon each interior angle is 108°. Now in ΔABC, since $AB = BC$ and $\angle ABC = 108°$, so $\angle CAB = \angle ACB = 36°$.

Similarly, in ΔDCB, we have $\angle BDC = \angle DBC = 36°$.

Therefore, $\angle EAF = \angle EAC = \angle EAB - \angle CAB$

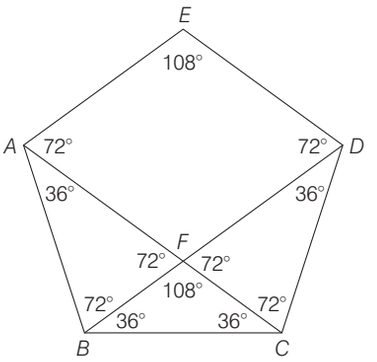
$$= 108° - 36° = 72°$$

Similarly, $\angle EDF = \angle EDB = 72°$.

So, in the quadrilateral $AEDF$, we have $\angle EAF = \angle EDF$.

As we know that the sum of all the four interior angles of a quadrilateral is always 360°, so in the quadrilateral $AEDF$ we have $\angle AFD = 360° - (108° + 72° + 72°) = 108°$

It shows that $\angle AED = \angle AFD$.



Thus you can see that $AB = AF = AE = ED = DC = DF$. That is all the four sides of quadrilateral $AEDF$ are equal.

So either it is a square or a rhombus; but since the internal angles are not equal to 90°, so it would certainly be a rhombus. Further you know that every rhombus is a kite, so $AEDF$ is a kite.

Now since the opposite angles of the rhombus $AEDF$ are not the supplementary angles, so $AEDF$ is not a cyclic quadrilateral.

However, since the sum of opposite sides is equal, that is $ED + AF = AE + DF$, so the rhombus $AEDF$ is a tangential quadrilateral.

Hence choice (d) is the best answer.

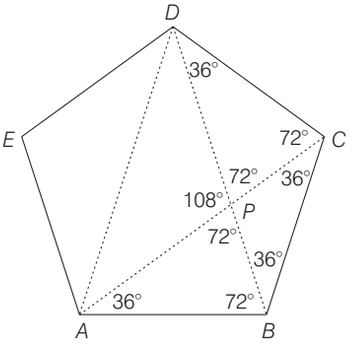
99 In ΔACB, $\angle ABC = 108°$ and $AB = BC$,

$$\therefore \qquad \angle BAC = \angle BCA = 36°$$

Similarly, in ΔDCB, $\angle DCB = 108°$

and $\qquad CD = CB$,

$$\therefore \qquad \angle CDB = \angle CBD = 36°$$



Now in ΔPBC, $\angle PBC = \angle PCB = 36°$,

So $\qquad \angle BPC = 108°$.

Therefore, $\qquad \angle APB = \angle DPC = (180 - 108) = 72°$

Thus, in ΔABP, two angles are equal, so the two sides will also be equal. That is $AP = AB = 2$ cm.

Similarly, in ΔDCP, two angles are equal, so the two sides will also be equal.

That is $DP = DC = 2$ cm.

Therefore, the required perimeter of the quadrilateral $APDE = 2 + 2 + 2 + 2 = 8$ cm.

Hence choice (d) is the correct one.

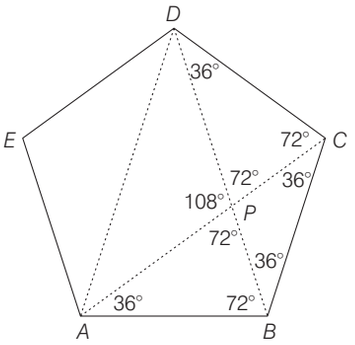
100 In ΔACB, $\angle ABC = 108°$ and $AB = BC$

$\therefore \quad \angle BAC = \angle BCA = 36°$

Similarly, in ΔDCB, $\angle DCB = 108°$

and $CD = CB$,

$\therefore \quad \angle CDB = \angle CBD = 36°$



Now, in ΔBPC, $\angle PBC = \angle PCB = 36°$,

$\therefore \quad \angle BPC = 180 - (36 + 36) = 108°$

As it is obvious that ΔABC and ΔBPC are similar triangles, so

$$\frac{AB}{AC} = \frac{PC}{BC}$$

$$\Rightarrow \quad \frac{2}{AP + PC} = \frac{PC}{2}$$

$$\Rightarrow \quad \frac{2}{2 + PC} = \frac{PC}{2}$$

$$\Rightarrow \quad PC = \frac{-2 \pm \sqrt{20}}{2} = -1 \pm \sqrt{5}$$

$$\Rightarrow \quad PC = -1 + \sqrt{5}.$$

(Since, length cannot be a negative value, so $PC \neq -1 - \sqrt{5}$)

Hence choice (a) is the correct one.

101 It is known that the each interior angle of a regular pentagon is 108°,

so, $\angle BAE = \angle AED = \angle EDC = \angle DCB = \angle CBA = 108°$.

Since $\angle ABE = \angle AEB = 36°$,

therefore $\angle EBC = \angle BED = 108° - 36° = 72°$

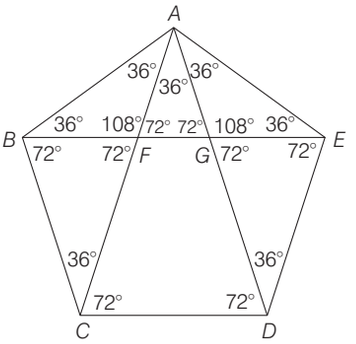
As the interior angles on the same side of a transversal are supplementary, that is $\angle EBC + \angle BCD = 180°$, so the line segments BE and CD are parallel.

Similarly, $AC \,||\, ED$ and $AD \,||\, BC$.

$\angle BCA = \angle BAC = 36°$

and $\angle FBC = 72°$, so $\angle BFC = 72°$.

$\therefore \quad \angle AFG = 72°$ and $\angle AGF = 72°$,



So, $\angle FAG = 36°$

Therefore, $\Delta BCF \sim \Delta FAG$.

Now, in ΔAFB, $\angle BAF = 36°$

and $\angle ABF = 36°$,

$\therefore \quad \angle AFB = 108°$

and in ΔBAE,

$\angle BAE = 108°$ and $\angle ABE = \angle AEB = 36°$.

Also in ΔABC, $\angle ABC = 108°$

and $\angle BCA = \angle BAC = 36°$

Thus, $\Delta AFB \sim \Delta BAE \sim \Delta ABC$

Now, since $\Delta BCF \sim \Delta FAG$

and $AF = BF$ and $BC = 1$

$$\therefore \quad \frac{BC}{BF} = \frac{AF}{FG}$$

$$\Rightarrow \quad \frac{BC}{BF} = \frac{BF}{FG}$$

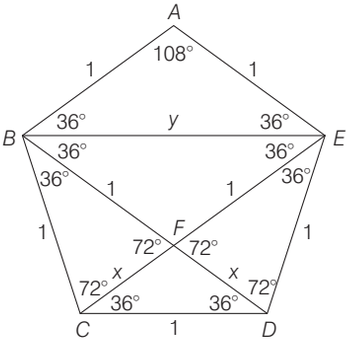
$$\Rightarrow \quad \frac{1}{BF} = \frac{BF}{FG} = BF^2 = FG.$$

Once again, since $\Delta BCF \sim \Delta FAG$

$$\therefore \quad \frac{\Delta BCF}{\Delta FAG} = \frac{BF^2}{FG^2} = \frac{FG}{FG^2} = \frac{1}{FG}$$

Hence choice (d) is the correct one.

102 Consider the following diagram



Now, triangles BFE and CDF are similar triangles, therefore $\frac{x}{1} = \frac{1}{y}$

But $BE = BD = CE = y = x + 1$, therefore

$$\frac{x}{1} = \frac{1}{y} \Rightarrow \frac{x}{1} = \frac{1}{x+1} \Rightarrow x(x+1) = 1$$

$$\Rightarrow \quad x^2 + x - 1 = 0$$

$$\Rightarrow \quad x = \frac{-1+\sqrt{5}}{2} \text{ and } x\,\frac{-1-\sqrt{5}}{2}$$

One of these lengths is negative, so it has to be discarded.

And the positive value of $x = \dfrac{-1+\sqrt{5}}{2}$

$$\therefore \quad y = x + 1 = \frac{1+\sqrt{5}}{2}$$

Hence choice (c) is the correct one.

Hint For a standard quadratic equation $ax^2 + bx + c = 0$, the two solutions of x are $\dfrac{-b \pm \sqrt{b^2 - 4ac}}{2a}$

Alternatively Choice (a) is wrong as the diagonal must be less than 2 cm.

Choice (b) is wrong, as the diagonal must be greater than 1 cm.

Choice (d) is absurd, as data is quite sufficient to determine the diagonal.

Hence choice (c) is the correct one.

Alternatively Let us consider that each side of the pentagon is a and each diagonal of the pentagon is b.

Now, using Ptolemy's theorem in cyclic quadrilateral $BCDE$, we have

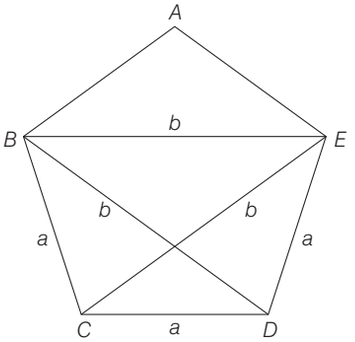
$$BC \times DE + BE \times CD = BD \times CE$$

$$\Rightarrow \quad a^2 + ab = b^2$$

$$\Rightarrow \quad b^2 - a^2 = ab$$

$$\Rightarrow \quad \frac{b^2}{ab} - \frac{a^2}{ab} = \frac{ab}{ab}$$

$$\Rightarrow \quad \frac{b}{a} - \frac{a}{b} = 1$$



$$\Rightarrow \quad x - \frac{1}{x} = 1$$

$$\Rightarrow \quad x^2 - 1 = x$$

$$\Rightarrow \quad x^2 - x - 1 = 0$$

$$\Rightarrow \quad x = \frac{1+\sqrt{5}}{2} \text{ or } \frac{1-\sqrt{5}}{2}$$

Since, $\dfrac{1-\sqrt{5}}{2}$ is a negative value, which is inadmissible.

Therefore, $x = \dfrac{b}{a} = \dfrac{1+\sqrt{5}}{2}$

But, since $a = 1$, therefore $b = \dfrac{1+\sqrt{5}}{2}$

103 First of all extend the sides DC and AB in order to meet at Q.

Now, the angle $BQC = 36°$.

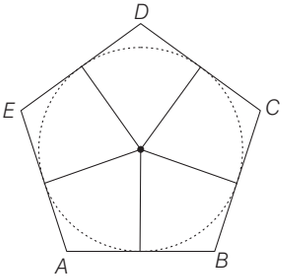
Since ΔBQC is an isosceles triangle so the perpendicular QP drawn from Q on the side BC will bisect the BC, and it will be the angular bisector of angle BQC, as well.

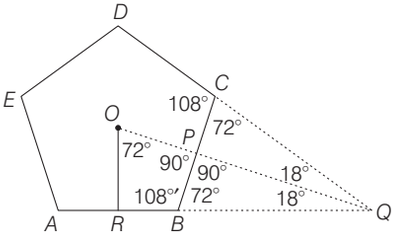
Similarly, the perpendiculars drawn from the incentre O of the regular pentagon $ABCDE$ will bisect the opposite sides as OR bisects AB at R and OP bisects BC at P.

Now as given that $BC = 2$ cm, therefore, using 36-72-72 degree theorem in ΔBQC, we have $BQ = CQ = (1 + \sqrt{5})$ cm.

Now, in right angled triangle BPQ,

$$PQ = \sqrt{BQ^2 - BP^2} = \sqrt{(1+\sqrt{5})^2 - 1^2} = \sqrt{5 + 2\sqrt{5}}$$





But since ΔBPQ is similar to ΔORQ, therefore

$$\frac{BQ}{BP} = \frac{OQ}{OR} \Rightarrow \frac{BQ}{BP} = \frac{OP + PQ}{OR}$$

$$\Rightarrow \quad \frac{1+\sqrt{5}}{1} = \frac{a + \sqrt{5+2\sqrt{5}}}{a}$$

$$\Rightarrow \quad a = \frac{\sqrt{5+2\sqrt{5}}}{\sqrt{5}} = \sqrt{\frac{5+2\sqrt{5}}{5}}$$

Hence choice (a) is the correct one.

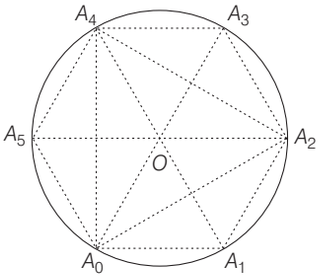
Hint Using the 72-72-36 degree theorem in ΔBQC, we have $BQ = CQ = 1 + \sqrt{5}$ cm since $BC = 2$ cm.

Alternatively Use trigonometric ratios.

104 Since radius of circle is 1 unit. So each side of the hexagon is 1 unit.

Therefore, $A_0A_3 = A_1A_4 = A_2A_5 = 2$ units.

$A_0A_2A_3$ is a right angle triangle as it is a triangle in the semi-circle. Since $A_2A_3 = 1$, $A_0A_3 = 2$, so $A_0A_2 = \sqrt{3}$.



Now, since $A_0A_4 = A_0A_2 = \sqrt{3}$.

Therefore, $A_0A_1 \times A_0A_2 \times A_0A_4 = 1 \times \sqrt{3} \times \sqrt{3} = 3$.

Hence choice (c) is the answer.

Alternatively This problem can be solved using 30-60-90 theorem as well.

Alternatively Problem can be solved by using the following concept too.

Area of parallelogram $A_0A_1A_2O$

$$= \text{Area of } \Delta A_0A_1O + \text{Area of } \Delta A_1A_2O$$

$$\frac{1}{2}(A_0A_2 \times OA_1) = 2\left(\frac{\sqrt{3}}{4} \times 1^2\right)$$

$$\Rightarrow \quad A_0A_2 = \sqrt{3}.$$

Therefore, $A_0A_1 \times A_0A_2 \times A_0A_4 = 1 \times \sqrt{3} \times \sqrt{3} = 3$.

Alternatively Problem can be solved by using the following concept too.

Area of $\Delta A_0A_2A_4 = \dfrac{A_0A_2 \times A_2A_4 \times A_4A_0}{4R}$

$$\Rightarrow \quad 3 \times \left(\frac{\sqrt{3}}{4} \times 1^2\right) = \frac{k^3}{4} \Rightarrow k = \sqrt{3}$$

Therefore, $A_0A_1 \times A_2A_2 \times A_2A_4 = \sqrt{3} \times \sqrt{3} \times 1 = 3$

105 In ΔEDC, $\angle EDC = 120°$ and $ED = DC$

$$\Rightarrow \quad \angle CED = \angle DCE = 30°$$

Similarly, in ΔFED, $\angle FED = 120°$

and $FE = ED \Rightarrow \angle DFE = \angle FDE = 30°$.

Therefore, in ΔGED,

$$\angle GED = \angle GDE = 30°$$

$$\Rightarrow \quad \angle GED = 120° \text{ and } GE = GD.$$

Now, using 30-30-120 degree theorem, we get the following results.

If $EG = GD = 1$, $ED = \sqrt{3}$. Therefore, $FD = \sqrt{3}ED = 3$. It shows that $FD = 3GD$.

It implies that $FG = 2GD$. Therefore, $Y : Z = 2 : 1$.

Now, in ΔCFD, $FG = 2GD$. Therefore, $X : Y = 2 : 1$

Thus, $Z : Y : X = 1 : 2 : 4$.

But $W = X + 2Y + Z = 4 + 2(2) + 1 = 9$

Therefore, $W : X : Y : Z = 9 : 4 : 2 : 1$

Hence, Choice (d) is the answer.

Alternatively Since $W = X + 2Y + Z$, therefore choice (a) is wrong.

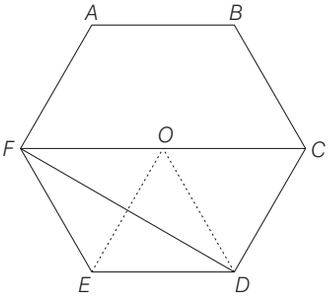
As $FC = 2ED$, $\Rightarrow X : Z = 4 : 1$, therefore choice (b) and (c) are wrong.

Hence choice (d) is correct.

Alternatively As area of $\Delta FEO = \Delta EOD = \Delta OCD$ and area of $\Delta FDE = \Delta FDO$.

It implies that area of $\Delta FCD = 2(\Delta FED)$

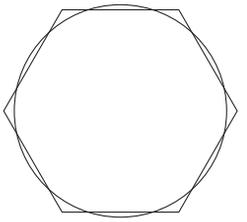
$$\Rightarrow \quad X + Y = 2(Y + Z).$$



Therefore choice (b) and (c) are wrong.

Further, $W = X + 2Y + Z$, therefore choice (a) is also wrong.

106 It can be deduced from the problem that the area of circle and area of hexagon are same.



Now, area of hexagon $= \dfrac{3\sqrt{3}}{2}a^2$.

Therefore, area of circle $= \dfrac{3\sqrt{3}}{2}a^2$.

Hence choice (b) is the correct one.

107 Total number of diagonals $= \dfrac{n(n-3)}{2}$

$$= \frac{12 \times 9}{2} = 54$$

Number of diagonals will pass through the centre

$$= \frac{n}{2} = \frac{12}{2} = 6$$

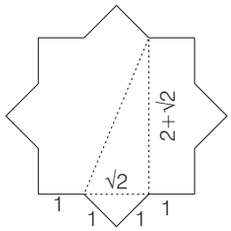
Therefore, the number of diagonals which do not pass through the center of the circumscribing circle

$= 54 - 6 = 48$.

Hence choice (d) is the correct one.

108 The diameter of the smaller circle
$\sqrt{(2+\sqrt{2})^2+(\sqrt{2})^2} = 2(\sqrt{2+\sqrt{2}})$

Therefore radius of the smaller circle $= \sqrt{2+\sqrt{2}}$



The diameter of the larger circle = diagonal of the square
$= \sqrt{2}(2+\sqrt{2}) = 2(\sqrt{2}+1)$

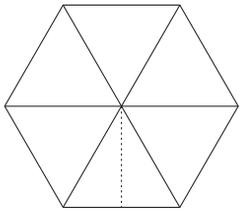
Therefore radius of the larger circle $= \sqrt{2}+1$

The ratio of area of smaller circle to that of larger circle

$$= \frac{\pi(\sqrt{2+\sqrt{2}})^2}{\pi(\sqrt{2}+1)^2} = \frac{2+\sqrt{2}}{3+2\sqrt{2}}.$$

Hence choice (a) is the correct one.

109 In the following diagram, there are six equilateral triangles and you can see that apothem is the perpendicular angle bisector of the equilateral triangle which forms two congruent triangles of 30-60-90 degree. If the apothem of the regular hexagon is a, then by using 30-60-90 degree theorem (or trigonometric ratios or Pythagoras theorem) we get to know that its side will be $\frac{2}{\sqrt{3}}a$.



Hence choice (d) is the correct one.

Alternatively If s be the length of each side and n be the number of sides, the apothem of a regular polygon is

$$a = \frac{1}{2} \times s \times \cot\left(\frac{\pi}{n}\right)$$

$$\Rightarrow \quad a = \frac{1}{2} \times s \times \cot\left(\frac{180}{6}\right)^\circ$$

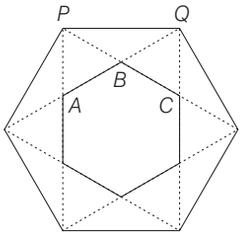
$$\Rightarrow \quad a = \frac{1}{2} \times s \times \cot 30^\circ$$

$$\Rightarrow \quad a = \frac{1}{2} \times s \times \sqrt{3}$$

$$\Rightarrow \quad s = \frac{2}{\sqrt{3}}a$$

110 Let us assume that each side of the internal hexagon be 1 cm, that is $AB = BC = \ldots = 1$ cm, then $AP = BP = BQ = CQ = 1$ cm, as ΔAPB and ΔBQC are equilateral triangles.

But in ΔPBQ, we have $\angle QPB = 30^\circ$, $\angle PQB = 30^\circ$ and $\angle PBQ = 120^\circ$, therefore either using cosine rule (or 30-30-120 degree theorem) we will have $PQ = \sqrt{3}$ cm. It means each side of the external hexagon is $\sqrt{3}$ cm.

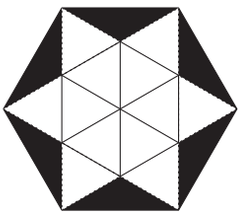


$$\therefore \frac{\text{Area of internal hexagon}}{\text{Area of external hexagon}} = \frac{\frac{3\sqrt{3}}{4}(1)^2}{\frac{3\sqrt{3}}{4}(\sqrt{3})^2} = \frac{1}{3}$$

Hence choice (a) is the correct one.

Alternatively : Draw three new lines passing through the centre of the hexagon, as shown below.

Now, you can easily observe that there are total 18 equilateral triangles as in 6 within the internal hexagon and $12 = (6 + 6)$ outside the internal hexagon. Plaese note that, in the following diagram, each of the 6 shaded obtuse triangles is equivalent to an equilateral triangle of side 1 cm.



Therefore, the required ratio of areas $= \frac{6}{18} = \frac{1}{3}$

Hint Consider the following triangles.

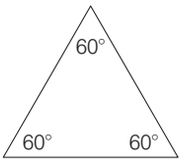


Fig. (i)

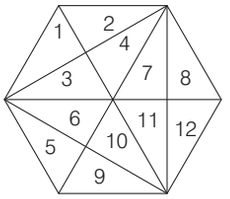
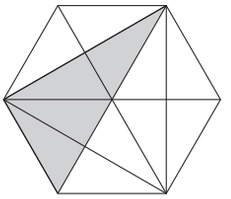
Fig. (ii)

The first triangle is an equilateral triangle with each of its sides 1 unit and fig. (ii) is an isosceles triangle with its angles 30-30-120 degree and each of the two smaller sides is 1 cm, then the area of both the triangles will be same.

111 Look closely at the following diagrams and you will find that there are total 12 isosceles right angled triangles each with equal area as each of these 12 triangles is congruent (30°-60°-90°).

Now, out of the 12 triangles 4 triangles fall under the shaded region and 8 triangles remain un-shaded.





Therefore, the required ratio $= \frac{4}{8} = \frac{1}{2}$.

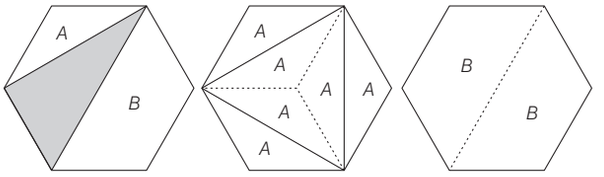
Hence choice (d) is the correct one.

Alternatively From the following diagrams you can easily figure it out that the region A (isosceles triangle) is equal to $\frac{1}{6}$ of the total area of the hexagon.

Similarly, region B (trapezium) is equal to $\frac{1}{2}$ of the total area of the hexagon.

Therefore the total un-shaded region is $\frac{1}{6} + \frac{1}{2} = \frac{4}{6} = \frac{2}{3}$ of the total area of the hexagon.

So the shaded region $= 1 - \frac{2}{3} = \frac{1}{3}$ of the total area of the hexagon.



Thus the required ratio of areas of the shaded region to un-shaded region $= \frac{\frac{1}{3}}{\frac{2}{3}} = \frac{1}{2}$.

Alternatively Please note that the following two figures are exactly the same except the triangle in the fig. (ii) is rotated 60° anti-clockwise with relation to the fig. (i).

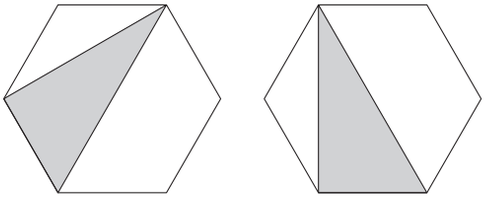


Fig. (i) Fig. (ii)

Now you can see that the area of the shaded region is equal to a right angle triangle. Assume that the each side of the hexagon is 1 cm, so the smaller diagonal of the hexagon (which is also the altitude of the triangle) is $\sqrt{3}$ cm and the longer diagonal (which is also the hypotenuse of the triangle) is 2 cm.

Then the area of the shaded region (or right angled triangle)

$$= \frac{1}{2} \times 1 \times \sqrt{3} = \frac{\sqrt{3}}{2} \text{ sq cm.}$$

And the area of the hexagon $= \frac{3\sqrt{3}}{2} \times (1)^2$

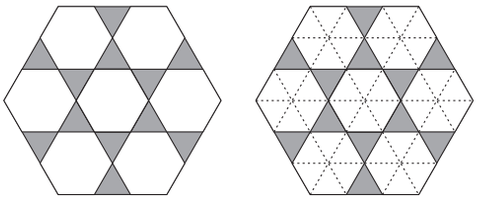
$$= \frac{3\sqrt{3}}{2} \text{ sq cm}$$

Therefore the area of un-shaded region

$$= \frac{3\sqrt{3}}{2} - \frac{\sqrt{3}}{2} = \sqrt{3} \text{ sq cm}$$

Thus the required ratio $= \frac{\left(\frac{\sqrt{3}}{2}\right)}{\sqrt{3}} = \frac{1}{2}$

112 In the following diagram you can easily notice that there are total 54 equilateral triangles of the same size. Out of 54 equilateral triangles 12 triangles are shaded and $42\,(=7\times 6)$ triangles are un-shaded.



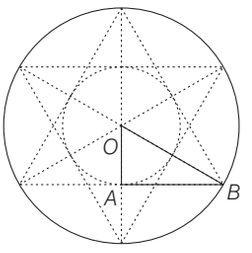
Even it is also obvious that each side of these 54 triangles is 1 cm.

Therefore area of the shaded region

$$= 12 \times \frac{\sqrt{3}}{4} \times (1)^2 = 3\sqrt{3} \text{ sq cm.}$$

Hence choice (c) is the correct one.

113 First of all join the opposite vertices of the hexagram, then you see that in the following diagram, ΔOAB is a right angled triangle, in which $\angle OBA = 30°$, $\angle BOA = 60°$, $\angle OAB = 90°$.



Also, OA is the inradius and OB is the circumradius of the hexagram.

Since area of the incircle is 3π sq cm, so its inradius $(OA) = \sqrt{3}$ cm.

Using 30-60-90 degree theorem in ΔOAB , we have $AB = 3$ cm and $OB = 2\sqrt{3}$ cm.

That is circumradius of the hexagram is $2\sqrt{3}$ cm.

Therefore, area of the circumcircle $= \pi(2\sqrt{3})^2 = 12\pi$ sq. cm.

Hence choice (a) is the correct one.

114 From the information given in the problem it can be concluded that the area of the outer hexagon is 4 times the area of the inner hexagon. That is, if a_0 and a_i be the sides of outer and inner hexagon, then

$$\frac{\text{Area of the outer hexagon}}{\text{Area of the inner hexagon}} = \frac{\frac{3\sqrt{3}}{2}(a_0)^2}{\frac{3\sqrt{3}}{2}(a_i)^2}$$

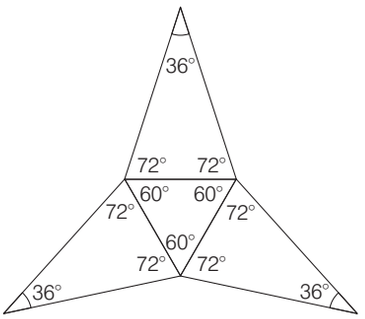
$$\Rightarrow \qquad \frac{4}{1} = \frac{(a_0)^2}{(a_i)^2} \Rightarrow \frac{a_0}{a_i} = \frac{2}{1}$$

$$\therefore \frac{\text{Perimeter of outer hexagon}}{\text{Perimeter of inner hexagon}} = \frac{6(a_0)}{6(a_i)} = \frac{2}{1}$$

Hence choice (d) is the correct one.

115 Connect the nearest three vertices of the hexagram which will form an equilateral triangle, as shown in the following diagram. Thus we can determine all the angles of this diagram.

Now, using 36-72-72 degree theorem we have the three sides of the isosceles triangles as $1 + \sqrt{5}$ mm, $1 + \sqrt{5}$ mm and 2 mm. It shows that the each side of the equilateral triangle is 2 mm.



Therefore, area of the equilateral triangle

$$= \frac{\sqrt{3}}{4} \times 2^2 = \sqrt{3} \text{ sq mm.}$$

Now the perpendicular of each isosceles triangle

$$= \sqrt{(1 + \sqrt{5})^2 - (1)^2} = \sqrt{5 + 2\sqrt{5}}$$

Therefore, area of each isosceles triangle

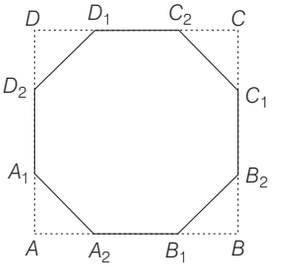
$$= \frac{1}{2} \times 2 \times \sqrt{5 + 2\sqrt{5}} = \sqrt{5 + 2\sqrt{5}}$$

Thus the total area of the hexagram $= \sqrt{3} + 3(\sqrt{5 + 2\sqrt{5}})$

Hence choice (a) is the correct one.

116 From the following diagram you can observe the symmetricity of the structure in which each side of the octagon is equal and each of the four triangles at the corner is an isosceles right angle triangle. If the legs (or the equal sides) of the right angles are k, then

$AA_1 = AA_2 = BB_1 = BB_2 = CC_1 = CC_2 = DD_1 = DD_2 = k$



Therefore $A_1A_2 = B_1B_2 = C_1C_2 = D_1D_2 = \sqrt{2}k$

That is each side of the octagon $= \sqrt{2}k$

It is known that $AB = BC = CD = DA = a$

But Since $AB = AA_2 + A_2B_1 + B_1B$

$$\therefore \qquad a = k + \sqrt{2}k + k$$

$$\Rightarrow \qquad a = k(2 + \sqrt{2})$$

$$\Rightarrow \qquad k = \frac{a}{(2 + \sqrt{2})}$$

Hence choice (c) is the correct one.

117 In triangle ABC, $AB = BC$

$$\therefore \qquad \angle CAB = \angle ACB = \angle y = 22.5°$$

as $\angle ABC = 135°$

Similarly, in triangle BCD, $BC = CD$

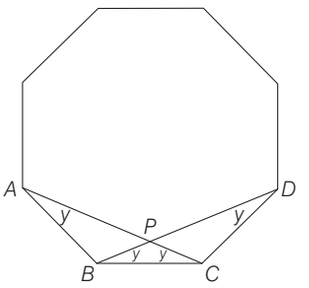
$$\therefore \qquad \angle DBC = \angle BDC = \angle y = 22.5°$$

as $\angle BCD = 135°$

Therefore, in triangle BPC,

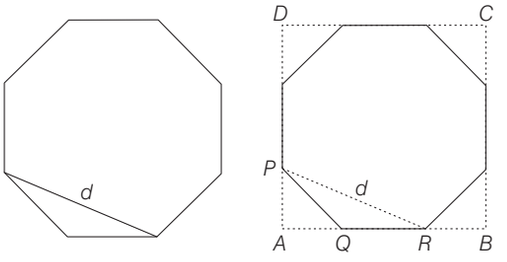
$$\angle BPC = 180° - 2y = 135°$$

Thus, $\angle APD = \angle BPC = x = 135°$



Hence choice (d) is the correct one.

118 In the following diagram PR is the shortest possible diagonal of the regular octagon. Triangle PAQ is an isosceles right triangle.



Let us consider

$$AP = AQ = b$$

$$\therefore \quad PQ = \sqrt{2}b$$

But since $PQ = QR = \sqrt{2}b$

That is $a = \sqrt{2}b \Rightarrow b = \dfrac{a}{\sqrt{2}}$

$$\therefore \quad PR = \sqrt{PA^2 + AR^2}$$

$$\Rightarrow \quad PR = \sqrt{b^2 + (b + \sqrt{2}b)^2}$$

$$\Rightarrow \quad PR = (\sqrt{4 + 2\sqrt{2}})\, b = \left(\frac{\sqrt{4 + 2\sqrt{2}}}{\sqrt{2}}\right) a$$

$$= (\sqrt{2 + \sqrt{2}})\, a$$

Hence choice (a) is the correct one.

Alternatively As $\angle PQR = 135°$, therefore by using cosine rule in the triangle ΔPQR, we have

$$\cos 135° = \frac{PQ^2 + QR^2 - PR^2}{2(PQ)(QR)}$$

$$\Rightarrow \quad \cos(90° + 45°) = \frac{a^2 + a^2 - d^2}{2(a)(a)}$$

$$\Rightarrow \quad -\sin 45° = \frac{a^2 + a^2 - d^2}{2(a)(a)}$$

$$\Rightarrow \quad -\frac{1}{\sqrt{2}} = \frac{2a^2 - d^2}{2a^2}$$

$$\Rightarrow \quad d = (\sqrt{2 + \sqrt{2}})\, a$$

119 In the following diagram PT is the longest possible diagonal of the regular octagon . Triangle RAS is an isosceles right triangle.

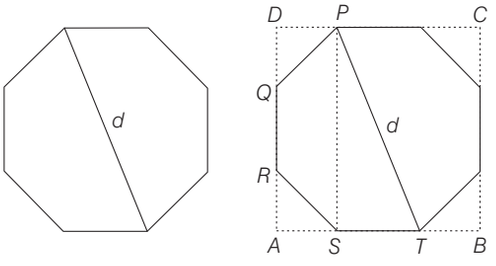
Let us consider $RA = AS = b$

$$\therefore \quad RS = \sqrt{2}b$$

But since $PQ = QR = RS = ST = \sqrt{2}b$

That is $a = \sqrt{2}b$

$$\Rightarrow \quad b = \frac{a}{\sqrt{2}}$$



$$\therefore \quad PS = DA = DQ + QR + RA = b + \sqrt{2}b + b$$

$$= (2 + \sqrt{2})b = (1 + \sqrt{2})a$$

$$\therefore \quad PT = \sqrt{PS^2 + ST^2}$$

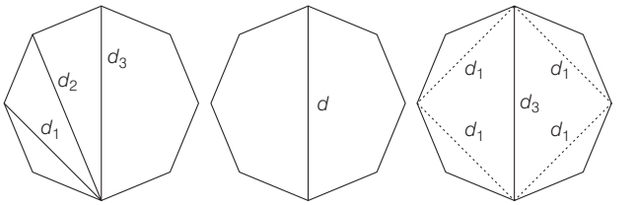
$$= \sqrt{[(1 + \sqrt{2})a]^2 + a^2} = (\sqrt{4 + 2\sqrt{2}})\, a$$

Hence choice (d) is the correct one.

NOTE Do you remember that in a regular octagon there are three diagonals of distinct lengths? So PS is one of the diagonals shorter than the longest diagonal and longer than the shortest diagonal.

Alternatively As you know that every regular octagon has three diagonals of distinct lengths, such that $d_1 < d_2 < d_3$. From the following diagrams, it is obvious that the required diagonal $d = d_3$

Even it is also obvious that $d_3 = \sqrt{2}(d_1)$

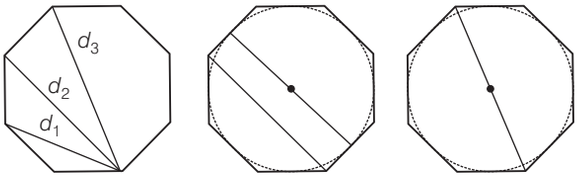


Therefore the required length of the diagonal is

$$d_3 = \sqrt{2}(d_1) = \sqrt{2} \times (\sqrt{2 + \sqrt{2}})\, a$$

$$= (\sqrt{4 + 2\sqrt{2}})\, a$$

120 If you observe closely, you will find that the inradius of the octagon is same as half of d_2 and circumradius of the octagon is same as half of d_3.



$$\text{Therefore the required ratio} = \frac{\frac{1}{2}(d_2)}{\frac{1}{2}(d_3)} = \frac{d_2}{d_3}$$

Hence choice (c) is the correct one.

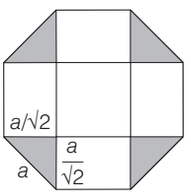
121 Let a be the side of the regular octagon, then each of the shorter sides of each of the isosceles right angled triangle at the four corners be $\dfrac{a}{\sqrt{2}}$.

Therefore area of all the four such triangles

$$= 4 \times \frac{1}{2} \times \left(\frac{a}{\sqrt{2}}\right)\left(\frac{a}{\sqrt{2}}\right) = a^2$$

And area of the square at the centre $= a^2$

Thus total shaded area $= 2a^2$



Now area of each of the four rectangles $= a \times \left(\frac{a}{\sqrt{2}}\right) = \frac{a^2}{\sqrt{2}}$

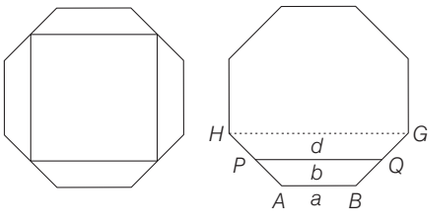
Therefore area of the unshaded region $= 4 \times \frac{a^2}{\sqrt{2}} = (2\sqrt{2})a^2$

Thus the required ratio $= \frac{2a^2}{(2\sqrt{2})a^2} = \frac{1}{\sqrt{2}}$

Hence choice (c) is the correct one.

122 In the following figures, you can easily observe that the side of the square, $b = \frac{d + a}{2}$

That is $(b) = \frac{[(1 + \sqrt{2})a] + a}{2} = \frac{(2 + \sqrt{2})a}{2}$



Hence choice (a) is the correct one.

Hint HG is parallel to AB. Since P and Q are the mid-points of HA and GB, so you can use mid-point theorem and thus PQ will be parallel to AB and HG; and PQ will be half of the sum of the AB and HG.

Alternatively It is known that $HA = AB = BG$

And $$PA = \frac{AH}{2} = \frac{a}{2}$$

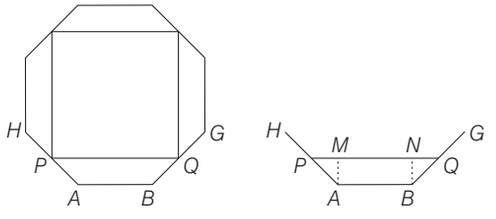
But since triangle PMA is an isosceles right angled triangle, so $$PM = \frac{PA}{\sqrt{2}} = \frac{a/2}{\sqrt{2}} = \frac{a}{2\sqrt{2}}$$

$$\therefore \quad PQ = PM + MN + NQ$$

$$\Rightarrow \quad PQ = PM + AB + PM \qquad (PM = MA = NB = NQ)$$

$$\Rightarrow \quad PQ = \frac{a}{2\sqrt{2}} + a + \frac{a}{2\sqrt{2}} = \left(1 + \frac{1}{\sqrt{2}}\right)a$$

$$\Rightarrow \quad PQ = \frac{(\sqrt{2} + 1)a}{\sqrt{2}} = \frac{(2 + \sqrt{2})a}{2}$$



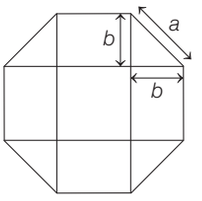
Hence choice (a) is the correct one.

123 In the following diagram of a regular polygon there are :

(i) 4 isosceles right angled triangles each having its area $= \frac{1}{2} \times b \times b$

(ii) 4 rectangles each having its area $= a \times b$

(iii) 1 square at the centre having its area $= a \times a$



Let each side of the isosceles triangle be b, then $a = \sqrt{2}b$

Therefore, total area of the octagon.

$$A = 4\left(\frac{1}{2} \times bb\right) + 4(ab) + (aa)$$

$$A = 2bb + 4ab + aa$$

$$A = 2\left(\frac{a}{\sqrt{2}} \times \frac{a}{\sqrt{2}}\right) + 4\left(a \times \frac{a}{\sqrt{2}}\right) + aa$$

$$A = a^2 + 2\sqrt{2}a^2 + a^2$$

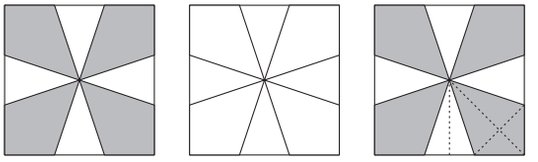
$$A = 2(1 + \sqrt{2})a^2$$

Hence choice (d) is the correct one.

124 Let the perpendicular height and base of each isosceles triangle be a and b, respectively; and the shorter diagonal and the longer diagonal of each kite be c and d, respectively.

Therefore area of each triangle $= \frac{1}{2} \times ab$

And, area of each kite $= \frac{1}{2} \times cd$



Now, if we assume that each side of the square is x, then we have $a = \frac{x}{2}$

But since area of each triangle is $\frac{1}{8}$ of the area of the square, therefore

$$\frac{1}{2} \times ab = \frac{1}{8} \times x \times x$$

$$\Rightarrow \quad \frac{1}{2} \times \frac{x}{2} \times b = \frac{1}{8} \times x \times x$$

$$\Rightarrow \quad b = \frac{x}{2}$$

Also, $$d = \frac{x}{\sqrt{2}}$$

Now, since $$\frac{1}{2} \times ab = \frac{1}{2} \times cd$$

$$\Rightarrow \quad \frac{1}{2} \times \frac{x}{2} \times \frac{x}{2} = \frac{1}{2} \times c \times \frac{x}{\sqrt{2}}$$

$$\Rightarrow \qquad c = \frac{x}{2\sqrt{2}}$$

Therefore, the required ratio $= \frac{d}{c} = \frac{\frac{x}{\sqrt{2}}}{\frac{x}{2\sqrt{2}}} = \frac{2}{1}$

Hence choice (a) is the correct one.

125 You can easily observe that there are 8 isosceles right angled triangles, which are shaded. If each smaller side (legs) of the isosceles right angled triangle is a, then the hypotenuse of each triangle would be $\sqrt{2}a$ and thus each side of the octagon would also be $s = \sqrt{2}a$.

The area of 8 triangles = 4 sq cm

$$\Rightarrow \qquad 8 \times \frac{1}{2} \times a^2 = 4 \text{ sq cm}$$

$$\Rightarrow \qquad a = 1 \text{ cm}$$

That is each side of the octagon is $s = \sqrt{2}a = \sqrt{2}$ cm

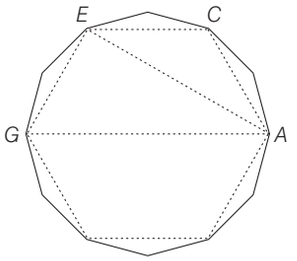
Therefore area of the octagon $= 2(1 + \sqrt{2})(s)^2$

$$= 2(1 + \sqrt{2})(\sqrt{2})^2 = 4(1 + \sqrt{2})$$

Thus the area of the common region $= 4(1 + \sqrt{2})\,\text{cm}^2$

Hence choice (b) is the correct one.

126 All the points are lying on the circle, so the quadrilateral $ACEG$ is a cyclic quadrilateral. Now, $\angle ACE = 120°$, since $AC, CE, EG, \ldots$ are the equal sides of a regular hexagon.

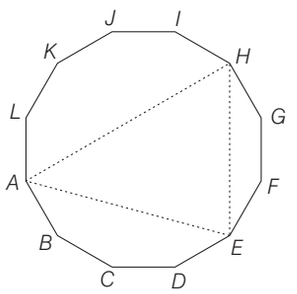


We know that the opposite angles of a cylic quadrilateral are supplementary. That is $\angle ACE + \angle AGE = 180°$.

Therefore, $\angle AGE = 180 - 120 = 60°$.

Hence choice (d) is the correct one.

127 Consider the hexagon $ALKJIH$, in which $\angle ALK = \angle LKJ = \angle KJI = \angle JIH = 180 - 30 = 150°$. Also, we know that the sum of all the interior angles of a hexagon $= (6 - 2) \times 180 = 720°$.



Therefore, $\angle LAH + \angle IHA = 720 - 4(150) = 120°$.

But, since $\angle LAH = \angle IHA$, therefore, $\angle IHA = 60°$.

Consider the quadrilateral $EFGH$, $\angle HGF = \angle GFE = 150°$. Also, we know that the sum of all the interior angles of a quadrilateral $= (4 - 2) \times 180° = 360°$.

Therefore, $\angle EHG + \angle FEH = 360° - 2(150) = 60°$.

But, since $\angle EHG = \angle FEH$, therefore, $\angle EHG = 30°$.

Now, we know that

$$\angle IHA + \angle AHE + \angle EHG = \angle IHG = 150°.$$

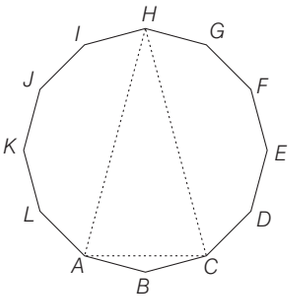
Therefore, $\angle AHE = 150° - (60 + 30) = 60°$

Hence choice (d) is the correct one.

128 Consider the hexagon $ALKJIH$, in which $\angle ALK = \angle LKJ = \angle KJI = \angle JIH = 180° - 30° = 150°$. Also, we know that the sum of all the interior angles of a hexagon $= (6 - 2) \times 180 = 720°$.

Therefore, $\angle LAH + \angle IHA = 720 - 4(150) = 120°$.

But, since $\angle LAH = \angle IHA$, therefore, $\angle IHA = 60°$.



Similarly, $\angle GHC = 60°$.

But since

$$\angle IHA + \angle AHC + \angle GHC = \angle IHG = 150°$$

Therefore, $\angle AHC = 150 - (60 + 60) = 30°$.

Hence choice (c) is the correct one.

129 The circumradius of the dodecagon is same as the circumradius of the triangle.

The circumradius of the triangle

$$= \frac{1}{\sqrt{3}}(\sqrt{3}\sqrt{2 + \sqrt{3}}) = \sqrt{2 + \sqrt{3}} \text{ cm}$$

Hence choice (c) is the correct one.

130 The circumradius of the dodecagon is same as the circumradius of the square.

Since each side of the square is $\sqrt{3} + 1$ cm, its diagonal would be $\sqrt{2}(\sqrt{3} + 1)$ cm and so the circumradius would be $\frac{1}{2}\left(\sqrt{2}(\sqrt{3} + 1)\right) = \frac{(\sqrt{3} + 1)}{\sqrt{2}}$ cm.

Hence choice (a) is the correct one.

131 The area of dodecagon $= 3 \times$ circumradius $= 3$ sq cm.

Hence choice (a) is the correct one.

132 Consider the following figures.

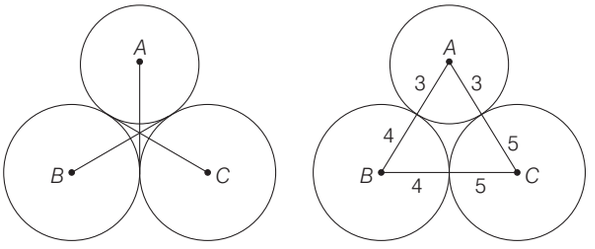


Fig. (i) Fig. (ii)

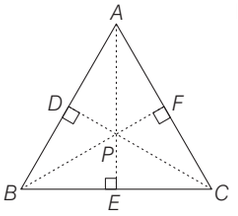

Fig. (iii)

In figure (iii), anyone can easily infer that ΔBDP and ΔBEP are congruent ones due to the Side-Angle-Side property. Consequently, it implies that BP (or BF) is the angle bisector as $\angle DBP = \angle EBP$.

Thus it can be generalized that all three tangents lines AE, BF, CD are angle bisectors. And, so the intersection of AE, BF and CD will be the incentre of ΔABC. It means PD, PE and PF each is the inradius of ΔABC. Let us assume that the inradius be r, such that $PD = PE = PF = r$.

Now you can use the relation,

area of ΔABC = inradius(r) × semi-perimeter (s)

$$\therefore \quad \sqrt{s(s-a)(s-b)(s-c)} = r \times s$$

$$\Rightarrow \quad \sqrt{12 \times 5 \times 4 \times 3} = r \times 12$$

$$\Rightarrow \quad r = \sqrt{5}$$

Hence choice (a) is the answer.

133 If the radius of smaller circle is exactly half of the radius of larger circle, YZ will be tangent to the smaller circle.

If the radius of smaller circle is less than half of the radius of the larger circle, YZ will neither touch nor intersect the smaller circle.

If the radius of smaller circle is greater half of the radius of larger circle, YZ will intersect the smaller circle at two distinct points.

Hence choice (c) is the correct one.

Solutions (for Q. Nos. 134 and 135)

134 Consider the following figure.

$$\angle ACB = \angle ABD = 60°$$

(Using the Alternate Segment Theorem)

$$\angle AOB = 2(\angle ACB) = 120°$$

(Using the concept of Central Angle)

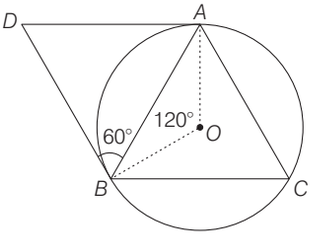
Now, since AD and BD are tangents, so $\angle OAD = 90°$ and $\angle OBD = 90°$.

Therefore, $\angle ADB = 360 - (\angle OAD + \angle AOB + \angle OBD) = 60°$.

Now the $\angle DAB = 180° - (\angle ABD + \angle ADB) = 60°$

Thus ΔADB is an equilateral triangle.

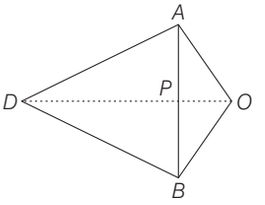
Now, we know that ΔAOB is an isosceles triangle as $OA = OB$, and $\angle AOB = 120°$, so $\angle OAB = \angle OBA = 30°$



Now consider the following figure, in which $OA = OB = 2$ cm and $AD = BD$ and AB is perpendicular to OD.

Now using 30-60-90° theorem, we get $OP = 1$ cm, and $AP = BP = \sqrt{3}$ cm.

Subsequently, $DP = 3$ cm and $AD = BD = 2\sqrt{3}$ cm.



Therefore, quadrilateral $OADB$ is a kite and so its area is $\frac{1}{2}(AB \times OD) = \frac{1}{2}(2\sqrt{3} \times 4) = 4\sqrt{3}$ sq. cm.

Hence choice (a) is the correct one.

Alternatively First of all determine the area of isosceles triangle AOB, then find the area of equilateral triangle ABD, and then add them up.

Area of quadrilateral $OADB = \frac{1}{2}(AB \times OP) + \frac{\sqrt{3}}{4}(AB)^2$

To determine AB and OP use 30-60-90 degree theorem or trigonometric ratios in ΔAOP or ΔBOP, where $OP \perp AB$ and $OA + OB = 2$.

135 The maximum possible area of quadrilateral $ACBD$ = Area of equilateral triangle ΔABD + maximum area of ΔABC

But, the maximum possible area of ΔACB can be obtained only when the radius CO will be perpendicular to AB. In that case ΔABC will be an equilateral triangle.

Therefore the maximum possible area of quadrilateral $ACBD$

$$= \frac{\sqrt{3}}{4} \times (AB)^2 + \frac{\sqrt{3}}{4} \times (AB)^2$$

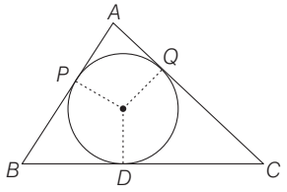
$$= 2\left[\frac{\sqrt{3}}{4} \times (AB)^2\right]$$

$$= 2\left[\frac{\sqrt{3}}{4} \times (2\sqrt{3})^2\right]$$

$$= 6\sqrt{3} \text{ sq. cm.}$$

Hence choice (a) is the correct one.

136 Let OP and OQ be the other two in-radii on the sides AB and AC, respectively. Also, all the three in-radii will be perpendicular to the respective sides.



Since the two tangents drawn from the same point on the same circle are equal, so $BD = BP = 2$ and $CD = CQ = 8$. Similarly, $AP = AQ = x$ (say).

Semi-perimeter of the triangle (s)

$$= \frac{1}{2}(AB + BC + AC) = (10 + x)$$

And, area of the triangle

$$= \sqrt{s(s-a)(s-b)(s-c)}$$
$$= \sqrt{(10+x)(8)(2)(x)}$$
$$= \sqrt{(10+x)(16x)}$$

And, in-radius of the triangle $= \sqrt{6}$

$$\Rightarrow \quad \frac{\text{Area of } \Delta ABC}{\text{Semi-perimeter of } \Delta ABC} = \sqrt{6}$$

$$\Rightarrow \quad \frac{\sqrt{(10+x)(16x)}}{10+x} = \sqrt{6} \Rightarrow x = 6 \text{ cm}$$

Therefore, $AB = 2 + 6 = 8$ and $AC = 8 + 6 = 14$.
Thus the required ratio 4 : 7.
Hence, choice (a) is the correct one.

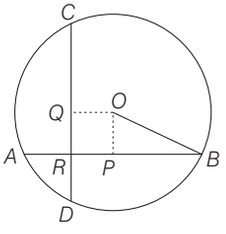
137 Let $AR = 2x$, then

$AB = AR + RB = 2x + 18$.

$\therefore$ $BP = x + 9$, as perpendicular OP bisects the chord AB at P.

But, you know that $AR \times RB = CR \times RD$

$$\therefore \quad 2x \times 18 = CR \times 6$$
$$\Rightarrow \quad CR = 6x$$
$$\therefore \quad OP = QR = CR - CQ = CR - \left(\frac{CD}{2}\right)$$
$$= CR - \left(\frac{CR + RD}{2}\right)$$
$$\Rightarrow \quad OP = 6x - \left(\frac{6x+6}{2}\right) = 3(x-1)$$



Now, since ΔOPB is a right angled triangle, therefore

$$OB^2 = OP^2 + BP^2$$
$$\Rightarrow \quad 12^2 = (3x-3)^2 + (x+9)^2$$
$$\Rightarrow \quad x = \sqrt{\frac{27}{5}} \Rightarrow AR = 2x = 6\sqrt{\frac{3}{5}}$$

Hence choice (a) is the correct one.

138 Since $\angle OAT = 90°$, $\therefore AT = 40$ cm

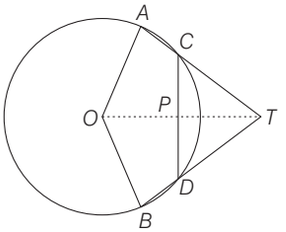
But you know that $AC = CP$,

$\therefore$ $CP + CT = 40$ cm.

Similarly, $PD + DT = 40$ cm

Thus the perimeter of $\Delta CDT = 80$ cm

The area of the required in circle would be greatest when the triangle is equilateral, which is not possible, so the triangle has to be isosceles. In that case, OT would bisect CD and pass through the point P, consequently $CP = DP$ and $\angle CPO = \angle CPT = 90°$.



Since ΔOAT and ΔCPT are similar triangles,

So $PT = OT - OP = 20$ cm, $CP = 15$ cm, $CT = 25$ cm.

Now, the semi-perimeter of the

$$\Delta CDT = \frac{80}{2} = 40 \text{ cm}$$

And area of the $\Delta CDT = \frac{1}{2} \times 30 \times 20 = 300$ sq cm

Therefore radius of the incircle that is inscribed in

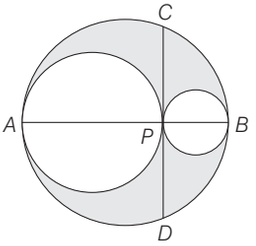
$$\Delta CDT = \frac{300}{40} = 7.5 \text{ cm}$$

Thus the required area of the incircle = $56.25\,\pi$ sq cm.

Hence choice (a) is the correct one.

139 Let AB and CD intersect each other at P. Now, let us consider the radius of the smaller inscribed circle is r and that of larger inscribed circle is R, then $AP = 2R$, $BP = 2r$ and $AB = 2(R + r)$. Area of the shaded region

$$= \pi(R+r)^2 - (\pi R^2 + \pi r^2)$$
$$= \pi[R^2 + r^2 + 2Rr - R^2 - r^2] = 2\pi Rr$$



But, $AP \times BP = CP \times DP$

$\Rightarrow \quad 2R \times 2r = 8 \times 8$

$\Rightarrow \quad rR = 16 \text{ cm}$

Therefore, the area of the shaded region $= 2\pi Rr$

$= 2\pi \times 16 = 32\pi \text{ sq cm.}$

Hence choice (c) is the correct one.

140 Since BP is the median of ΔABC, so you can use Apollonius theorem, as follows.

$$AB^2 + BC^2 = 2\left(BP^2 + \left(\frac{AC}{2}\right)^2\right)$$

$\Rightarrow \quad 441 + 225 = 2(BP^2 + 144)$

$\Rightarrow \quad BP = 3\sqrt{21} \text{ cm}$

Now, we have,

$$DP \times BP = AP \times PC$$

$\Rightarrow \quad DP \times 3\sqrt{21} = 12 \times 12$

$\Rightarrow \quad DP = \frac{48}{\sqrt{21}} \text{ cm}$

Therefore, the required ratio $= \frac{BP}{PD} = \frac{3\sqrt{21}}{48\sqrt{21}} = \frac{1}{16}$

Hence choice (a) is the correct one.

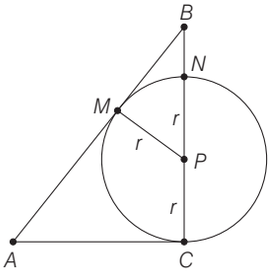
141 Let radius of the circle be r cm, then $PC = PM = PN = r$ cm.

Now, in ΔBMP, we have $BM^2 + MP^2 = BP^2$

$\Rightarrow \quad BM^2 + r^2 = (BN + NP)^2$

$\Rightarrow \quad BM^2 + r^2 = (2 + r)^2$

$\Rightarrow \quad BM = 2\sqrt{(r+1)}$



Now, in ΔABC, we have

$$AC^2 + BC^2 = AB^2$$

$\Rightarrow \quad AC^2 + (BN + NC)^2 = (AM + BM)^2$

$\Rightarrow \quad 6^2 + (2 + 2r)^2 = (6 + 2\sqrt{r+1})^2$

$\Rightarrow \quad r^2 + r = 6\sqrt{(r+1)}$

Squaring both sides, we get

$$r^4 + 2r^3 + r^2 - 36r - 36 = 0 \qquad \ldots(\text{i})$$

Now, the above equation has exactly two real roots; $r = -1$ and $r = 3$. But since negative value of r is inadmissible, as radius can never be negative, so only $r = 3$ is the valid answer. Otherwise, go through the choices and substitute the value of r in the above equation.

As none of the 4, 2 and 2.5 satisfies both side of the above equation (i), so choice (d) has to be the correct answer.

Hence choice (d) is the correct one.

Hint ($AM = AC$, as both are tangents on the same circle drawn from a common point)

NOTE The best way to solve this problem is to go through the given choices. For finding the roots (or roots) you may like to refer the chapter on Equations, Quadratic equations and Polynomial equations in Quantum CAT.

142 Since ΔAPB and ΔDPC are similar triangles, so we have

$$\frac{AB}{CD} = \frac{AP}{DP} = \frac{BP}{CP}$$

$\Rightarrow \quad \frac{6}{CD} = \frac{2}{3} = \frac{5}{CP}$

$\Rightarrow \quad CD = \frac{6 \times 3}{2} = 9$

Hint $\angle APB = \angle DPC$, as they are vertically opposite angles.

$\angle BAC = \angle BDC$, as both the angles are on the same side of the chord BC.

Similarly, $\angle ABD = \angle ACD$.

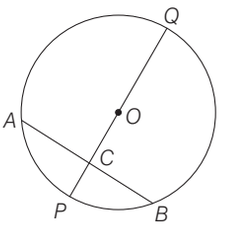
Hence choice (c) is the correct one.

143 First of all extend PO till Q a point on the circumference.

Now using power of a point theorem you will have

$$AC \times BC = PC \times CQ$$

$\Rightarrow \quad 7 \times 5 = 1 \times CQ \Rightarrow CQ = 35$



Now, if the radius of the circle be r, then $OQ = r$ and $OC = r - 1$

$\therefore \quad CQ = OQ + CO = 2r - 1$

That is $2r - 1 = 35 \Rightarrow r = 18$

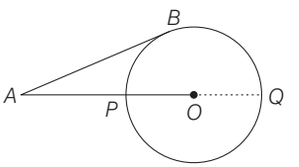
Hence choice (d) is the correct answer.

144 First of all extend PO till Q, a point on the circumference.

Now using power of a point theorem you will have

$$AB^2 = AP \times AQ \Rightarrow 196 = 7 \times AQ$$

$\Rightarrow \quad AQ = 28 \quad \therefore PQ = AQ - AP = 21$



Now, if the radius of the circle be r, then $OP = OQ = r = \frac{21}{2}$

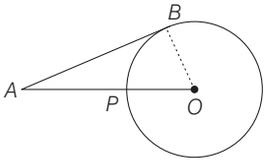
Therefore, circumference of the circle

$$= 2\pi r = 2\pi \times \frac{21}{2} = 66$$

Hence choice (a) is the correct answer.

Alternatively First of all connect OB, then OB will be perpendicular on AB, as OB is the radius of the circle.

Let radius of the the circle be r, then $OP = OB = r$.



Therefore, we have

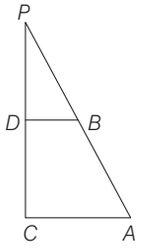
$$AB^2 + OB^2 = AO^2$$

$$\Rightarrow \quad 14^2 + r^2 = (7 + r)^2 \Rightarrow r = \frac{21}{2}$$

Therefore circumference of the circle

$$= 2\pi r = 2\pi \left(\frac{21}{2}\right) = 66$$

145 Since CP is a common tangent, so AC and BD are perpendiculars to CP. Now, you can observe that the two triangles (ΔPDB and ΔPCA) are similar triangles, as you can apply AAA rule.



$$\therefore \quad \frac{DB}{PB} = \frac{CA}{PA}$$

$$\Rightarrow \quad \frac{6}{PB} = \frac{15}{PB + AB}$$

$$\Rightarrow \quad \frac{6}{PB} = \frac{15}{PB + 21}$$

$PB = 14$ cm and $PA = PB + AB = 35$ cm

Now, using Pythagoras theorem in ΔPDB and ΔPCA, we have

$$PD = \sqrt{PB^2 - DB^2} = 4\sqrt{10}$$

and

$$PC = \sqrt{PA^2 - CA^2}$$

$$= 10\sqrt{10} \text{ cm}$$

$$\therefore \quad CD = PC - PD$$

$$= (10 - 4)\sqrt{10} = 6\sqrt{10} \text{ cm}$$

Hence choice (d) is the correct answer.

Hint $AB = 15 + 6 = 21$ cm

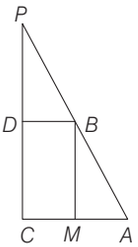
And, AAA rules says that if the three angles of any two triangles are same, both the triangles are similar. In this problem $\angle P$ is common in both the triangles and one angles is right angles in both the triangles, so the third angle in both the triangles will naturally be same.

Alternatively First of all draw a perpendicular BM from B on CA, so BM will be parallel to DC.

Now, $$MA = CA - CM$$

$$= 15 - 6 = 9 \text{ cm}$$

And, $$BA = 6 + 15 = 21 \text{ cm}$$



Now, applying Pythagoras theorem in ΔBMA, you will have

$$BM^2 = BA^2 - MA^2$$

$$\Rightarrow \quad BM^2 = 21^2 - 9^2 = 360$$

$$\Rightarrow \quad BM = 6\sqrt{10} \text{ cm}$$

146 We can easily figure out that the radius of the larger circle A is double the radius of each of the smaller circle B.

That means area of circle A = 4 (area of each circle B)

$$\Rightarrow \quad A = 4B$$

It implies that the area of four smaller circles is same as the area of larger circle.

It implies that area covered by region D is same as area covered by region C.

Hence choice (d) is the correct one.

147 First of all connect OC, OP and OQ.

Now, $OC = OP = OQ = 6$ cm.

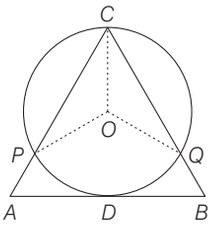
But, since D is the mid-point of AB, so CD is the median. And, since $AC = BC$, so CD is an angle bisector too. Also, CD is perpendicular to AB and must pass through the centre O.

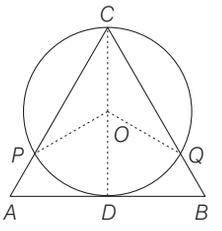
Please note that ΔCOP and ΔCOQ are symmetric.

$\angle PCO = \angle CPO = 30°$ and $\angle COP = 120°$.

Similarly, $\angle QCO = \angle CQO = 30°$ and $\angle COQ = 120°$.

Therefore, $\angle POQ = 120°$.





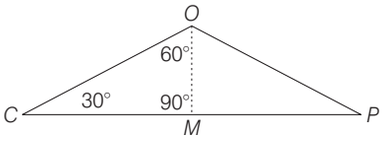
Now, area of the sector

$$POQ = \pi(6)^2 \times \frac{120^\circ}{360^\circ} = 12\pi$$

Now, drop a perpendicular on CP. Since $CO = PO = 6$ cm, therefore $OM = 3$ cm and $CM = 3\sqrt{3}$ cm, so $CP = 6\sqrt{3}$ cm.

Therefore, area of $\Delta COP = \frac{1}{2} \times CP \times OM$

$$= \frac{1}{2} \times 6\sqrt{3} \times 3 = 9\sqrt{3} \text{ sq cm.}$$



Similarly, the area of $\Delta COQ = 9\sqrt{3}$ sq cm.

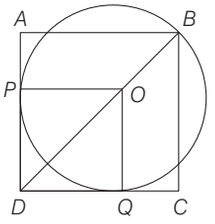
Therefore, area of the common region

$$= 12\pi + 9\sqrt{3} + 9\sqrt{3}$$

$$= 12\pi + 18\sqrt{3} \text{ sq. cm.}$$

Hence choice (c) is the correct one.

148 In the given figure, drop the two perpendiculars OP and OQ from the centre O of the circle and it is important to know that the centre O falls on the diagonal BD of the square $ABCD$.



Now, let us assume that the side of the square is a cm.

Therefore $AB = BC = CD = AD = a$ cm and $BD = \sqrt{2}a$ cm.

But, $BD = BO + OD$

$\Rightarrow$ $\sqrt{2}\,a = 1 + \sqrt{2}$

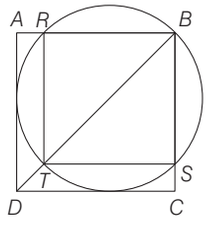
$\Rightarrow$ $a = \frac{1 + \sqrt{2}}{\sqrt{2}}$ cm

Hence, choice (c) is the correct one.

Hint : Since OB, OP, OQ are the radii of the same circle, so $OB = OP = OQ = 1$ cm, and since OD is the diagonal of the square $POQD$, so $OD = \sqrt{2}$ cm.

149 In the following figure, $RB = TS$ and $BS = RT$. But, since $RB = BS$, therefore, $RBST$ is a square.

And, for that reason BT and BD coincide.



Now, the area of the square $RBST = \frac{BT^2}{2} = \frac{2^2}{2} = 2$ sq cm

And area of the circle $= \pi r^2 = \pi(1)^2 = \pi$

Total area between the circle and the square $RBST = \pi - 2$

Therefore, the area of the circle which is outside the square $ABCD = \frac{\pi - 2}{2}$

Thus, the required area of the common region between the square $ABCD$ and the given circle

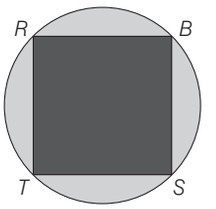
$$= \pi - \left(\frac{\pi - 2}{2}\right) = \frac{\pi + 2}{2}.$$

Hence choice (b) is the correct one.

Hint : In the following figure, area of circle $= \pi$ sq. cm

And, area of square (black region) $= 2$ sq. cm

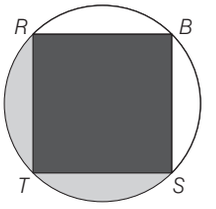
And, the area of shaded grey region $= (\pi - 2)$ sq. cm



Therefore, the area of the common region in the following figure

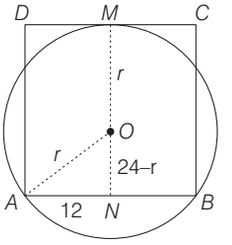
$$= \pi - \left(\frac{\pi - 2}{2}\right)$$

$$= \frac{\pi + 2}{2} \text{ sq cm.}$$



150 Let radius of the circle is r, then $AO = MO = r$.

Therefore, $ON = MN - MO = 24 - r$



Now, using Pythagoras theorem in ΔAON, we have

$$OA^2 = AN^2 + ON^2$$

$\Rightarrow$ $r^2 = 12^2 + (24 - r)^2 \Rightarrow r = 15$ cm

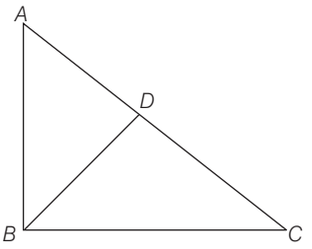
Hence choice (d) is the correct one.

☑ Level 02 *Higher Level Exercise*

1 $BD = 53\,\text{cm}$

$\therefore \quad AD = CD = BD = 53\,\text{cm}$

$\therefore \quad AC = 2 \times 53 = 106\,\text{cm}$



$AB + BC + AC = 2 \times 126\,\text{cm} = 252\,\text{cm}$

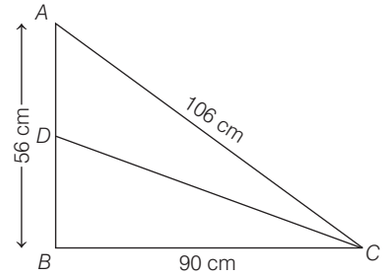
$\therefore \quad AB + BC = 146\,\text{cm}$

Let $AB = x\,\text{cm}$

$\therefore \quad BC = (146 - x)\,\text{cm},\ AB^2 + BC^2 = AC^2$

$$x^2 + (146 - x)^2 = (106)^2 \qquad \ldots(1)$$

Solving the equation (1), we get $x = 56$ and $x = 90$



Consider $AB = 56$ cm, then $BC = 90$ cm

Longest median will fall on the shortest side.

Now, the area of $\Delta BCD = \frac{1}{2} \times BD \times BC$

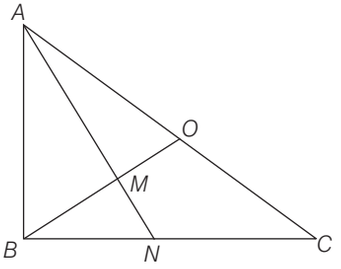
$$= \frac{1}{2} \times 28 \times 90 = 1260\,\text{cm}^2$$

2 Let $AB = BC = a$, then $AC = \sqrt{2}a$

$\therefore \quad AO = OC = BO = \sqrt{2}a/2 = a/\sqrt{2}$

Now, by angle bisector theorem

$$\frac{AB}{AO} = \frac{BM}{MO} \quad \Rightarrow \quad \frac{BM}{MO} = \frac{a}{a/\sqrt{2}} = \frac{\sqrt{2}}{1}$$



$\therefore \quad MO = 20$ cm

$\therefore \quad BM = 20\sqrt{2}$ cm

$\therefore \quad BO = 20 + 20\sqrt{2} = 20\,(1 + \sqrt{2})$ cm

Now, since $BO = a/\sqrt{2} = AB/\sqrt{2}$

$\therefore \quad AB = \sqrt{2}\,(BO) = 1.414\ [20\ (1 + 1.414)]$

$= 68.2843 = 68.28$ cm

3 $\angle A + \angle B = 90°$

$\angle A - \angle B = 89 - 1 = 88$

$\angle A - \angle B = 88 - 2 = 86$

$\angle A - \angle B = 87 - 3 = 84$

… … … … …

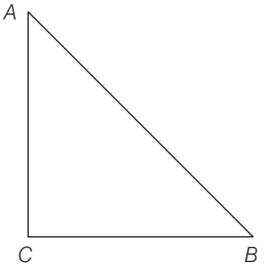
$\angle A - \angle B = 45 - 45 = 0$

$\angle A - \angle B = 44 - 46 = -2$

… … … … …

$\angle A - \angle B = 1 - 89 = -88$

Thus k can assume total $44 + 1 + 44 = 89$ values

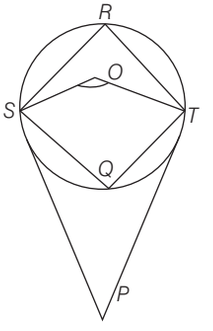


4 $\angle SPT$ and $\angle SOT$ are supplementary, then

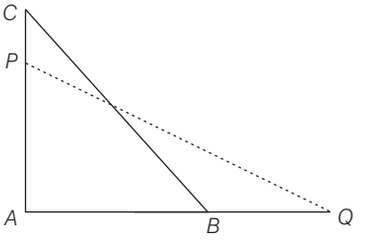
$\angle SOT = 180° - 50° = 130°$

$\therefore \quad \angle SRT = \frac{1}{2}\,(\angle SOT) = 65°$

$\therefore \quad \angle SQT = 180 - 65° = 115°$



5 Let BC be the ladder, then



$BC = 6.5$ m

and $AB = 5.2$ m

$\therefore \quad AC = \sqrt{(BC)^2 - (AB)^2}$

$\Rightarrow \quad AC = 3.9$ m

Now, $PQ^2 = PA^2 + AQ^2$

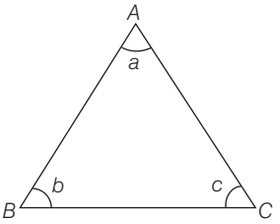
$(6.5)^2 = (2.5)^2 + AQ^2 \Rightarrow AQ = 6$ m

$\therefore \quad BQ = AQ - AB = 6 - 5.2 = 0.8$ m

$\therefore$ The foot of the ladder will slip by 0.8 m

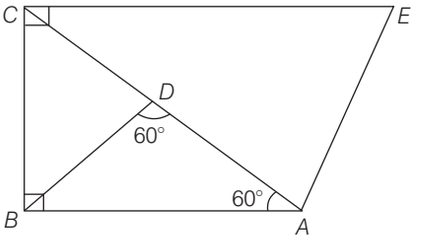
6 $\angle A + \angle B + \angle C = 180$

Any one of angle can possess the values from 1 to 178.



7 Cannot be determined.

8 ΔABC is a right angled



and $\angle ABC = 90°$

Let $AB = x$

then $AB = AD = CD = BD = x$

$\therefore$ ΔABD is equilateral triangle

$\therefore$ $\angle CAE = 60°$

$\therefore$ $\angle BCA = 30° \Rightarrow \angle ACE = 60°$

$\therefore$ $\angle CEA = 60°$, also.

Hence, ΔACE is an equilateral triangle

Thus, $AC = AE = CE = 2x$

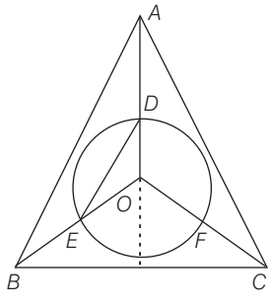
and $\dfrac{BC}{AB} = \tan 60° = \sqrt{3} \Rightarrow BC = AB\sqrt{3} = x\sqrt{3}$

$\therefore$ $\dfrac{BC}{EC} = \dfrac{x\sqrt{3}}{2x} = \dfrac{\sqrt{3}}{2}$

9 $\pi r^2 = 3\pi \Rightarrow r = \sqrt{3}$

$\therefore$ $DE = 2r^2 - 2r^2\cos 120°$

$DE = r^2$ $(\because \sqrt{3} = r)$



But $AB = 2DE$ (By similarly of triangles)

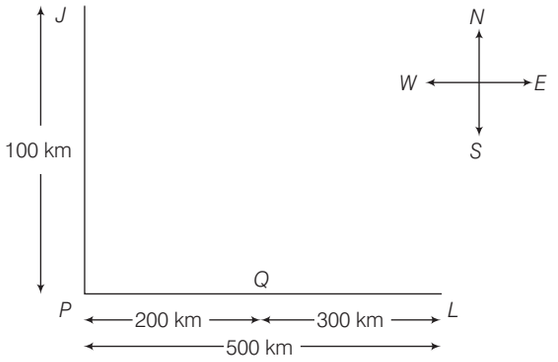
$\therefore$ $AB = 2r^2 = 2 \times (\sqrt{3})^2 = 6$

$(\because D$ and E are the mid-points of OA and $OB)$

$\therefore$ Perimeter of triangle $ABC = 3 \times 6 = 18$ units.

10 Time taken in the collision of the two trains

$$= \frac{500}{(40 + 60)} = 5\,\text{h}$$



In 5 hours, plane will cover $5 \times 200 = 1000$ km distance

11 Two trains meet with an accident at a place 200 $(= 40 \times 5)$ km away from Patiala.

$\therefore$ The required distance = 200 km

12 Area of $\Delta BDE = \dfrac{1}{2} \times \dfrac{2}{5} AB \times \dfrac{2}{7} BC$

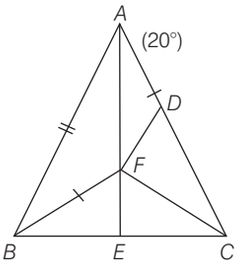
$= \dfrac{4}{35} \times \dfrac{1}{2} (AB \times BC) = \dfrac{4}{35}$ area of ΔABC

$\therefore$ Area of $\Delta ABC = \dfrac{35}{4} \times 20 = 175\,\text{cm}^2$

13 Let E be on BC and $BE = EC$

Let F be on AE so that triangle FBC is equilateral.

$\angle DAB = \angle ABF = 20°$



and $DA = BF$

$\therefore$ Trapezoid $ADFB$ is isosceles.

$\angle FAD = \angle DBF = 10°$

$\Rightarrow$ $\angle DBC = 10 + 60 = 70°$

14 Calculate them physically (or manually)

15 $AB = 6$ cm, $\angle C = 60°$ and $\angle A = \angle B = 60°$

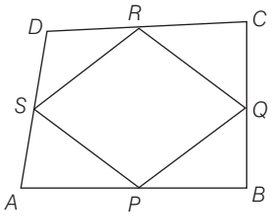
$\therefore$ ΔABC is an equilateral triangle

$\therefore$ Area of $\Delta ABC = \dfrac{\sqrt{3}}{4} \times (6)^2 = 9\sqrt{3}$

Area of $(\Delta ADE + \Delta BFG) = 2 \times \dfrac{\sqrt{3}}{4} \times (2)^2 = 2\sqrt{3}$

$\therefore$ Area of pentagon $= 9\sqrt{3} - 2\sqrt{3} = 7\sqrt{3}\,\text{cm}^2$

16 Since, $PQRS$ is a parallelogram



$\therefore \quad \angle PSR = 90^\circ \ (\angle PSR + \angle PQR = 180^\circ)$

17 From the given relation, we can say that $x = wr$, $y = wr^2$, $z = wr^3$.

$\therefore \quad z - w = w(r^3 - 1)$

Now, since $y > 90$ and $x < 90$, therefore $r > 1$.

Further, it is known that $w + x + y + z = w(1 + r + r^2 + r^3) = 360$, which is integer. Ans, it is also given that r is an integer, so w, x, y and z should also be integers.

r	$1 + r + r^2 + r^3$	$w = \dfrac{360}{1 + r + r^2 + r^3}$	$z - w = w(r^3 - 1)$
2	15	24	168
3	40	9	236
4	75	Non-integer	—
5	156	Non-integer	—
6	259	Non-integer	—

Here, we see that for $r = \{2, 3\}$ we have w as an integer. For $r = 4, 5, 6$, we have w as a non-integer value. Also, for $r \geq 7$, $0 \leq w < 1$. That means w is a non-integer for $r \geq 7$.

Now, for $r = 2$, we have $w = 24$, $x = 48$, $y = 96$, $z = 112$, which satisfies the condition that $w, x < 90$ and $y, z > 90$.

But, for $r = 3$, we have $w = 9$, $x = 27$, $y = 81$, $z = 243$, which means $y < 90$. That is wrong.

Hence choice (a) is the correct one.

18 $\angle ROQ = 180 - 50 = 130^\circ$

$$\left(\because \quad \angle OQP + \angle ORP + \angle QOR + \angle QPR = 360^\circ \text{ and } \angle OQP = \angle ORP = 90^\circ\right)$$

Now, since $RT = TM$ and $QS = SM$

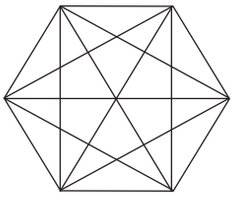
Also $OR = OM = OQ$

$\therefore \quad \angle ROT = \angle TOM$ and $\angle MOS = \angle SOQ$

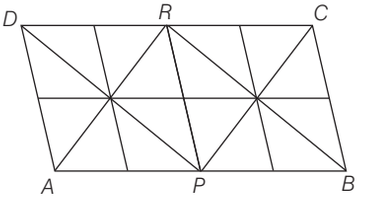
$\therefore \quad \angle SOT = \dfrac{1}{2}\angle ROQ$

$\therefore \quad \angle SOT = \dfrac{130}{2} = 65^\circ$

19 $12 + 6 + 1 = 19$



20 There are total 16 similar triangles each with equal area.



Here, 4 out of 16 triangles are taken. So the number of shaded triangles = 4 and number of unshaded triangles = 12

$\therefore \quad$ Required ratio $= \dfrac{1}{3}$

21 Number of total rectangles $= {}^4C_2 \times {}^3C_2 = 6 \times 3 = 18$

22 $\angle PDB = \angle QEA = 80^\circ$

$\therefore \quad \angle PED = \angle QDE = 10^\circ \quad (\because \angle DPE = \angle DQE = 90^\circ)$

$\therefore \quad \angle DRE = 180 - (10 + 10) = 160^\circ$

$\therefore \quad \angle PRD = 180 - \angle DRE = 20^\circ.$

23 $OC = \dfrac{AB}{2}$

$AO = OC = OB$

$\therefore \quad \angle OAC = \angle OCA = \angle BCO = \angle OBC = 45^\circ$

$\therefore \quad \angle ACB = 90^\circ$

24 Please note that all the given triangles are equilateral.

Area of shaded region $= 3\left[\pi r^2 \dfrac{60}{360} - \dfrac{\sqrt{3}}{4} \times r^2\right]$

$= \dfrac{r^2}{2}\left[\pi - \dfrac{3\sqrt{3}}{2}\right]$

26 $\angle ORP = 90^\circ$ ($\because$ OP is a diameter of smaller circle)

$OS = 5$ cm and $OR = 4$ cm

$\therefore \quad SR = \sqrt{(5)^2 - (4)^2} = 3$ cm

$\therefore \quad SP = 2(SR) = 6$ cm

(Since, OR passes through centre O and perpendicular to SP therefore OR bisects SP.)

27 $\dfrac{AD}{AB} = \dfrac{DO}{BO} = 1$

$\Rightarrow \quad OB = OD = 8$ cm

$\because$ $ABCD$ is a cyclic quadrilateral

$\therefore \quad DO \times BO = CO \times AO$

$8 \times 8 = 4 \times AO \Rightarrow AO = 16$ cm

$\therefore \quad AC = 16 + 4 = 20$ cm

28 When $\angle A = 60^\circ$, $BC = b = c$.

And, when $\angle A = 90^\circ$, $a = \sqrt{2}b = \sqrt{2}c$

$\therefore \quad 60^\circ < A < 90^\circ, \quad c < a < c\sqrt{2}$

29 $OR^2 = (OQ)^2 + (RQ)^2$

$OR^2 = 5OQ^2 \qquad [\because RQ = 2(OQ)]$

$\Rightarrow$ radius $(r) = OQ\sqrt{5}$

$\therefore \quad OQ = \dfrac{r}{\sqrt{5}}$

Again, $OC^2 = OH^2 + HC^2$

$r^2 = (OQ + QH)^2 + (QH)^2$

$r^2 = \left(\dfrac{r}{\sqrt{5}} + QH\right)^2 + (QH)^2 \qquad (\because HQ = HC)$

$\Rightarrow \quad QH = \dfrac{r}{\sqrt{5}}$

$\therefore \quad HC = \dfrac{r}{\sqrt{5}} = \dfrac{RQ}{2} \Rightarrow RC = \sqrt{(RD)^2 + (DC)^2}$

$= \sqrt{\left(\dfrac{r}{\sqrt{5}}\right)^2 + \left(\dfrac{r}{\sqrt{5}}\right)^2} = r\sqrt{\dfrac{2}{5}}$

$\therefore \quad RC + FS = 2r\sqrt{\dfrac{2}{5}}$

30 The best way is to consider some values and verify the results.

31 $\angle OCT = 90°, \quad \angle DCT = 45°$

$\therefore \quad \angle OCB = 45°$

$\therefore \quad \angle COB = 45° \qquad (\Delta OBC$ is a right angled triangle)

$\therefore \quad \angle AOC = 180° - 45° = 135°$

Now, $\because \quad CD = 10 \Rightarrow BC = 5\text{ cm} = OB$

$\Rightarrow \quad OC = 5\sqrt{2}\text{ cm} = OA$

Again, $AC^2 = OA^2 + OC^2 - 2OA \cdot OC \cos 135°$

$= 2(OA)^2 - 2(OA)^2 . \cos 135°$

$= 2(5\sqrt{2})^2 - 2(5\sqrt{2})^2 \times \left(-\dfrac{1}{\sqrt{2}}\right) = 100 + \dfrac{100}{\sqrt{2}}$

$AC^2 \approx 170.70 \Rightarrow AC \approx 13\text{ cm}$

$\therefore$ Perimeter of $\Delta OAC = OA + OC + AC$

$= 5\sqrt{2} + 5\sqrt{2} + 13 = 27\text{ cm}$

32 $\angle ACB = 60° \qquad (\because \angle ACB + \angle ADB = 180°)$

and $\angle CAB = 30° \qquad (\because \angle ACB + \angle CAB = 90°)$

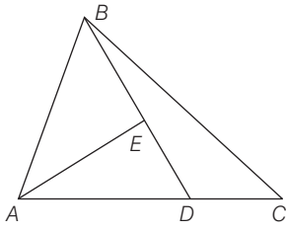
$AC = 2 \times 6 = 12\text{ cm}$

$\dfrac{BC}{AC} = \sin 30° = \dfrac{1}{2} \Rightarrow BC = 6\text{ cm}$

and $\dfrac{BC}{AB} = \tan 30° = \dfrac{1}{\sqrt{3}} \Rightarrow AB = 6\sqrt{3}\text{ cm}$

$\therefore$ Area of $\Delta ABC = \dfrac{1}{2} \times 6 \times 6\sqrt{3} = 18\sqrt{3}\text{ cm}^2$

33 Area of $\Delta BAE = \dfrac{1}{4} AC \times \dfrac{1}{3} BD = \dfrac{1}{12}$ Area of ΔABC



34 $\dfrac{AE}{EC} = \dfrac{AB}{BC} = \dfrac{7.5}{10.5} = \dfrac{5}{7}$

Now, $AB^2 + BC^2 = AC^2$

$(5k)^2 + (7k)^2 = (18)^2$

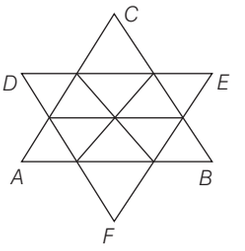
$74k^2 = 324 \quad \Rightarrow \quad k^2 = \dfrac{324}{74}$

Area of $\Delta ABC = \dfrac{1}{2} \times AB \times BC = \dfrac{1}{2} \times 5k \times 7k$

$= \dfrac{35}{2} k^2 = \dfrac{35}{2} \times \dfrac{324}{74} = 76.621\text{ cm}^2$

35 There are total 12 similar triangles each with equal area. But a larger triangle ABC (or DEF) has only 9 smaller triangles. Out of 9 triangles only 6 triangles are common.

$\therefore$ Area of common region

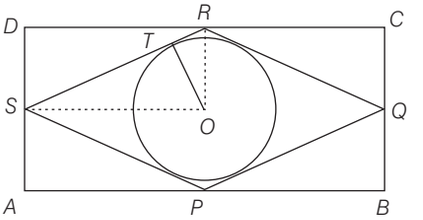


$= \dfrac{6}{9} \times 198 = 132\text{ cm}^2$

36 $9 \times 180 - 2 \times 360 = 180 \times 5 = 900°$

37 $OR = DS = \dfrac{AD}{2} = 6\text{ cm}$

and $OS = DR = \dfrac{DC}{2} = 8\text{ cm}$



$\therefore \quad SR = 10\text{ cm}$

$\therefore$ Area of $\Delta ORS = \dfrac{OS \times OR}{2} = \dfrac{SR \times OT}{2}$

$\dfrac{8 \times 6}{2} = \dfrac{10 \times OT}{2} \Rightarrow OT = \dfrac{48}{10}\text{ cm}^2$

$\therefore$ Area of circle $= \pi r^2 = \pi \times \left(\dfrac{48}{10}\right)^2 = \dfrac{576}{25}\pi\text{ cm}^2$

38 $200 = 2^3 \times 5^2$

Number of total factors $= (3 + 1) \times (2 + 1) = 12$

$\therefore$ Total number of required rectangles $= \dfrac{12}{2} = 6$

Area $= b \times l$

$200 = 1 \times 200 = 2 \times 100 = 4 \times 50 = 5 \times 40$

$= 8 \times 25 = 10 \times 20$

39 Since a circle can pass through any 3 non-collinear points, so from total 8 points we can have maximum possible number of circles = ${}_8C^3 = 56$

But, since it is given that 4 points lie on the same circle, therefore we will have fewer circles drawn.

Therefore, the actual number of circles drawn
$= {}_8C^3 - {}_4C^3 + 1 = 53$

NOTE When we reduce ${}_4C^3$ circles from ${}_8C^3$, we actually reduce all the possible circles, but there must be 1 circle with 4 points on its circumference. That's why we are adding 1 after deducting ${}_4C^3$.

40 Here, AC and BC are the secants of the circle and AB is tangent at D

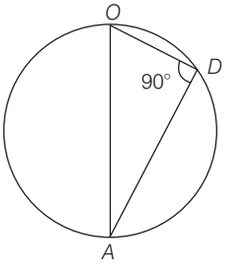
$\therefore \quad AE \times AC = AD^2$

$$AE \times 4 = (3)^2 \quad \Rightarrow \quad AE = \frac{9}{4}$$

$$\therefore \quad CE = 4 - \frac{9}{4} = \frac{7}{4}$$

$$\therefore \quad CE : (AE + AD) = \frac{7}{4} : \left(\frac{9}{4} + 3\right) = \frac{7}{4} : \frac{21}{4} = 1 : 3$$

41 $\angle ADO$ is a right angle (angle of a semicircle)
New since OD is perpendicular on the chord AC and OD passes through the centre O of the larger circle ABC, then OD must bisect the chord AC at D.



$\therefore \quad AD = CD = 6$ cm

42 $\angle CED = 120°$ ($\because$ $ACED$ is cyclic)

and $\angle BED = 60°$

$\therefore \quad \angle EDB = 90°$

$$\therefore \quad \frac{BD}{BE} = \cos 30° \quad \Rightarrow \quad \frac{6}{BE} = \frac{\sqrt{3}}{2}$$

$$\Rightarrow \quad BE = 4\sqrt{3} \text{ cm}$$

$$\therefore \quad BC = BE + CE = 4\sqrt{3} + 5\sqrt{3} = 9\sqrt{3}\text{cm}$$

Now, since AB and CB are the secants of the circle.

$$\therefore \quad BD \times BA = BE \times BC$$

$$6 \times BA = 4\sqrt{3} \times 9\sqrt{3} \Rightarrow BA = 18 \text{ cm}$$

Again, ΔACB is a right angled triangle ($\because \angle C = 90°$)

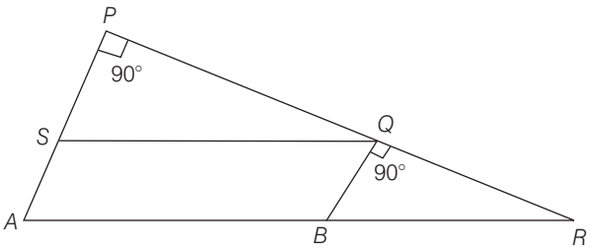
$$\therefore \quad AC = AB \sin 30° \quad (\sin 30° = 1/2)$$

$AC = 9$ cm (Alternatively apply Pythagorus theorem).

and $AD = AB - BD = 12$ cm

$$\therefore \quad \frac{AC}{AD} = \frac{9}{12} = \frac{3}{4}$$

43 $AB = SQ = 25$ cm and $PQ = 24$ cm, therefore $SP = 7$ cm



$$AP = 12 \text{ cm} \quad \text{and} \quad SP = 7 \text{ cm}$$

(ΔPSQ, ΔQBR and ΔPAR are similar)

$$\therefore \quad AS\ (= BQ) = 12 - 7 = 5 \text{ cm}$$

$$\therefore \quad \frac{PS}{SQ} = \frac{PA}{AR} \quad \Rightarrow \quad \frac{7}{25} = \frac{12}{AR} \quad \Rightarrow \quad AR = \frac{300}{7}$$

$$\therefore \quad BR = AR - AB = \frac{300}{7} - 25$$

$$\therefore \quad BR = \frac{125}{7} \Rightarrow \frac{AB}{BR} = \frac{25 \times 7}{125} = \frac{7}{5}$$

44

$$\frac{SP}{PQ} = \frac{BQ}{QR}$$

$$\Rightarrow \quad \frac{7}{24} = \frac{5}{QR} \quad \Rightarrow \quad QR = \frac{120}{7}$$

$$\therefore \quad \frac{\text{Area of } \Delta APR}{\text{Area of } \Delta BQR} = \frac{\frac{1}{2} \times AP \times PR}{\frac{1}{2} \times BQ \times QR} = \frac{12 \times \frac{288}{7}}{5 \times \frac{120}{7}} = \frac{144}{25}$$

$(PR = PQ + QR)$

Alternatively

$$\frac{\text{Area of } \Delta APR}{\text{Area of } \Delta BQR} = \left(\frac{AP}{BQ}\right)^2 = \left(\frac{12}{5}\right)^2 = \frac{144}{25}$$

45 $x^2 + y^2 + z^2 = xy + yz + zx$

$$\Rightarrow \quad x^2 + y^2 + z^2 - xy - yz - zx = 0$$

$$\Rightarrow \quad 2(x^2 + y^2 + z^2 - xy - yz - zx) = 0$$

$$\Rightarrow (x^2 + y^2) + (y^2 + z^2) + (z^2 + x^2) - 2xy - 2yz - 2zx = 0$$

$$\Rightarrow \quad (x - y)^2 + (y - z)^2 + (z - x)^2 = 0$$

$$\Rightarrow \quad x = y = z$$

$\therefore$ The given triangle is an equilateral triangle.

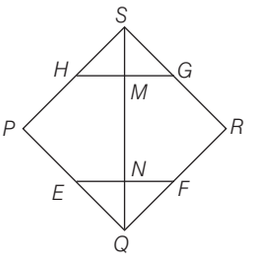
46 Let $AD = 3a$ and $DC = 6a$

$$\therefore \quad DH = HG = GC = \frac{6a}{3} = 2a$$

$$HM = MG = \frac{2a}{2} = a = SM$$

$\therefore \quad NQ = a$ (also)

$\therefore \quad SQ = SM + MN + NQ$
$\quad = a + 3a + a = 5a$



Since diagonal of square, $SQ = 5a$

But, SQ = diameter of circle $PQRS$ = diagonal of square

$PQRS$

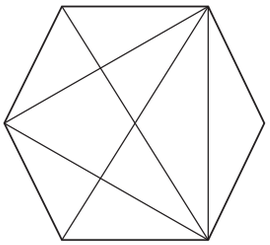
$\therefore$ Radius of the circle $= \dfrac{5a}{2}$

$\Rightarrow$ Area of the circle $= \pi \times \left(\dfrac{5a}{2}\right)^2$

Here $\dfrac{\text{Area of circle}}{\text{Area of rectangle}} = \dfrac{\frac{25}{4}(a^2\pi)}{3a \times 6a} = \dfrac{25\pi}{72}$

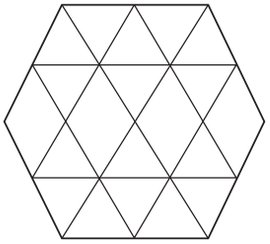
47 In the first diagram, join the opposite vertices of the hexagon. It gives us 12 congruent right angle triangles. Out of them 6 such triangles fall inside the triangle ΔBDF.

Therefore, area of $\Delta BDF = \dfrac{1}{2}$ (area of hexagon)



Now, in the second diagram, we can observe that there 24 congruent equilateral triangles. Out of them 9 such triangles fall inside the triangle ΔPQR.

Therefore, area of $\Delta PQR = \dfrac{9}{24}$ 24(area of hexagon)



Therefore, we have

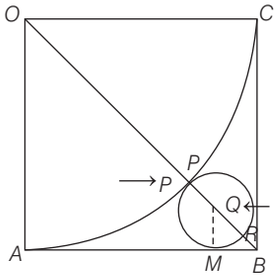
$$\frac{\text{Area of } \Delta BDF}{\text{Area of } \Delta PQR} = \frac{\frac{1}{2}(\text{Area of hexagon})}{\frac{9}{24}(\text{Area of haxon})} = \frac{1/2}{9/24} = \frac{4}{3}$$

Hence choice (c) is the correct one.

48 $OA = AB = BC = OC = OP$

Let $OA = R$ (radius of the larger circle), then $OB = R\sqrt{2}$

Similarly $PQ = MQ = QR = r$ (radius of the smaller circle)



then $BQ = r\sqrt{2}$

Therefore, $BP = PQ + BQ = r + r\sqrt{2}$

Similarly, $BP = OB - OP = R\sqrt{2} = R\sqrt{2} - R$

$\Rightarrow R(\sqrt{2} - 1) = r(\sqrt{2} + 1)$

$\Rightarrow r = R(\sqrt{2} - 1)^2$

$\Rightarrow r = R(3 - 2\sqrt{2})$

$$\therefore \frac{\text{Area of larger circle}}{\text{Area of smaller circle}} = \frac{\pi R^2}{4\pi r^2} = \frac{R^2}{4(3-2\sqrt{2})^2 R^2}$$

$$= \frac{1}{4(17 - 12\sqrt{2})}$$

$$= \frac{1}{68 - 48\sqrt{2}}$$

49 AX, BY and CZ are perpendiculars drawn on the tangent AD from the centers X, Y and Z of the respective circles.

Let $CZ = NZ = PZ = r_1$, $BY = MY = NY = r_2$, $X = MX = r_3$ and $DP = k$.

Since, $\angle ADG = 90°$, therefore $\angle BYD = \angle AXD = 45°$.

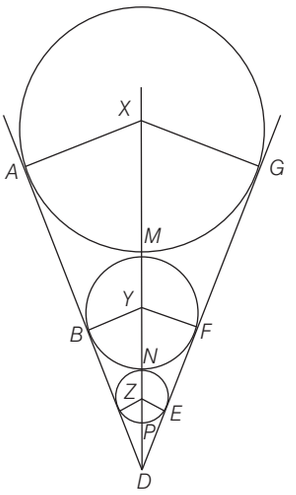
Now, since $CZ = r_1$, therefore $DZ = \sqrt{2}\, r_1$

Now, since $BY = r_2$, therefore

$$DY = \sqrt{2}r_2 = r_2 + r_1 + \sqrt{2}r_1$$

$\Rightarrow r_2(\sqrt{2} - 1) = r_1(\sqrt{2} + 1)$

$$\Rightarrow r_2 = \frac{r_1}{(\sqrt{2} - 1)^2}$$



Similarly, since $AX = r_3$, therefore $DX = \sqrt{2}r_3$

$\Rightarrow \sqrt{2}r_3 = r_3 + r_2 + \sqrt{2}r_2$

$\Rightarrow \sqrt{2}r_3 = r_3 + r_2(\sqrt{2} + 1)$

$$\Rightarrow \sqrt{2}r_3 = r_3 + \frac{r_1}{(\sqrt{2} - 1)^3}$$

$$\Rightarrow r_2(\sqrt{2} - 1) = \frac{r_1}{(\sqrt{2} - 1)^3}$$

$$\Rightarrow \frac{r_3}{r_1} = \frac{1}{(\sqrt{2} - 1)^4}$$

$\Rightarrow \quad \dfrac{r_3}{r_1} = \dfrac{1}{17 - 12\sqrt{2}}$

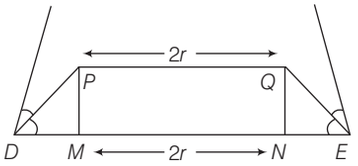
Hence choice (b) is the correct one.

50 $\dfrac{\text{Area of } \Delta ABC}{\text{Area of } \Delta AED} = \left(\dfrac{BC}{0.65\,BC}\right)^2 = \dfrac{1}{0.4225}$

$\therefore \quad$ Area of $\Delta AED = 0.4225 \times 68 = 28.73 \text{cm}^2$

51 Let the radius of each circle be r unit then

$$PQ = QR = PR = 2r$$
$$\angle PDM = \angle QEN = 30°$$



$\therefore \quad \dfrac{DM}{DP} = \cos 30°$

$$DM = DP \times \frac{\sqrt{3}}{2} \qquad [DP = QE = (r)]$$

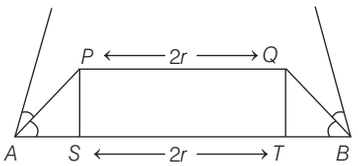
$\Rightarrow \quad DM = \dfrac{r\sqrt{3}}{2}$

$\therefore \quad DE = DM + MN + NE$

$$= \frac{r\sqrt{3}}{2} + 2r + \frac{r\sqrt{3}}{2} = (2 + \sqrt{3})r$$

$\therefore \quad DE = DF = EF = (2 + \sqrt{3})r$

Again, $\angle PAS = \angle QBT = 30°$



$\therefore \quad \dfrac{PS}{AS} = \tan 30° = \dfrac{1}{\sqrt{3}} \Rightarrow \dfrac{r}{AS} = \dfrac{1}{\sqrt{3}}$

$\Rightarrow \quad AS = r\sqrt{3} = BT$

$\therefore \quad AB = AS + ST + BT = r\sqrt{3} + 2r + r\sqrt{3} = 2r(1 + \sqrt{3})$

$\therefore \quad AB = BC = AC = 2r(1 + \sqrt{3})$

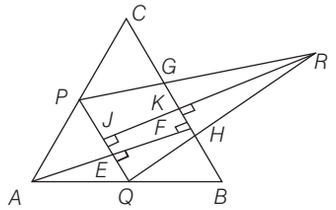
Ratio of perimeter of equilateral triangle
= ratio of their sides

$\therefore$ Ratio of perimeter of $\Delta ABC : \Delta DEF : \Delta PQR$

$$= 2(1 + \sqrt{3}) : (2 + \sqrt{3}) : 2$$

52 $\Delta APQ \sim \Delta ACB, \quad BC = 2PQ$

and $\quad BC \,||\, PQ \Rightarrow AF = 2AE \Rightarrow AE = EF$



Again $\Delta RGH \sim \Delta RPQ$

and $\quad PQ = 2GH \qquad$ (By mid-point theorem)

$\Rightarrow \quad RJ = 2RK \quad \Rightarrow \quad RK = JK$

But since $\quad EF = JK$

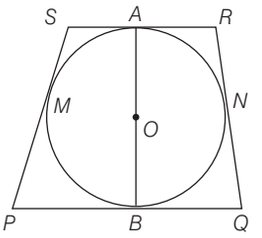
$\therefore \quad AE = EF = JK = RK$

$\therefore \quad RJ = RK + JK \quad$ and $\quad AF = AE + EF$

and $\quad RJ = AF = h$ (say),

Then $\dfrac{\text{Area of } \Delta PQR}{\text{Area of } \Delta ABC} = \dfrac{\frac{1}{2} \times PQ \times h}{\frac{1}{2} \times BC \times h} = \dfrac{PQ}{BC} = \dfrac{1}{2}$

53 It can be solved using the property of tangents.
(Tangents on the circle drawn from the same points are same in length)



Points M, A, N and B are the points of tangent.

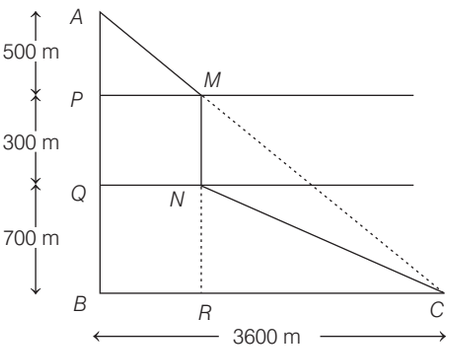
$\therefore \quad PS + QR = PQ + SR = 2(21) = 42 \text{ cm}$

$\therefore \quad$ Perimeter of trapezium $= 2(42) = 84$ cm

54 Let MN be the bridge.

$$\Delta APM \sim \Delta ABC \quad \Rightarrow \quad \frac{AP}{PM} = \frac{AB}{BC}$$

$$\frac{500}{PM} = \frac{1500}{3600} \quad \Rightarrow \quad PM = 1200 = QN = BR$$



$\therefore \quad RC = BC - BR = 2400 \text{ m}$

and $\quad NR = BQ = 700 \text{ m}$

$\therefore \quad NC = \sqrt{NR^2 + RC^2}$

$\Rightarrow \quad NC = 2500 \text{ m}$

Also $\quad AM = \sqrt{AP^2 + PM^2}$

$\Rightarrow \quad AM = 1300 \text{ m}$

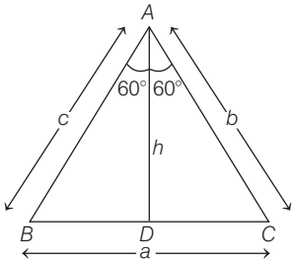
$\therefore$ Total distance to be travelled $= AM + MN + NC$

$$= 1300 + 300 + 2500$$
$$= 4100 \text{ m}$$

55 Let $AD = h$ (say)

then Area of $\Delta ABC = \frac{1}{2} bc \sin 120° = \frac{\sqrt{3}}{4} bc$

Area of $\Delta BAD = \frac{1}{2} ch \sin 60° = \frac{\sqrt{3}}{4} ch$



and area of $\Delta CAD = \frac{1}{2} bh \sin 60° = \frac{\sqrt{3}}{4} bh$

Now, $A(\Delta ABC) = A(\Delta BAD) + A(\Delta CAD)$

$$\frac{\sqrt{3}}{4} bc = \frac{\sqrt{3}}{4} ch + \frac{\sqrt{3}}{4} bh$$

$$\Rightarrow \quad bc = h(b + c) \Rightarrow h = \frac{bc}{b + c}$$

56 Using Crossed ladders theorem, we have

$$\frac{1}{AB} + \frac{1}{CD} = \frac{1}{EF}$$

Further, using Pythagoras theorem in ΔBAC, we have

$$AB = \sqrt{BC^2 - AC^2}$$

Similarly, using Pythagoras theorem in ΔDCA, we have

$$CD = \sqrt{AD^2 - AC^2}$$

Therefore, we have

$$\frac{1}{\sqrt{BC^2 - AC^2}} + \frac{1}{\sqrt{AD^2 - AC^2}} = \frac{1}{EF}$$

$$\frac{1}{\sqrt{210^2 - AC^2}} + \frac{1}{\sqrt{174^2 - AC^2}} = \frac{1}{70}$$

Now, the best way is to go through the given options. Let us consider option (b) and substitute $AC = 126$.

$$\frac{1}{\sqrt{210^2 - AC^2}} + \frac{1}{\sqrt{174^2 - AC^2}}$$

$$= \frac{1}{168} + \frac{1}{120} = \frac{1}{70}$$

Hence choice (b) is the correct one.

57 We can solve this problem by applying Mass-Point Geometry. Since $AX : XC = 2 : 3$, therefore, weight at point $A = 3$ and weight at point $C = 2$.

That means weight at point X

$$= \text{weight } (A) + \text{weight } (C) = 3 + 2 = 5.$$

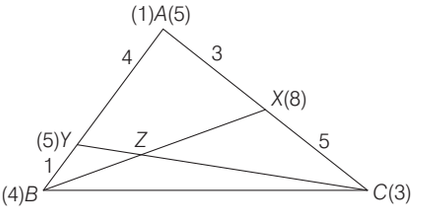
Now, since the weight (Z) = weight (B) + weight (X), therefore weight $(B) = 9 - 5 = 4$.

Hence choice (c) is the correct one.

58 Since the weight $(C) = 2$ and weight $(A) = 3$ and weight $(B) = 4$, therefore $AY : BY = 4 : 3$.

Hence choice (b) is the correct one.

59 The best way is to apply Mass-Point Geometry concept. We can say that the mass (or weight) at point Y is $5 (= AY + BY)$ and the mass at X is $8 (= AX + BX)$.

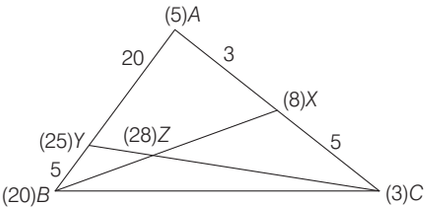


Further, the weight at A is 1 and weight at B is 4. Similarly, the weight at C is 3 and weight at A is 5.

Since, we are getting two different weights at A, so we need to take LCM of these two weights 1 and 5, which is 5.

Now, we need to revise the weights at all the points due to a new weight at A.

Considering the line segment AB, we need to multiply every value by 5, while all the values related to line segment AC will remain unchanged.



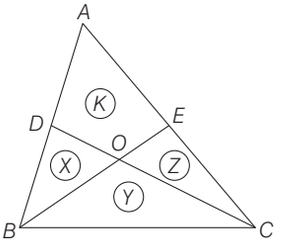
Now, the weight at point Z is 28, which can be obtained by $BZ + XZ$ or $CZ + YZ$.

Therefore, $BZ = 8$ and $XZ = 20$. Similarly, $CZ = 25$ and $YZ = 3$.

Thus the required ratio of $BZ : CZ = 8 : 25$.

Hence choice (a) is the correct one.

60 This problem can be solved by extending the crossed ladders theorem. However, if you do not want to go into details, you can always use this relation, as stated below.



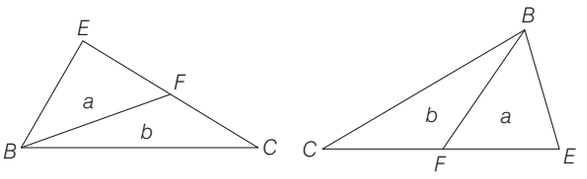
Let the area of the ΔABC be T, then

$$\frac{1}{T} + \frac{1}{Y} = \frac{1}{X + Y} + \frac{1}{Y + Z} \Rightarrow \frac{1}{T} + \frac{1}{8} = \frac{1}{15} + \frac{1}{12}$$

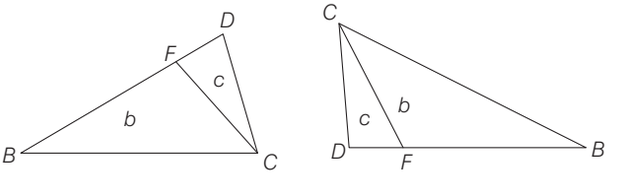
$$\Rightarrow \quad T = 40 \Rightarrow K = 40 - (7 + 8 + 4) = 21 \text{ sq cm}$$

Hence choice (a) is the correct one.

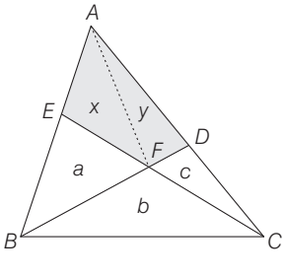
61 Since two triangles *EFB* and *FCB* have same height, therefore, $\frac{EF}{FC}=\frac{a}{b}$. …(i)



Similarly, two triangles *BFC* and *FDC* have same height, therefore, $\frac{BF}{FD}=\frac{b}{c}$. …(ii)



Now, the two triangles *BFA* and *DFA* have same height, therefore $\frac{BF}{FD}=\frac{a+x}{y}$



But, we know from equation (ii) that $\frac{BF}{FD}=\frac{b}{c}$

Therefore, $\frac{a+x}{y}=\frac{b}{c}$

$\Rightarrow$ $by=ca+cx$ …(iii)

Similarly, we can find $\frac{x}{c+y}=\frac{a}{b}$

$\Rightarrow$ $bx=ca+ay$ …(iv)

Solving the simultaneous equations (iii) and (iv) using substitution method, we get the following values of x and y.

$$x=\frac{ac(a+b)}{b^2-ac} \text{ and } y=\frac{ac(b+c)}{b^2-ac}$$

Therefore, total area of quadrilateral

$$AEFD=\frac{ac(a+2b+c)}{b^2-ac}$$

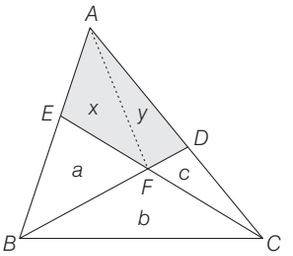
Hence choice (a) is the correct one.

Alternatively Apply ladder theorem, and find the result as explained below.

$$\frac{1}{(a+b+c+d)}+\frac{1}{b}=\frac{1}{(a+b)}+\frac{1}{(b+c)}$$

$\Rightarrow$ $$d=\frac{ac(a+2b+c)}{b^2-ac}$$

62 From the previous problem, we know that $\frac{a+x}{y}=\frac{b}{c}$ and $\frac{x}{c+y}=\frac{a}{b}$.

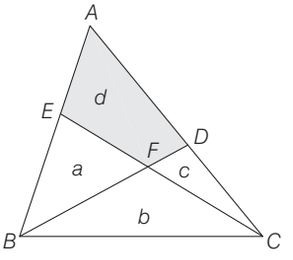


Therefore, we have $\frac{75+x}{y}=\frac{100}{40}$ and $\frac{x}{40+y}=\frac{75}{100}$

Alternatively By solving these two equations, we get $x=75$ and $y=60$. Therefore the area of quadrilateral $AEFD=135$ units.

Hence choice (b) is the correct one.

Apply ladder theorem, and find the result as explained below.



$$\frac{1}{(a+b+c+d)}+\frac{1}{b}=\frac{1}{(a+b)}+\frac{1}{(b+c)}$$

$\Rightarrow$ $$\frac{1}{(215+d)}+\frac{1}{100}=\frac{1}{175}+\frac{1}{140}$$

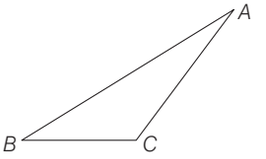
$\Rightarrow$ $d=135$

63 Area of triangle $ABC=\frac{1}{2}ab\sin C$

$\Rightarrow$ $$15\sqrt{3}=\frac{1}{2}\times 6\times 10\sin C$$

$\Rightarrow$ $$\sin C=\frac{\sqrt{3}}{2}$$

$\Rightarrow$ $$C=120^\circ$$



Now use cosine rule : $\cos C=\frac{a^2+b^2-c^2}{2ab}$

$\Rightarrow$ $\cos 120^\circ=\frac{36+100-c^2}{2\times 6\times 10}$ $\Rightarrow$ $-\frac{1}{2}=\frac{136-c^2}{120}$

$\Rightarrow$ $c=14$

Now use the following relation :

Δ(area of triangle)

$= r$ (inradius) $\times$ s(semi-perimeter of triangle)

$$\Rightarrow \quad 15\sqrt{3} = r \times \left(\frac{6+10+14}{2}\right)$$

$$\Rightarrow \quad r = \sqrt{3} \Rightarrow r^2 = 3$$

Hence choice (c) is the correct answer.

64 Since ΔABC is an isosceles triangle, therefore, by dropping a perpendicular from B on AC, the perpendicular BD will bisect AC, and BD will also pass through the incentre E.

Now, drop another perpendicular EF on AB, then $EF = ED = r = \sqrt{3}$.

In right angle ΔEFB, $\angle FBE = 60°$ and $\angle BEF = 30°$.

So, by using 30-60-90 degree theorem, we have $\frac{BE}{EF} = \frac{2}{\sqrt{3}}$

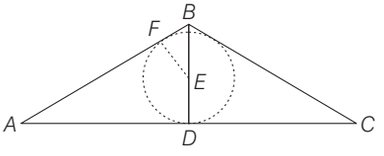
$$\Rightarrow \quad BE = \frac{2}{\sqrt{3}} EF = \frac{2}{\sqrt{3}} r$$

$$\therefore \quad BD = DE + BE = r + \frac{2}{\sqrt{3}} r = \sqrt{3} + 2 \qquad \ldots(i)$$

Again, using 30-60-90° degree theorem in ΔABD, we have

$$\frac{AD}{BD} = \frac{\sqrt{3}}{1}$$

$$\Rightarrow \quad AD = \sqrt{3}(BD) = \sqrt{3}(\sqrt{3}+2) \qquad \ldots(ii)$$



$$\therefore \quad \text{Area of } \Delta ABC = \frac{1}{2}(AC)(BD)$$

$$= \frac{1}{2}(2AD)(BD) = (AD)(BD)$$

$$= \sqrt{3}(\sqrt{3}+2)^2 = 12 + 7\sqrt{3}$$

Hence choice (c) is the answer.

Alternatively By applying 30-30-120 degree theorem, in the given triangle, if we assume $AB = BC = a$, then we have $AC = \sqrt{3}a$.

Either by dropping a perpendicular BD on AC or using any other technique we can have the area of triangle $ABC = \frac{\sqrt{3}\,a^2}{4}$ and semi-perimeter of the triangle

$$= \frac{(2+\sqrt{3})a}{2}$$

Now using the relation, area = inradius $\times$ semi-perimeter, we have

$$\frac{\sqrt{3}\,a^2}{4} = \sqrt{3} \times \frac{(2+\sqrt{3})a}{2}$$

$$\Rightarrow \quad a = 2(2+\sqrt{3})$$

Thereforen area of the triangle

$$= \frac{\sqrt{3}a^2}{4} = \frac{\sqrt{3}[2(2+\sqrt{3})]^2}{4} = 12 + 7\sqrt{3}$$

65 Let us consider an equilateral triangle. And assume point P is the incentre then $d_1 = d_2 = d_3 = k$ and $h_1 = h_2 = h_3 = 3k$. It implies that

$$\frac{d_1}{h_1} + \frac{d_2}{h_2} + \frac{d_3}{h_3} = \frac{1}{3} + \frac{1}{3} + \frac{1}{3} = 1$$

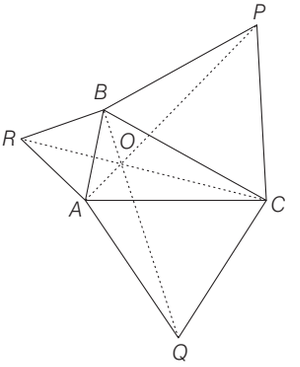
To confirm the above result, let us take another example. Let us consider a right angle triangle with the sides 3, 4 and 5. Now assume that the point P is the incentre then, $d_1 = d_2 = d_3 = 1$ and $h_1 = 3$, $h_2 = 2.4$ and $h_3 = 4$. It implies that

$$\frac{d_1}{h_1} + \frac{d_2}{h_2} + \frac{d_3}{h_3} = \frac{1}{3} + \frac{1}{2.4} + \frac{1}{4} = 1$$

As in both the considerations our result is unique.
It means 1 is the correct answer.

Hence choice (c) is the answer.

66 If you rotate ΔARC clockwise about A by 60°, it will overlap the ΔABQ completely, as $\angle RAC = \angle BAQ$. Also, $AR = AB$ and $AC = AQ$. Therefore, ΔRAC and ΔBAQ are congruent. It implies that $RC = BQ$.



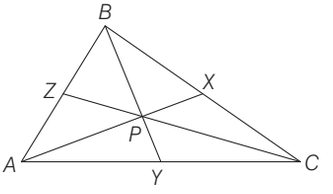
Similarly, you can prove that $RC = AP$.

Thus we can conclude that $AP = BQ = CR$

Hence choice (b) is the answer.

Hint : $\angle RAC = \angle RAB + \angle BAC = \angle BAC + \angle CAQ = \angle BAQ$

67 Let the altitude of the triangle ABC be h assuming that AC is the base.



$$\therefore \quad \Delta(ABY) = \frac{1}{2} \times AY \times h \Rightarrow AY = 2 \times \frac{\Delta(ABY)}{h}$$

Similarly, $$CY = 2 \times \frac{\Delta(CBY)}{h}$$

$$\therefore \quad \frac{AY}{CY} = \frac{\Delta(ABY)}{\Delta(CBY)}$$

In the same manner, we can have

$$\frac{AY}{CY} = \frac{\Delta(APY)}{\Delta(CPY)}$$

Now using the componendo-dividendo method, we have

$$\frac{AY}{CY} = \frac{\Delta(ABY) - \Delta(APY)}{\Delta(CBY) - \Delta(CPY)}$$

$$\Rightarrow \quad \frac{AY}{CY} = \frac{\Delta(ABP)}{\Delta(CBP)}$$

Similarly, when AB is assumed to be the base, then we have

$$\frac{AZ}{BZ} = \frac{\Delta(ACP)}{\Delta(BCP)}$$

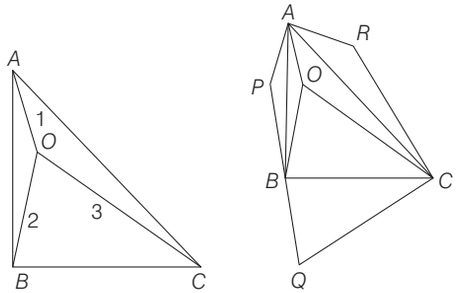
Similarly, when BC is assumed to be the base, then we have

$$\frac{BX}{CX} = \frac{\Delta(BAP)}{\Delta(CAP)}$$

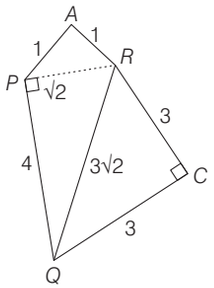
$$\therefore \quad \frac{AZ}{BZ}\frac{BX}{CX}\frac{CY}{AY} = \frac{\Delta(ACP)}{\Delta(BCP)}\frac{\Delta(BAP)}{\Delta(CAP)}\frac{\Delta(CBP)}{\Delta(ABP)} = 1$$

Hence eqs. choice (a) is the correct one.

68 Consider the following figures. Since AB and BC are the legs of the right angle triangle, so AC would be the hypotenuse and $\angle B = 90°$ and $\angle BAC = \angle BCA = 45°$



Let P, Q and R be the reflections of point O about AB, BC and CA, respectively. The $\angle PAR = 90°$, $\angle QCR = 90°$ and $\angle PBQ = 180°$. Thus the area of pentagon $ARCQP$ is twice the area to ΔABC. The area of $\Delta ABC = \frac{l^2}{2}$, so the area of pentagon $= l^2$.



Since $\angle PAR = 90°$, so

$PR = \sqrt{2} \times AO; \quad (AP = AR = AO = 1)$

Similarly, since $\angle QCR = 90°$, so

$$QR = \sqrt{2} \times CO = 3\sqrt{2}; \quad (CQ = CR = CO = 3)$$

And $PQ = (PB + BQ) = 2(BO) = 4$

But, since $(\sqrt{2})^2 + (4)^2 = (3\sqrt{2})^2$. It implies that ΔQPR is a right angle triangle. Thus the total area of pentagon is comprised of three right angle triangles of which two are isosceles ones.

$$\frac{1}{2}(PA \times AR) + \frac{1}{2}(PR \times PQ) + \frac{1}{2}(RC \times CQ)$$

$$= 2\left(\frac{1}{2} \times AB \times BC\right)$$

$$\frac{1}{2}(1 \times 1) + \frac{1}{2}(\sqrt{2} \times 4) + \frac{1}{2}(3 \times 3) = 2\left(\frac{l^2}{2}\right)$$

$$5 + 2\sqrt{2} = l^2$$

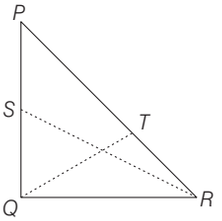
It implies that $a = 5$ and $b = 2$. Therefore $\frac{a}{b} = 2.5$

Hence choice (a) is the correct one.

69 Since, in ΔRQS and ΔPQR, $\angle QSR = \angle PRQ$ and $\angle SQR = \angle PQR$, there $\Delta RQS \sim \Delta PQR$.

$$\therefore \quad \frac{PQ}{RQ} = \frac{RQ}{SQ}$$

$$\Rightarrow \quad SQ = \frac{RQ^2}{PQ} = \frac{81}{12} = 6.75$$



Similarly, $\Delta QTR \sim \Delta PQR$

$$\therefore \quad \frac{QR}{PR} = \frac{RT}{QR} \Rightarrow RT = \frac{(QR)(QR)}{PR} = \frac{81}{15} = 5.4$$

Then we have,

$$PS \times PT = (PQ - SQ) \times (PR - RT)$$

$$= (12 - 6.75) \times (15 - 5.4) = 5.25 \times 9.6 = 50.4$$

Hence choice (a) is the correct one.

70 Given that $\frac{AQ}{BQ} = \frac{3}{2}$ and $\frac{AR}{CR} = \frac{4}{3}$

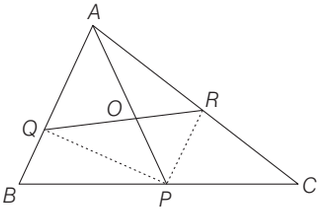
$$\therefore \quad \frac{\text{Area } (\Delta AQP)}{\text{Area } (\Delta BQP)} = \frac{3}{2} = \frac{3m}{2m}$$

and $$\frac{\text{Area } (\Delta ARP)}{\text{Area } (\Delta CRP)} = \frac{4}{3} = \frac{4n}{3n}$$

$\therefore$ Area $(\Delta ABP) = 5m$ and Area $(\Delta ACP) = 7n$

Since, AP is the median, therefore area (ΔABP) = area (ΔACP)

$$\Rightarrow \quad 5m = 7n \Rightarrow \frac{m}{n} = \frac{7}{5} = \frac{7k}{5k}$$



Since height of the triangle AOQ and that of QOP are same and the height of triangle AOR and that of ROP are same, therefore $\frac{\Delta AOQ}{\Delta QOP} = \frac{\Delta AOR}{\Delta ROP}$

And let area $(\Delta QOP) = x$ and area $(\Delta ROP) = y$, then

$$\frac{3m - x}{x} = \frac{4n - y}{y}$$

$$\Rightarrow \quad \frac{21k - x}{x} = \frac{20k - y}{y} \Rightarrow \frac{x}{y} = \frac{21}{20}$$

Hence choice (a) is the correct one.

71 $(1)^2 + (\sqrt{\varphi})^2 = 1 + \varphi = 1 + \dfrac{1+\sqrt{5}}{2} + \dfrac{3+\sqrt{5}}{2}$

$$\varphi^2 = \left(\frac{1+\sqrt{5}}{2}\right)^2 = \frac{3+\sqrt{5}}{2}$$

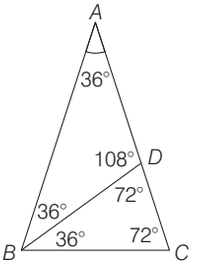
Since $1^2 + (\sqrt{\varphi})^2 = \varphi^2$, therefore it is a right angle triangle. Hence, choice (b) is the correct one.

72 From the given data it can be concluded that $BC = BD = AD$, as ΔCBD and ΔBDA are isosceles triangles.

$$\therefore \quad \frac{AC}{BC} = \frac{BC}{DC}$$

$$\Rightarrow \quad \frac{AC}{AD} = \frac{AD}{DC} = \frac{AD}{AC - AD} = \frac{\frac{AD}{AD}}{\frac{AC}{AD} - \frac{AD}{AD}} = \frac{1}{\frac{AC}{AD} - 1}$$

$$\Rightarrow \quad x = \frac{1}{x-1} \Rightarrow x^2 - x - 1 = 0 \qquad \left(\frac{AC}{AD} = x\right)$$



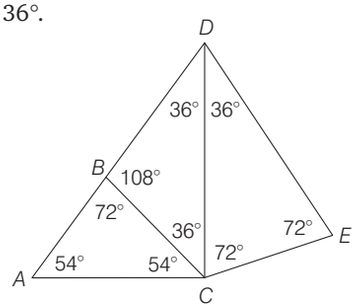
$$\Rightarrow \quad x = \frac{1+\sqrt{5}}{2} \Rightarrow \frac{AC}{AD} = \frac{1+\sqrt{5}}{2}$$

$$\Rightarrow \quad \frac{AB}{BC} = \frac{1+\sqrt{5}}{2} \qquad (\because AB = AC \text{ and } BC = AD)$$

Hence choice (c) is the correct one.

Hint : To find out how to solve a quadratic equation like $x^2 - x - 1 = 0$, you may like to refer the chapter on QUADRATIC EQUATIONS in this book only.

73 First of all extend AB to a point D such that $\angle ACD = 90°$. Then draw a line segment DE equal to DC, such that $\angle CDE = 36°$.



Now we know that in ΔCDE, if $CE = 1$, $DC = DE = \varphi$.

And, in ΔCBD, if $CD = \varphi$, $BC = BD = 1$.

Now, in ΔABC, $BC = AB = 1$.

Therefore, in right angle ΔADC, $AD = 2$ and $CD = \varphi$.

Thus we have $AC = \sqrt{AD^2 - CD^2}$

$$= \sqrt{4 - \varphi^2} = \sqrt{4 - (\varphi + 1)}$$

$$= \sqrt{3 - \varphi}$$

Therefore (i) and (iii) are valid.

Hence choice (c) is the correct one.

74 Looking at the angles of ΔAEB, we can say that $\angle EAB = \angle EBA = 72°$ and $\angle AEB = 36°$.

Therefore, $AB = \varphi$ and $EA = EB = \varphi^2$.

Now, by looking at the angles of ΔADB, we can say that $\angle ADB = \angle ABD = 54°$ and $\angle DAB = 72°$.

Therefore, $AD = AB = \varphi$.

Again, by looking at the angles of ΔACB, we can say that $\angle ACB = \angle CAB = 72°$ and $\angle ABC = 36°$.

Therefore, $AB = BC = \varphi$ and $AC = 1$.

Thus we see that $AC = 1$, $AD = \varphi$ and $AE = \varphi^2$.

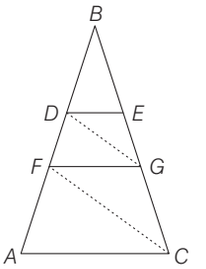
It implies that $CD = \varphi - 1 = \dfrac{1}{\varphi}$ and $DE = \varphi^2 - \varphi$

$$= (\varphi + 1) - \varphi = 1.$$

Thus, we have $AC : CD : DE = 1 : \dfrac{1}{\varphi} : 1 = \varphi : 1 : \varphi$

Hence choice (d) is the correct one.

75 Given that $\angle ABC = 36°$ and $DE \,||\, FG \,||\, AC$, we have $\angle BDE = \angle BED = \angle BFG = \angle BGF = \angle BAC = \angle BCA = 72°$.



In ΔBDE, since $BD = BE = \varphi$, we have $DE = 1$. Now connect DG and the we have $DE = EG = DF = 1$.

In ΔDFG, since $DF = 1$, we have $DG = FG = \varphi$.

Now connect FC and then we have $FG = GC = AF = \varphi$.

In ΔFAC, since $AF = \varphi$, we have $FC = AC = \varphi^2$.

But it can be established that $\varphi^2 = \varphi + 1$.

Hence choice (d) is the correct one.

76 We know that in this triangle, $\dfrac{AB}{AD} = \dfrac{1+\sqrt{5}}{2}$

$$\Rightarrow \quad BC = CD = AD = AB - BD = (1 + \sqrt{5})$$

Now, drop a perpendicular CP from C on BD, which will bisect the BD, as $BC = CD$.

$$\therefore \quad CP = \sqrt{(1+\sqrt{5})^2 - 1^2} = \sqrt{5 + 2\sqrt{5}}$$

$$\therefore \text{ Area of isosceles triangle } \Delta BCD = \frac{1}{2} \times 2 \times \sqrt{5 + 2\sqrt{5}}$$

$$= \sqrt{5 + 2\sqrt{5}} \text{ cm}^2$$

Hence choice (a) is the correct one.

77 Let $AB = AC = CD = x$ and it is given that $BD = CD = (\sqrt{5} - 1)$ cm

Now, since the triangle $\Delta BDA \sim \Delta BAC$

$$\therefore \quad \frac{BA}{BD} = \frac{BC}{BA}$$

$$\Rightarrow \quad \frac{x}{\sqrt{5}-1} = \frac{(\sqrt{5}-1)+x}{x} \Rightarrow x = 2$$

Now, draw a perpendicular DP on AB, which will bisect AB.

The length of this perpendicular

$$= \sqrt{(\sqrt{5}-1)^2 - (1)^2} = \sqrt{5-2\sqrt{5}} \text{ cm}$$

Therefore the area of $\Delta ABD = \frac{1}{2} \times 2 \times (\sqrt{5-2\sqrt{5}})$

$$= \sqrt{5-2\sqrt{5}} \text{ cm}^2$$

Hence choice (a) is the correct one.

78 $\angle CAB = \angle CBA = 80°$

$\Rightarrow$ $AC = BC$ and $\angle ACB = 20°$.

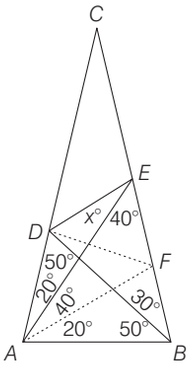
And, $\angle ADB = \angle ABD = 50° \Rightarrow AD = AB$

Now draw a line AF from A on BC, such that $\angle AFB = 80°$

$\Rightarrow$ $AF = AB$

$\therefore$ $\angle BAF = 20°$ and $\angle AFE = 100°$.

$\Rightarrow$ $\angle FAE = 40°$ and $\angle AEF = 40° \Rightarrow AF = EF$



Now, we know that $AD = AB = AF = EF$ and $\angle DAF = 60°$.

Therefore, ΔDAF is an equilateral triangle. That is $AD = AF = DF$.

Therefore, we have

$$\angle EDF = \angle DEF = \frac{1}{2}(\angle DFB)$$

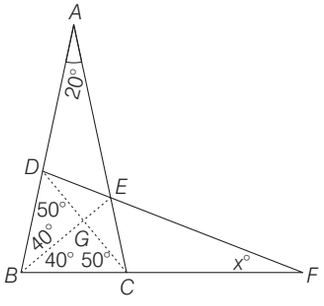
$$= \frac{1}{2}(\angle DFA + \angle AFB) = \frac{1}{2}(60° + 80°) = 70°$$

But, $\angle x° = \angle DEF - \angle AEF = 70° - 40° = 30°$

Hence choice (c) is the correct one.

79 Since $\angle ABC = \angle ACB = 80°$, therefore, $\angle DBE = 40°$ and $\angle DCE = 30°$.

Now, in triangle DBC, $\angle DBC = 80°$, $\angle BDC = 50°$. Therefore right angle triangle ΔDGB and ΔCGB are congruent.

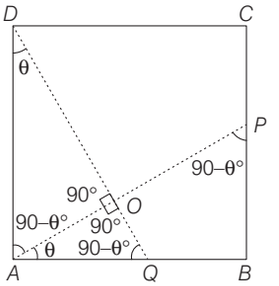


Now, consider the triangles ΔEDG and ΔECG, where EG is common, $DG = CG$ and $\angle DGE = \angle CGE = 90°$, Therefore, the two triangles ΔEDG and ΔECG are congruent. Now, since $\angle ECG = 30°$, therefore, we have $\angle EDG = 30°$.

Now, consider the ΔDBF, where $\angle DBF = 80°$ and $\angle BDF = 80°$, so the $\angle DFB = 180° - (80 + 80) = 20°$.

Hence choice (b) is the correct one.

80 First of all try to observe the similarity. Let us consider $\angle ADQ = \theta$, we have $\angle AQD = 90 - \theta$. Since $AD = AB$, $AQ = BP$ and $\angle DAQ = \angle ABP = 90°$, therefore ΔDAQ is congruent to ΔABP.



Now, in ΔAQO, $\angle OAQ = \theta$ and $\angle OQA = 90 - \theta$, which implies that $\angle AOQ = 90°$.

Thus we see that ΔDAQ, ΔABP and ΔAOQ are similar, where $\frac{DA}{AQ} = \frac{AB}{BP} = \frac{AO}{OQ} = \frac{2}{1}$.

Now, if we consider $OQ = 1$ cm, we have $AO = 2$ cm and $AQ = \sqrt{5}$ cm, $BP = \sqrt{5}$ cm and $OD = 4$ cm. Thus, we have $AB = BC = CD = DA = 2\sqrt{5}$ cm.

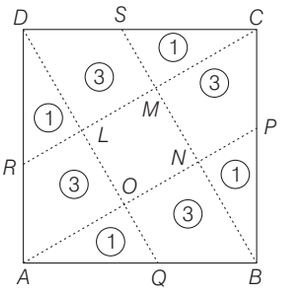
Now, area of square $ABCD = 20 \text{ cm}^2$, area of $\Delta DAQ = \Delta ABP = 4 \text{ cm}^2$ and area of $\Delta AOQ = 1 \text{ cm}^2$.

Therefore area of quadrilateral $QBPO = \Delta ABP - \Delta AOQ = 5 - 1 = 4 \text{ cm}^2$

And, area of quadrilateral $OPCD$ = area of square $ABCD - (\Delta ABP + \Delta DOA) = 20 - (5 + 4) = 11 \text{ cm}^2$

Therefore the required ratio is 4 : 11.

Hence choice (c) is the correct one.



Alternatively Let's draw the lines RC and SB as shown in the diagram, where R and S are the mid-points on respective sides of the square $ABCD$. Also, you can see that RC is parallel to AP and DQ is parallel to SB.

As per mid-point theorem, area of $\Delta DRL = \frac{1}{4}(\Delta DAO)$. Thus, if area of the ΔDRL is 1 unit, the area of ΔDAO will be 4 units. And, the same logic applies with other triangles too.

Now, if you join SQ, you will get four congruent triangles ΔDAQ, ΔDSQ, ΔSQB and ΔSCB with equal area.

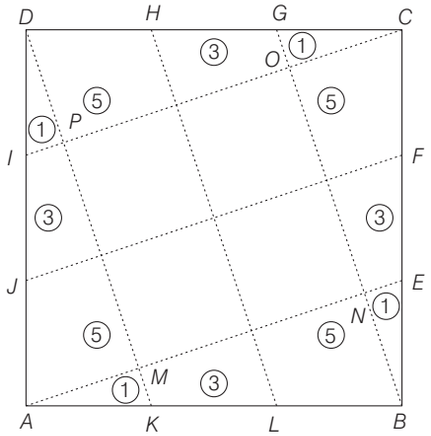
Further, since, the area of triangle ΔDAQ is 5 units, the area of square $ABCD$ will be four times, that is, 20 units.

Therefore, the area of square $LMNO$
$= 20 - (1 + 3 + 1 + 3 + 1 + 3 + 1 + 3) = 4$ units.

Therefore area of quadrilateral $QBPO = 1 + 3 = 4$ units and the area of quadrilateral $OPCD = 1 + 3 + 3 + 4 = 11$ units.

Thus the required ratio is 4 : 11.

81 Since all the triangles are similar, so we can apply the rule of similarity and find the areas of all the triangles, as shown in the diagram.



Total area of square

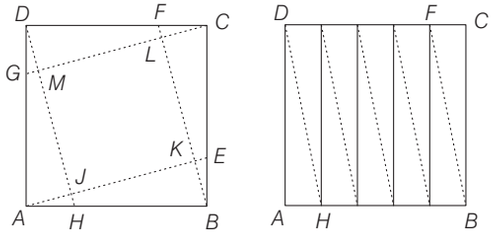
$$ABCD = \Delta DAK + \square DHLK + \square HGBL + \Delta GCB$$
$$= \Delta DAK = 2(\Delta DAK) + 2(\Delta DAK) + \Delta DAK$$
$$= 6(\Delta DAK) = (1 + 3 + 5 + 1) \times 6 = 60 \text{ units.}$$

Therefore, area of square $MNOP$ = area of square $ABCD - (\Delta DAM - \Delta ABN + \Delta BCO + \Delta CDP)$
$= 60 - 4 \times (1 + 3 + 5) = 24$ units

Hence choice (b) is the correct one.

Hint If you join HK and GL, you see that the total area of the square $ABCD$ can be divided into 6 triangles of the same size as of ΔDAK.

82 If the area of $\Delta DGM = 1$ unit, area of $\Delta DAJ = 25$ units and area of $\Delta DAH = 25 + 1 = 26$ units.



Area of square $ABCD = 26 \times 10 = 260$ units.

Area of square $JKLM$ = area of square $ABCD$
$-$ (area of $\Delta DAJ + \Delta ABK + \Delta BCL + \Delta CDM$)
$= 260 - 4 \times (25) = 160$ units.

Therefore required ratio $= \dfrac{160}{260} = \dfrac{8}{13}$

Hence choice (a) is the correct one.

83 If the area of ΔDGS is 4 units, area of ΔDAP will be 25 units and area of ΔDAH will be 29 units.

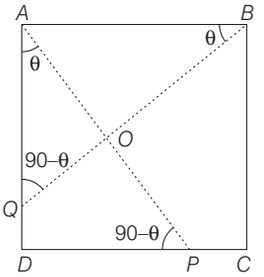
Area of square $ABCD = \left(\dfrac{5}{2}\right) \times 2 \times \Delta DAH = 145$ units.

Area of square $PQRS$ = area of square
$ABCD - (\Delta DAP + \Delta ABQ + \Delta BCR + \Delta CDS)$
$= 145 - 4(25) = 45$ units

Thus the required ratio $= \dfrac{45}{145} = \dfrac{9}{29}$

Hence choice (c) is the correct one.

84 ΔBAQ and ΔADP are congruent, that's why $\angle AOQ = 90°$. Thus we see that AO is a perpendicular on BQ. It means, $\dfrac{\Delta AOQ}{\Delta AOB} = \left(\dfrac{4}{5}\right)^2 = \dfrac{16}{25}$.



Since ΔAOQ and ΔBOA are similar, therefore

$$\frac{\text{area } \Delta AOQ}{\text{area } \Delta BOA} = \left(\frac{4}{5}\right)^2 = \frac{16}{25}$$

Now, $\dfrac{\Delta AOQ}{\Delta ADP} = \dfrac{\Delta AOQ}{\Delta BAQ}$

$$= \frac{\Delta AOQ}{\Delta AOB + \Delta AOQ}$$
$$= \frac{16}{25 + 16} = \frac{16}{41}$$

Thus, we have $\dfrac{\Delta ADP}{\square ABCD} = \dfrac{\Delta ADP}{2(\Delta ADC)} = \dfrac{41}{2\left[41\left(\dfrac{5}{4}\right)\right]} = \dfrac{2}{5}$

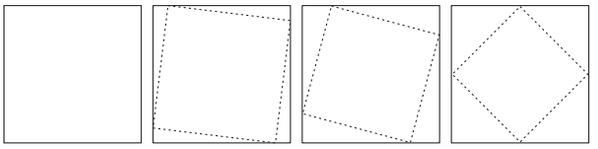
Therefore, $\dfrac{\Delta AOQ}{\square OBCP} = \dfrac{\Delta AOQ}{\square ABCD - (\Delta AOB + \Delta ADP)}$

$$= \frac{16}{\dfrac{205}{2} - (25 + 41)}$$
$$= \frac{32}{73}$$

Hence choice (d) is the correct one.

85 Maximum value of $a^2 + b^2 + c^2 + d^2$ will be obtained when the vertices of quadrilateral overlap the vertices of the square. In that case, actually a, b, c and d are the greatest possible values.

And, the minimum value of $a^2 + b^2 + c^2 + d^2$ will be obtained when the vertices of quadrilateral are the mid-points of the sides of the square. In this case actually a, b, c and d are the smallest possible values.



Hence choice (a) is the correct one.

86 As you know that $AF = CF$ and $AE = CE$, and since it is given that $AF = EF = EC$, therefore ΔAEF and ΔCEF are two equilateral triangle of same area.

Thus, the quadrilateral $AECF$ is a rhombus.

Let's assume that each side of this rhombus is a unit. Then the inradius of the circle inscribed in the rhombus

$$\square AECF = \frac{\text{Area of } \square AECF}{\text{semiperimeter of } \square AECF}$$

Area of $\square AECF = 2 \times \frac{\sqrt{3}}{4} \times a^2$

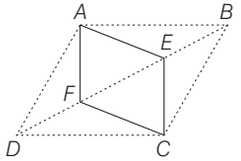
$$= \frac{\sqrt{3}}{2} \times a^2$$

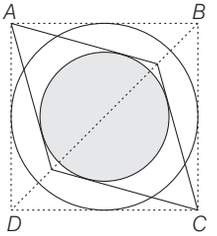
And semi-perimeter of $\square AECF = 2a$

Therefore, the inradius of the incircle

$$= r = \frac{\frac{\sqrt{3}}{2} \times a^2}{2a} = \frac{\sqrt{3}}{4} a$$

Thus the area of the incircle of $\square AECF = \pi\left(\frac{\sqrt{3}}{4} a\right)^2 = \frac{3\pi}{16} a^2$





Now, the largest circle can be drawn in a rhombus only when it's a square. Then the diagonal of square $ABCD$ is $BD = AC = \sqrt{3}a$

But, this diagonal of square $ABCD$ will act as the diameter of the inscribed circle.

Therefore area of the circle that I inscribed in the square

$$ABCD = \pi \times \left(\frac{\sqrt{3}a}{2}\right)^2 = \frac{3\pi}{4} \times a^2$$

Thus the required ratio $= 1 : 4$

Hence choice (c) is the correct one.

87 If h be the height of the trapezium, the area of trapezium $\square ABCD = \frac{1}{2} \times (AB + CD) \times h$

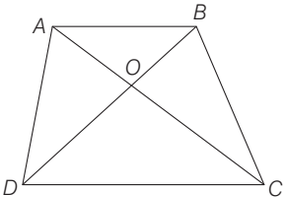
$$\Rightarrow \qquad 350 = \frac{1}{2} \times (21 + 49) \times h$$

$$\Rightarrow \qquad h = 10 \text{ cm}$$

Since, ΔABO and ΔCDO are similar triangles, therefore the heights of these triangles will be in the ratio of their respective bases. That is if h_1 and h_2 be the heights of ΔABO and ΔCDO, then

$$\frac{h_1}{h_2} = \frac{AB}{CD} = \frac{21}{49} = \frac{3}{7}$$

But, since, $h_1 + h_2 = 10$, therefore $h_1 = 3$ cm and $h_2 = 7$ cm



Thus the area of $\Delta ABO = \frac{1}{2} \times 21 \times 3 = \frac{63}{2}$

And, area of the $\Delta CDO = \frac{1}{2} \times 49 \times 7 = \frac{343}{2}$

Therefore Area of $\Delta AOD + \Delta BOC = \square ABCD - (\Delta AOB + \Delta COD)$

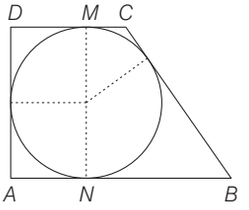
$$350 - (203) = 147 \text{ sq cm}$$

But, as you know that the area of $\Delta AOD = \Delta BOC$

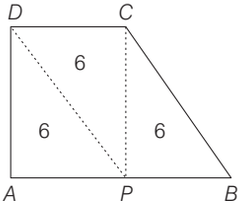
Therefore, area of $\Delta AOD = \frac{147}{2} = 73.5$ sq cm

Hence choice (b) is the correct one.

88 Let's draw a diagram as per the given problem.



$DP \,||\, CB$, as $AP = PB$. Thus $\Delta DAP = \Delta PDC = \Delta CPB = 6$



Let radius of the incircle is r. So $DA = CP = 2r$. And let us consider $CD = AP = PB = x$.

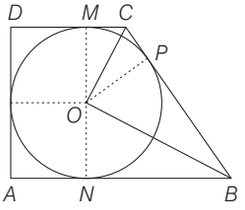
As $DM < CD \Rightarrow r < x$ and $CD < DA \Rightarrow x < 2r$.

Since $\frac{1}{2}(2xr) = 6 \Rightarrow rx = 6$

Choice	rx	r	x	$r < x$	$x < 2r$	Result
(a)	6	3	2	No	Yes	Impossible
(b)	6	2	3	Yes	Yes	Possible
(c)	6	3/2	4	Yes	No	Impossible
(d)	6	1	6	Yes	No	Impossible

Hence choice (b) is the answer.

Alternatively Let's draw a diagram as per the given problem.



Then $\angle POC = \angle COM$, since PC and MC are tangents on the same circle from the same point C. Now if you assume $\angle COP = \theta$, then $\angle BOP = 90 - \theta$.

Therefore ΔCMO and ΔONB are similar. That is $\frac{CM}{MO} = \frac{ON}{NB}$.

Let us assume $DC = x$ and radius is r, then $CM = x - r$ and $NB = 2x - r$.

Therefore, $$\frac{CM}{MO} = \frac{ON}{NB}$$

$$\Rightarrow \quad \frac{x-r}{r} = \frac{r}{2x-r}$$

$$\Rightarrow \quad 2x = 3r \qquad \ldots(i)$$

Also the area of quadrilateral = 18

$$\Rightarrow \quad \frac{1}{2}(2r \times 3x) = 18$$

$$\Rightarrow \quad rx = 6 \qquad \ldots(ii)$$

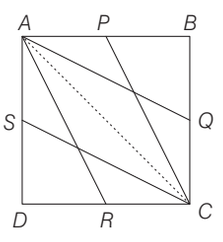
From eqs. (i) and (ii), $r = 2$.

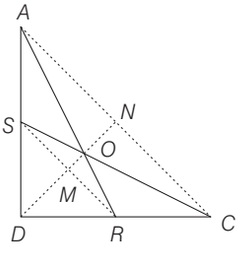
89 Since area of kite $CSAP$ is 200 sq cm, it means the area of $\Delta CSA = 100$ sq cm.

Which is turn implies that the area of $\Delta CDS = 100$ sq cm

Thus the area of $\Delta CDA = \Delta CDS + \Delta CSA = 200$ sq cm

But as $AD = CD$, so we have $AD = CD = 20$ cm





It means $AS = DS = DR = RC = 10$ cm.

Therefore, area of $\Delta SDR = 50$ sq cm

So, the area of parallelogram $ASRC = \Delta ADC - \Delta SDR = 150$ sq cm.

Now, if $OM = x$, then $ON = 2x$. That is $MN = 3x$, then $DM = 3x$

It implies that $DN = 6x = 10\sqrt{2}$

$$\Rightarrow \quad x = \frac{5\sqrt{2}}{3}$$

Therefore, area of ΔAOC

$$= \frac{1}{2} \times AC \times ON$$

$$= \frac{1}{2} \times 20\sqrt{2} \times \frac{10\sqrt{2}}{3}$$

$$= \frac{200}{3} \text{ sq cm.}$$

Thus the area of common region

$$= 2 \times \frac{200}{3} = \frac{400}{3} \text{ sq cm.}$$

Hence choice (c) is the correct one.

90 We know that in any quadrilateral the sum of any three sides must be greater than the fourth side. Therefore we have, $a + b + c > d$, such that $a, b, c \le d$.

Case	$a + b + c$	d
I	7	5
II	8	4
III	9	3
IV	10	2
V	11	1

Case	$a+b+c$	a	b	c	d	No. of combinations
I	7	1	1	5	5	4
		1	2	4		
		1	3	3		
		2	2	3		
II	8	1	3	4	4	3
		2	2	4		
		2	3	3		
III	9	3	3	3	3	1
IV	10	—	—	—	2	0
V	11	—	—	—	1	0

Case IV and Case V do not satisfy the required conditions.

Thus the total number of required combinations
$= 4 + 3 + 1 = 8$.

Hence choice (a) is the correct one.

91 Let us assume that $RD = h$, $OR = a$ and $OD = r$

First of all extend the sides DC and AB in order to make them meet at Q. Now, the angle $BQC = 36°$.

Since ΔBQC is an isosceles triangle so the perpendicular QP drawn from Q on the side BC will bisect the BC, and it will be the angular bisector of angle BQC, as well.

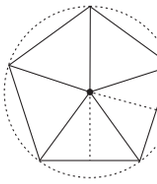
Similarly, the perpendiculars drawn from the incentre/circumcentre O of the regular pentagon $ABCDE$ will bisect the opposite sides as OR bisects AB at R and OP bisects BC at P.

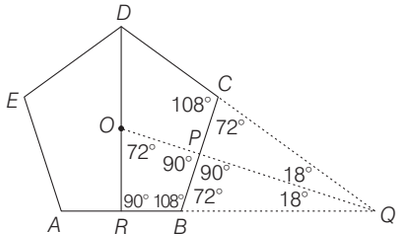
Now as given that $BC = 2$ cm, therefore using 36-72-72 degree theorem in ΔBQC, we have

$$BQ = CQ = (1 + \sqrt{5}) \text{ cm}$$

Now, in right angled triangle BPQ,

$$PQ = \sqrt{BQ^2 - BP^2} = \sqrt{(1+\sqrt{5})^2 - 1^2} = \sqrt{5+2\sqrt{5}}$$





But since ΔBPQ is similar to ΔORQ, therefore

$$\frac{BQ}{BP} = \frac{OQ}{OR}$$

$$\Rightarrow \quad \frac{BQ}{BP} = \frac{OP+PQ}{OR}$$

$$\Rightarrow \quad \frac{1+\sqrt{5}}{1} = \frac{a+\sqrt{5+2\sqrt{5}}}{a}$$

$$\Rightarrow \quad a = \frac{\sqrt{5+2\sqrt{5}}}{\sqrt{5}}$$

Now, in right angle ΔDRQ,

$$h = DR = \sqrt{DQ^2 - RQ^2}$$

$$= \sqrt{(DC+CQ)^2 - (RB+BQ)^2}$$

$$= \sqrt{(3+\sqrt{5})^2 - (2+\sqrt{5})^2} = \sqrt{5+2\sqrt{5}}$$

$$\therefore \quad r = DO = DR - OR = h - a$$

$$= \sqrt{5+2\sqrt{5}} - \frac{\sqrt{5+2\sqrt{5}}}{\sqrt{5}}$$

$$= \sqrt{5+2\sqrt{5}}\left(1 - \frac{1}{\sqrt{5}}\right) = \frac{3+\sqrt{5}}{\sqrt{5+2\sqrt{5}}}$$

Hence choice (a) is the correct one.

Alternatively

Looking at the following figures you can easily figure out that the circumradius of pentagon in fig (i) will be same as the circumradius of the isosceles triangle in fig (ii).

Using 36-72-72 degree theorem, in ΔDAB, we have $AD = BD = 1+\sqrt{5}$ cm, as $AB = 2$ cm.

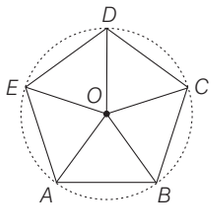


Fig (i)

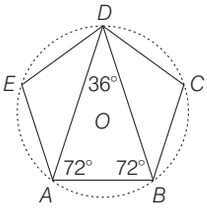

Fig (ii)

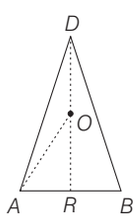

Fig (iii)

Now, let us assume that $DR = h$ and $DO = AO = r$ and $OR = a$

We know that the circumradius of an isosceles triangle with the lateral sides x and base y is $\dfrac{x^2}{2\sqrt{x^2 - \frac{y^2}{4}}}$

Therefore, the circumradius of the ΔADB

$$= \frac{(1+\sqrt{5})^2}{2\sqrt{(1+\sqrt{5})^2 - \frac{(2)^2}{4}}} = \frac{6+2\sqrt{5}}{2\sqrt{5+2\sqrt{5}}} = \frac{3+\sqrt{5}}{\sqrt{5+2\sqrt{5}}}$$

Alternatively Consider the figures intended for the previous alternate solution.

$$AR^2 + RD^2 = AD^2$$

$$\Rightarrow \quad 1 + h^2 = (1+\sqrt{5})^2 = 6 + 2\sqrt{5}$$

$$\Rightarrow \quad h = \sqrt{5+2\sqrt{5}}$$

But, $\quad OR^2 = OA^2 - AR^2$

$$\Rightarrow \quad (h-r)^2 = r^2 - 1^2$$

$$\therefore \quad h^2 + r^2 - 2hr = r^2 - 1 \Rightarrow 1 + h^2 = 2hr$$

$$\Rightarrow \quad 6 + 2\sqrt{5} = 2(\sqrt{5+2\sqrt{5}})r$$

$$\Rightarrow \quad r = \frac{3+\sqrt{5}}{\sqrt{5+2\sqrt{5}}}$$

92 Let inradius be x and circumradius be y and side be z, then

$$x^2 + \left(\frac{z}{2}\right)^2 = y^2$$

$$\Rightarrow \quad x^2 + 9 = y^2$$

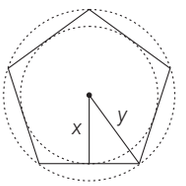
$$\Rightarrow \quad y^2 - x^2 = 9$$

$$\Rightarrow \quad (y+x)(y-x) = 9$$

$$\Rightarrow \quad 9(y-x) = 9$$

$$\Rightarrow \quad y - x = 1$$

$$\Rightarrow \quad x = 4,\ y = 5$$



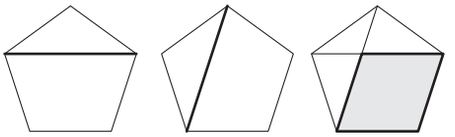
Therefore, area of circumcircle = 25 π sq cm

And area of incircle = 16π sq cm

Thus the total required area = 25π + 16π = 41π sq cm

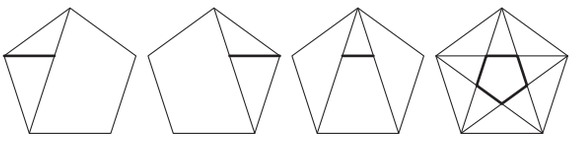
Hence choice (a) is the correct one.

93 In this pentagon the side S and the diagonal D are parallel, so we have a parallelogram as shown below in the fig (iii).



So the length of the highlighted segment in the fig (iv) and (v) is $d = D - S$

And the length of the highlighted section in the fig (vi) is $s = D - 2d = 2S - D$



But, we know that the diagonal (D) of a regular pentagon

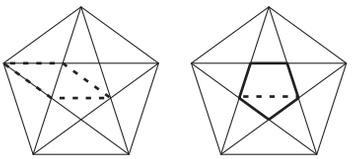
$$= \frac{1+\sqrt{5}}{2} \times \text{side}$$

$$\therefore \quad D = \frac{1+\sqrt{5}}{2} \times S$$

$$\therefore \quad s = 2S - D = 2S - \left(\frac{1+\sqrt{5}}{2}\right)S = \frac{(3-\sqrt{5})S}{2}$$

Hence choice (b) is the correct one.

94 In the following figure, there is a parallelogram shown by the dotted lines. And each side of this parallelogram is same and equal to the diagonal of the smaller pentagon.



Thus the diagonal of the smaller pentagon $= d = D - S$

$$= \left[\left(\frac{1+\sqrt{5}}{2}\right)S\right] - S = \left(\frac{\sqrt{5}-1}{2}\right)S$$

Hence choice (c) is the correct one.

95 $\angle PED = \angle PDE = \angle BCQ = \angle CBQ = 72°$

and $\quad \angle EPD = \angle BQC = 36°.$

Now, we know that for a 72°-36°-72° triangle, the ratio of sides is $(1+\sqrt{5}) : 2 : (1+\sqrt{5})$.

That means, if $DE = 2$, $PE = PD = 1 + \sqrt{5}$.

96 We know that $\angle EAB = \angle ABC = \angle BCD = \angle CDE = \angle DEA = 108°$

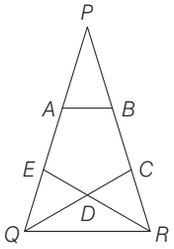
Therefore, $\angle PAB = \angle PBA = 72°$ and $\angle APB = 36°$.

Similarly, $\angle QED = \angle QDE = 72°$ and $\angle EQD = 36°$.

Also, $\angle RDC = \angle RCD = 72°$ and $\angle DRC = 36°$.

Thus, we have $\angle QDR = 108°$ and $\angle DQR = \angle DRQ = 36°$.

Therefore, ΔERQ and ΔEDQ are similar triangles.



Now, we know that for a 72°· 36°· 72° triangle, the ratio of sides is $(1+\sqrt{5}) : 2 : (1+\sqrt{5})$

Therefore,

$$PQ = PR = (1+\sqrt{5}) + 2 + (1+\sqrt{5})$$
$$= 4 + 2\sqrt{5}.$$

And,

$$QR = ER = ED + DR$$
$$= 2 + (1+\sqrt{5}) = 3 + \sqrt{5}$$

Thus the perimeter of $\Delta PQR = PQ + PR + QR$

$$= 11 + 5\sqrt{5}$$

Hence choice (b) is the correct one.

97 Since $\angle EPT = \angle PET = 72°$, therefore,

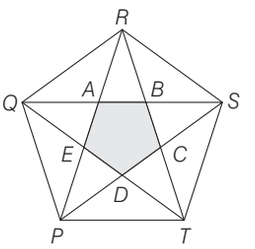
$$PT = ET = ED + DT$$

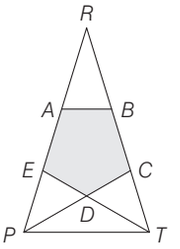
But, we know that

$$DT = \left(\frac{1+\sqrt{5}}{2}\right)DC = \left(\frac{1+\sqrt{5}}{2}\right)ED$$

Therefore, $PT = ED + DT = ED + \left(\frac{1+\sqrt{5}}{2}\right)ED$

$$= \left(\frac{3+\sqrt{5}}{2}\right)ED$$





$\because \quad PT = \left(\frac{3+\sqrt{5}}{2}\right)ED$

$\therefore$ Area of larger pentagon = area of smaller pentagon $\times \left(\frac{3+\sqrt{5}}{2}\right)^2$

$\Rightarrow$ Area of larger pentagon = area of smaller pentagon $\times \left(\frac{7+3\sqrt{5}}{2}\right)$

$\Rightarrow$ Area of larger pentagon $= \left(\frac{7-3\sqrt{5}}{2}\right) \times \left(\frac{7+3\sqrt{5}}{2}\right)$

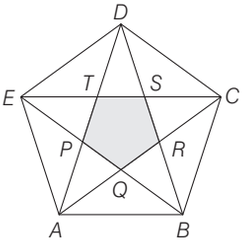
$\Rightarrow$ Area of larger pentagon = 1

Hence choice (a) is the correct one.

98 First of all let us understand a couple of relations before we proceed to solve this problem.

Given that $\varphi = \frac{\sqrt{5}+1}{2}$, so we have $\varphi + 1 = \varphi^2$ and

$2\varphi + 1 = \varphi^3$



Now, we know that $\frac{PQ}{QB} = \frac{1}{\varphi}$

and $\quad AB = PB = PQ + QB = 1 + \varphi = \varphi^2$

When $AB = \varphi^2, PQ = 1$

So, when $AB = 1, PQ = \dfrac{1}{\varphi^2}$

Now, we know that

$$\frac{\text{Area of } ABCDE}{\text{Area of } PQRST} = \frac{K(AB)^2}{K(PQ)^2} = \frac{(1)^2}{\left(\frac{1}{\varphi^2}\right)^2} = \frac{1}{\frac{1}{\varphi^4}} = \frac{\varphi^4}{1}$$

Hence choice (b) is the correct one.

99 There are clearly four distinct sizes of pentagon. Let's call the smallest pentagon P_1 and so the largest pentagon P_4.

Each side of $P_1 = 1$

Each side of $P_2 = 1 + \varphi = \varphi^2$

Each side of $P_3 = \varphi^2 + \varphi^3 = \varphi^2(1 + \varphi) = \varphi^4$

Each side of $P_4 = \varphi^4 + \varphi^5 = \varphi^4(1 + \varphi) = \varphi^6$

Hence choice (d) is the correct one.

100 Since each side of the smaller pentagon is 1 cm, so each side of the larger pentagon will be

$$\left(1 + \frac{2}{1+\sqrt{5}} + 1\right) = \frac{3+\sqrt{5}}{2} \text{ cm.}$$

Thus the area of the larger pentagon

$$= \frac{1}{4}\left(\sqrt{5\,(5 + 2\sqrt{5})}\right)\left(\frac{3+\sqrt{5}}{2}\right)^2$$

$$= \frac{1}{4}(6.88)(6.85) = 11.72 \text{ sq. cm}$$

Hence choice (b) is the correct one.

101 We know that if the side of a pentagon is s, the area of the inscribed pentagram is

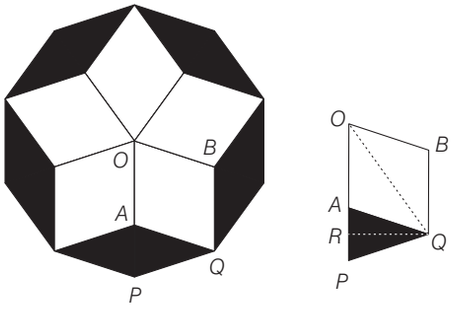
$$A = \frac{1}{2}\left[\sqrt{5(5 - 2\sqrt{5})}\right]s^2$$

$$\Rightarrow \quad A = \frac{1}{2}\left[\sqrt{5(5 - 2\sqrt{5})}\right]$$

Now, the best way is to substitute the numerical value of $\varphi = \dfrac{\sqrt{5}+1}{2}$ in the given options in order to find out the correct match.

Hence choice (c) is the correct one.

102



It is known that $PQ = AQ$ and $AQ = OA$.

So we have $PQ = AQ = OA = 1 + \sqrt{5}$ cm.

Now, applying 72°-36°-72° theorem, we get $AP = 2$ cm.

Now, let's drop a perpendicular RQ from Q on AP, which will bisect the AP. Now try to understand that the perpendicular RQ can act as the height of both the triangles ΔAQP and ΔOQP.

Therefore $RQ = \sqrt{AQ^2 - AR^2} = \sqrt{(1-\sqrt{5})^2 - 1^2} = \sqrt{5 + 2\sqrt{5}}$

Thus, area of $\Delta OQA = \dfrac{1}{2}(OA) \times (RQ)$

$$= \frac{1}{2}(1 + \sqrt{5})\,(\sqrt{5 + 2\sqrt{5}})$$

Therefore, required area = 5 × area of rhombus $OBQA$

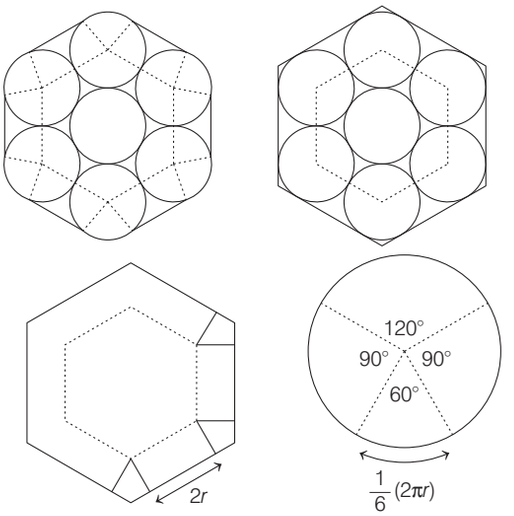
$$= 10 \times \text{area of } \Delta OAQ$$

$$= 10\left(\frac{1}{2}(1 + \sqrt{5})(\sqrt{5 + 2\sqrt{5}})\right)$$

$$= 5(1 + \sqrt{5})(\sqrt{5 + 2\sqrt{5}})$$

Hence choice (c) is the correct one.

103 The perimeter obtained by wrapping a band around the circle will consist of six straight segments of length d (where d is the diameter) and 6 arcs, each with length $\frac{1}{6}$th of a circle, as the arc angle is 60°.

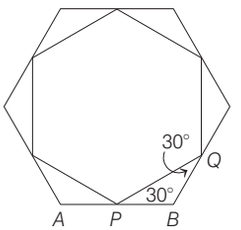


Therefore the required perimeter is

$$p = 6(d) + 6\left(\frac{2\pi r}{6}\right) = 6(2r) + 2\pi r = 2(6 + \pi)r$$

Hence choice (a) is the correct one.

104 Since the side of H_1 is 64 cm, that is AB = 64 cm, therefore $AP = BP = BQ = \ldots = 32$ cm. Now since the angles of triangle PBQ are 30°, 30°, 120°, so $PQ = 32\sqrt{3}$ cm.



In the similar way, each side of $H_3 = 64 \times \left(\frac{\sqrt{3}}{2}\right)^2$

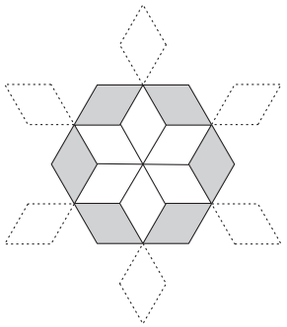
And, each side of $H_4 = 64 \times \left(\frac{\sqrt{3}}{2}\right)^3$

Therefore, each side of $H_7 = 64 \times \left(\frac{\sqrt{3}}{2}\right)^6 = 27$ cm

Hence choice (a) is the correct one.

NOTE The answer should be given in cm, not in mm.

105 If you look closely at the figure, you will notice that the area comprised by the hexagram is equal to the 6 rhombi and thus the area comprised by the hexagon is equal to 12 rhombi.



It implies that the area of 12 rhombi

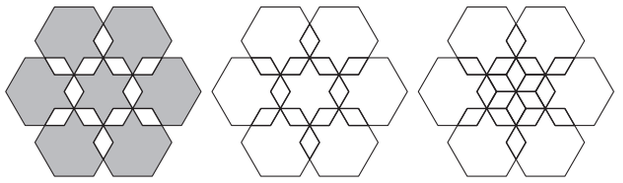
= area of hexagon = 84 sq cm.

Hence choice (d) is the correct one.

106 As per the figure, the area of the 12 rhombi

= area of each hexagon.

Therefore area of each rhombus $= \frac{84}{12} = 7$ sq cm.



Total shaded area = shaded area of the 6 outer hexagons – shaded area of the central hexagon

= area of 9 rhombi × 6 + area of 6 rhombi

$= (9 \times 6 \times 7) + (6 \times 7) = 9 \times (42) + (42)$

$= 42 \times 10 = 420$ sq cm.

Hence choice (a) is the correct one.

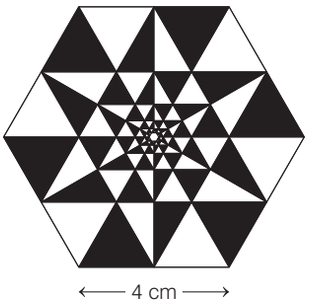
107 There are total 6 shaded equilateral triangles along the perimeter of the hexagon.

So area of each such equilateral triangle is $\frac{6\sqrt{3}}{6} = \sqrt{3}$ sq cm.

Therefore, side of each such equilateral triangles is 2 cm.

Further, it implies that the side of the regular hexagon is 4 cm.

Therefore, area of the hexagon $= \frac{3\sqrt{3}}{2} \times 4^2 = 24\sqrt{3}$ sq cm.



As you can observe that the half of the area of the regular hexagon is shaded and rest half is un-shaded, so the total area of the un-shaded region $= \frac{1}{2} \times 24\sqrt{3} = 12\sqrt{3}$ sq cm.

Hence choice (d) is the correct one.

Hint Area of an equilateral triangle $= \frac{\sqrt{3}}{4} \times \text{side}^2$

And, area of a regular hexagon $= \frac{3\sqrt{3}}{2} \times \text{side}^2$

108 Let $a_1, a_2, a_3, a_4, a_5, a_6, a_7$ be the side of the seven hexagons such that

$a_1 > a_2 > a_3 > a_4 > a_5 > a_6 > a_7$.

Then we have, $\frac{3\sqrt{3}}{2}(a_1)^2 - \frac{3\sqrt{3}}{2}(a_2)^2$

$= \frac{3\sqrt{3}}{2}(a_2)^2 - \frac{3\sqrt{3}}{2}(a_3)^2$

$= \frac{3\sqrt{3}}{2}(a_3)^2 - \frac{3\sqrt{3}}{2}(a_4)^2$

$= \frac{3\sqrt{3}}{2}(a_4)^2 - \frac{3\sqrt{3}}{2}(a_5)^2$

$= \frac{3\sqrt{3}}{2}(a_5)^2 - \frac{3\sqrt{3}}{2}(a_6)^2$

$= \frac{3\sqrt{3}}{2}(a_6)^2 - \frac{3\sqrt{3}}{2}(a_7)^2$

$= \frac{3\sqrt{3}}{2}(a_7)^2$

Or $\frac{3\sqrt{3}}{2}(a_1^2 - a_2^2) = \frac{3\sqrt{3}}{2}(a_2^2 - a_3^2)$

$= \frac{3\sqrt{3}}{2}(a_3^2 - a_4^2)$

$= \frac{3\sqrt{3}}{2}(a_4^2 - a_5^2)$

$= \frac{3\sqrt{3}}{2}(a_5^2 - a_6^2) = \frac{3\sqrt{3}}{2}(a_6^2 - a_7^2) = \frac{3\sqrt{3}}{2}a_7^2$

Or $(a_1^2 - a_2^2)$

$= (a_2^2 - a_3^2) = (a_3^2 - a_4^2) = (a_4^2 - a_5^2)$

$= (a_5^2 - a_6^2) = (a_6^2 - a_7^2) = a_7^2$

$\therefore \quad (a_6^2 - a_7^2) = a_7^2$

$\Rightarrow \quad a_6^2 = 2a_7^2$

And $(a_5^2 - a_6^2) = (a_6^2 - a_7^2)$

$\Rightarrow \quad a_5^2 = 3a_7^2$

And $(a_4^2 - a_5^2) = (a_5^2 - a_6^2)$

$\Rightarrow \quad a_4^2 = 4a_7^2$

And $(a_3^2 - a_4^2) = (a_4^2 - a_5^2)$

$\Rightarrow \quad a_3^2 = 5a_7^2$

And $(a_2^2 - a_3^2) = (a_3^2 - a_4^2) \Rightarrow a_2^2 = 6a_7^2$

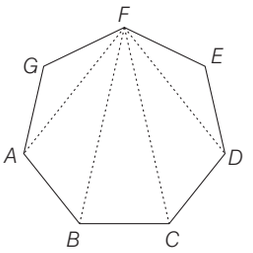
And $(a_1^2 - a_2^2) = (a_2^2 - a_3^2) \Rightarrow a_1^2 = 7a_7^2$

$\therefore \quad \dfrac{a_1}{a_7} = \dfrac{\sqrt{7}}{1}$

Hence choice (d) is the correct one.

109 First of all you must know that as whenever a polygon is regular, it is necessarily a cyclic polygon. That is all its vertices lie on the circle. this ensures that all the inscribed angles must be equal, that is

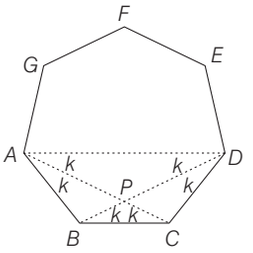
$$\angle GFA = \angle AFB = \angle BFC = \angle CFD$$
$$= \angle DFE = \frac{\pi}{7} = \frac{180^\circ}{7}$$



So, based on the above logic, we have

$$\angle BAC = \angle BCA = \angle BDC = \angle DBC = \angle CAD$$
$$= \angle BDA = \frac{180}{7} = k \text{ (say)}$$

That is $180^\circ = 7k$

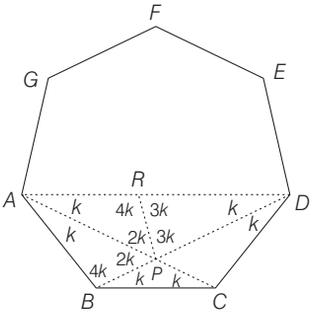


Now, due to symmetricity triangle APD is isosceles, that is $AP = DP$ and therefore $\angle APD = 180 - (k + k) = 5k$

It implies that $\angle APB = 180 - \angle APD = 2k$

Therefore, $\angle ABP = 180 - (\angle BAP + \angle APB)$
$= 180 - 3k = 4k$

Now choose a point R on AD such that $\angle APR = 2k$ and $\angle ARP = 4k$, that is ΔAPB and ΔAPR are congruent.
Therefore, $AR = AB$



Now, $\angle RPD = 180 - (\angle APB + \angle APR)$
$= 7k - (2k + 2k) = 3k$

And $\angle PRD = 180 - (\angle RDP + \angle RPD)$
$= 7k - (k + 3k) = 3k$

Therefore, $\angle PRD = \angle RPD = 3k$

It implies that ΔRDP is an isosceles triangle.

That is $RD = PD$

$\therefore \quad AB + BD = AB + DP + PB = AB + RD + PB$
$= AR + RD + BP = AD + BP$

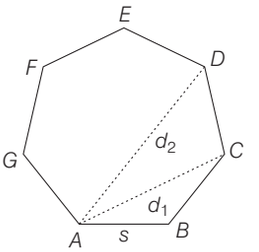
Hence choice (c) is the correct one.

110 According to Ptolemy's theorem on the cyclic quadrilateral, "the sum of the products of the two pairs of opposite sides of a cyclic quadrilateral equals the product of its two diagonals." That is in the cyclic quadrilateral $ACDE$ we have

$\therefore \quad AC \times DE + CD \times AE = AD \times CE$

$\Rightarrow \quad d_1 \times s + s \times d_2 = d_1 d_2 \Rightarrow s(d_1 + d_2) = d_1 d_2$

$\Rightarrow \quad \dfrac{d_1 + d_2}{d_1 d_2} = \dfrac{1}{s} \Rightarrow \dfrac{1}{d_1} + \dfrac{1}{d_2} = \dfrac{1}{s}$



Hence choice (d) is the correct one.

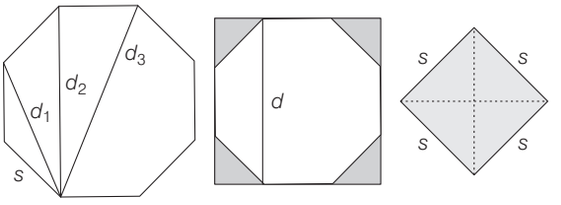
Hint $AD = AE$ and $AC = CE$

111 Look at the following figures and find that the problem is talking about d_2, the second largest diagonal of the octagon.

From the first two figures it can be seen that $d_2 = d$

And d is equal to the side of the circumscribing square.

So, the area of the circumscribing square = d^2



Now, the area of the shaded region (in the circumscribing square)

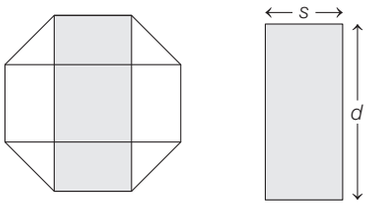
= area of the smaller square formed by joining the four corner triangles = s^2

Therefore, area of the octagon = area of the circumscribing square – area of the smaller square formed by joining the four corner triangles.

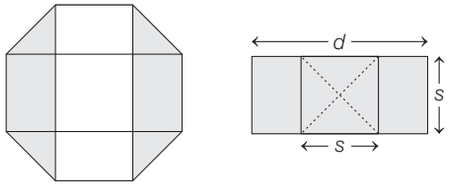
$$= d^2 - s^2$$

Now look at following diagrams.

The area of the vertical rectangle = ds



And the area of the horizontal rectangle = ds



Therefore, the total area of the octagon

$$= ds + ds = 2ds$$

Hence choice (d) is the correct one.

Alternatively

As you know $d = d_2 = (1 + \sqrt{2})s$

And area of octagon, $A = (1 + \sqrt{2})s^2$

Let us consider choice (b), then we will have

$$d^2 - s^2 = [(1 + \sqrt{2})s]^2 - s^2 = 2(1 + \sqrt{2})s^2 = A$$

Therefore, $A = d^2 - s^2$

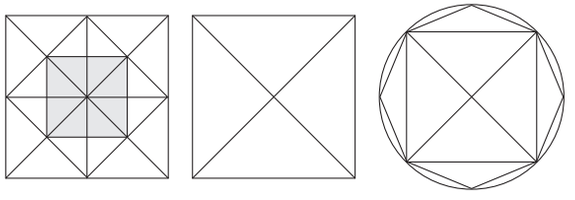
Now, let us consider choice (c), then we will have

$$2ds = 2 \times (1 + \sqrt{2})s \times s = 2(1 + \sqrt{2})s^2 = A$$

Therefore $A = 2ds$

Hence choice (d) is the most appropriate one.

112 Since area of the third square (shaded region) is 1 sq cm, so the area of the second square would be 2 sq cm. similarly, the area of the first square (the largest one) would be 4 sq cm.



That is the diameter of the circle is $2\sqrt{2}$ cm, so the radius of the circle is $\sqrt{2}$ cm and the area of the circle is 2π sq cm.

Likewise, the longest diagonal of the octagon is $2\sqrt{2}$ cm.

So, the side of the octagon

$$= \frac{2\sqrt{2}}{\sqrt{4 + 2\sqrt{2}}} = \frac{2}{\sqrt{2 + \sqrt{2}}}$$

Therefore, area of the octagon

$$= 2(1 + \sqrt{2})\left(\frac{2}{\sqrt{2 + \sqrt{2}}}\right)\ 4\sqrt{2} \text{ sq cm.}$$

Thus the difference between the areas of circle and octagon = $2\pi - 4\sqrt{2}$

$$= 2(\pi - 2\sqrt{2}) \text{ sq cm.}$$

Hence choice (a) is the correct one.

113 Area of the octagon = $2(\sqrt{2} - 1)$ sq cm

$$\Rightarrow \quad 2(\sqrt{2} + 1)s^2 = 2(\sqrt{2} + 1)$$

$$\Rightarrow \quad s^2 = \frac{\sqrt{2} - 1}{\sqrt{2} + 1}$$

$$\Rightarrow \quad s^2 = \frac{\sqrt{2} - 1}{\sqrt{2} + 1} \times \frac{\sqrt{2} - 1}{\sqrt{2} - 1} \Rightarrow s = \sqrt{2} - 1$$

Now, each side of the square = $(\sqrt{2 + \sqrt{2}})s$

$$= (\sqrt{2 + \sqrt{2}})(\sqrt{2} - 1)$$

Therefore, area of the square

$$= [(\sqrt{2 + \sqrt{2}})(\sqrt{2} - 1)]^2$$

$$= (2 + \sqrt{2})(3 - 2\sqrt{2}) = \sqrt{2}(\sqrt{2} - 1)$$

114 By joining A, C, E, G we get a square whose diagonals, AE and CG, are 20 cm each. Therefore, each side (AC, CE, EG, GA) of the square is $10\sqrt{2}$ cm and $AO = CO = EO = GO = 10$ cm.

Therefore, each of $\Delta AOC = \frac{1}{2} \times AO \times OC = 50 \text{ cm}^2$

Now, due to symmetricity or uniformity of the figure the diagonals AE and CG will act as the angular bisector of $\angle A, \angle E, \angle C, \angle G$.

Therefore, $\angle OAB = \angle OCB = 15°$

Thus the $\angle BAC = \angle OAC - \angle OAB = 45° - 15° = 30°$.

Similarly, $\angle BCA = 30°$.

Therefore in triangle ΔABC,

$$\angle ABC = 180° - (\angle BAC + \angle BCA) = 120°$$

Now, using 30 – 30 – 120 degree theorem in ΔABC (or dropping a perpendicular BP on AC from B and using 30-60-90 degree theorem in ΔABP or ΔCBP) you can find that $AB = BC = \frac{10\sqrt{2}}{\sqrt{3}}$ and $BP = \frac{5\sqrt{2}}{\sqrt{3}}$

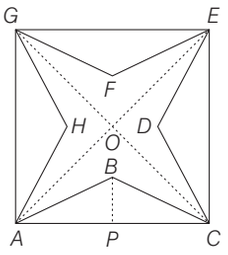
Therefore, area of triangle

$$ABC = \frac{1}{2} \times AC \times BP = \frac{50}{\sqrt{3}} \text{ cm}^2$$

Thus the area of the quadrilateral $AOCB$

= area of triangle AOC – are of triangle ABC

$$= 50 - \frac{50}{\sqrt{3}} \text{ cm}^2$$



Therefore, the area of the octogon

$$= \text{area of quadrilaterals } (OABC + OCDE + OEFG + OGHA)$$

$$= 4 \text{ (area of quadrilateral } OABC)$$

$$= 4\left(50 - \frac{50}{\sqrt{3}}\right) = \frac{200}{\sqrt{3}}(\sqrt{3} - 1)$$

Hence choice (a) is the correct one.

115 Look at the second figure, which has two concentric octagons and the area of inner octagon is same as the area of the shaded region in the first octagon.

Now pay attention very closely in the second figure and try to figure out the fact that the circumradius of the outer octagon is double the inradius of the inner octagon.

Therefore, if the circumradius of the outer octagon be R_0 and the inradius of the inner octagon be r_i and each side of the inner octagon be a, then

$$r_i = \frac{(1 + \sqrt{2})a}{2}$$

$$\therefore \qquad R_0 = 2r_i = (1 + \sqrt{2})a$$

Now, if the side of the outer octagon is s, then

$$s = \frac{2R_0}{\sqrt{4 + 2\sqrt{2}}} = \frac{2(1 + \sqrt{2})a}{(\sqrt{4 + \sqrt{2}})}$$

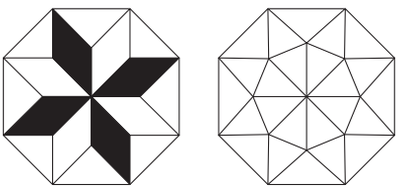
$$= \frac{\sqrt{2}(2 + \sqrt{2})a}{\sqrt{2}\,(\sqrt{2 + \sqrt{2}}\,)} = (\sqrt{2 + \sqrt{2}})a$$

Therefore, area of the outer octagon $= 2(1 + \sqrt{2})s^2$

$$= 2(1 + \sqrt{2})[(\sqrt{2 + \sqrt{2}})a]^2 \text{ cm}^2$$

$$= 2(1 + \sqrt{2})a^2[(\sqrt{2 + \sqrt{2}})]^2 \text{ cm}^2$$

$$= 2(1 + \sqrt{2})a^2 \times [(2 + \sqrt{2})] \text{ cm}^2$$



But, since area of the inner octagon $= 2(1 + \sqrt{2})a^2 = 8$ cm

Therefore, area of the outer octagon

$$= 2(1 + \sqrt{2})a^2 \times (2 + \sqrt{2}) \text{ cm}^2$$

$$= 8 \times (2 + \sqrt{2}) \text{ cm}^2$$

Hence choice (a) is the correct one.

Alternatively Area of the 4 shaded rhombi = 8 sq cm.

So the total area of all the 8 rhombi = 16 sq cm.

Now we have to determine the area of 8 isosceles right angled triangles, each having one side common with the side of the octagon.

Let each side of the inner octagon be a, then the circumraius of the inner radius (say r)

$$= \frac{(\sqrt{4 + 2\sqrt{2}})a}{2} = \frac{(\sqrt{2 + \sqrt{2}})a}{\sqrt{2}}$$

And the area of the inner octagon $= 2(1 + \sqrt{2})a^2 = 8$

But the area of each isosceles triangle $= \frac{1}{2}r^2$

$$= \frac{1}{2}\left[\frac{(\sqrt{2 + \sqrt{2}})a}{\sqrt{2}}\right]^2 = \frac{(2 + \sqrt{2})a^2}{4}$$

Therefore area of all the 8 triangles

$$= 8 \times \left[\frac{(2 + \sqrt{2})a^2}{4}\right] = 2(2 + \sqrt{2})a^2$$

$$= \sqrt{2}[2(1 + \sqrt{2})a^2] = 8\sqrt{2}$$

Thus, the area of the outer octagon

$$= 16 + 8\sqrt{2} = 8(2 + \sqrt{2}) \text{ cm}^2$$

116 Look at the following figures. The central angle of the regular decagon is always 36°.

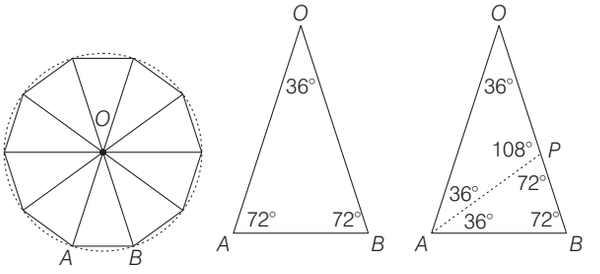


Fig (i) Fig (ii) Fig (iii)

Then we will have 10 isosceles triangles which are congruent and their common vertex is the circumcentre of the decagon.

Now, look at the fig (iii) $AB = AP = OP = 2$ cm

If $PB = x$, $OA = OB = (2 + x)$ cm

But since ΔAOB is similar to ΔBAP, therefore we have

$$\frac{OA}{AB} = \frac{AB}{BP}$$

$$\Rightarrow \qquad \frac{2 + x}{2} = \frac{2}{x}$$

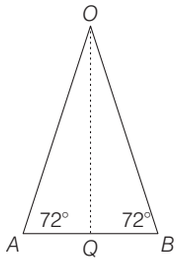
$$\Rightarrow \qquad x = \sqrt{5} - 1 \text{ cm}$$

$$\therefore \qquad OA = OB = 2 + x$$

$$\Rightarrow \qquad OA = 1 + \sqrt{5} \text{ cm}$$

Hence choice (a) is the correct one.

117 Since the ΔAOB is symmetrical, therefore the perpendicular OQ bisects AB such that $AQ = BQ$



Now, using Pythagoras theorem in ΔAOQ we get

$$OQ = \sqrt{OA^2 - AQ^2}$$

From the previous solution we know that $OA = 1 + \sqrt{5}$ cm, therefore

$$OQ = \sqrt{(1+\sqrt{5})^2 - (1)^2} = \sqrt{5 + 2\sqrt{5}} \text{ cm.}$$

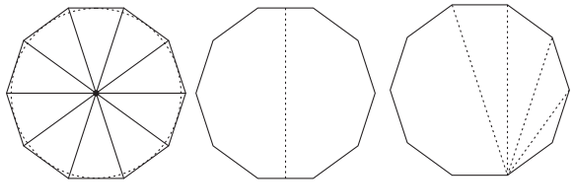
Hence choice (a) is the correct one.

118 Look carefully at the fig (i) in the earlier solutions and you will find that the longest diagonal = 2× circumradius

$$= 2(1 + \sqrt{5}) \text{ cm}$$

Hence choice (d) is the correct one.

119 From the following figures, it is obvious that the second longest diagonal is exactly double the length of the apothem of the decagon.

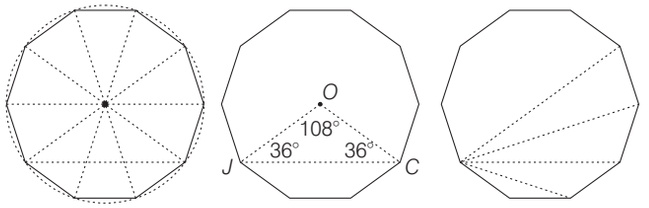


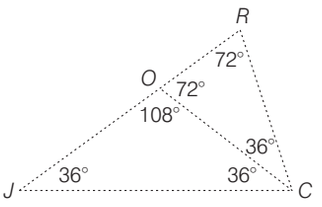
Therefore, the second longest diagonal = 2× apothem

$$= 2\sqrt{5 + 2\sqrt{5}} \text{ cm}$$

Hence choice (b) is the correct one.

120 From the following figures, it is obvious that the third longest diagonal is equal to the longer side of the triangle OJC, which is formed by connecting the two vertices and the centre of the decagon as shown below.





Now, let us consider $JO = r$ and $RO = m$, therefore, $JR = r + m$ and $JO = OC = RC = r$

But, since ΔJRC and ΔCOR are similar, so we have

$$\frac{JR}{RC} = \frac{RC}{RO}$$

$$\Rightarrow \quad \frac{r+m}{r} = \frac{r}{m}$$

$$\Rightarrow \quad m^2 + rm - r^2 = 0$$

As, we know that $r = 1 + \sqrt{5}$ cm, therefore

$$m^2 + rm - r^2 = 0$$

$$\Rightarrow \quad m^2 + (1+\sqrt{5})m - (1+\sqrt{5})^2 = 0$$

$$\Rightarrow \quad m = 2$$

$$\therefore \quad JR = JC = r + m = 3 + \sqrt{5} \text{ cm}$$

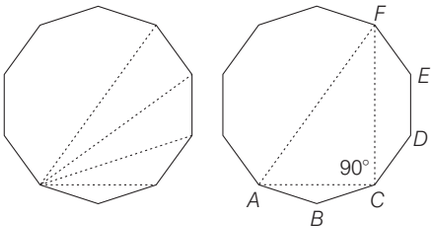
Hence choice (c) is the correct one.

121 From the following figures let's figure out all the pertinent angles.

$$\angle ACB = \angle CAB = 18°$$

And, $$\angle FCD = \angle EFC = 36°$$

$$\therefore \quad \angle ACF = 90°$$



Otherwise, if you observe that AF acts as a diameter and vertex C falls on the circumference of the circle, so angle ACF will be a right angle.

Since each side of the decagon is 2 cm, so the longest diagonal $AF = 2 + 2\sqrt{5}$ cm and the third longest diagonal $CF = 3 + \sqrt{5}$ cm.

Now, as triangle ACF is right one, so the required shortest diagonal

$$AC = \sqrt{AF^2 - CF^2}$$

$$= \sqrt{(2+2\sqrt{5})^2 - (3+\sqrt{5})^2} = \sqrt{10 + 2\sqrt{5}} \text{ cm}$$

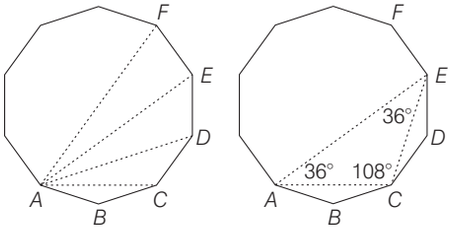
Hence choice (a) is the correct one.

Alternatively From the following figures let's figure out all the pertinent angles.

$$\angle ACB = \angle CAB = \angle ECD = \angle CED = 18°$$

$$\therefore \quad \angle ACE = 108°$$

Since $AC = CE$, therefore triangle ACE is an isosceles triangle.



Since each side of the octagon is 2 cm, so the second longest diagonal

$$AE = 2\sqrt{5+2\sqrt{5}} \text{ cm}$$

Now, using the 36-36-108 degree theorem in triangle ACE, we have

$$\frac{AE}{AC} = \frac{1+\sqrt{5}}{2} \Rightarrow \frac{2\sqrt{5+\sqrt{5}}}{AC} = \frac{1+\sqrt{5}}{2}$$

$$\Rightarrow \quad AC = \frac{4(\sqrt{5+2\sqrt{5}})}{1+\sqrt{5}} = (\sqrt{5+2\sqrt{5}})(\sqrt{5}-1)$$

$$\Rightarrow \quad AC = \sqrt{(5+2\sqrt{5})(\sqrt{5}-1)(\sqrt{5}-1)}$$

$$= \sqrt{10+2\sqrt{5}}$$

Therefore, the required shortest diagonal = $\sqrt{10+2\sqrt{5}}$ cm

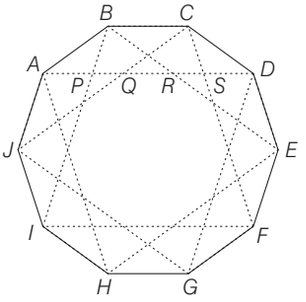
122 In the quadrilateral $ABCD$,

$$\angle ABC = \angle BCD = 144°$$

so the $\angle BAD = \angle CDA = 36°$

By extending this logic, we can say that $ABCQ$ is a rhombus, where $\angle BAQ = \angle BCQ = 36°$ and $\angle ABC = \angle AQC = 144°$.

That means $AQ = CQ = BC = AB = 2$ cm.



Since $ABCD$ is a paralleogram, $BC \| AD$. Therefore,

$$\angle BRA = \angle CBR = 36°$$

Therefore in ΔABR, $\angle BAR = \angle BRA = 36°$

and $\angle ABR = 108°$.

Now in ΔABR, we can apply 36°-72°-36° theorem.

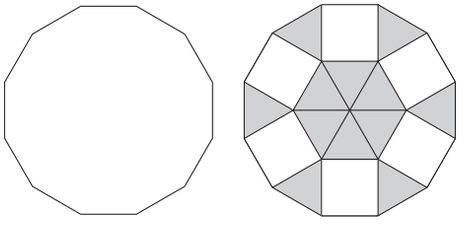
$$\therefore \quad AR = \frac{(1+\sqrt{5})}{2} AB$$

$$\Rightarrow \quad AR = 1+\sqrt{5}$$

Thus, $QR = AR - AQ = (1+\sqrt{5}) - 2 = \sqrt{5}-1$

Hence choice (c) is the correct one.

123 The given dodecagon can be partitioned into 12 congruent equilateral triangles and 6 congruent squares as shown below,



The area of each equilateral triangle

$$= \frac{\sqrt{3}}{4} \times 1^2 = \frac{\sqrt{3}}{4} \text{ sq cm.}$$

And, the area of each square = $1^2 = 1$ sq cm

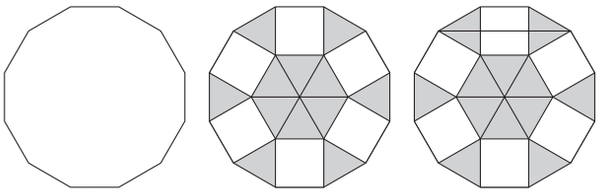
Therefore, the required total area of dodecagon

$$= 12 \times \frac{\sqrt{3}}{4} + 6 \times 1 = (3\sqrt{3}+6) \text{ sq cm}$$

Hence choice (b) is the correct one.

124 The given dodecagon can be partitioned into 12 congruent equilateral triangles and 6 congruent squares as shown below.

Now, the length of the second smallest diagonal = (2 × height of the equilateral triangle) + (side of the square)



The height of each equilateral triangle

$$= \frac{\sqrt{3}}{2} \times 1 = \frac{\sqrt{3}}{2} \text{ cm}$$

And, the side of each square = 1 cm.

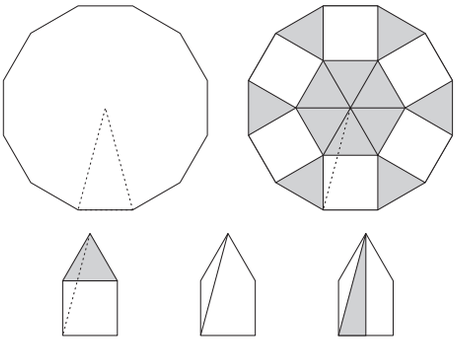
Therefore, the required total length of the diagonal

$$= 2 \times \frac{\sqrt{3}}{2} + 1 = (\sqrt{3}+1) \text{ cm}$$

Hence choice (b) is the correct one.

125 The given dodecagon can be partitioned into 12 congruent equilateral triangles and 6 congruent squares as shown below.

Now, from the following figures the length of the circumradius = length of the diagonal of the pentagon.



The length of the diagonal of the pentagon

$$= \sqrt{\left(\frac{1}{2}\right)^2 + \left(1+\frac{\sqrt{3}}{2}\right)^2} = \sqrt{2+\sqrt{3}}$$

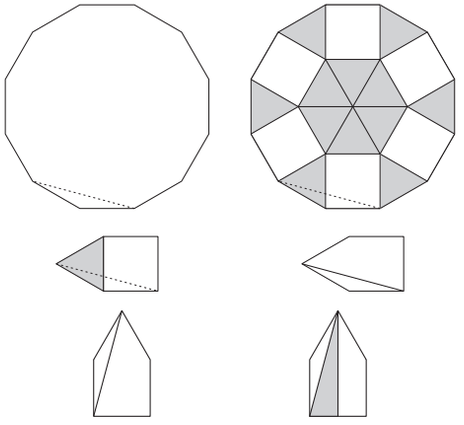
And, the side of each square = 1 cm

Therefore, the required total length of the circumradius = $\sqrt{2+\sqrt{3}}$ cm

Hence choice (a) is the correct one.

126 The given dodecagon can be partitioned into 12 congruent equilateral triangles and 6 congruent squares as shown below.

Now, from the following figures the length of the smallest diagonal = length of the diagonal of the pentagon.



The length of the diagonal of the pentagon

$$= \sqrt{\left(\frac{1}{2}\right)^2 + \left(1 + \frac{\sqrt{3}}{2}\right)^2}$$

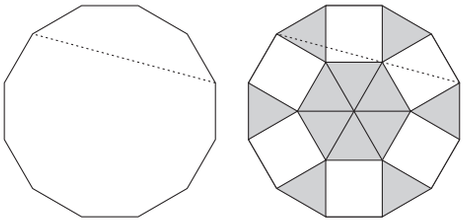
$$= \sqrt{2 + \sqrt{3}}$$

Therefore, the required total length of the diagonal

$$= (\sqrt{2 + \sqrt{3}})\ \text{cm}$$

Hence choice (a) is the correct one.

127 The given dodecagon can be partitioned into 12 congruent equilateral triangles and 6 congruent squares as shown below. Now, from the following figures the length of the third smallest diagonal = length of the diagonal of the pentagon + length of the diagonal of the square.



The length of the diagonal of the pentagon

$$= \sqrt{\left(\frac{1}{2}\right)^2 + \left(1 + \frac{\sqrt{3}}{2}\right)^2}$$

$$= \sqrt{2 + \sqrt{3}}$$

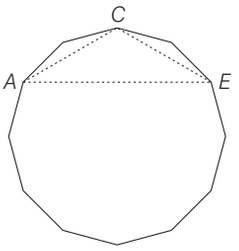
And, the length of the diagonal of square = $\sqrt{2}$

Therefore, the required total length of the diagonal

$$= (\sqrt{2 + \sqrt{3}}) + \sqrt{2}\ \text{cm}$$

Hence choice (d) is the correct one.

Alternatively In the following diagram of a regular dodecagon $\angle ACE = 120°$ and $\angle CAE = \angle CEA = 30°$



Since each side of the dodecagon is 1 cm, so the smallest diagonal will be $\sqrt{2 + \sqrt{3}}$ cm. That is

$AC = CE = \sqrt{2 + \sqrt{3}}$ cm.

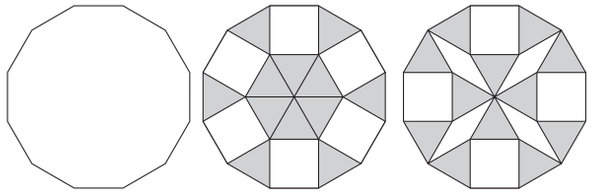
Therefore, using 30-30-120 degree theorem in ΔACE, we have $AE = \sqrt{3}(\sqrt{2 + \sqrt{3}})$

128 Look at the following figures carefully. Area of each dodecagon is same.

From the fig (ii) it is clear that the total area of the dodecagon = area of 12 equilateral triangles + area of 6 squares.

But, from fig (iii), the area of the dodecagon = area of 12 equilateral triangles + area of 4 squares + area of 4 kites

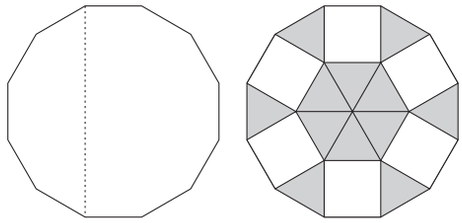
Thereore, area of 4 kites = area of 2 squares = 2 sq cm



Hence choice (a) is the correct one.

129 The given dodecagon can be partitioned into 12 congruent equilateral triangles and 6 congruent squares as shown below.

Now, from the following figures the length of the second longest diagonal = $2\times$ length of the side of the square + $2\times$ height of the equilateral triangle



The length of the diagonal of the dodecagon

$$= 2\times 1 + 2\times\frac{\sqrt{3}}{2}$$

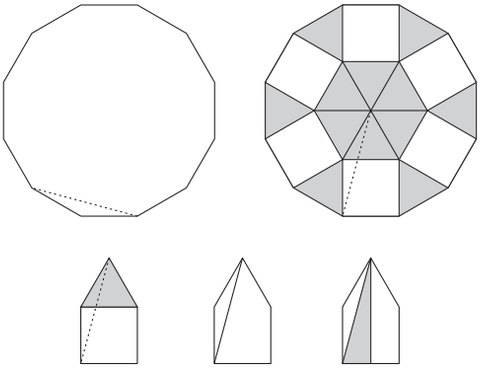
Therefore, the required total length of the diagonal

$$= 2 + \sqrt{3}\ \text{cm}$$

Hence choice (c) is the correct one.

130 The given dodecagon can be partitioned into 12 congruent equilateral triangles and 6 congruent squares as shown below.

Now, from the following figures the length of the circumradius = length of the diagonal of the pentagon.



The length of the diagonal of the pentagon

$$= \sqrt{\left(\frac{1}{2}\right)^2 + \left(1 + \frac{\sqrt{3}}{2}\right)^2} = \sqrt{2+\sqrt{3}}$$

Therefore, the total length of the circumradius

$$= \sqrt{2+\sqrt{3}} \text{ cm}$$

Thus, the required length of the longest diagonal

$= 2\times$ length of the circumradius $= 2\sqrt{2+\sqrt{3}}$ cm

Hence (a) is the correct one.

131 Given that the perimeter of the figure is 24 cm, so each side of the each rhombus would be 1 cm. Fig (ii) shows the perimeter of the fig (i)

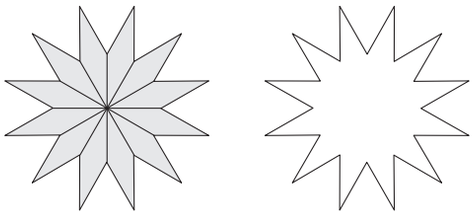


Fig (i) Fig (ii)

Now, when you connect all the outer (disjoint) vertices of the given figure you will get a regular dodecagon and each side of the dodecagon would be 1 cm, as there would be 12 equilateral triangles formed along the edge of the dodecagon.

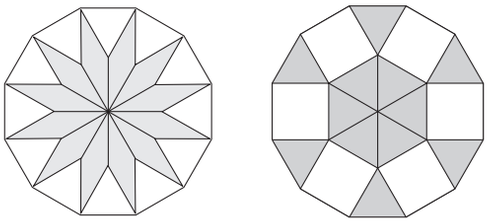

Fig (i) Fig (ii)

Now, consider fig (iii) and fig (iv); each of them has equal area.

However, dodecagon in fig (iii) has 12 equilateral triangles and 12 rhombi.

And, dodecagon in fig (iv) has 12 equilateral triangles and 6 squares.

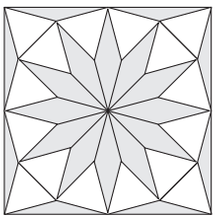
That means the area of 12 rhombi in fig (iii) is same as the total area of the 6 squares in fig (iv)

Therefore, the required area of 12 rhombi = total area of 6 squares = 6 sq cm

Hence choice (a) is the correct one.

132 From the following figure, it can be seen that the dodecagon consists of 12 equilateral triangles and 12 rhombi

And the square consists of 16 equilateral triangles and 16 rhombi.



Therefore, the required ratio

$$= \frac{12 \text{ (equilateral triangles + rhombi)}}{16 \text{ (equilateral triangles + rhombi)}} = \frac{3}{4}$$

Hence choice (a) is the correct one.

Hint : There are 8 isosceles triangles between the dodecagon and the square. These 8 triangles form the 4 rhombi. And each such rhombus is congruent with the each of the rhombi inside the dodecagon .

133 The inner dodecagon consists of 12 equilateral triangles and 12 rhombi, while the external consists of 48 equilateral triangles and 48 rhombi

Therefore, the required ratio

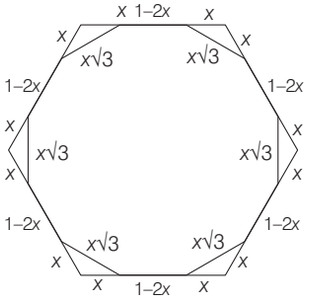
$$= \frac{12 \text{ (equilateral triangles + rhombi)}}{48 \text{ (equilateral triangles + rhombi)}} = \frac{1}{4}$$

Hence choice (b) is the correct one.

134 Let x be the length that you have to cut off from each corner, then the length of each side of hexagon = 1

The length of each side of the dodecagon

$$= 1 - (x + x) = 1 - 2x$$



But, from the corner triangle which is an isosceles triangle with the angles 30°, 30, 120° , you can determine that the third side of the corner triangle is $x\sqrt{3}$.

However, you can observe that the third (longer) side of the corner triangle is same as the side of the dodecagon.

Therefore, $x\sqrt{3} = 1 - 2x$

$\Rightarrow \quad (2+\sqrt{3})x = 1$

$\Rightarrow \quad x = \dfrac{1}{2+\sqrt{3}}$

$\Rightarrow \quad x = \dfrac{1}{2+\sqrt{3}} \times \dfrac{2-\sqrt{3}}{2-\sqrt{3}}$

$\Rightarrow \quad x = 2-\sqrt{3}$

Now, the total area to be cut off = 6 isosceles triangles

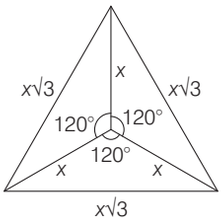
$= 2$ equilateral triangles of side $x\sqrt{3}$

$= 2 \times \dfrac{\sqrt{3}}{4} \times (x\sqrt{3})^2 = \dfrac{3\sqrt{3}}{2} x^2$

$= \dfrac{3\sqrt{3}}{2}(2-\sqrt{3})^2 = \dfrac{21\sqrt{3}}{2} - 18$

Hence choice (b) is the correct one.

NOTE When you join 3 isosceles triangles, which are congruent, whose 1 angle is 120°, you get an equilateral triangle, as depicted below.

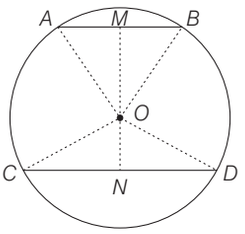


135 Since the distance between the two parallel chords is greater than the radius, so the chords will be lying on the opposite sides of the centre.

Therefore, $\dfrac{\pi}{k} < \pi \Rightarrow k > 1$

And $\dfrac{2\pi}{k} < \pi \Rightarrow k > 2$

Thus you can conclude that choices (a) and (b) are out of consideration.



In the given figure,

$$\angle AOB = \frac{\pi}{k}$$

and $$\angle COD = \frac{2\pi}{k}.$$

Now, if you consider choice (c), that is $k = 3$, then

$$\angle AOB = \frac{\pi}{k} = 60°$$

and $$\angle COD = \frac{2\pi}{k} = 120°$$

Therefore $\angle AOB = \angle OAB = \angle OBA = 60°$, so $OM = \sqrt{3}$

And $\angle CON = 60°$

$\angle OCN = 30°$, $\angle ONC = 90°$, so using 30-60-90 degree theorem we get $ON = 1$.

Therefore $MN = OM + ON = \sqrt{3} + 1$

It implies that $k = 3$ is the valid answer. So

$$\lfloor k \rfloor = \lfloor 3 \rfloor = 3.$$

Hence choice (c) is the correct one.

Alternatively

$$2\cos\frac{\pi}{2k} + 2\cos\frac{\pi}{k} = \sqrt{3} + 1$$

Let $\dfrac{\pi}{2k} = \theta$, Therefore

$$2\cos\theta + 2\cos 2\theta = \sqrt{3} + 1$$

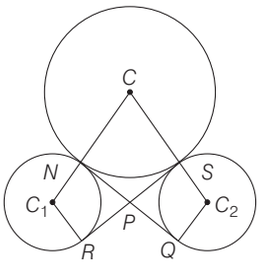
$\Rightarrow \quad 2\cos\theta + 2(2\cos^2\theta - 1) = \sqrt{3} + 1$

$\Rightarrow \quad \cos\theta = \dfrac{-1 \pm (2\sqrt{3}+1)}{4}$

$\Rightarrow \quad \cos\theta = \dfrac{\sqrt{3}}{2} \Rightarrow \theta = \dfrac{\pi}{6}$

$\Rightarrow \quad \dfrac{\pi}{2k} = \dfrac{\pi}{6} \Rightarrow k = 3$

136 Consider the following diagram with three distinct circles as shown below.



Since NQ an RS are tangents, so we have

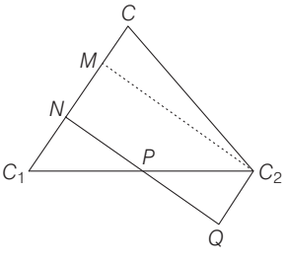
$$\angle C_1NQ = \angle CNQ = \angle C_2SR = \angle CSR$$
$$= \angle C_1RS = \angle C_2QN = 90°$$

And, $C_1N = C_1R = C_2S = C_2Q = 1$

And, $C_1P = C_2P = 3$

$\therefore \quad PN = PR = PS = PQ = \sqrt{3^2 - 1^2} = \sqrt{8}$

Now, look at the following figure.



Now, let's draw a line C_2M parallel to NQ, then

$$\angle C_2MC = 90°$$

Therefore, $MN = C_2Q = 1$.

Let r be the radius of circle C, then

$$MC_2 = \sqrt{(CC_2)^2 - (CM)^2}$$

$\Rightarrow \quad 2\sqrt{8} = \sqrt{(r+1)^2 - (r-1)^2} \Rightarrow r = 8$

Hence choice (a) is the correct one.

NOTE $MC_2 = NQ = NP + NQ = \sqrt{8} + \sqrt{8} = 2\sqrt{8}$

And, $CC_2 = CS + SC_2 = r + 1$

Similarly, $CM = CN - MN = r - 1$

137 Since P, Q, S and R are concyclic, we have $\angle P = \angle R$ and $\angle Q = \angle S$.

Also, $\angle P = \angle S$ and $\angle Q = \angle R$, as $PQ \,||\, RS$.

It implies that $\angle P = \angle Q = \angle R = \angle S$.

Now, $\angle P = \angle Q = \angle O = 180°$

But, since $PQ > OP$, we have $\angle P = \angle Q < \angle O$.

$\therefore \quad \angle P + \angle Q + \angle O = 180°$

$\Rightarrow \quad 2(\angle P) + \angle O = 180°$

$\Rightarrow \quad 2(\angle P) + \angle P < 180°$

$\Rightarrow \quad 3(\angle P) < 180°$

$\Rightarrow \quad \angle P < 60° \Rightarrow \angle P \leq 59°$

Hence choice (c) is the correct one.

138 Since BR and QR are the two tangents from a common point R to the same circle, therefore $BR = QR$

Now, since OB and OQ are the two radii of the same circle, therefore

$$OB = OQ$$

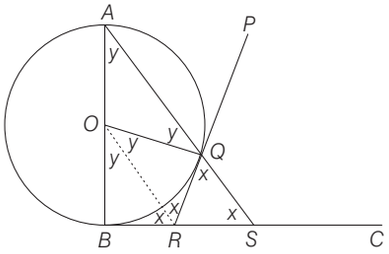
Thus, the quadrilateral $OBRQ$ is a kite.

$\therefore \quad \angle BOQ = 2(\angle BOR) = 2y$ (say)

further, $\angle BOQ = 2(\angle BAQ) = 2y$

$\Rightarrow \quad \angle BOR = \angle BAQ$

It implies that $OR \,||\, AQ$



That means $\angle ORB = \angle ASB = \angle QSR = x$ (say)

Then, $\angle RQS = \angle ORQ = \angle ORB = x$

$\therefore \quad \angle RQS = \angle QSR = x$

It implies that $RQ = RS$. Even $BR = RQ$, therefore $BR = RS$

Hence choice (b) is the correct one.

139 Since AB is parallel to CD , so we have

$$\frac{OP}{OS} = \frac{OQ}{OC} = \frac{8}{17}$$

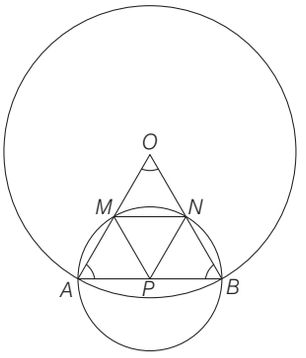
But, $OR = OC = 17$

It implies that $\dfrac{OQ}{OR} = \dfrac{8}{17}$

But, we have $\dfrac{OC}{OT} = \dfrac{OQ}{OR} = \dfrac{8}{17}$

Hence choice (d) is the correct one.

140 Triangle OAB is an equilateral triangle. Now consider the centre P of the smaller circle and join PM, PN and MN. Thus we see that the area of triangle OAB is divided into four equal parts.



The area of sector $PMN = \dfrac{1}{6}\pi(6)^2 = 6\pi$ sq. cm

Area of ΔAMP = Area of

$$\Delta PNB = \frac{\sqrt{3}}{4}(6)^2 = 9\sqrt{3} \text{ sq. cm}$$

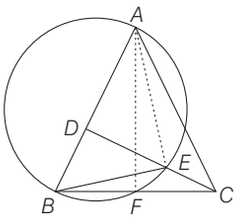
Total shaded area

$$= 6\pi + 2(9\sqrt{3}) = 6(\pi + 3\sqrt{3}) \text{ sq. cm}$$

Hence choice (a) is the correct one.

141 First of all join A to F. Now, you can see $\angle AFB = 90°$, as its an angle in a semicircle. That means AF is perpendicular on BC . But, since $AB = AC$, therefore AF will bisect BC. That is

$BF = CF = \dfrac{2\sqrt{2}}{2} = \sqrt{2}$ cm.



Now, ΔAEB is also a right angle triangle as $\angle AEB = 90°$.

And, thus ΔDEB and ΔEAB are similar. Therefore,

$$\frac{BE}{BD} = \frac{AB}{BE}$$

$\Rightarrow \quad BE^2 = (BD)(AB)$

But since ΔAFB and ΔCDB are similar, we have

$$\frac{BD}{BC} = \frac{BF}{AB}$$

$\Rightarrow \quad \dfrac{BD}{BC} = \dfrac{\left(\dfrac{BC}{2}\right)}{AB}$

$\Rightarrow \quad BC^2 = 2(BD)(AB)$

From eqs. (i) and (ii), we have

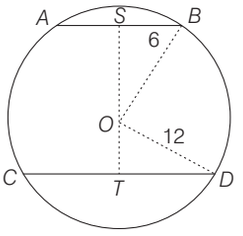
$$BC^2 = 2BE^2$$

$\Rightarrow \quad BE^2 = \dfrac{BC^2}{2} = \dfrac{(2\sqrt{2})^2}{2} = 4$

$\Rightarrow \quad BE = 2$ cm

Hence choice (a) is the correct one.

142 Consider the following figure (i) in which let us assume that the radius is r. That is $OB = OD = r$, where O is the centre of the circle. As the chords AB and CD are parallel so the line passing through the centre of the circle will be perpendicular bisector of these chords. That is $AS = SB = 6$ and $CT = TD = 12$ and $\angle OSB = 90°$ and $\angle OTD = 90°$.



Now, using Pythagoras theorem in ΔOSB, we have

$$OB^2 = OS^2 + SB^2$$

$$\Rightarrow \quad r^2 = x^2 + 6^2 \qquad \ldots(i)$$

Similarly, using Pythagoras theorem in ΔOTD, we have

$$OD^2 = OT^2 + TD^2$$

$$\Rightarrow \quad r^2 = (18 - x)^2 + 12^2 \qquad \ldots(ii)$$

Now, comparing the eq. (i) and eq. (ii), we get

$$x^2 + 6^2 = (18 - x)^2 + 12^2$$

$$\Rightarrow \quad x = 12$$

$$\Rightarrow \quad OS = 12$$

and $$OT = 18 - 12 = 6$$

Now, substituting the value of x in eq. (i) or eq. (ii), we get the radius of the circle $r = 6\sqrt{5}$

Now, look at the figure (ii) in which $SM = MT = \frac{ST}{2} = 9$.

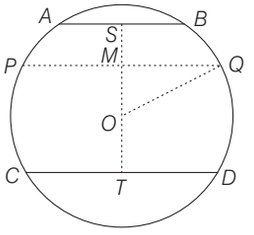
$$\therefore \quad OM = OS - SM = 12 - 9 = 3$$

Then by using Pythagoras theorem in ΔOMQ,

we get $$MQ = \sqrt{OQ^2 - OM^2}$$

$$\Rightarrow \quad MQ = \sqrt{(6\sqrt{5})^2 + 3^2} \Rightarrow MQ = 3\sqrt{21}$$

$$\therefore \quad PQ = 6\sqrt{21}$$

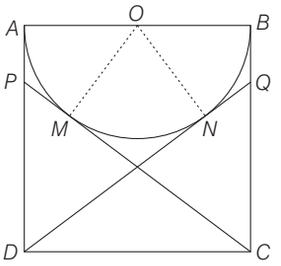


That is $$\sqrt{a} = 6\sqrt{21}$$

Therefore, $$a = 756$$

Hence choice (b) is the correct one.

143 Since, CP and DQ are tangents to the circle, so if O is the centre of the semi circle, then the two radii OM and ON will be perpendicular to CP and DQ, respectively, as shown in the diagram.



As DA and DN are the common tangents to the same circle, so $DA = DN = 4$ cm. Similarly, $CB = CM = 4$ cm.

Further, PA and PM are the common tangents to the same circle, so $PA = PM = x$ cm. Similarly, $BQ = NQ = x$ cm.

Now, $$DQ^2 = DC^2 + CQ^2$$

or $$(DN + NQ)^2 = DC^2 + (BC - BQ)^2$$

or $$(4 + x)^2 = 4^2 + (4 - x)^2$$

or $$x = 1 \text{ cm}.$$

It implies, $AP = BQ = 1$ cm and $DP = CQ = 3$ cm.

Now, the area of $\Delta DRC = \frac{1}{4}$ area of rectangle $PQCD$

$$= \frac{1}{4}(4 \times 3) = 3 \text{ sq. cm.}$$

Hence choice (a) is the correct one.

Alternatively Go through options.

Choice (d): If area of triangle $DRC = 5$, then area of rectangle $PQCD = 4 \times 5 = 20$ sq cm. Since area of rectangle $PQCD$ is greater than the area of square $ABCD$, so it's an invalid choice.

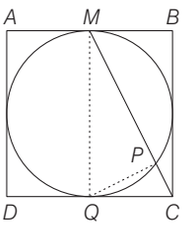
Choice (a) : If area of triangle $DRC = 3$, then area of rectangle $PQCD = 4 \times 3 = 12$ sq cm. It implies that $CQ = 3$ cm and $BQ = 1$ cm.

Now, since $BQ = NQ = 1$ cm, therefore

$$DQ = DN + NQ = 5 \text{ cm as } DN = AD = 4 \text{ cm}.$$

As, $DQ^2 = DC^2 + CQ^2$, therefore the presumed choice (a) is valid one. However, when you consider the values of choices (b) and (c), the pythagorean relation between DC, QC and DQ can't be satisfied.

144 First of all drop a perpendicular MQ on CD. Now, join PQ, then PQ will be perpendicular to MC, as angle MPQ is an angle in a semicircle.



Since $QC = 40$ mm and $MQ = 80$ mm

$$\therefore \quad MC = 40\sqrt{5} \text{ mm}$$

Now, using the similarity of triangles in ΔMPQ and MQC, we get

$$\frac{MP}{MQ} = \frac{MQ}{MC}$$

$$\Rightarrow \quad \frac{MP}{80} = \frac{80}{40\sqrt{5}} \Rightarrow MP = 32\sqrt{5}$$

$$PC = MC - MP = 40\sqrt{5} - 32\sqrt{5}$$

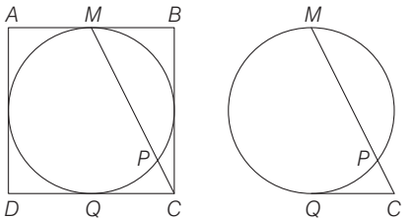
$$= (40 - 32)\sqrt{5} = 8\sqrt{5}$$

Hence choice (a) is the correct answer.

Alternatively In the following figure, you can use the "power of a point theorem" as shown below

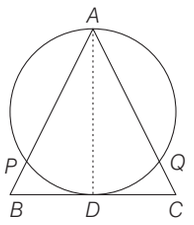
$$MC \times PC = QC^2$$

$$\Rightarrow \quad 40\sqrt{5} \times PC = 40^2 \quad \Rightarrow PC = 8\sqrt{5}$$



145 In the following figure, $\angle BAD = \angle DAC = 30°$ and $\angle ABD = \angle ACD = 60°$.

Now, using 30-60-90 degree theorem (or Pythagoras theorem) in ΔADC we have $DC = 10$ cm and $AC = 20$ cm



Now, using Power of a point theorem in the above figure, we have $AC \times QC = DC^2$

$$\Rightarrow \quad 20 \times QC = 10^2 \Rightarrow QC = 5\,\text{cm}$$

Hence choice (d) is is the correct answer.

146 Consider the figure (i). Using the 30-60-90 degree theorem (or sine rule) in ΔADC we get $AD = 12\sqrt{2}$, $CD = 4\sqrt{6}$ and $AC = 8\sqrt{6}$.

Therefore, area of triangle $ABC = 96\sqrt{3}$ sq cm.

$$(\Delta ABC = \frac{\sqrt{3}}{4} \times (8\sqrt{6})^2 = 96\sqrt{3}$$

or $$\Delta ABC = \frac{1}{2} \times 8\sqrt{6} \times 12\sqrt{2} = 96\sqrt{3})$$

Now, since the radius of the circle

$$= \frac{1}{2} \times AD = 6\sqrt{2}\,\text{cm}$$

Therefore, area of the circle $= \pi(6\sqrt{2})^2 = 72\pi$

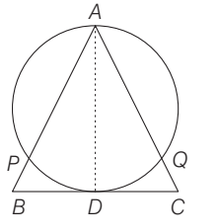


Fig (i)

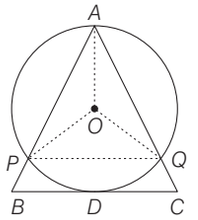

Fig (ii)

Now, consider the figure (ii). In the ΔPAQ, $\angle PAQ = 60°$, so $\angle POQ = 120°$, as both the angles are formed by the same chord (PQ) on the same side of PQ, whereas one is the inscribed angle and other one is the central angle.

Further, since $AP = AQ$,

$$\therefore \quad \angle APQ = \angle AQP = 60°$$

Now, since $\angle APQ = \angle AQP = \angle PAQ = 60°$, therefore triangle PAQ is an equilateral triangle.

(There are many ways to prove that $AP = AQ$. One approach is to observe that there is an obvious symmetricity. And the other approach is to prove that $BP = CQ$ by applying Power of a Point theorem; since $BD = DC$ and $AB = AC$ therefore $BP = CQ$.)

Now, the side of the equilateral triangle PAQ is $6\sqrt{6}$ cm.

(To know that how you can find the side of triangle PAQ please refer the HINT at the end of the solution.)

Now, the area of triangle $PAQ = 54\sqrt{3}$

$$(\Delta PAQ = \frac{\sqrt{3}}{4} \times (6\sqrt{6})^2 = 54\sqrt{3}$$

or $$\Delta PAQ = \frac{1}{2} \times 6\sqrt{6} \times 9\sqrt{2} = 54\sqrt{3})$$

Now, consider the figure (iii), in which the area of common (or unshaded) region

= area of ($\Delta AOP + \Delta AOQ$) + area of the sector $POQD$

$$= \frac{2}{3} \text{ of area of triangle } APQ + \frac{1}{3} \text{ of area of the circle}$$

$$= \frac{2}{3} \times 54\sqrt{3} + \frac{1}{3} \times 72\pi = 36\sqrt{3} + 24\pi$$

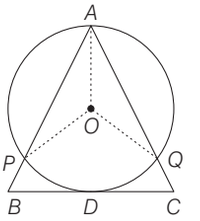

Fig (iii)

Thus, total area of the shaded region

= [total area of the circle – total area of the unshaded (or common) region] + [total area of the triangle ABC – total area of the unshaded (or common) region]

$$= [72\pi - (36\sqrt{3} + 24\pi)] + [96\sqrt{3} - (36\sqrt{3} + 24\pi)]$$

$$= 24(\pi + \sqrt{3})$$

Hence choice (a) is the correct answer.

Hint How to find the side of triangle PAQ ?

Method 1 : Consider the figure (iv), in which you can apply Power of Point theorem, as shown below.

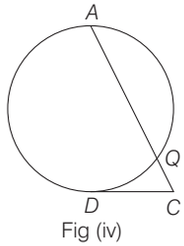

Fig (iv)

$$CA \times CQ = CD^2$$

$$\Rightarrow \quad 8\sqrt{6} \times CQ = (4\sqrt{6})^2$$

$$\Rightarrow \quad CQ = 2\sqrt{6}\,\text{cm}$$

$$\therefore \quad AQ = AC - QC$$

$$= 8\sqrt{6} - 2\sqrt{6} = 6\sqrt{6}\,\text{cm}$$

Method 2 : Consider the figure (v), in which you can use 30-60-90 degree theorem (or cosine rule) and you will get $AP = AQ = PQ = \sqrt{3}(6\sqrt{2}) = 6\sqrt{6}$ cm.

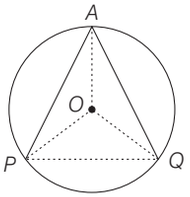

Fig (v)

Method 3 : Consider the figure (vi), in which AO has been extended to S to meet PQ.

Since $AO = 6\sqrt{2}$, so $OS = 3\sqrt{2}$ and $AS = 9\sqrt{2}$

(In an equilateral triangle inradius is always half of the circumradius of the same triangle. Here, OS is inradius and AO is circumradius of the triangle PAQ)

Now, using 30-60-90 degree theorem (or sine rule) you will have $AS = 9\sqrt{2}$, $SQ = 3\sqrt{6}$ and $AQ = 6\sqrt{6}$ cm.

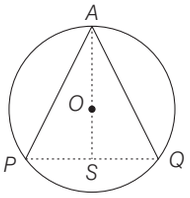

Fig. (vi)

Alternatively In the following figure, connect the centre O with P, Q and A.

Here, $\angle BAC = \angle PAQ = 60°$ and $AP = AQ$

Therefore, $\angle APQ = \angle AQP = 60°$.

That is, ΔAPQ is equilateral triangle. It implies that

$$AP = AQ = PQ.$$

Now, since $OA = OP = OQ$; ΔAOP, ΔAOQ and ΔPOQ are congruent.

Thus we have, $\angle AOP = \angle AOQ = \angle POQ = 120°$

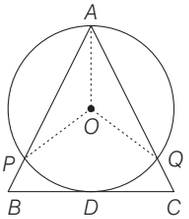

Fig (i)

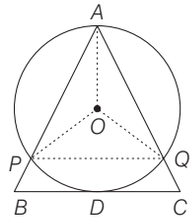

Fig (ii)

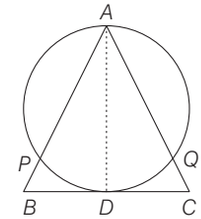

Fig (iii)

Now, area of the sector $POQD = \pi r^2 \times \dfrac{120}{360}$

$$= \frac{1}{3}\pi r^2 = \frac{1}{3}\pi(6\sqrt{2})^2 = 24\pi$$

And the area of $\Delta AOP = \Delta AOQ = \Delta POQ$

$$= \frac{1}{3}(\Delta PAQ) = \frac{1}{3} \times \frac{\sqrt{3}}{4} \times (6\sqrt{6})^2 = 18\sqrt{3}$$

Therefore, area of the total unshaded region

= area of $(\Delta AOP + \Delta AOQ)$ + area of the sector $POQD$

$= 2 \times (18\sqrt{3}) + 24\pi = 12(3\sqrt{3} + 2\pi)$

Now, the area of the shaded region in the circle

= total area of the circle – total area of the unshaded region

$= \pi(6\sqrt{2})^2 - 12(3\sqrt{3} + 2\pi) = 12(4\pi - 3\sqrt{3})$

And, the area of the shaded region in the triangle

= total area of the triangle ABC

– total area of the un-shaded region

$$= \frac{\sqrt{3}}{4} \times (8\sqrt{6})^2 - 12(3\sqrt{3} + 2\pi) = 12(5\sqrt{3} - 2\pi)$$

Therefore, the total area of the shaded region

$$= 12(4\pi - 3\sqrt{3}) + 12(5\sqrt{3} - 2\pi)$$

$$= 24(\pi + \sqrt{3}) \text{ sq cm}$$

NOTE Radius of the circle $= \dfrac{1}{2} \times AD$

$$= \frac{1}{2} \times 12\sqrt{2} = 6\sqrt{2} \text{ cm}$$

Now, since $OA = OP = OQ = 6\sqrt{2}$, therefore by using cosine rule or 30-30-120 degree theorem in triangles AOP or AOQ or POQ, we would have

$$AP = AQ = PQ = \sqrt{3}(6\sqrt{2}) = 6\sqrt{6} \text{ cm}$$

Otherwise, using Power of Point theorem, we would have

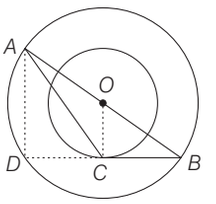
$$CA \times CQ = CD^2$$

And, in triangle ADC, using 30-60-90 degree theorem (or sine rule) we would have

$$AD = 12\sqrt{2}, CD = \frac{12\sqrt{2}}{\sqrt{3}} = 4\sqrt{6}$$

and $AC = 8\sqrt{6}$

147 First of all, extend BC to a point D on the larger circle and then join A with D and O with C. Now, since AB is the diamet er of the larger circle, so ΔADB is a right angle triangle and since BC is the tangent and OC is the radius of the smaller triangle, so ΔOCB is a right angle triangle.



Therefore, using Pythagoras theorem, you can have

$$BC = \sqrt{OB^2 - OC^2}$$

$$= \sqrt{29^2 - 21^2} = 20 \text{ cm}$$

However, both the triangles are similar ones, where

$$\frac{OB}{AB} = \frac{BC}{BD} = \frac{OC}{AD} = \frac{1}{2}$$

$\therefore$ $AB = 58$, $AD = 42$, $BD = 40$ and $CD = 20$ cm

Now, join AC, which will act as the hypotenuse of the right angle triangle ADC.

Therefore, by applying Pythagoras theorem in ΔADC, you can have

$$AC = \sqrt{AD^2 + CD^2} = \sqrt{42^2 + 20^2}$$

$$= 2\sqrt{541} = 46.52 \text{ cm}$$

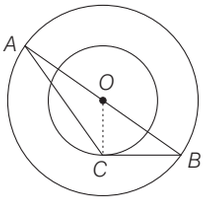
Hence choice (b) is the correct answer.

Alternatively First of all join OC, which is the median of ΔABC, as $AO = BO$. Also, ΔOCB is a right angle triangle.

Therefore, using Pythagoras theorem, you can have

$$BC = \sqrt{OB^2 - OC^2}$$

$$= \sqrt{29^2 - 21^2} = 20 \text{ cm}$$



Now, using Apollonius theorem in ΔABC, you can have

$$AC^2 + BC^2 = 2\left(OC^2 + \left(\frac{AB}{2}\right)^2\right)$$

$$\Rightarrow \quad AC^2 + 20^2 = 2(21^2 + 29^2)$$

$$\Rightarrow \quad AC^2 = 2164$$

$$\Rightarrow \quad AC = 46.52 \text{ cm}$$

148 The best way is to go through the options considering the fact that the maximum area of the circle is πr^2.

Choice (a) : Since $4r^2 > \pi r^2$, which is impossible, so this choice is invalid.

Choice (b) : Since d has no direct relationship with r, the radius of the circle, so d is interminable. Therefore we can not give the answer in terms of d alone. So, this choice is also an invalid one.

Choice (c) : If $r = d$, minimum area of the square $= r^3$.

For $r > 2$, $2r^2 < r^3$, which means maximum area is less than the minimum area.

So, it is again an invalid choice. Essentially, the maximum area can be obtained only when the quadrilateral is a square and the minimum area can be obtained only when the quadrilateral is a square and the minimum area can be obtained only when the quadrilateral is a kite with its longer diagonal equal to the diameter of the circle and the smaller diagonal equal to $2r\sqrt{r^2 - d^2}$.

Hence choice (d) is the correct answer.

149 Consider the following figure. Let C_1, C_2 and C_3 be the centres of these circles, as shown in the figure. Let $AB = DC_3 = x$

Therefore, $DC_3 = \sqrt{(C_1C_3)^2 - (DC_1)^2}$

$$\Rightarrow \quad x = \sqrt{(r_1 + r_3)^2 - (r_1 - r_3)^2}$$

$$\Rightarrow \quad x = 2\sqrt{r_1 r_3}$$

Now, let $BC = C_3E = y$

Therefore, $C_3E = \sqrt{(C_2C_3)^2 - (C_2E)^2}$

$$\Rightarrow \quad y = \sqrt{(r_2 + r_3)^2 - (r_2 - r_3)^2} \Rightarrow y = 2\sqrt{r_2 r_3}$$

Thus, $AC = x + y = 2\sqrt{r_1 r_3} + 2\sqrt{r_2 r_3}$

$$= 2(\sqrt{r_1 r_3} + \sqrt{r_2 r_3}) \quad \ldots(i)$$

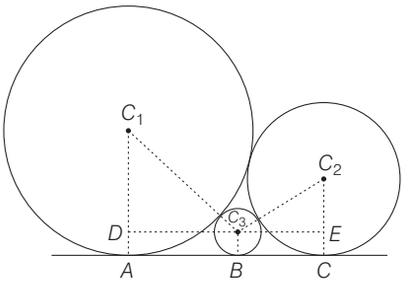


Fig (i)

Now, in the following figure (ii),

$$FC_2 = \sqrt{(C_1C_2)^2 - (FC_1)^2}$$

$$\Rightarrow \quad x + y = \sqrt{(r_1 + r_2)^2 - (r_1 - r_2)^2}$$

$$\Rightarrow \quad x + y = 2\sqrt{r_1 r_2} \quad \ldots(ii)$$

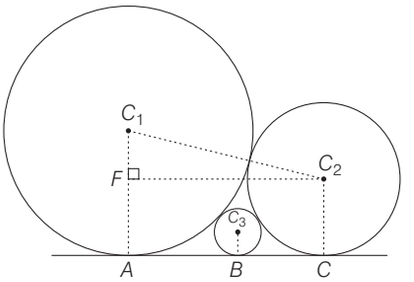

Fig (ii)

Now, comparing the equations (i) and (ii), we get

$$2(\sqrt{r_1 r_3} + \sqrt{r_2 r_3}) = 2\sqrt{r_1 r_2}$$

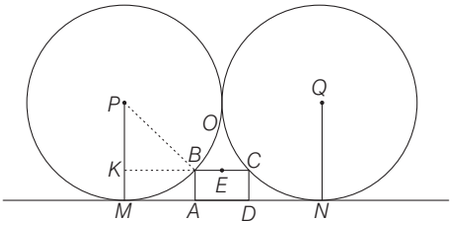
$$\Rightarrow \quad \frac{\sqrt{r_1 r_3}}{\sqrt{r_1 r_2}} + \frac{\sqrt{r_2 r_3}}{\sqrt{r_1 r_2}} = 1$$

$$\Rightarrow \quad \frac{\sqrt{r_3}}{\sqrt{r_2}} + \frac{\sqrt{r_3}}{\sqrt{r_1}} = 1$$

$$\Rightarrow \quad \frac{1}{\sqrt{r_2}} + \frac{1}{\sqrt{r_1}} = \frac{1}{\sqrt{r_3}}$$

Hence choice (c) is the correct one.

150 Draw a line KB making it collinear with BC, such that K falls on PM. Looking at the information we can say that and $PK = PM - KM$ and $KB = KE - BE$, $PK^2 + KB^2 = PB^2$



$$\Rightarrow \quad (r - x)^2 + \left(r - \frac{x}{2}\right)^2 = r^2$$

$$\Rightarrow \quad 5x^2 - 12rx + 4r^2 = 0 \Rightarrow x = 0.4\,r$$

Hence choice (d) is the correct one.

151 The radius of circle $A = 1$ cm, so its curvature $= \frac{1}{1} = 1$

The radius of circle $B = \frac{1}{1}$ cm, so its curvature $= \frac{1}{1} = 1$

The radius of circle $C = \frac{1}{1}$ cm, so its curvature $= \frac{1}{1} = 1$

Now, using Descartes' circle equation theorem you will have

$$(a + b + c + d)^2 = 2(a^2 + b^2 + c^2 + d^2)$$

$$\Rightarrow \quad (1 + 1 + 1 + d)^2 = 2(1^2 + 1^2 + 1^2 + d^2)$$

$$\Rightarrow \quad (3 + d)^2 = 2(3 + d^2)$$

$$\Rightarrow \quad d^2 - 6d - 3 = 0 \Rightarrow d = 3 + 2\sqrt{3}$$

$\therefore$ Radius of circle $D = \frac{1}{3 + 2\sqrt{3}}$ cm

Hence choice (a) is the correct one.

Hint : To know how to obtain the value of d please refer Quadratic Equations in Quantum CAT.

152 The radius of circle $A = 1$ cm, so its curvature $= \frac{1}{1} = 1$

The radius of circle $B = \frac{1}{2}$ cm, so its curvature $= \frac{1}{\left(\frac{1}{2}\right)} = 2$

The radius of circle $C = \frac{1}{2}$ cm, so its curvature $= \frac{1}{\left(\frac{1}{2}\right)} = 2$

Now, using Descartes' circle equation theorem you will have

$$(a + b + c + d)^2 = 2((-a)^2 + b^2 + c^2 + d^2)$$

$$\therefore \quad (-1 + 2 + 2 + d)^2 = 2((-1)^2 + 2^2 + 2^2 + d^2)$$

$$\Rightarrow \quad (3 + d)^2 = 2(9 + d^2) \Rightarrow d^2 + 6d + 9 = 0$$

$$\Rightarrow \quad (d - 3)^2 = 0 \Rightarrow d = 3$$

$\therefore$ Radius of circle $D = \frac{1}{3}$ cm

Hence choice (b) is the correct one.

153 The radius of circle $P = 1$ cm, so its curvature $= \frac{1}{1} = 1$

The radius of circle $A = \frac{1}{2}$ cm, so its curvature $= \frac{1}{\frac{1}{2}} = 2$

The radius of circle $B = \frac{1}{2}$ cm, so its curvature $= \frac{1}{\frac{1}{2}} = 2$

Now, using Descartes's circle equation theorem you will have

$$(-p + a + b + c)^2 = 2((-p)^2 + a^2 + b^2 + c^2)$$

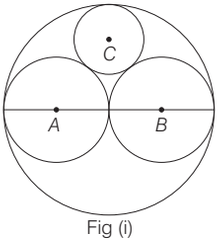


Fig (i)

$$\therefore \quad (-1 + 2 + 2 + c)^2 = 2((-1)^2 + 2^2 + 2^2 + c^2)$$

$$\Rightarrow \quad (3 + c)^2 = 2(9 + c^2)$$

$$\Rightarrow \quad c^2 + 6c + 9 = 0$$

$$\Rightarrow \quad (c - 3)^2 = 0 \Rightarrow c = 3$$

$\therefore$ Radius of circle $C = \frac{1}{3}$ cm

So the curvature of the circle $C = 3$.

Now, consider the fig (ii), in which all the four circles are tangent to each other.

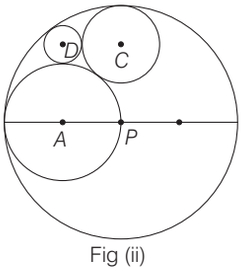

Fig (ii)

Now, using Descartes' circle equation theorem you will have

$$(-p + a + c + d)^2 = 2((-p)^2 + a^2 + c^2 + d^2)$$

$$\therefore \quad (-1 + 2 + 3 + d)^2 = 2((-1)^2 + 2^2 + 3^2 + d^2)$$

$$\Rightarrow \quad (4 + d)^2 = 2(14 + d^2)$$

$$\Rightarrow \quad d^2 - 8d + 12 = 0 \Rightarrow d = 6 \text{ or } 2$$

$\therefore$ Radius of circle $D = \frac{1}{6}$ cm or $\frac{1}{2}$ cm. But, since $\frac{1}{2}$ cm is the radius of circle A, so it has to be less than $\frac{1}{2}$, therefore, the required radius of circle $D = \frac{1}{6}$ cm.

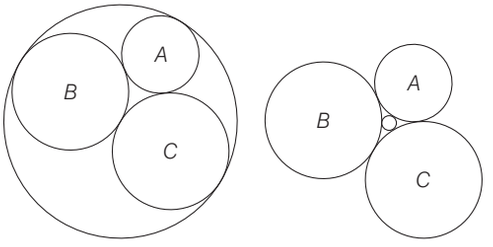
Hence choice (a) is the correct one.

154 From the statement given in the problem it is obvious that all the four circles are tangent to each other. Then, without any doubt, you can apply Descartes' circle theorem in order to get the radius of the circle.

Let a, b and c be the curvatures of the existing circles and d be the curvature of fourth circle, then

$$(a + b + c + d)^2 = 2(a^2 + b^2 + c^2 + d^2)$$

$$\therefore \quad \left(\frac{1}{1} + \frac{1}{2} + \frac{1}{3} + d\right)^2 = 2\left(\left(\frac{1}{1}\right) + \left(\frac{1}{2}\right)^2 + \left(\frac{1}{3}\right)^2 + d^2\right)$$



$$\Rightarrow \quad \left(\frac{11}{6} + d\right)^2 = 2\left(\frac{49}{36} + d^2\right)$$

$$\Rightarrow \quad 36d^2 - 132d - 23 = 0$$

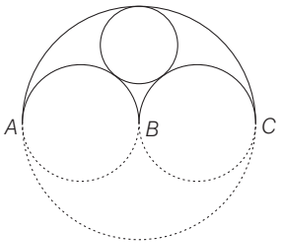
$$\Rightarrow \quad d = -\frac{1}{6} \text{ or } \frac{23}{6}$$

The minus sign indicates that the circle is externally tangent.

$\therefore$ Radius of circle $D = 6$ cm or $\frac{6}{23}$ cm.

Hence choice (d) is the correct one.

155 First of all, complete all the semicircles as shown in the following figure. Now, since all the four circles are tangent to each other, so you can apply the Descartes' circle theorem in order to get the radius of the desired circle.



Let radius of the circle of diameter AC be r_1,

then $r_1 = \frac{1}{2}$ cm

So the curvature of the concerned circle $a = -2$

(Since the circle is circumscribing, that's why minus sign is applied)

And, let radius of the circles of diameter AB be r_2, then

$r_2 = \frac{1}{6}$ cm

So the curvature of the concerned circle $AB = 6$

And, let radius of the circle of diameter BC be r_3, then

$r_3 = \frac{1}{3}$ cm

So the curvature of the concerned circle $BC = 3$

Let a, b and c be the curvatures of the semicircles and d be the curvature of desired circle, then

$$(a + b + c + d)^2 = 2(a^2 + b^2 + c^2 + d^2)$$

That is

$$(-2 + 6 + 3 + d)^2 = 2((-2)^2 + 6^2 + 3^2 + d^2)$$

$$\Rightarrow \quad (7 + d)^2 = 2(49 + d^2)$$

$$\Rightarrow \quad d^2 + 14d + 49 = 0$$

$$\Rightarrow \quad d = 7$$

$$\Rightarrow \quad r_4 = \frac{1}{7} \text{ cm}$$

Hence choice (a) is the correct one.

TEST OF LEARNING

1 Use cosine rule in the given triangle,

$$\cos C = \frac{a^2 + b^2 - c^2}{2ab}$$

$$\Rightarrow \quad \cos\frac{\pi}{6} = \frac{(x^2 + x + 1)^2 + (x^2 - 1)^2 - (2x + 1)^2}{2(x^2 + x + 1)(x^2 - 1)}$$

$$\Rightarrow \quad \frac{\sqrt{3}}{2} = \frac{2x^2 + 2x - 1}{2(x^2 + x + 1)}$$

$$\Rightarrow \quad x = (1 + \sqrt{3}), -(2 + \sqrt{3})$$

Hence choice (d) is the answer.

2 The roots will be real when discriminant $D \geq 0$. That is

$$[2(a + b + c)]^2 - 12\lambda(ab + bc + ac) \geq 0$$

$$\Rightarrow \quad (a + b + c)^2 \geq 3\lambda(ab + bc + ac)$$

$$\Rightarrow \quad a^2 + b^2 + c^2 + 2(ab + bc + ca) \geq 3\lambda(ab + bc + ac)$$

$$\Rightarrow \quad \frac{a^2 + b^2 + c^2 + 2(ab + bc + ca)}{3(ab + bc + ca)} \geq \lambda$$

$$\Rightarrow \quad \lambda \leq \frac{a^2 + b^2 + c^2}{3(ab + bc + ca)} + \frac{2}{3}$$

Now, using the fundamental property of existence of a triangle; the sum of any two sides of a triangle is always greater than the third side. So

$$a + b > c \Rightarrow |c - b| < a$$

$$\Rightarrow \quad b^2 + c^2 - 2bc < a^2 \qquad \ldots(i)$$

$$\Rightarrow \quad b + c > a \Rightarrow |a - c| < b$$

$$\Rightarrow \quad a^2 + c^2 - 2ac < b^2 \qquad \ldots(ii)$$

$$\Rightarrow \quad c + a > b \Rightarrow |b - a| < c$$

$$\Rightarrow \quad a^2 + b^2 - 2ab < c^2 \qquad \ldots(iii)$$

From eqs. (i), (ii) and (iii)

$$2(a^2 + b^2 + c^2) - 2(ab + bc + ca) < (a^2 + b^2 + c^2)$$

$$\Rightarrow \quad \frac{a^2 + b^2 + c^2}{(ab + bc + ca)} < 2$$

$$\Rightarrow \quad \frac{a^2 + b^2 + c^2}{3(ab + bc + ca)} < \frac{2}{3} \qquad \ldots(iv)$$

$$\therefore \quad \lambda \leq \frac{a^2 + b^2 + c^2}{3(ab + bc + ca)} + \frac{2}{3}$$

$$\Rightarrow \quad \lambda < \frac{2}{3} + \frac{2}{3}$$

$$\Rightarrow \quad \lambda < \frac{4}{3}$$

Hence choice (a) is the answer.

NOTE If $a < 2$ and $b \leq 2$, $a = b < 4$ is correct and $a + b \leq 4$ is wrong.

3 As we know that, in a triangle the sum of the two sides is always greater than the third side, so we have the following 3 relations.

$$a+b>c \Rightarrow ac+bc>c^2$$
$$b+c>a \Rightarrow ab+ac>a^2$$
$$c+a>b \Rightarrow bc+ab>b^2$$

Adding the above 3 inequations, we get

$$2(ab+bc+ca)>a^2+b^2+c^2$$
$$\Rightarrow \quad a^2+b^2+c^2<2(ab+bc+ca)$$
$$\Rightarrow \quad \frac{a^2+b^2+c^2}{ab+bc+ca}<2$$

Now, we know that the lengths of each side of triangle are always real numbers and if ab and c are real numbers then

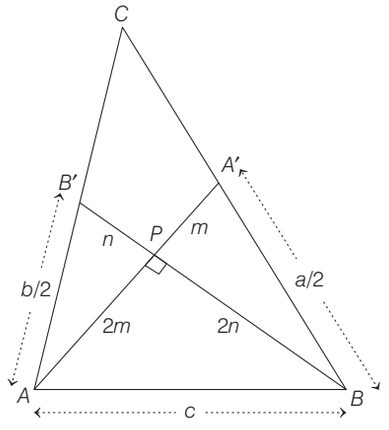
$$(a-b)^2+(b-c)^2+(c-a)^2 \geq 0$$
$$\Rightarrow \quad 2(a^2+b^2+c^2)-2(ab+bc+ca) \geq 0$$
$$\Rightarrow \quad a^2+b^2+c^2 \geq ab+bc+ca$$
$$\Rightarrow \quad \frac{a^2+b^2+c^2}{ab+bc+ca} \geq 1$$

Therefore, we can conclude that $1 \leq \frac{a^2+b^2+c^2}{(ab+bc+ca)}<2$.

$$\Rightarrow \quad 1 \leq k < 2.$$

Hence choice (a) is correct.

4 Since medians intersect each other in the ratio of 1 : 2, therefore $B'P = n$, $PB = 2n$ and $A'P = m$, $PA = 2m$.



In $\Delta A'PB$, $m^2+(2n)^2=\left(\frac{a}{2}\right)^2 \Rightarrow m^2+4n^2=\frac{a^2}{4}$

In $\Delta B'PA$, $n^2=(2m)^2$

$$\left(\frac{b}{2}\right)^2 \Rightarrow n^2+4m^2=\frac{b^2}{4}$$
$$\therefore \quad 5(m^2+n^2)=\frac{(a^2+b^2)}{4}$$

Now, in ΔAPB, $(2m)^2+(2n)^2=c^2$

$$\Rightarrow \quad 4(m^2+n^2)=c^2$$
$$\therefore \quad c^2=4(m^2+n^2)=\frac{a^2+b^2}{5}$$
$$\Rightarrow \quad 5c^2=a^2+b^2$$

Now, using the cosine rule in ΔABC, we have

$$\cos C=\frac{a^2+b^2-c^2}{2ab}$$
$$=\frac{a^2+b^2-\left(\frac{a^2+b^2}{5}\right)}{2ab}=\frac{2(a^2+b^2)}{5ab}$$

As a and b both are positive, so $0<\cos C<1$

$$\therefore \quad \frac{2(a^2+b^2)}{5ab}<1 \Rightarrow 2a^2-5ab+2b^2<0$$

Now, for a moment assuming the above inequality as the equality and then solving the quadratic equation in b, we get $b=\frac{a}{2}, 2a$. That is $\frac{a}{2}<b<2a$ is the requisite condition for the triangle's existence. Hence choice (d) is the correct one.

Alternatively Let us consider $AP = 6$, $BP = 8$, $AB = 10$, as ΔAPB is a right angle triangle. Since, AA' and BB' are medians intersecting at P, so $A'P = 3$ and $B'P = 4$.

Now, $\quad AB'=\sqrt{AP^2+B'P^2}=\sqrt{52}$

and $\quad BA'=\sqrt{BP^2+A'P^2}=\sqrt{73}$

$\therefore \quad b=AC=2\sqrt{52}$ and $a=BC=2\sqrt{73}$

and $c=AB=10$

Option (a) : $a^2+b^2=4(52)+4(73)$

$=4(52+73)=500=5(100)=5c^2$.

Option (b) : $\frac{a}{2}=\sqrt{73}$, $2a=4\sqrt{73}$, $b=2\sqrt{52}$. It shows that $\frac{a}{2}<b<2a$. Therefore option (b) is also correct.

Hence option (d) is valid.

5 $\because \quad AM \geq GM$

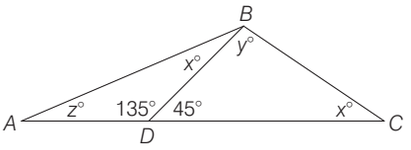
$$\frac{\frac{z}{x}+\frac{z}{y}}{2} \geq \sqrt{\left(\frac{z}{x}\right)\left(\frac{z}{y}\right)}$$
$$\frac{z}{x}+\frac{z}{y} \geq 2\sqrt{\left(\frac{z}{x}\right)\left(\frac{z}{y}\right)}$$
$$\frac{z}{x}+\frac{z}{y} \geq 2\sqrt{\frac{z^2}{xy}}$$
$$\frac{z}{x}+\frac{z}{y} \geq 2\sqrt{\frac{x^2+y^2}{xy}}$$
$$\frac{z}{x}+\frac{z}{y} \geq 2\sqrt{\frac{x}{y}+\frac{y}{x}}$$
$$\frac{z}{x}+\frac{z}{y} \geq 2\sqrt{2} \qquad \left[\because \left(\frac{y}{x}+\frac{x}{y}\right) \geq 2\right]$$

Hence choice (d) is the correct one.

6 Since BD is a median, so $AD = DC$. Let us say $AD = DC = 1$, and $\angle BAC = z°$. Further, let us assume that $\angle DBC = y°$, therefore $\angle DCB + \angle DBC = x + y = 135°$. It implies that $\angle ABC = 135°$. Then it is obvious that $\Delta ABC \sim \Delta ADB$.

That is $\frac{AC}{AB} = \frac{AB}{AD}$

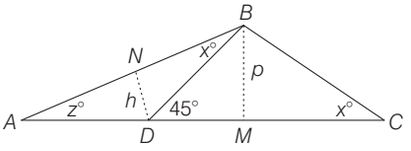
$\Rightarrow \frac{2}{AB} = \frac{AB}{1} \Rightarrow AB = \sqrt{2}$



Now, we know that a median divide that total area of a triangle in two equal parts, therefore, $\Delta ABD = \Delta DBC$

Let us drop a perpendicular h on AB from D in ΔABD and a perpendicular p on DC from B in ΔBDC. Then we have, $\Delta ABD = \Delta DBC$

$\Rightarrow \frac{1}{2} \times AB \times h = \frac{1}{2} \times CD \times p \Rightarrow \sqrt{2}h = p$



As we see that in a right angle triangle ΔBMD, the hypotenuse $BD = 2h = 2ND$, therefore from 30-60-90 degree theorem $\angle NBD = 30°$. That is $x = 30°$.

Hence choice (b) is the correct one.

Alternatively Extend CB to E such that ΔAEC is a right angle triangle and AC is its hypotenuse, then $AD = ED = DC$, as AD, ED, DC will acts as the radii of the circle, say it is r.

Now, as $\angle EBD$ is the external angle of ΔDBC, so $\angle EBD = (45 + x)°$

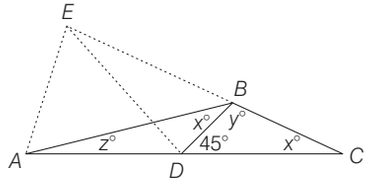
But, $\angle EBD = \angle EBA + \angle ABD$

$\Rightarrow 45 + x = \angle EBA + x \Rightarrow \angle EBA = 45°$

Now, since in ΔAEB, $\angle AEB = 90°$ and $\angle EBA = 45°$, therefore $\angle EAB = 45°$.

That is ΔAEB is an isosceles right angled triangle. It implies that $EA = EB$.

Let us assume $EA = EB = p \Rightarrow AB = \sqrt{2}p$



Now, since ΔABC is similar to ΔADB, therefore

$$\frac{AC}{AB} = \frac{AB}{AD} \Rightarrow \frac{2r}{\sqrt{2}p} = \frac{\sqrt{2}p}{r}$$

$\Rightarrow r = p$

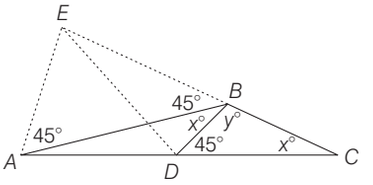
$\therefore AE = EB = ED = AD = DC = r$

That is in right angle triangle ΔAEC, we have $AC = 2AE$.

Therefore in ΔAEC by 30-60-90 degree theorem,

$$\angle ECA = 30° \Rightarrow x = 30°$$

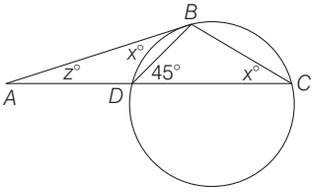
Alternatively Extend CB to E such that ΔAEB is a right angle triangle and AC is its hypotenuse, then $AD = ED = DC$, as AD, ED, DC will acts as the radii of the circle, say it is r. In ΔDBC, we have $x + y = 135°$, therefore in ΔABC we have $\angle ABC = 135°$. It implies that $\angle EBA = 45°$.



Thus we see that in right angle ΔEBA we have $\angle AEB = 90°$, $\angle EBA = 45°$ and $\angle EAB = 45°$.

Therefore, $AE = EB = r$.

Alternatively Since $\angle BCD = \angle DBA$, therefore we can conclude that the angles in the alternate segment are same. It implies that AB is a tangent to a circle that passes through the points D, B and C.



Therefore, $AC \times AD = AB^2$. That is $2AD \times AD = AB^2$.

$\Rightarrow AB = \sqrt{2}AD$

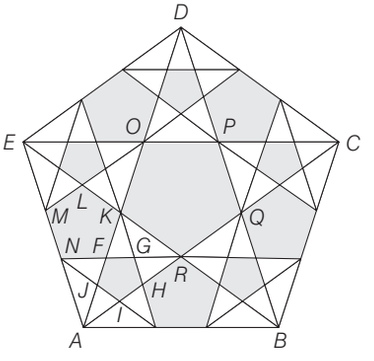
Now the rest of the solution can be taken from any of the previous solutions to the same problem.

7 Applying 36°-72°-36° theorem, in triangle JFM, we have $\frac{FM}{FJ} = \frac{1 + \sqrt{5}}{2}$.

Since each side of the pentagon $FGHIJ$ is 2 cm, therefore each side of the pentagon $FKLMN$ would be $1 + \sqrt{5}$ cm.

We know that $KR = FR = FG + GR = FG + \frac{1 + \sqrt{5}}{2} FG$. That is $\frac{KR}{FG} = \frac{3 + \sqrt{5}}{2}$.

Since each side of the pentagon $FGHIJ$ is 2 cm, therefore each side of the pentagon $KOPQR$ would be $3 + \sqrt{5}$ cm.



Therefore, total shaded area

$$= 5\left(\frac{1}{4}(\sqrt{5(5+2\sqrt{5})})\,2^2\right) + 5\left(\frac{1}{4}(\sqrt{5(5+2\sqrt{5})})\,(1+\sqrt{5})^2\right) + \left(\frac{1}{4}(\sqrt{5(5+2\sqrt{5})})\right)(3+\sqrt{5})^2$$

$$= \frac{1}{4}(\sqrt{5(5+2\sqrt{5})})\,[20 + (30+10\sqrt{5}) + (14+6\sqrt{5})]$$

$$= (\sqrt{5(5+2\sqrt{5})})\,(16+4\sqrt{5})\,\text{cm}^2$$

Hence choice (a) is the correct one.

8 Given that $AB = BC = CD = DA = a$

Let us consider $a = 12$ cm.

Now in triangle HAB and PGB,

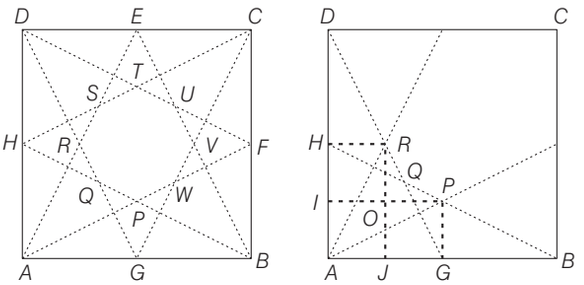
$$\frac{AH}{AB} = \frac{PG}{GB} = \frac{1}{2}$$

$\therefore$ $AH = AG = GB = 6$ and $PG = 3$

Similarly, in triangle DAG and DHR,

$$\frac{AG}{AD} = \frac{HR}{HD} = \frac{1}{2}$$

$\therefore$ $AG = AH = DH = 6$ and $HR = 3$



Therefore, $RO = OP = 3$

Now, in triangle HIP and ROP,

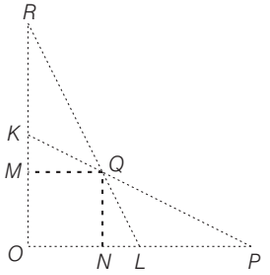
$$\frac{HI}{IP} = \frac{KO}{OP} = \frac{1}{2}$$

$\therefore$ $OP = 3, OK = 1.5, KR = 1.5$

Similarly, in triangle GJR and POR,

$$\frac{GJ}{JR} = \frac{OL}{OR} = \frac{1}{2}$$

$\therefore$ $OR = 3, OL = 1.5, LP = 1.5$



Now, if we assume $KM = x$, then $MQ = 2x$

But $MQ = QN = 2x$

$\therefore$ $NP = 4x$ and $LP = 3x$, as $NL = KM = x$

But $NL = KM = x$

and $PQ = \sqrt{QN^2 + NP^2}$

$\Rightarrow$ $PQ = \sqrt{(2x)^2 + (4x)^2} = 2x\sqrt{5}$

$\therefore$ $KM = x \Rightarrow OP = 6x$

$\Rightarrow$ $AB = 24x = 12$

$\Rightarrow$ $x = \frac{1}{2}$

$\therefore$ $PQ = 2 \times \frac{1}{2} \times \sqrt{5} = \sqrt{5}$

Thus when $AB = 12$, $PQ = \sqrt{5}$, so when $AB = a$, $PQ = \frac{\sqrt{5}\,a}{12}$

There are 8 internal angles in the octagon, such that $\angle P = \angle R = \angle T = \angle V$ and $\angle Q = \angle S = \angle U = \angle W$. That is half of the internal angles are same of one value and rest half are of another value. So it's not an equiangular octagon, so it's not a regular octagon too.

However, each side of the octagon is same, so it's an equilateral octagon.

Thus statements (ii) and (iv) are correct.

Hence choice (b) is the correct one.

Alternatively Using the coordinate geometry to find the answer.

Let the coordinate of point A, B, C, D be $(0, 0)$, $(a, 0)$, (a, a) $(0, a)$ respectively, then AF is $y = \frac{x}{2}$ and BH is $\frac{x}{a} + \frac{2y}{a} = 1$.

Therefore P is $\left(\frac{a}{2}, \frac{a}{4}\right)$

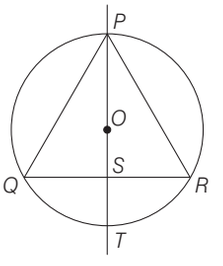
Similarly, DG is $\frac{2x}{a} + \frac{y}{a} = 1$

Equating BH and DG we get the coordinates of $Q = \left(\frac{a}{3}, \frac{a}{3}\right)$

$\therefore$ $PQ = \sqrt{\left(\frac{a}{2} - \frac{a}{3}\right)^2 + \left(\frac{a}{4} - \frac{a}{3}\right)^2} = \frac{\sqrt{5}\,a}{12}$

Hence choice (b) is the correct one.

9 Considering the given conditions, the best you can do is assume an equilateral triangle, say of each side $2\sqrt{3}$. Then, from the following figure, $QS = SR = \sqrt{3}$ and $PS = 3$, $PO = 2$, $OS = 1$ and $ST = 1$.



(i) $\frac{1}{PS} + \frac{1}{ST} < \frac{2}{\sqrt{QS \times SR}}$

$\Rightarrow \frac{4}{3} < \frac{2}{3}$. That is invalid.

(ii) $\frac{1}{PS}+\frac{1}{ST}>\frac{2}{\sqrt{QS\times SR}}$

$\Rightarrow \frac{4}{3}>\frac{2}{3}$. That is valid.

(iii) $\frac{1}{PS}+\frac{1}{ST}<\frac{4}{QR}$

$\Rightarrow \frac{4}{3}<\frac{2\sqrt{3}}{3}$. That is invalid.

(iv) $\frac{1}{PS}+\frac{1}{ST}>\frac{4}{QR}$

$\Rightarrow \frac{4}{3}>\frac{2\sqrt{3}}{3}$. That is valid.

Hence choice (b) is the answer.

Alternatively

Applying the theorem, you will get, $PS\times ST = QS\times SR$

Now, apply the principle of $AM \geq GM$ with $\frac{1}{PS}+\frac{1}{ST}$ as shown below.

$$\frac{\frac{1}{PS}+\frac{1}{ST}}{2}\geq\sqrt{\frac{1}{PS}+\frac{1}{ST}}$$

$$\Rightarrow \quad \frac{1}{PS}+\frac{1}{ST}\geq\frac{2}{\sqrt{QS\times SR}}$$

Similarly, $$\frac{QS+SR}{2}\geq\sqrt{QS\times SR}$$

$$\Rightarrow \quad \frac{QR}{2}\geq\sqrt{QS\times SR}$$

$$\Rightarrow \quad \frac{1}{\sqrt{QS\times SR}}\geq\frac{2}{QR}$$

$$\Rightarrow \quad \frac{1}{PS}+\frac{1}{ST}\geq\frac{4}{QR}$$

Therefore, you will have

$$\frac{1}{PS}+\frac{1}{ST}\geq\frac{2}{\sqrt{QS\times SR}}$$

and $$\frac{1}{PS}+\frac{1}{ST}\geq\frac{4}{QR}$$

But since S is not at the centre, so $PS\neq ST$ and $QS\neq SR$, so you will have the strict inequality, as following.

$$\frac{1}{PS}+\frac{1}{ST}>\frac{2}{\sqrt{QS\times SR}}$$

and $$\frac{1}{PS}+\frac{1}{ST}>\frac{4}{QR}$$

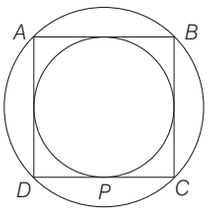
Hence choice (b) is the answer.

10 Consider P at the mid-point of CD which will also lie on C_1, then

$$PA^2+PB^2+PC^2+PD^2$$
$$=5+5+1+1=12$$

Now consider Q at D (Q coinciding with D), which will also lie on C_2, then $QA^2+QB^2+QC^2+QD^2$

$$=DA^2+DB^2+DC^2+DQ^2$$
$$=4+8+4+0=16$$



$$\therefore \quad \frac{PA^2+PB^2+PC^2+PD^2}{QA^2+QB^2+QC^2+QD^2}=\frac{12}{16}=0.75$$

Hence choice (a) is the answer.

Hint You must be wondering that why I have chosen P and Q at these places. If you are smart enough, you can figure it out, from the question, that the answer would not change it you change the locations of P and Q. That's why, for our convenience, I have chosen P on C_1 such that I can measure PA, PB, PC, PD easily and for the same reason I have chosen Q on C_2.

11 When you shift Z to P, D will shift to Y, which makes $XD = XY$. Simultaneously, C will shift to X, which makes $CY = XY$. Therefore $DX = CY$. Now, when you shift Z to B, D will shift to A, which makes $XD = AX$. Simultaneously, C will shift to B, which makes $CY = BY$. But, we know that $AX = BX < BY$, so $XD < CY$.

It implies that $XD \leq CY$.

Hence choice (b) is the correct one.

12 Look at the following figures. First of all, consider the figure (ii), in which the radius of the circle inscribed in the shaded region is $\left(\frac{1}{3}-\frac{1}{4}\right)=\frac{1}{12}$ cm.

Now, consider the fig (iii) and find the radius of the second circle in the shaded region. It can be done using the Descartes' circle theorem.

Let a, b and c be the curvatures of the existing circles and d be the curvature of desired circle, then

$(a+b+c+d)^2 = 2(a^2+b^2+c^2+d^2)$

That is $(-3+4+12+d)^2 = 2((-3)^2+4^2+12^2+d^2)$

$$\Rightarrow \quad (13+d)^2 = 2(169+d^2)$$

$$\Rightarrow \quad d^2-26d+169=0$$

$$\Rightarrow \quad d=13 \Rightarrow r_4=\frac{1}{13}\text{ cm}$$

Using the same approach you can find the curvature of other new circles as shown in fig (iv).

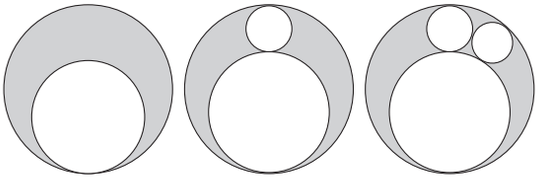


Fig. (i) Fig. (ii) Fig. (iii)

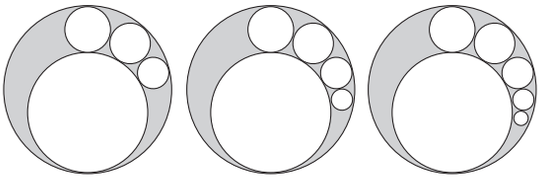

Fig. (iv) Fig. (v) Fig. (vi)

Let a, b and d be the curvatures of the existing circles and e be the curvature of desired circle, then

$$(a + b + d + e)^2 = 2(a^2 + b^2 + d^2 + e^2)$$

That is

$$(-3 + 4 + 13 + e)^2 = 2((-3)^2 + 4^2 + 13^2 + e^2)$$

$$\Rightarrow \quad (14 + e)^2 = 2(194 + e^2)$$

$$\Rightarrow \quad e^2 - 28e + 192 = 0 \Rightarrow e = 16$$

(Since $e = 12$ is not a possible value, as it is less than the value of the previous circle. Do you remember that the smaller circle has greater curvature?)

Now, consider the other figures (v) and (vi). Use the same approach as above, and you will find the other curvatures as 21 and 28.

Thus, you can see that the curvatures of these circles are as follows

12, 13, 16, 21 and 28.

Looking at the pattern you can find the values of all the curvatures, as given below

12, 13, 16, 21, 28, 37, 48, 61, 76, 93, 112, 133 and 156.

Out of the above 13 curvatures, except the first one (that is 12) all other curvatures repeat twice due to symmetricity.

Therefore, total sum of all the 25 curvatures

$$= 12 + 2(13 + 16 + \ldots + 156)$$

$$= 12 + 2(794) = 1600$$

Hence choice (b) is the correct one.

13 Given that the point of tangent of C_1 is $\frac{2}{5}$ cm (or 0.4 cm) away from Y-axis and the point of tangent of C_2 is $\frac{3}{7}$ cm (or 0.4284 cm) away from the Y-axis, so the point of tangent of C_3 must be somewhere between $\frac{2}{5}$ and $\frac{3}{7}$ (or 0.4 cm and 0.4288 cm) away from the Y-axis.

Choice (a) : $\frac{26}{35} = 0.7428$ cm, which is more than 0.4284 cm

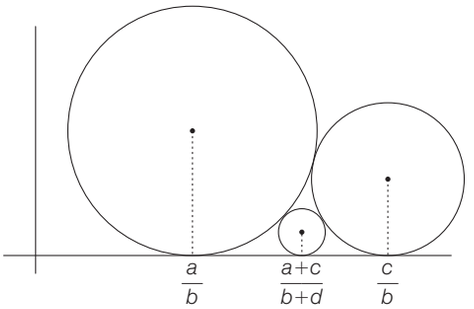
Choice (b) : $\frac{57}{144} = 0.3958$ cm, which is less than 0.4 cm

Choice (c) : $\frac{17}{36} = 0.4722$ cm, which is more than 0.4284 cm

Choice (d) : $\frac{35}{84} = 0.4167$ cm, which is between 0.4 cm and 0.4284 cm

Hence choice (d) is the correct one.

Alternatively If a circle C_1 is $\frac{a}{b}$ unit away from Y-axis and its corresponding diameter is $\frac{1}{b^2}$ and the other circle C_2 is $\frac{c}{d}$ unit away from Y-axis and its corresponding diameter is $\frac{1}{d^2}$ and these two circles are tangent to each other and have X-axis as their common tangent, the third circle C_3 will be tangent to the two circles C_1 and C_2 and tangent to X-axis when it is $\frac{a+b}{c+d}$ unit away from Y-axis and its diameter would be $\frac{1}{(c+d)^2}$.



Therefore, the required answer would be $\frac{2+3}{5+7} = \frac{5}{12} = \frac{35}{84}$

Hence choice (d) is the correct one.

Alternatively

Join the lines as shown in the diagram. Let us consider the radius of C_1, C_2 and C_3 be r_1, r_2 and r_3, respectively.

Now, we have $BQ = \sqrt{AB^2 - AQ^2}$

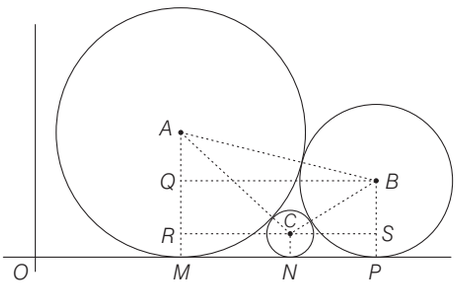
$$\Rightarrow \quad BQ = \sqrt{(r_1 + r_2)^2 - (r_1 - r_2)^2}$$

$$\Rightarrow \quad BQ = \sqrt{\left(\frac{1}{50} + \frac{1}{98}\right)^2 - \left(\frac{1}{50} - \frac{1}{98}\right)^2}$$

$$\Rightarrow \quad BQ = \frac{1}{35}$$

Again, $BQ = RS = RC + CS$

$$= \sqrt{(r_1 + r_3)^2 - (r_1 - r_3)^2} + \sqrt{(r_2 + r_3)^2 - (r_2 - r_3)^2}$$



$$\Rightarrow \quad BQ = 2\sqrt{r_1 r_3} + 2\sqrt{r_2 r_3}$$

$$\Rightarrow \quad BQ = 2(\sqrt{r_1 r_3} + \sqrt{r_2 r_3})$$

$$\Rightarrow \quad \frac{1}{35} = 2\left(\frac{1}{5}\sqrt{\frac{r_3}{2}} + \frac{1}{7}\sqrt{\frac{r_3}{2}}\right)$$

$$\Rightarrow \quad \frac{1}{35} = \frac{24}{35}\sqrt{\frac{r_3}{2}}$$

$$\Rightarrow \quad r_3 = \frac{1}{288} \text{ cm}$$

But, we know that

$$MN = RC = \sqrt{(r_1 + r_3)^2 - (r_1 - r_3)^2}$$

$$\Rightarrow \quad MN = RC = 2\sqrt{r_1 r_3} = 2\sqrt{\left(\frac{1}{50}\right)\left(\frac{1}{288}\right)} = \frac{1}{60}$$

Therefore, the required distance $= ON = OM + MN$

$$\Rightarrow \quad ON = \frac{2}{5} + \frac{1}{60}$$

$$= \frac{25}{60} = \frac{5}{12} = \frac{35}{84}$$

14 Given that $AP = BP = p$ and $BQ = CQ = q$, therefore $PQ = p + q$.

Since $RB = MU = m$, so we have $PR = PB - RB = p - m$.

Also, $PM = p + m$

Let us consider $MR = UB = h$, we have

$$MR^2 = PM^2 - PR^2$$

$$\Rightarrow \quad h^2 = (p + m)^2 - (p - m)^2 \qquad \ldots(i)$$

Now, we have,

$$OM = OW - MW = (p + q) - m$$

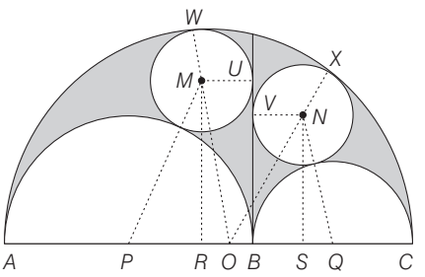
And, $\quad RO = RB - OB = RB - (OC - BC)$

$$= m - (p + q - 2q) = m - p + q$$

Again, $\quad MR^2 = OM^2 - RO^2$

$$\Rightarrow \quad h^2 = (p + q - m)^2 - (m - p + q)^2 \qquad \ldots(ii)$$

Now, solving eqn. (i) and eqn. (ii) we get $m = \dfrac{pq}{p + q}$



Similarly, we can find out n, as shown below.

Let us consider $SN = j$, where $NQ = q + n$ and $SQ = BQ - BS = q - n$, we have $SN^2 = NQ^2 - SQ^2$

$$\Rightarrow \quad j^2 = (q + n)^2 - (q - n)^2 \qquad \ldots(iii)$$

Now, we have, $ON = OX - NX = (p + q) - n$

And, $\quad OS = OB + BS = (OC - BC) + BS$

$$= (p + q - 2q) + n = p - q + n$$

Again, $\quad SN^2 = ON^2 - OS^2$

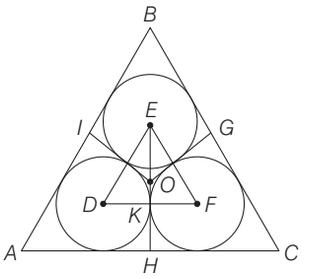
$$\Rightarrow \quad j^2 = (p + q - n)^2 - (p - q + n)^2 \qquad \ldots(iv)$$

Now, solving eqs. (iii) and (iv) we get $n = \dfrac{pq}{p + q}$

Thus, we see that $m = n$ and $m + n = \dfrac{2pq}{p + q}$

Hence choice (c) is the correct one.

15 The best way is to convert this general scenario into a specific case by assuming an equilateral triangle where each of the three circles has same radius of 1 cm.



Then we have $DE = 2$ and $EK = \sqrt{3}$. And therefore, $EO = \dfrac{2}{\sqrt{3}}$ and $OK = \dfrac{1}{\sqrt{3}}$.

Also $KH = 1$.

Thus we have, inradius

$$OI = OG = OH = 1 + \frac{1}{\sqrt{3}}.$$

Now, you can substitute the value of $r_1 = r_2 = r_3 = 1$ in the given options and you would see that

Choice (a) : $\dfrac{\sqrt{r_1 r_2 r_3}}{r_1 + r_2 + r_3 - 2\sqrt{r_1 + r_2 + r_3}} = \dfrac{1}{3 - 2\sqrt{3}}$

It gives us a negative value, so it's invalid.

Choice (b) : $\dfrac{2\sqrt{r_1 r_2 r_3}}{r_1 + r_2 + r_3 - \sqrt{3}\sqrt{r_1 + r_2 + r_3}} = \dfrac{2}{3 - 3} = \dfrac{2}{0}$

It gives us an undefined value, so it's invalid.

Choice (c) : $\dfrac{2\sqrt{r_1 r_2 r_3}}{r_1 + r_2 + r_3 - \sqrt{r_1 + r_2 + r_3}} = \dfrac{2}{3 - \sqrt{3}}$

$$= \frac{2(3 + \sqrt{3})}{(3 - \sqrt{3})(3 + \sqrt{3})}$$

$$= \frac{2(3 + \sqrt{3})}{6} = 1 + \frac{1}{\sqrt{3}}$$

Hence choice (c) is the correct one.

CHAPTER 13

Elements of Algebra

Algebra plays a very crucial role in CAT since on an average 35–40% problems of 'Quantitative Aptitude' section are related to algebra and the questions asked from this section are not very calculative and can be solved quickly through options. According to the past years question papers, the questions of this section are very logical in spite of being algebraic.

Their level can be of High School Standard or IIT-JEE level. But you need not to go for an IIT coaching or for higher studies in maths. For this, first you have the command over the fundamentals, then solve the plenty of problems so that you must be aware with variety and diversity of problems. This section is written in this book as per the needs of those students who are really very poor in algebra and for the same, I have started from the zero level and created the standard of problems higher than CAT level. So in this journey of learning of algebra you have to learn maximum from the problems given in the chapter, because theory is never sufficient in itself.

Chapter Checklist

- Fundamental Concept of Algebra
- Algebraic Expression
- Polynomial
- Operations on Algebraic Expression
- Remainder Theorem
- Factor Theorem
- H.C.F. and L.C.M. of Polynomials
- Rational Expressions
- Basic Facts to Remember
- Linear Equations
- Simultaneous Linear Equations
- Algebraic Methods of Solving Simultaneous
- Equations in Two Variables
- **CAT Test**

13.1 Fundamental Concept of Algebra

1. **Literal Numbers (or literals) :** Algebra is a branch of mathematics in which all the arithmetical operations are performed by using letters (like, *a, b, c, ..., p, q, r, ... x, y, z*) along with numerals. The letters used in algebra represent generalised numbers (or unknown) numbers. They are called literals.
2. **Operations on Literals :** Since literals represent numbers, so they obey all the rules of operations of addition, subtraction, multiplication and division of numbers.

Addition of Literals and Numbers

(i) $x + y = y + x$ (ii) $x + 3 = 3 + x$ (iii) $(x + y) + z = x + (y + z)$

(iv) $(x + 0) = x = (0 + x)$ (v) $x + (-x) = 0 = (-x) + x$

Subtraction of Literals and Numbers

(i) $4 - x$ (ii) $x - 4$ (iii) $x - y = -(y - x)$

(iv) $y - x = -(x - y)$ (v) $x - 0 = x$

Multiplication of Literals and Numbers

(i) $x \times y = xy\ (xy = x + x + x + \ldots\ y \text{ times})$

(ii) $4 \times x = 4x$ (not as $x4$) $(4x = x + x + x + x)$

(iii) $1 \times x = x$ (not as $1x$) (iv) $xy = yx$

(v) $(xy)z = x(yz)$ (vi) $1 \cdot x = x = x \cdot 1$

(vii) $x(y + z) = xy + xz$ (viii) $0 \cdot x = 0 = x \cdot 0$

Division of Literals and Numbers

(i) $4 \div x = \frac{4}{x}$ (ii) $x \div 4 = \frac{x}{4}$

(iii) $x \div y = \frac{x}{y}$ (iv) $0 \div x = 0$

NOTE $x \div 0$, *i.e.,* $\frac{x}{0}$ is not defined.

Powers of a Literal

(i) $x \times x = x^2$ or $x \times x \times x = x^3$ etc.

i.e., $x \times x \times \ldots n \times \text{times} = x^n$

(ii) $x^1 = x$ (iii) $x^0 = 1$

NOTE x^n is read as x raised to the power n or x to the power n or x power n.
$x \rightarrow$ base, $n \rightarrow$ exponent or index, $x^n \rightarrow$ exponential expression

Language of Algebra

Statement	Meaning
$a = b$	a is equal to b
$a \neq b$	a is not equal to b
$a < b$	a is less than b
$a > b$	a is greater than b
$a \leq b$	a is less than or equal to b
$a \geq b$	a is greater than or equal to b
$a \nless b$	a is not less than b
$a \ngtr b$	a is not greater than b.

Constraints and Variables

Constants : A symbol which has a fixed value is called a constant. *e.g.,* 4, 5, 0, $-3, \frac{2}{5}, 3\frac{2}{7}$, etc.

Variable : A symbol which can assume various numerical values is called a variable.

e.g., Area of rectangle = length $(l) \times$ breadth $(b) = l \times b$.

Here, length (l) and breadth (b) can assume any possible numerical values.

Perimeter of a square $= 4a$ ($a \rightarrow$ side of a square)

Here, a can assume any possible numerical value.

Price of 10 balls $= 10x = 10 \times 2 = 20$ or $10 \times 5 = 50$, etc.

Here, x can assume any possible numerical value.

NOTE In $5x$, 5 is constant and x is variable but together $5x$ is variable. Similarly, $5 + x, x - 5, 5 - x, \frac{x}{5}$ and $\frac{5}{x}$ are variables.
Hence, a combination of a constant and a variable is a variable.

13.2 Algebraic Expression

A collection of constants and literals connected by one or more of the operations of addition, subtraction, multiplication and division is called an **"algebraic expression".**

The various parts of an algebraic expression separated by + or – sign are called **"terms"** of the algebraic expression.,

e.g.,

Algebraic expression	Number of terms	Terms
(i) $4x$	1	$4x$
(ii) $8x + 3y$	2	$8x$, $3y$
(iii) $7 + 3x - 2y^2$	3	7, $3x$, $-2y^2$
(iv) $\frac{7}{8}x^3 + 3x^2 + 4x - 9$	4	$\frac{7}{8}x^3$, $3x^2$, $4x$, -9

NOTE Multiplication and division do not separate the terms of an algebraic expression, *e.g.,* $7x$ is a single term, similarly $x / 7$ is also a single term.

Types of Algebraic Expressions

1. **Monomial :** An algebraic expression having only one term is called a monomial.

   e.g., $3x, -5y, 12xy^2, \frac{3x}{y}, \frac{7x^2}{3y}$, etc.

2. **Binomial :** An algebraic expression having two terms is called a binomial, *e.g.,* $3x + 4y, 7x^2 + 2x, 9yz^2 - 4x^2$, $3x - \frac{2}{3}y$, etc.

NOTE A trinomial has three terms.

3. **Polynomial (or multinomial) :** An algebraic expression having two or more than two terms is called a multinomial or polynomial, *e.g.,*
   (i) $7x^2 - 3y$ is a polynomial having 2 terms
   (ii) $7x^4 - 3x^2 + 5x$ is a polynomial having 3 terms
   (iii) $3x^4 - 7x^3 + 3xy + 8$ is a polynomial having 4 terms, etc.

NOTE Mono $\rightarrow$ single or one, Bi $\rightarrow$ two, Tri $\rightarrow$ three, Poly/Multi $\rightarrow$ many, and nomial $\rightarrow$ terms

Product : When two or more constants or literals (or both) are multiplied, then the result so obtained is called the **'product'**, *e.g.,* $7xy$ is the product of 7, x and y.

Factors : Each of the quantity (constant or literal) multiplied together to form a product is called a **'factor'** of the product.

A constant factor is called a **numerical factor** and any factor containing only literals is called a **literal factor.** *e.g.,*

(i) In $7xy$, the numerical factor is 7 and literal factors are x, y and xy.

(ii) In $-7x^2y$, the numerical factor is -7 and the literal factors are, x^2, y, x, xy and x^2y.

Constant terms : The term of an algebraic expression having no literal factors is called its **constant term.** *e.g.*

In the algebraic expression $3x^2 + 7x + 8$, the constant term is 8. (Since, 8 is not associated with any literals)

Coefficients : In an algebraic expression any factor of a term is called the **coefficient** of the remaining factor of the term, *e.g.,* $4xy + 5x^2y - 17$. In the first term $4xy$,

(i) numerical coefficient = 4 (ii) literal coefficient $= xy$

(iii) coefficient of $4 = xy$ (iv) coefficient of $x = 4y$

(v) coefficient of $y = 4x$ (vi) coefficient of $4x = y$

(vii) coefficient of $4y = x$

Similarly, we can find the coefficient of the other two terms.

Like and unlike terms : The terms having same literal coefficients are called **like terms** else the terms are called **unlike terms,** *e.g.,*

(i) $7xy, 4xy, 9xy, -\frac{3}{2}xy$ are like terms

(ii) $3x^2y, 5x^2y, 8x^2y, \ldots, -7x^2y$ are like terms

(iii) $3x, 5x^2y, 9xy^2z$ are unlike terms, etc.

13.3 Polynomial

Polynomials in one variable : An algebraic expression of the form $a + bx + cx^2 + dx^3 + \ldots$ where $a, b, c, d, \ldots$ are constants and x is a variable, is called a polynomial in the variable x. The greatest power of x present in the polynomial is called the **degree of the polynomial.**

NOTE No term in a polynomial can be of the form $\frac{1}{x}, \frac{1}{x^2}$, etc.

e.g.,

(i) $7 + 3x$ is a polynomial in x of degree 1.

(ii) $7y^2 + 3y - 10$ is a polynomial in y of degree 2.

(iii) $8k^3 + 3k^2 - 15$ is a polynomial in k of degree 3.

(iv) $7x^5 + 3x^2 + 8$ is a polynomial in x of degree 5.

(v) $3x^4 + 5x^3 + 7x - \frac{8}{x}$ is not a polynomial.

(vi) 8 can be written as $8x^0$, so it is a polynomial in x of degree 0, *i.e.,* in general a single constant term is always of degree 0 (zero).

Polynomials in two or more variables

Any algebraic expression in two or more variables is called a polynomial if every variable present in it has only non-negative integral powers.

In case of a polynomial in two or more variables, the sum of the powers of the variables in each term is taken and the greatest sum is the **degree of the polynomial.**

NOTE No term in a polynomial can be of the form $\frac{1}{x}, \frac{1}{x^2}, \frac{x}{y}$, etc.

Examples :

(i) $8x^2 - 5xy + 3x - 7y + 2$ is a polynomial in two variables x and y. The degree of its terms are 2, $(1+1)$, 1, 1, 0, so the degree of the polynomial is 2.

(ii) $8a^3 + 9b^2a^3 + 12b^3 - \frac{5}{7}a + 15$ is a polynomial in two variables a and b. The degree of its terms are 3, $(2+3)$, 3, 1, 0, so the degree of the polynomial is 5.

NOTE The degree of a polynomial is equal to the maximum value of the sum of the powers of the variables in any term. Degree is always a whole number. It is not defined for polynomials having fractional and negative exponent.

Substitution

The process of finding the value of an algebraic expression by replacing the variables (literals) by their particular values is called substitution.

Exp. 1) If $x = 3$ and $y = 4$, find the value of

(i) $3x + 2y$ *(ii)* $4x - 3y$ *(iii)* $18xy$ *(iv)* $\frac{15x}{12y}$

Solution

(i) $3x + 2y = 3 \times 3 + 2 \times 4$ (substituting $x = 3$ and $y = 4$)
$= 9 + 8 = 17$

(ii) $4x - 3y = 4 \times 3 - 3 \times 4$ (substituting $x = 3$ and $y = 4$)
$= 12 - 12 = 0$

(iii) $18xy = 18 \times 3 \times 4$ (substituting $x = 3$ and $y = 4$)
$= 216$

(iv) $\frac{15x}{12y} = \frac{15 \times 3}{12 \times 4} = \frac{15}{16}$

Exp. 2) If $x = -3$, find the value of $4x^2 - 5x + 3$.

Solution $4x^2 - 5x + 3 = 4 \times (-3)^2 - 5 \times (-3) + 3$
$= 36 + 15 + 3 = 54$

Exp. 3) If $a = 4, b = -3, c = 2$, find the value of $4a^2 + 5b - 12c$.

Solution $4a^2 + 5b - 12c = 4 \times (4)^2 + 5(-3) - 12(2)$
$= 64 - 15 - 24 = 25$

13.4 Operations on Algebraic Expression

Addition of like terms : In any algebraic expression only like terms can be added or subtracted. Thus, the sum of two or more like terms is a like term whose numerical coefficient is the sum of coefficients of given like terms.

e.g., $2x = x + x$, $3x = x + x + x$, $4x = x + x + x + x$.

$\therefore\ 2x + 3x + 4x = (x + x) + (x + x + x) + (x + x + x + x) = 9x$

Similarly, $2x^2 + 3x^2 = (2 + 3)x^2 = 5x^2$

and $5xy + (-3xy) = [5 + (-3)]\,xy = 2xy$

Thus, we cannot further simplify $7x + 5x^2$ into single term, since both are unlike terms.

Addition of Algebraic Expressions

Exp. 1) Solve the following expression

$(4a + 2b - 3c) + (3a - 2b + 4c)$

Solution $(4a + 2b - 3c) + (3a - 2b + 4c)$

$= (4a + 3a) + (2b - 2b) + (-3c + 4c)$

$= (4 + 3)a + (2 - 2)b + (-3 + 4)c = 7a + c$

Exp. 2) Add $2x^2 + 5xy - 2y^2$, $3x^2 - 2xy + 5y^2$ and $-2x^2 + 8xy + 3y^2$.

Solution $(2x^2 + 5xy - 2y^2) + (3x^2 - 2xy + 5y^2) + (-2x^2 + 8xy + 3y^2)$

$= (2x^2 + 3x^2 - 2x^2) + (5xy - 2xy + 8xy) + (-2y^2 + 5y^2 + 3y^2)$

$= 3x^2 + 11xy + 6y^2$

Subtraction of Algebraic Expressions

Exp. 1) Subtract $3x + 2y - z$ from $4x - 5y + 3z$.

Solution $(4x - 5y + 3z) - (3x + 2y - z)$

$= (4x - 3x) + (-5y - 2y) + [3z - (-z)] = x - 7y + 4z$

Exp. 2) Subtract $7x^3 - 3x^2 + 8x + 16$ from $9x^3 + 6x^2 - 6x + 20$.

Solution $(9x^3 + 6x^2 - 6x + 20) - (7x^3 - 3x^2 + 8x + 16)$

$= (9x^3 - 7x^3) + [6x^2 - (-3x^2)] + [(-6x) - (8x)] + (20 - 16)$

$= 2x^3 + 9x^2 - 14x + 4$

Multiplication of Algebraic Expressions

It follows the distributive property. In this operation all the numerals are multiplied with each other individually and all the literals (or variables) multiplied with each other as per the rule.

Exp. 1) Find the product of $6xy$ and $7x^2$.

Solution $6xy \times 7x^2 = (6 \times 7) \times (xy \times x^2)$

$= (6 \times 7) \times (x \times y \times x \times x) = 42 \times x^3 y$

Exp. 2) Find the product of $3ab^2$ and $(4ab + 3b^2)$.

Solution $3ab^2 \times (4ab + 3b^2) = 3ab^2 \times 4ab + 3ab^2 \times 3b^2$

$= 3 \times a \times b \times b \times 4 \times a \times b + 3 \times a \times b \times b \times 3 \times b \times b$

$= 12a^2b^3 + 9ab^4 = 3ab^3(4a + 3b)$

Exp. 3) Multiply $(a + b)$ by $(c + d)$.

Solution $(a + b)(c + d) = a(c + d) + b(c + d) = ac + ad + bc + bd$

Exp. 4) Multiply $(5x - 4)$ by $(3x + 5)$.

Solution $(5x - 4) \times (3x + 5) = 5x \times (3x + 5) - 4(3x + 5)$

$= 15x^2 + 25x - 12x - 20 = 15x^2 + 13x - 20$

Division of Algebraic Expressions

Exp. 1) Solve $x^6 \div x^4$

Solution $\dfrac{x^6}{x^4} = \dfrac{x \times x \times x \times x \times x \times x}{x \times x \times x \times x} = x \times x = x^2$

Exp. 2) Solve $35x^3y^2 \div 7x^2y^2$

Solution $\dfrac{35x^3y^2}{7x^2y^2} = \dfrac{7 \times 5 \times x \times x \times x \times y \times y}{7 \times x \times x \times y \times y} = 5x$

Thus, we can say $7x^2y^2$ and $5x$ are the two factors of $35x^3y^2$.

Exp. 3) Divide $14x^3y^2 + 8x^2y^3 - 32x^2y^5$ by $-2xy^2$.

Solution $\dfrac{14x^3y^2 + 8x^2y^3 - 32x^2y^5}{-2xy^2}$

$= \dfrac{(14x^3y^2)}{(-2xy^2)} + \dfrac{(8x^2y^3)}{(-2xy^2)} + \dfrac{(-32x^2y^5)}{(-2xy^2)}$

$= -7x^2 - 4xy + 16xy^3$

Exp. 4) Divide $(4x^2 + 3x + 2)$ by $(x + 2)$

Solution

$$x + 2 \overline{)\ 4x^2 + 3x + 2\ (4x - 5}$$

$$\underline{4x^2 + 8x}$$

$$-5x + 2$$

$$\underline{-5x - 10}$$

$$12$$

Here $(x + 2)$ is divisor and $(4x - 5)$ is quotient and 12 is remainder and $(4x^2 + 3x + 2)$ is the dividend.

NOTE

(i) If there is a '+' sign before a bracket, then the signs of the terms inside the bracket do not change.

(ii) If there is a '–' sign before a bracket, then the signs of all the terms inside the bracket change.

General Form of a Polynomial

The expression of the form $a_0x^n + a_1x^{n-1} + a_2x^{n-2} + \ldots + a_n$ in which $a_0, a_1, a_2, \ldots, a_n$ are constants $(a_0 \neq 0)$ and n is a positive integer is called a polynomial (or rational integral function) in x of degree n. We may denote it by $f(x)$,

i.e., $f(x) = a_0x^n + a_1x^{n-1} + a_2x^{n-2} + \ldots + a_n$.

Algebraic Expression as a Function : A function is an operation which forms a relation between two variables.

e.g., $y = x^2$, $y = 3x$, $y = x^2 + 3$, etc.

This operation is represented by $f(x)$, *i.e.,*

$y = f(x) \Rightarrow f(x) = x^2$ (f is called operand)

$f(x) = 3x \Rightarrow f(x) = x^2 + 3$

Exp. 1) If $f(x) = x^3 + 2x$, then find the value of $f(3)$.

Solution $\because f(x) = x^3 + 2x \therefore f(3) = (3)^3 + 2(3) = 27 + 6 = 33$

Exp. 2) If $f(x) = 2x^3 + 3x^2 + 5$, then find the value of $f(2)$.

Solution $\because f(x) = 2x^3 + 3x^2 + 5$

$\therefore f(2) = 2(2)^3 + 3(2)^2 + 5 = 16 + 12 + 5 = 33$

Graphical Expression Algebraic Expression

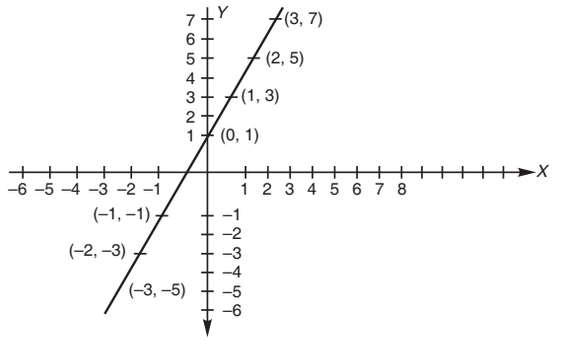
All the polynomial expressions that can be written as $y = f(x)$ can be represented in two dimensional co-ordinate system.

Exp. 1) $y = f(x) = 2x + 1$

Solution

x	–3	–2	–1	0	1	2	3
y	–5	–3	–1	1	3	5	7

Hint Find the corresponding values of y for each value of x. Generally we consider some +ve and some –ve values of x. Now we plot the graph as per the values obtained in the table.

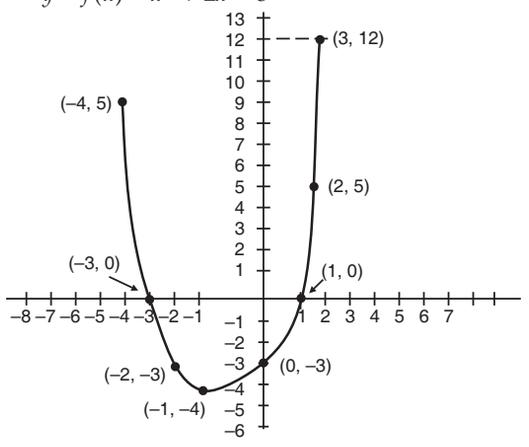


The points are represented as (x, y) and the values of (x, y) represent the points on the plane.

NOTE $y = 2x + 1$ is a linear equation, therefore the graph of the given equation shows a straight line.

Exp. 2) $f(x) = x^2 + 2x - 3$

Solution $y = f(x) = x^2 + 2x - 3$



x	– 4	– 3	–2	–1	0	1	2	3
y	5	0	–3	–4	–3	0	5	12

Since, $y = x^2 + 2x - 3$ is a quadratic equation, therefore the graph is a parabola.

13.5 Remainder Theorem

If a polynomial (*i.e.,* a rational integral function) $f(x)$ is divided by $(x - a)$, then the remainder is obtained by substituting a for x in $f(x)$, *i.e.,* the remainder is $f(a)$.

Exp. 1) Find the remainder when $x^2 - 6x + 5$ is divided by $(x + 2)$.

Solution Let $f(x) = x^2 - 6x + 5$. Thus by remainder theorem, the remainder when $f(x)$ is divided by $(x + 2)$, *i.e.,* $[x - (-2)]$ is $f(-2)$

$\therefore f(-2) = (-2)^2 - 6, (-2) + 5 = 4 + 12 + 5 = 21.$

$\therefore$ Thus, the remainder is 21.

NOTE

1. If a polynomial $f(x)$ is divided by $(x + a)$, then remainder is $f(-a)$
2. If a polynomial $f(x)$ is divided by $(x - a)$, then remainder is $f(a)$
3. If a polynomial $f(x)$ is divided by $(ax + b)$, then the remainder is $f(-b/a)$

Hint To get the value of remainder first of all write the divisor equal to zero, *i.e.,* if divisor is $(x + a)$, then write $x + a = 0$
Then, find the value of x, *i.e.,* $x + a = 0 \Rightarrow x = -a$. Then, put the obtained value of x in the polynomial, *i.e.,* $f(x) = 3x^2 + 4x - 5$
$\Rightarrow f(-a) = 3(-a)^2 + 4(-a) - 5$, then solve the function (or expression) and get the simplified value of remainder.

Exp. 2) If $2x^3 + 3x^2 + 7x + 6$ be divided by $2x + 1$, find the remainder.

Solution Let $f(x) = 2x^3 + 3x^2 + 7x + 6.$

Then the remainder when $f(x)$ is divided by $(2x + 1)$

$\therefore 2x + 1 = 0$

$\Rightarrow x = -\frac{1}{2}$

$\therefore f\left(-\frac{1}{2}\right) = 2\left(-\frac{1}{2}\right)^3 + 3\left(-\frac{1}{2}\right)^2 + 7\left(-\frac{1}{2}\right) + 6$

$= -\frac{1}{4} + \frac{3}{4} - \frac{7}{2} + 6$

$= \frac{-1 + 3 - 14 + 24}{4} = \frac{12}{4} = 3$

Exp. 3) Find the remainder when the expression $3x^3 + 8x^2 - 6x + 1$ is divided by $(x + 3)$.

Solution Let $f(x) = 3x^3 + 8x^2 - 6x + 1$

$\because x + 3 = 0$

$\Rightarrow x = -3$

$\therefore f(-3) = 3(-3)^3 + 8(-3)^2 - 6(-3) + 1$

$= -81 + 72 + 18 + 1 = 10$

Hence, the remainder is 10.

Exp. 4) When $x^3 + 3x^2 - kx + 4$ is divided by $x - 2$, the remainder is k. Find the value of the constant k.

Solution Let $f(x) = x^3 + 3x^2 - kx + 4$

Now, since $x - 2 = 0 \Rightarrow x = 2$

$\therefore \quad f(2) = (2)^3 + 3(2)^2 - k(2) + 4 = 24 - 2k$

$\therefore$ Remainder $= 24 - 2k = k \Rightarrow k = 8$

($\because$ the given remainder is k)

13.6 Factor Theorem

If $f(x)$ be a polynomial (*i.e.,* rational integral function) in x and $f(a) = 0$, then $(x - a)$ is a factor of $f(x)$.

By remainder theorem if $f(x)$ be divided by $(x - a)$ the remainder is $f(a)$. But $f(a) = 0$, *i.e.,* there is no remainder.

$\therefore$ $f(x)$ is exactly divisible by $(x - a)$

Hence, $(x - a)$ is a factor of $f(x)$.

NOTE

1. If $f(x)$ be a polynomial and $f(-a) = 0$, then $(x + a)$ is a factor of $f(x)$.
2. If $f(x)$ be a polynomial and $f(-b/a) = 0$, then $(ax + b)$ is a factor of $f(x)$.

Exp. 1) Show that $(x - 2)$ is a factor of the polynomial $2x^2 - 5x + 2$.

Solution Let $f(x) = 2x^2 - 5x + 2$

$\because \quad (x - 2) = 0$

$\Rightarrow \quad x = 2$

$\therefore \quad f(2) = 2(2)^2 - 5(2) + 2$

$f(2) = 0$

$\therefore$ By factor theorem $(x - 2)$ is a factor of $2x^2 - 5x + 2$.

Exp. 2) Prove that $(2x + 5)$ is a factor of the polynomial $2x^2 + 11x + 15$.

Solution Let $f(x) = 2x^2 + 11x + 15$

$\because \quad 2x + 5 = 0 \Rightarrow x = -5/2$

$\therefore \quad f(-5/2) = 2(-5/2)^2 + 11(-5/2) + 15$

$= \frac{25}{2} - \frac{55}{2} + 15$

$f(-5/2) = 0$

Hence, $(2x + 5)$ is a factor of $f(x) = 2x^2 + 11x + 15$.

Exp. 3) Prove that $(a - b)$ is a factor of $(a^3 - b^3)$.

Solution Let $f(a) = a^3 - b^3$

$\because \quad (a - b) = 0 \Rightarrow a = b$

$\therefore \quad f(b) = (b)^3 - b^3$

$f(b) = 0$

$\therefore \quad f(a) = 0$

Hence, $(a - b)$ is a factor of $a^3 - b^3$.

Exp. 4) If $(x - 3)$ and $(x + 4)$ are both the only factors of $f(x)$, then find $f(x)$.

Solution Since, there are only two factors of $f(x)$, therefore the product of $(x - 3)$ and $(x + 4)$ is equal to $f(x)$.

$\therefore \quad f(x) = (x - 3)(x + 4)$

$f(x) = x^2 + x - 12$

13.7 H.C.F. and L.C.M. of Polynomials

1. A polynomial $D(x)$ is a divisor of the polynomial $P(x)$ if it is a factor of $P(x)$. Where $Q(x)$ is another polynomial such that $P(x) = D(x) \cdot Q(x)$
2. **HCF/GCD (Greatest Common Divisor) :** A polynomial $h(x)$ is called the HCF or GCD of two or more given polynomials, if $h(x)$ is a polynomial of highest degree dividing each one of the given polynomials.

NOTE The coefficient of highest degree term is always taken as positive.

3. **LCM (Least Common Multiple) :** A polynomial $P(x)$ is called the LCM of two or more given polynomials, if it is a polynomial of smallest degree which is divided by each one of the given polynomials.

   For any two polynomials $P(x)$ and $Q(x)$. We have :

   $P(x) \times Q(x) =$ [HCF of $P(x)$ and $Q(x)$]

   $\times$ [LCM of $P(x)$ and $Q(x)$]

Exp. 1) Find the HCF and LCM of the following polynomials $(x + 2)^2(x - 3)^2(x + 1)^2$, $(x + 1)^3(x + 2)^3(x - 3)$.

Solution Let $P(x) = (x + 2)^2(x - 3)^2(x + 1)^2$

and $Q(x) = (x + 1)^3(x + 2)^3(x - 3)$

HCF $= (x + 1)^2(x + 2)^2(x - 3)$

(For the HCF we take the highest power of factors common to both $P(x)$ and $Q(x)$) and LCM $= (x + 1)^3(x + 2)^3(x - 3)^2$

[For LCM we take the highest powers of the factors either of $P(x)$ or $Q(x)$]

Exp. 2) Find the HCF and LCM of the following polynomials $22x(x + 1)^2$, $36x^2(2x^2 + 3x + 1)$

Solution Let $P(x) = 22x(x + 1)^2$

and $Q(x) = 36x^2(2x^2 + 3x + 1)$

$P(x) = 2 \times 11 \times x \times (x + 1)^2$

and $Q(x) = 2 \times 18 \times x^2 \times (x + 1)(2x + 1)$

$\therefore$ HCF $= 2 \times x \times (x + 1) = 2x(x + 1)$

and LCM $= 2x(x + 1) \times 11 \times 18 \times x \times (x + 1)(2x + 1)$

$= 396x^2(x + 1)^2(2x + 1)$

(To find the LCM, first take the HCF and then take all the rest factors).

Exp. 3) Find the HCF and LCM of $(3+13x-30x^2)$ and $(25x^2-30x+9)$.

Solution Let $P(x)=(3+13x-30x^2)$

and $Q(x)=(25x^2-30x+9)$

or $P(x)=3+13x-30x^2$

$=3+18x-5x-30x^2$

$=-(6x+1)(5x-3)$

$Q(x)=25x^2-30x+9=(5x-3)^2$

$\therefore$ HCF of $P(x)$ and $Q(x)=(5x-3)$

and LCM of $P(x)$ and $Q(x)=-(5x-3)^2(6x+1)$.

Exp. 4) The HCF of two polynomials is $(x-2)(x+3)$ and their LCM is $(x-2)^2(x+3)(x+1)$. If one of the polynomial is x^2-x-2, find the other.

Solution HCF $=(x-2)(x+3)$

and LCM $=(x-2)^2(x+3)(x+1)$

$\therefore$ HCF $\times$ LCM $=(x-2)^3(x+3)^2(x+1)$

Let $P(x)=x^2-x-2=x^2-2x+x-2$

$=(x-2)(x+1)$

$\therefore$ $P(x)\cdot Q\cdot(x)=$ HCF $\times$ LCM

$\therefore$ $Q(x)=\dfrac{\text{HCF}\times\text{LCM}}{P(x)}$

$=\dfrac{(x-2)^3(x+3)^2(x+1)}{(x-2)(x+1)}$

$=(x-2)^2(x+3)^2$

$\therefore$ The other polynomial [say $Q(x)$] is $(x-2)^2(x+3)^2$.

13.8 Rational Expressions

If $P(x)$ and $Q(x)$ are two polynomials such that $Q(x)\neq 0$, then the quotient $\dfrac{P(x)}{Q(x)}$ is called a rational expression.

- Every polynomial is a rational expression but a rational expression need not be a polynomial.
- The rational expression $\dfrac{P(x)}{Q(x)}$ is said to be in its simplest form (or in lowest terms) if the G.C.D. of $P(x)$ and $Q(x)$ is 1.
- To express a rational expression in its simplest form, express the polynomials in the numerator and in the denominators as product of simplest factors (*i.e.,* no further factorization is possible), and then cancel the common factors.

Exp. 1) Which of the following algebraic expressions are polynomials?

(a) $x^2-\sqrt{3}x+4$ (b) $x^3-3x^2+4\sqrt{x}$

(c) $\sqrt{2}x^2-\sqrt{3}x+\sqrt{5}$ (d) x^3-2x+x^{-2}

Solution

(a) $x^2-\sqrt{3}x+4$ is a polynomial and (c) $\sqrt{2}x^2-\sqrt{3}x+\sqrt{5}$ is also a polynomial

(b) $x^3-3x^2+4\sqrt{x}$ is not polynomial since $4\sqrt{x}=4x^{1/2}$, *i.e.,* power of x is $\dfrac{1}{2}$ (*i.e.,* fractional)

(d) x^3-2x+x^{-2} is not a polynomial since x^{-2} has negative power of x.

Exp. 2) Express the following in the lowest terms. $\dfrac{x^2+6x+9}{x^2-9}$

Solution $\dfrac{x^2+6x+9}{x^2-9}=\dfrac{(x+3)(x+3)}{(x+3)(x-3)}=\dfrac{x+3}{x-3}$

Important Formulae

1. $(a+b)^2=a^2+b^2+2ab$
2. $(a-b)^2=a^2+b^2-2ab$
3. $(a+b)^2=(a-b)^2+4ab$
4. $(a-b)^2=(a+b)^2-4ab$
5. $(a^2+b^2)=\dfrac{1}{2}[(a+b)^2+(a-b)^2]$
6. $a^2-b^2=(a+b)(a-b)$
7. $(a+b)^3=a^3+b^3+3ab(a+b)$
8. $(a-b)^3=a^3-b^3-3ab(a-b)$
9. $a^3+b^3=(a+b)(a^2+b^2-ab)$
10. $a^3-b^3=(a-b)(a^2+b^2+ab)$
11. $(a+b+c)^2=(a^2+b^2+c^2)+2(ab+bc+ac)$
12. $a^3+b^3+c^3-3abc$
    $=(a+b+c)(a^2+b^2+c^2-ab-bc-ac)$
    if $a+b+c=0$, then $a^3+b^3+c^3=3abc$
13. $a^4+b^4+a^2b^2=(a^2+b^2+ab)(a^2+b^2-ab)$
14. $a^4-b^4=(a-b)(a+b)(a^2+b^2)$
15. $a^8-b^8=(a-b)(a+b)(a^2+b^2)(a^4+b^4)$

13.9 Basic Facts to Remember

1. **To factorize the cyclic expressions :**
   (a) Arrange the terms in decreasing or increasing powers of one of the letters (or literals)
   (b) Make one factor common by taking two or three terms together.
   (c) Rewrite the terms of the other factor in decreasing or increasing power of the next letter.
   (d) Repeat the process till all the factors are found out.

2. Sigma (Σ) notation :

$\Sigma x = x + y + z$, for letters x, y, z

$\Sigma xy = xy + yz + zx$

$\Sigma x^2(y - z) = x^2(y - z) + y^2(z - x) + z^2(x - y)$

3. Some important results :

(a) $\Sigma(x - y) = 0$ (b) $\Sigma(x^2 - y^2) = 0$

(c) $\Sigma(x^3 - y^3) = 0$ (d) $\Sigma x(y - z) = 0$

(e) $\Sigma x^2(y^2 - z^2) = 0$

(f) $\Sigma x^2(y - z) = -(x - y)(y - z)(z - x)$

(g) $\Sigma x(y^2 - z^2) = (x - y)(y - z)(z - x)$

(h) $\Sigma(x - y)^3 = 3(x - y)(y - z)(z - x)$

Exp. 1) Factorize
$x(y^2 + z^2) + y(z^2 + x^2) + z(x^2 + y^2) + 2xyz$

Solution $x(y^2 + z^2) + y(z^2 + x^2) + z(x^2 + y^2) + 2xyz$

$= xy^2 + xz^2 + yz^2 + x^2y + x^2z + y^2z + 2xyz$

Arranging in decreasing powers of x

$= x^2y + x^2z + xy^2 + xz^2 + 2xyz + y^2z + yz^2$

$= x^2(y + z) + x(y^2 + z^2 + 2yz) + yz(y + z)$

$= x^2(y + z) + x(y + z)^2 + yz(y + z)$

$= (y + z)[x^2 + x(y + z) + yz]$

$= (y + z)(x^2 + xy + xz + yz)$

$= (y + z)[x(x + y) + z(x + y)]$

$= (y + z)(x + y)(x + z)$

$= (x + y)(y + z)(z + x)$

Exp. 2) Factorize $\Sigma xy(x + y) + 2xyz$

Solution $\Sigma xy(x + y) + 2xyz$

$= xy(x + y) + yz(y + z) + zx(z + x) + 2xyz$

$= x^2y + x^2z + y^2z + y^2x + z^2x + z^2y + 2xyz$

$= x^2(y + z) + x(y^2 + z^2 + 2yz) + yz(y + z)$

$= x^2(y + z) + x(y + z)^2 + yz(y + z)$

$= (y + z)[x^2 + x(y + z) + (yz)]$

$= (y + z)[x(x + y) + z(x + y)]$

$= (y + z)(x + y)(y + z)$

Introductory Exercise 13.1

1. Sunny Gupta scored x marks in Maths, y marks in *DI/DS* and 40 marks in English. What is his total score in these three subjects?
(a) $100 - (x + y)$ (b) $100 - (x + y + 40)$
(c) $x + y - 40$ (d) $x + y + 40$

2. Quotient of z by 4 is multiplied by thrice the number y.
(a) $\frac{3y}{4z}$ (b) $\frac{3z}{4y}$
(c) $\frac{3yz}{4}$ (d) $\frac{3}{4yz}$

3. Express $6 \times p \times q \times r \times p \times p \times p$ in the exponential form
(a) $6(p^4 + q + r)$ (b) $6 \times 4p \times q \times r$
(c) $6p^4qr$ (d) none of these

4. Find the number of terms in $2x^2 - \frac{3}{x} + \frac{5}{x^2} + 9$.
(a) 1 (b) 2
(c) 3 (d) 4

5. Find the number of terms in
$$4xyz - \frac{3}{x^2} + 6xy^2 - 5z^3 + 6x.$$
(a) 3 (b) 4
(c) 5 (d) 6

6. Find the number of terms in $7 \times a + b \div 3 - c + b$.
(a) 3 (b) 5
(c) 4 (d) 6

7. Find the coefficient of z^3 in $-7xy^2z^3$.
(a) xy^2 (b) -7
(c) $7xy^2$ (d) $-7xy^2$

8. In the following, which pair contains like terms?
(a) $2x^2y, 2xy^2$ (b) $2xy, -3yx$
(c) $6, 6x$ (d) $2xy, 3xyz$

9. Find the degree of the polynomial $4x^3 - 2x^2y^3 + 6$.
(a) 3 (b) 4
(c) 5 (d) 6

10. Simplify the following :
$$2x^2 + 3y^2 - 5xy + 5x^2 - y^2 + 6xy - 3x^2$$
(a) $7x^2 + 4y^2 - 11xy$ (b) $7x^2 + 2y^2 - 30xy$
(c) $4x^2 + 2y^2 - 11xy$ (d) $4x^2 + xy + 2y^2$

11. If sum of two polynomials is $5x^2 + 3x - 1$. If one of them is $3x^3 - 2x + 7$. Find the other.
(a) $3x^3 + 5x^2 + 5x - 8$ (b) $-3x^3 + 5x^2 + 5x - 8$
(c) $2x^2 + x + 6$ (d) none of these

12. Multiply $\frac{1}{2}a^2b - \frac{2}{3}ab^2 + 5$ by $6abc$:
(a) $3a^3b^2c - 4a^2b^3c + 30abc$
(b) $3a^3b^3c - 4a^3b^2c + 6abc$
(c) $6a^3b^2 + 18ab^2c + 30abc$
(d) none of the above

13. Find the product of $\left(\frac{1}{2}x^2 - \frac{1}{3}y^2\right)$ and $\left(\frac{1}{2}x^2 + \frac{1}{3}y^2\right)$.

(a) $\frac{1}{9}y^4 - \frac{1}{4}x^4$ (b) $\frac{1}{4}x^4 - \frac{1}{9}y^4$

(c) $4x^2 - 9y^4$ (d) $\frac{1}{4}x^4 - \frac{1}{9}y^9$

14. Divide $36x^2y^5 + 42xy^3 - 24x^3y^2 - 12y^5$ by $-6y^2$.

(a) $6x^2y^3 - 7xy + 4x^3 + 2y^3$

(b) $-6x^2y^3 - 7xy^2 + 4x^2 + 2y^3$

(c) $-6x^2y^3 - 7xy + 4x^3 + 2y^3$

(d) none of the above

15. Find the remainder when the expression $3x^2 + 8x^2 - 6x + 1$ is divided by $x + 3$.

(a) 1 (b) 10

(c) 6 (d) 0

16. Find the value of a if the division of $ax^3 + 9x^2 + 4x - 10$ by $(x + 3)$ leaves a remainder 5.

(a) 1 (b) 2

(c) 3 (d) 4

17. If $(x + 1)$ and $(x - 2)$ are factors of $x^3 + ax^2 - bx - 6$, then find the values of a and b respectively.

(a) 2, 3 (b) 3, 5

(c) 5, 3 (d) 2, 5

18. If $(5x^2 + 14x + 2)^2 - (4x^2 - 5x + 7)^2$ is divided by $(x^2 + x + 1)$, then, quotient 'q' and remainder 'r' are given by :

(a) $q = (x^2 + 19x - 5), r = 0$

(b) $q = 9(x^2 + 19x - 5), r = 0$

(c) $q = (x^2 + 19x - 5), r = 1$

(d) $q = 9(x^2 + 19x - 5), r = 1$

19. On dividing $(x^3 - 6x + 7)$ by $(x + 1)$, then the remainder is :

(a) 2 (b) 0

(c) 12 (d) 6

20. When $(x^4 - 3x^3 + 2x^2 - 5x + 7)$ is divided by $(x - 2)$, then the remainder is :

(a) 0 (b) –3

(c) 2 (d) 3

21. If $x^3 + 5x^2 + 10k$ leaves remainder $-2x$ when divided by $x^2 + 2$, then the value of k is :

(a) –2 (b) –1 (c) 1 (d) 2

22. If $(x^{11} + 1)$ is divided by $(x + 1)$, then the remainder is :

(a) 0 (b) 2 (c) 1 (d) 10

23. If $5x^3 + 5x^2 - 6x + 9$ is divided by $(x + 3)$, then the remainder is :

(a) 0 (b) –32

(c) 23 (d) –63

24. If $f(x)$ is divided by $(2x + 3)$, then the remainder is :

(a) $f(2/3)$ (b) $f(-2/3)$

(c) $f(3/2)$ (d) $f(-3/2)$

25. When $(x^3 - 2x^2 + px - q)$ is divided by $(x^2 - 2x - 3)$, the remainder is $(x - 6)$. The values of p and q are :

(a) $p = -2, q = -6$ (b) $p = 2, q = -6$

(c) $p = -2, q = 6$ (d) $p = 2, q = 6$

26. If $(x - 2)$ is a factor of $(x^2 + 3qx - 2q)$, then the value of q is :

(a) –2 (b) –1

(c) 1 (d) 2

27. Find the value of k, if $(x + 2)$ exactly divides $x^3 + 6x^2 + 4x + k$.

(a) 4 (b) 6

(c) –8 (d) –10

28. Which one of the following is a factor of $x^4 - 5x^3 + 5x^2 - 10x + 24$?

(a) $(x + 2)$ (b) $(x + 4)$

(c) $(x - 2)$ (d) none of these

29. If $(x + k)$ is a common factor of $(x^2 + px + q)$ and $(x^2 + lx + m)$, then the value of k is :

(a) $l + p$ (b) $m - q$ (c) $\frac{l - p}{m - q}$ (d) $\frac{m - q}{l - p}$

30. If $(x - a)$ is a factor of $(x^3 - 3x^2a + 2a^2x + b)$, then the value of b is :

(a) 0 (b) 1

(c) 2 (d) 3

31. $(x^{29} - x^{25} + x^{13} - 1)$ is divisible by :

(a) $(x + 1)$ but not by $(x - 1)$

(b) $(x - 1)$ but not by $(x + 1)$

(b) both $(x + 1)$ and $(x - 1)$

(d) neither $(x - 1)$ nor $(x + 1)$

32. One of the factors of $3x^3 + x^2 - 12x - 4$ is :

(a) $3x - 2$ (b) $3x - 1$

(c) $3x + 1$ (d) $3x + 2$

33. $x^{100} + 2x^{99} + k$ is divisible by $(x + 1)$, then the value of k is :

(a) –3 (b) –2

(c) 1 (d) 2

34. If $(x - 1)$ is a factor of $(x^3 - m)$, then the value of m is :

(a) –6 (b) –5

(c) 1 (d) 3

35. If the polynomial $f(x)$ is such that $f(-3) = 0$, then a factor of $f(x)$ is :

(a) –3 (b) 3

(c) $\frac{1}{3}$ (d) $x + 3$

36. If $\left(x+\frac{1}{x}\right)=2$, then $\left(x^2+\frac{1}{x^2}\right)$ is equal, to :

(a) 2 (b) 4
(c) 5 (d) 6

37. If $\left(x-\frac{1}{x}\right)=4$, then the value of $\left(x^2+\frac{1}{x^2}\right)$ is :

(a) 16 (b) 18
(c) 14 (d) none of these

38. If $\left(x+\frac{1}{x}\right)=2\sqrt{3}$, then the value of $\left(x^3+\frac{1}{x^3}\right)$ is :

(a) $12\sqrt{3}$ (b) 18
(c) $18\sqrt{3}$ (d) none of these

39. If $\left(x+\frac{1}{x}\right)=3$, then the value of $\left(x^3+\frac{1}{x^3}\right)$ is equal to :

(a) $18\sqrt{3}$ (b) 18
(c) $9\sqrt{3}$ (d) 12

40. If $\left(x+\frac{1}{x}\right)=2$, then the value of $\left(x^6+\frac{1}{x^6}\right)$ is :

(a) 2 (b) 4
(c) 8 (d) none of these

41. If $\left(x^2+\frac{1}{x^2}\right)=6$, then the value of $\left(x-\frac{1}{x}\right)$ is :

(a) 2 (b) 3
(c) –2 (d) both (a) and (c)

42. If $\left(x^3-\frac{1}{x^3}\right)=36$, then the value of $\left(x-\frac{1}{x}\right)$ is :

(a) 1 (b) 2
(c) 3 (d) 6

43. If $\left(x^3+\frac{1}{x^3}\right)=2$, then the value of $\left(x+\frac{1}{x}\right)$ is :

(a) 1 (b) 2
(c) 3 (d) 4

44. If $\left(x^4+\frac{1}{x^4}\right)=34$, then the value of $\left(x-\frac{1}{x}\right)$ is :

(a) 1 (b) 2 (c) 3 (d) 4

45. If $\left(x^4+\frac{1}{x^4}\right)=119$, then the value of $\left(x^3-\frac{1}{x^3}\right)$ is :

(a) 49 (b) 27
(c) 36 (d) 63

46. If $\left(3x-\frac{2}{x}\right)=5$, then the value of $\left(9x^2-\frac{4}{x^2}\right)$ is :

(a) 25 (b) 35
(c) 30 (d) none of these

47. If $m^2-4m+1=0$, then the value of $\left(m^3+\frac{1}{m^3}\right)$ is :

(a) 48 (b) 52
(c) 64 (d) none of these

48. If $x+y=13$ and $xy=40$, then the value of (x^2+y^2) is :

(a) 69 (b) 80
(c) 89 (d) none of these

49. If $(x+y)=13$ and $xy=36$, then the value of (x^3+y^3) is

(a) 369 (b) 936
(c) 693 (d) none of these

50. If $(x+y)=8$ and $xy=15$, then the value of (x^3-y^3) is :

(a) 120 (b) 60
(c) 98 (d) 82

51. If $(x+y+z)=6$ and $(xy+yz+zx)=11$, then the value of $(x^3+y^3+z^3-3xyz)$ is :

(a) 81 (b) 54
(c) 18 (d) none of these

52. If $(x+y+z)=0$, then the value of $(x^3+y^3+z^3)$ is :

(a) $3x^3y^3z^3$ (b) $3xyz$
(c) xyz (d) $3(x+y+z)$

53. If $a^{1/3}+b^{1/3}+c^{1/3}=0$, then :

(a) $a+b+c=0$ (b) $a+b+c=3abc$
(c) $a^3+b^3+c^3=0$ (d) $(a+b+c)^3=27abc$

54. If $2^x-2^{x-1}=8$, then the value of x^3 is :

(a) 46 (b) 27
(c) 64 (d) 8

55. If $3^x+3^{x+1}=36$, then the value of x^x is :

(a) 64 (b) 3125
(c) 81 (d) 4

56. If a and b are non zero rational unequal numbers, then $\frac{(a+b)^2-(a-b)^2}{a^2b-ab^2}$ is equal to :

(a) $\frac{1}{a-b}$ (b) $\frac{2}{a-b}$
(c) $\frac{4}{a-b}$ (d) $\frac{1}{ab}$

57. If $\frac{x}{(b-c)(b+c-2a)}$

$=\frac{y}{(c-a)(c+a-2b)}=\frac{z}{(a-b)(a+b-2c)}$,

then the value of $(x+y+z)$ is :

(a) $a+b+c$ (b) 0
(c) $a^2+b^2+c^2$ (d) can't be determined

58. $(a^4+5a^3+6a^2)$ is equal to :

(a) $a(a^2+3)(a+2)$ (b) $a(a+3)(a^2+2)$
(c) $a^2(a+3)(a+2)$ (d) $a^2(a-2)(a-3)$

59. The factors of (x^4+16) are :

(a) $(x^2+4)(x^2-4)$ (b) $(x^2+4)(x^2+4)$
(c) $x(x^2+2)(x^4+4)$ (d) do not exist

60. If $(a^{3/2} - ab^{1/2} + a^{1/2}b - b^{3/2})$ is divided by $(a^{1/2} - b^{1/2})$, then the quotient is :
(a) $a + b$ (b) $a - b$ (c) $a^{1/2} + b^{1/2}$ (d) $a^2 - b^2$

61. The factors of $x(y^2 - z^2) + y(z^2 - x^2) + z(x^2 - y^2)$ are :
(a) $(x - y)(y - z)(z - x)$ (b) $(x + y)(y + z)(z + x)$
(c) $(y - x)(z - y)(x - z)$ (d) $(x + y)(z - y)(x - z)$

62. $(a + b)^3 - (a - b)^3$ can be factorized as :
(a) $2a(a^2 + 3b^2)$ (b) $2a(3a^2 + b^2)$
(c) $2b(3a^2 + b^2)$ (d) $2a(a^2 + 3b^2)$

63. The factors of $(x^4 + 4)$ are :
(a) $(x^2 + 2)^2$ (b) $(x^2 + 2x + 2)(x^2 - 2x + 2)$
(c) $(x^2 + 2)(x^2 - 2)$ (d) none of these

64. The factors of $x^3 - 7x + 6$ are :
(a) $(x - 1)(x + 3)(x - 2)$ (b) $(x + 1)(x + 2)(x - 3)$
(c) $x(x - 6)(x - 1)$ (d) $(x^2 - 6)(x - 1)$

65. The factors of $(64x^3 - 216y^3)$ are :
(a) $(4x - 6y)(16x^2 - 36y^2)$
(b) $(4x - 6y)[16x^2 + 36y^2 + 24xy]$
(c) $(4x + 6y)(4x - 6y)$
(d) none of the above

66. The factors of $(a^2 + 4b^2 + 4b - 4ab - 2a - 8)$ are :
(a) $(a - 2b - 4)(a - 2b + 2)$
(b) $(a - b + 2)(a - 4b - 4)$
(c) $(a + 2b - 4)(a + 2b + 2)$
(d) none of the above

67. The factors of $(a - b)^3 + (b - c)^3 + (c - a)^3$ are :
(a) $(a + b + c)(a^2 + b^2 + c^2 + ab + bc + ac)$
(b) $(a + b + c)(a^2 + b^2 + c^2 - ab - bc - ac)$
(c) $3(a - b)(b - c)(c - a)$
(d) $(a - b)(b - c)(c - a)$

68. If $a + b + c = 0$, then $a^2 + b^2 + c^2$ is :
(a) 0 (b) $2(a^2 - bc)$
(c) $-4(ab + bc + ca)$ (d) $-2(ab + bc + ca)$

69. Which of the following statements are true?
1. LCM of $10a^2bc, 15abc, 20ab^2c^2$ is $120a^2b^2c^2$
2. HCF of $(x^2 - 6x + 9)$ and $(x^3 - 27)$ is $(x - 3)$
3. HCF of $(6x^2 - 7x - 3)$ and $(2x^2 + 11x - 21)$ is $2x - 3$.
(a) 1, 2, 3 (b) 1, 2 (c) 1, 3 (d) 2, 3

70. The LCM of $(2x^2 - 3x - 2)$ and $(x^3 - 4x^2 + 4x)$ is :
(a) $x(2x^2 + 1)(x^2 + 2)$ (b) $x(2x + 1)(x - 2)^2$
(c) $x(2x^2 + 1)(x - 1)^2$ (d) $x(2x + 1)(x^2 - 1)$

71. The GCD of $2(x^2 - y^2)$ and $5(x^3 - y^3)$ is :
(a) $2(x^2 - y^2)$ (b) $x + y$
(c) $x - y$ (d) $10(x^2 - y^2)(x^2 + y^2 + xy)$

72. The GCD of $(x^4 - 4x^2 + 3)$ and $(x^4 - x^2 - 6)$ is :
(a) $(x - 1)$ (b) $(x + 1)$ (c) $(x^2 - 1)$ (d) $(x^2 - 3)$

73. The HCF of $(x^2 - 4), (x^2 - 5x - 6)$ and $(x^2 + x - 6)$ is :
(a) 1 (b) $x + 2$ (c) $x - 2$ (d) $(x^2 + x - 6)$

74. The GCD of $[x^2 - ax - (a + 1)]$ and $[ax^2 - x - (a + 1)]$ is :
(a) $(x - 1)$ (b) $(x + 1)$
(c) $(x + a + 1)$ (d) $(x - a - 1)$

75. LCM of the polynomials P and Q, where
$P = (x - 2)(x + 1)^2(x + 3)^2$
$Q = (x + 1)^2(x + 3)(x + 4)$ is given by :
(a) $(x - 2)(x + 1)(x + 3)^2(x + 4)$
(b) $(x - 2)(x + 4)(x + 3)^2(x + 1)^2$
(c) $(x - 2)(x + 1)^2(x + 3)(x + 4)$
(d) $(x + 1)(x - 2)(x + 3)(x + 4)$

76. The LCM of $(a^3 + b^3)$ and $(a^4 - b^4)$ is :
(a) $(a^3 + b^3)(a^2 + b^2)(a - b)$
(b) $(a^3 + b^3)(a^2 + b^2)(a + b)$
(c) $(a^3 + b^3)(a^2 + b^2 + ab)(a + b)$
(d) $(a^3 + b^3)(a^2 - b^2)(a - b)$

77. The HCF of $(x^4 - 1)$ and $(x^3 + x^2 + x + 1)$ is :
(a) $(x^2 - 1)(x^2 + 1)$ (b) $(x^2 + 1)(x + 1)$
(c) $(x + 1)(x^2 - 1)$ (d) $(x + 1)(x^2 + 1)(x^3 + 1)$

78. The GCD of $(2x^2 - 4x), (3x^4 - 12x^2)$ and $(2x^5 - 2x^4 - 4x^3)$ is :
(a) $x(x - 2)$ (b) $2x(x - 2)$ (c) $2x(2 - x)$ (d) $2x(2 + x)$

79. The HCF of two expressions P and Q is 1. Their LCM is :
(a) $(P + Q)$ (b) $(P - Q)$
(c) PQ (d) $(P)^Q$

80. The LCM of $(x + 2)^2(x - 2)$ and $(x^2 - 4x - 12)$ is :
(a) $(x + 2)(x - 2)^2$ (b) $(x - 2)(x + 2)(x - 6)$
(c) $(x - 2)(x + 2)$ (d) $(x - 2)(x - 6)(x + 2)^2$

81. The HCF of $a^2 - ab - 2b^2$ and $2a^2 - ab - b^2$ is :
(a) $(a + b)$ (b) $(a - b)$
(c) $(2a - 3b)$ (d) none of these

82. HCF and LCM of $a^2b^3c^4$ and $a^5b^4c^3$ are :
(a) $a^2b^3c^4$, $a^5b^4c^3$ (b) $a^2b^3c^3$, $a^2b^3c^4$
(c) $a^2b^3c^3$, $a^5b^4c^4$ (d) $a^5b^3c^3$, $a^5b^4c^3$

Directions (for Q. Nos. 83 to 86) *Express each of the following as a rational expressions.*

83. $\dfrac{(x + 3)}{(x - 2)} - \dfrac{(x + 1)}{(x - 3)}$:
(a) $\dfrac{x - 7}{(x^2 + 5x - 6)}$ (b) $\dfrac{7 - x}{(x^2 - 5x + 6)}$
(c) $\dfrac{x - 7}{2x^2 - 5x + 6}$ (d) $\dfrac{x - 7}{x^2 - 5x + 6}$

84. $\frac{x+1}{x-1}+\frac{x-1}{x+1}$:

(a) $\frac{1}{2}\frac{(x^2+1)}{(x^2-1)}$ (b) $\frac{(x^2+1)}{(x^2-1)}$ (c) $\frac{2(x^2+1)}{(x^2-1)}$ (d) $\frac{x^2-1}{x^2+1}$

85. $\frac{x^2-5x+6}{x^2-9x+20}\div\frac{x^2-3x+2}{x^2-5x+4}$:

(a) $\frac{(x-4)}{(x-3)}$ (b) $\frac{(x-3)}{(x-5)}$

(c) $\frac{(x-2)}{(x-5)}$ (d) $\frac{(x-5)}{(x-3)}$

86. Sum of $\frac{2x^2+3}{x-3}$ and its reciprocal is :

(a) $\frac{4x^4+13x^2-6x+18}{2x^3-6x^2+3x-9}$ (b) $\frac{4x^4-13x^2+6x-18}{3x^2-6x^3+3x+9}$

(c) $\frac{4x^4-13x^2-6x+18}{4x^3-6x^2+3x-9}$ (d) none of these

Directions (for Q. Nos. 87 to 89) *Express the following in the lowest terms.*

87. $\frac{(x-3)(x^2-5x+4)}{(x-4)(x^2-2x-3)}$:

(a) $\frac{x-1}{x+1}$ (b) $\frac{x+1}{x-1}$ (c) $\frac{x-1}{x-2}$ (d) $\frac{x+1}{x+3}$

88. $\left(\frac{2x^2+1}{x-1}+\frac{x-1}{x+1}\right)\times\left(\frac{x^2-1}{2x}\right)$:

(a) $\frac{2x^2+3x}{2}$ (b) $\frac{2x^3+3x^2-x+2}{2x}$

(c) $\frac{2x^3-3x^2+x-2}{2x}$ (d) none of these

89. $\sqrt{\frac{(x^2+3x+2)(x^2+5x+6)}{x^2(x^2+4x+3)}}$:

(a) $\frac{x+2}{2}$ (b) $\frac{x+2}{x}$

(c) $\frac{x-2}{x}$ (d) $\frac{x+4}{x+3}$

90. Simplify $\frac{1}{(a-b)(a-c)}+\frac{1}{(b-c)(b-a)}+\frac{1}{(c-a)(c-b)}$

(a) 0 (b) 1

(c) 3 (d) none of these

91. Express $\frac{1}{(1-x)}+\frac{1}{(1+x)}+\frac{2}{(1+x^2)}+\frac{4}{(1+x^4)}$ as a rational expression :

(a) 1 (b) $\frac{1-x^4}{1+x^4}$

(c) $\frac{8}{1-x^8}$ (d) none of these

13.10 Linear Equations

Equations : A statement of equality which involves literal number(s) is called an equation.

e.g., $4x=12,\quad 4+x=10,\quad 7-2x=5$ etc.

NOTE The literal numbers involved in each equation are called its variables (unknowns). Usually the variables are denoted by letters towards the end of English alphabet, *e.g., x, y, z, u, v, w,* etc.

Linear Equation : An equation in which the highest power of the variables involved is one, is called a linear equation. *e.g.,* $x+y=10,\ 7x=21,\ \frac{x}{3}=8.$

Linear Equation in one Variable : An equation containing only one variable (literal) with highest power 1 is called a linear equation in one variable. *e.g.,* $17x=51,$ $23+x=30,\ 5y=30,$ etc.

Linear Equation in two Variables : An equation of the form $ax+by=c$, where a, b and c are real numbers is called a linear equation in two variables x and y.

The graph of a linear equation $ax+by=c$ is a straight line.

$3x+2y=18,$ is an example of a linear equation in two variables.

- The value of the variables that satisfy the equation is called the solution (or solution set) of the equation.

An equation can be solved by using the following rules :

(i) The same number may be added to both sides of the equation.

(ii) The same number may be subtracted from both sides of the equation.

(iii) Both sides of the equation may be multiplied by same non zero number.

(iv) Both sides of the equation may be divided by same non-zero number.

(v) A term may be transposed from one side of the equation to the other side, but its sign will change. This is called rule of transposition.

Important Points About Linear Equation in Two Variables:

(i) The graph of an equation of the type $x=k$ (where k is a constant) is a straight line parallel to the y-axis at a distance of k units from the y-axis.

(ii) The graph of an equation of the type $y = k$ (where k is a constant) is a straight line parallel to the x-axis at a distance of k units from the x-axis.

(iii) The point of intersection of the two lines gives the solution of the two equations.

(iv) A single linear equation in two variables has infinite no. of solutions.

13.11 Simultaneous Linear Equations

Two or more linear equations in two variables form a system of linear simultaneous equations.

e.g., $a_1x + b_1y = c_1$ and $a_2x + b_2y = c_2$

Consistent System : A system consisting of two simultaneous linear equations is said to be consistent, if it has at least one solution.

Inconsistent System : A system consisting of two simultaneous linear equations is said to be inconsistent, if it has no solution. If there are two simultaneous equations :

$a_1x + b_1y = c_1$ and $a_2x + b_2y = c_2$, then

Unique solution	Infinite solution	No solution
$\frac{a_1}{a_2} \neq \frac{b_1}{b_2}$	$\frac{a_1}{a_2} = \frac{b_1}{b_2} = \frac{c_1}{c_2}$	$\frac{a_1}{a_2} = \frac{b_1}{b_2} \neq \frac{c_1}{c_2}$
(Independent equation)	(Dependent equation)	(Inconsistent equation)

- The homogeneous system has a non-zero solution only when $\frac{a_1}{a_2} = \frac{b_1}{b_2}$ and in this case, the system has an infinite number of solution.
- A system of equations has unique solution, when only one variable satisfies the equation.
- For a system of equations a unique solution is possible only when the number of variables is equal to or less than number of independent and consistent equations.

  e.g., $2x + 3y = 5$ and $7x + 5y = 20$

  and $2x + 3y = 5,\quad 7x + 5y = 12,\quad 5x + 8y = 13$
- The equation of the type $ax + by = c$ and $kax + kby = kc$ are known as dependent equations.

  e.g., $2x + y = 11$ …(i)

  $6x + 3y = 33$ …(ii)

  Here eq. (ii) is the multiple of eq. (i). Thus, there are basically both the equations same, *i.e.,* eq. (ii) is dependent on eq. (i). In this case there are infinite number of solutions.
- The equation of the type $ax + by = c$ and $kax + kby = lc$ are known as inconsistent equations.

  e.g., $3x + 2y = 8$ …(i)

  and $6x + 4y = 6$ …(ii)

Properties of graphs of $a_1x + b_1y = c_1$ and $a_2x + b_2y = c_2$

(i) intersecting if the system has a unique solution.

(ii) coincident if the system has infinite number of solution

(iii) parallel if the system has no solution.

Graphical Representation of Simultaneous Linear Equations

(i) intersecting lines (unique solution)

e.g., $x + y = 4$ …(i)

and $3x + 2y = 11$ …(ii)

$\therefore \quad 3(x + y) = 3 \times 4 \Rightarrow 3x + 3y = 12$

$\therefore \quad 3x + 3y = 12$

$3x + 2y = 11$

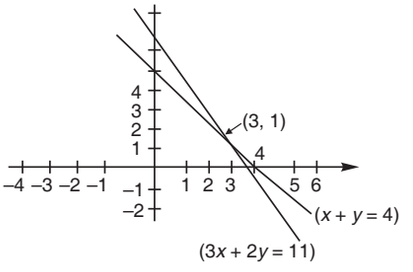
$_ \quad _ \quad _$

$y = 1$

$\therefore \quad x + y = 4 \Rightarrow x + 1 = 4 \Rightarrow x = 3$

$\therefore \quad x = 3$ and $y = 1$

Thus, two given lines intersect at $x = 3,\ y = 1$.

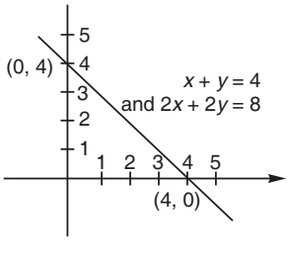


(ii) Coincident lines (infinite number of solutions)

e.g., $x + y = 4$ …(i)

$2x + 2y = 8$ …(ii)

The two equations are dependent, therefore the graph of two lines will coincide.

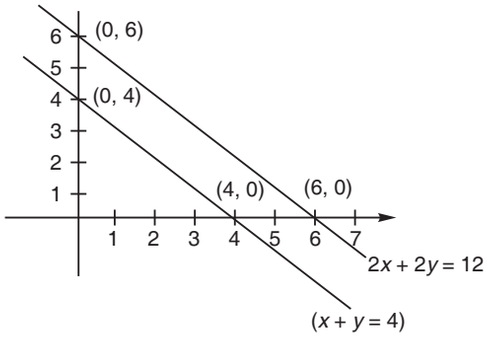


(iii) Parallel lines (no solution)

e.g., $x + y = 4$ …(i)

$$2x + 2y = 12 \quad \ldots(ii)$$

Since, the system of equations is inconsistent therefore there is no any solution and in this case we obtain two different parallel lines.



13.12 Algebraic Methods of Solving Simultaneous Equations in Two Variables

- Elimination method
  - Substitution method
  - Comparison method
  - Elimination method or Addition or Subtraction of Equations
  - Cross multiplication method (Cramer's rule)

Exp. 1) Solve the following equations $3x + 5y = 9$ and $2x + 3y = 4$

(a) by substitution method (b) by elimination method (c) by comparison method

Solution (a) $3x + 5y = 9 \quad \ldots(i)$

$2x + 3y = 4 \quad \ldots(ii)$

Express y in terms of x from eq. (i)

$$y = \frac{9 - 3x}{5} \quad \ldots(iii)$$

Substitute this value of y in eq. (ii)

$$2x + 3\left(\frac{9 - 3x}{5}\right) = 4$$

$\Rightarrow \quad 10x + 27 - 9x = 20 \quad \Rightarrow \quad x = -7$

Substitute $x = -7$ in eq. (iii)

$\therefore \quad x = -7, \quad y = 6.$

NOTE We can express x in terms of y for one equation and substitute this value in other.

(b) $3x + 5y = 9 \quad \ldots(i)$

$2x + 3y = 4 \quad \ldots(ii)$

Multiply eq. (i) by 3 and (ii) by 5.

$9x + 15y = 27 \quad \ldots(iii)$

$10x + 15y = 20 \quad \ldots(iv)$

$\quad - \quad - \quad -$

$-x + 0 = 7$

$\Rightarrow \quad x = -7$

Substitute $x = -7$ in eq. (i)

$3(-7) + 5y = 9$

$\Rightarrow \quad -21 + 5y = 9$

$\Rightarrow \quad y = 6$

$\therefore \quad x = -7 \quad \text{and} \quad y = 6$

NOTE We can eliminate x by multiplying (i) by 2 and (ii) by 3 and then subtract the resulting equations.

(c) $3x + 5y = 9 \quad \ldots(i)$

$2x + 3y = 4 \quad \ldots(ii)$

From eq. (i) $\quad x = \dfrac{9 - 5y}{3} \quad \ldots(iii)$

and from eq. (ii) $\quad x = \dfrac{4 - 3y}{2} \quad \ldots(iv)$

Comparing eq. (iii) and (iv)

$$\frac{9 - 5y}{3} = \frac{4 - 3y}{2}$$

$\Rightarrow \quad 2(9 - 5y) = 3(4 - 3y) \Rightarrow 18 - 10y = 12 - 9y$

$\Rightarrow \quad y = 6 \quad \ldots(v)$

Substitute the value of y in eq. (iii)

$$x = \frac{9 - 5(6)}{3} = \frac{-21}{3} = -7$$

$\therefore \quad x = -7 \quad \text{and} \quad y = 6$

NOTE We can compare the value of y in terms of x.

Exp. 2) Solve the equations $3x + 5y = 9$ and $2x + 3y = 4$ by cross multiplication method.

Solution If there are two simultaneous equations

$a_1x + b_1y = c_1 \quad \text{and} \quad a_2x + b_2y = c_2$, where $c_2 \neq 0$,

Then $\quad \dfrac{x}{b_1c_2 - b_2c_1} = \dfrac{y}{c_1a_2 - c_2a_1} = \dfrac{-1}{a_1b_2 - a_2b_1}$

$$\left[\frac{x}{\begin{matrix} b_1 & c_1 \\ b_2 & c_2 \end{matrix}} = \frac{y}{\begin{matrix} c_1 & a_1 \\ c_2 & a_2 \end{matrix}} = \frac{-1}{\begin{matrix} a_1 & b_1 \\ a_2 & b_2 \end{matrix}}\right]$$

Here, $\quad a_1 = 3 \quad b_1 = 5 \quad c_1 = 9$

$a_2 = 2 \quad b_2 = 3 \quad c_2 = 4$

$\therefore \quad \dfrac{x}{(20 - 27)} = \dfrac{y}{(18 - 12)} = \dfrac{-1}{(9 - 10)} \Rightarrow \dfrac{x}{-7} = \dfrac{y}{6} = 1$

$\Rightarrow \quad x = -7 \quad \text{and} \quad y = 6.$

Exp. 3) Find the correct choice.

$(A)\ 5x + 2y = 16$, $7x - 4y = 2$ — (P) no solution

$(B)\ 5x + 2y = 16$, $3x + \dfrac{6}{5}y = 2$ — (Q) unique solution

$(C)\ 5x + 2y = 16$, $\dfrac{15}{2}x + 3y = 24$ — (R) infinite number of solution

(a) $A - P, B - Q, C - R$ *(b)* $A - R, B - P, C - Q$

(c) $A - Q, B - P, C - R$ *(d)* $A - Q, B - R, C - P$

Solution

(A) $\frac{5}{7} \neq \frac{2}{-4}$.

$\therefore$ The system of equations has unique solution.

(B) $\frac{5}{3} = \frac{2}{6/5} \neq \frac{16}{2}$.

$\Rightarrow \quad \frac{5}{3} = \frac{5}{3} \neq \frac{8}{1}$

$\therefore$ The system of equations has no solution.

(C) $\frac{5}{15/2} = \frac{2}{3} = \frac{16}{24} \Rightarrow \frac{2}{3} = \frac{2}{3} = \frac{2}{3}$

$\therefore$The system of equations has infinite number of solution.

Exp. 4) Solve for x and y

$$4(x-3) = 3(y+3)$$
$$17 - 2x = 8 - (2y+1)$$

Solution $4(x-3) = 3(y+3)$

$\Rightarrow \quad 4x - 3y = 21$ …(i)

and $\quad 17 - 2x = 8 - (2y+1)$

$\Rightarrow \quad x - y = 5$ …(ii)

Multiply eq. (ii) by 3 and subtract froms eq.

$$4x - 3y = 21$$
$$3x - 3y = 15$$
$$- \quad + \quad -$$
$$x = 6$$

Substitute $x = 6$ in eq. (ii), we get $y = 1$

$\therefore \quad x = 6$ and $y = 1$.

Exp. 5) Solve for x and y

$$0.04x + 0.02y = 5$$
$$0.5(x-2) - 0.4y = 29$$

Solution $0.04x + 0.02y = 5$

$\Rightarrow \quad 4x + 2y = 500$ (multiply both sides by 100)

$\Rightarrow \quad 2x + y = 250$ …(i)

and $\quad 0.5(x-2) - 0.4y = 29$

$\Rightarrow \quad 5(x-2) - 4y = 290$ (multiply both sides by 10)

$\Rightarrow \quad 5x - 4y = 300$ …(ii)

Multiply eq. (i) by 4 and add to eq. (ii)

$$8x + 4y = 1000$$
$$5x - 4y = 300$$
$$13x = 1300$$

$\Rightarrow \quad x = 100$

Substitute $x = 100$, in eq. (i), we get

$$y = 50$$

$\therefore \quad x = 100$ and $y = 50$.

Exp. 6) Solve for x and y

$$\frac{3x-y}{5} = 2y - 1, \quad \frac{3x}{8} - \frac{y}{4} = \frac{1}{2}$$

Solution $3x - y = 5(2y-1)$

$\Rightarrow \quad 3x - 11y = -5$ …(i)

and $\quad \frac{3x}{8} - \frac{y}{4} = \frac{1}{2} \Rightarrow 3x - 2y = 4$ …(ii)

Subtract eq. (ii) from (i)

$$3x - 11y = -5$$
$$3x - 2y = 4$$
$$- \quad + \quad -$$
$$-9y = -9 \Rightarrow y = 1$$

Substitute $y = 1$ in eq. (i), we get

$x = 2 \ \therefore x = 2$ and $y = 1$

Exp. 7) Solve for x and y $\frac{2}{x} + \frac{3}{y} = 2, \quad \frac{8}{x} - \frac{6}{y} = 2$

Solution $\frac{2}{x} + \frac{3}{y} = 2$ …(i)

$\frac{8}{x} - \frac{6}{y} = 2$ …(ii)

Let $\frac{1}{x} = A$ and $\frac{1}{y} = B$

$\therefore \quad 2A + 3B = 2$ …(iii)

and $\quad 8A - 6B = 2$ …(iv)

Multiply eq. (iii) by 2

$$4A + 6B = 4 \Rightarrow 8A - 6B = 2$$
$$12A = 6 \Rightarrow A = 1/2$$

Substitute $A = \frac{1}{2}$ in eq. (i), we get

$$B = \frac{1}{3}$$

$\therefore \quad x = 2$ and $y = 3$.

Exp. 8) Solve for x and y $\frac{2}{3x+2y} + \frac{3}{3x-2y} = \frac{17}{5}$

$$\frac{5}{3x+2y} + \frac{1}{3x-2y} = 2$$

Solution Let $\frac{1}{3x+2y} = A$ and $\frac{1}{3x-2y} = B$

$\therefore \quad 2A + 3B = \frac{17}{5} \Rightarrow 10A + 15B = 17$ …(i)

and $\quad 5A + B = 2$ …(ii)

Multiply eq. (ii) by 2 and subtract from eq. (i)

$$10A + 15B = 17$$
$$\underline{10A + 2B = 4}$$
$$13B = 13 \Rightarrow B = 1$$

Substitute $B = 1$ in eq. (ii), we get $A = \frac{1}{5}$

Now, $\quad A = \frac{1}{3x+2y} = \frac{1}{5} \Rightarrow 3x + 2y = 5$ …(iii)

and $\quad B = \frac{1}{3x-2y} = 1 \Rightarrow 3x - 2y = 1$ …(iv)

$\therefore$ Add eq. (iii) to eq. (iv) $3x + 2y = 5$

$3x - 2y = 1 \Rightarrow 6x = 6 \Rightarrow x = 1$

Substitute $x = 1$ in eq. (iii), we get $y = 1$

$\therefore \quad x = 1$ and $y = 1$.

Introductory Exercise 13.2

Directions (for Q. Nos. 1 to 4) *Solve the following system of equations*

1. $x - y = 0.9, \frac{11}{2(x+y)} = 1$:
(a) 3.2, 3.5 (b) 3.2, 2.3 (c) 2.3, 2.5 (d) 4, 3.1

2. $\frac{x+y}{xy} = 2, \frac{x-y}{xy} = 6$:
(a) $-\frac{1}{2}, \frac{1}{4}$ (b) $\frac{1}{2}, -\frac{1}{4}$ (c) $\frac{1}{2}, -\frac{3}{2}$ (d) $-\frac{1}{4}, -\frac{3}{4}$

3. $\frac{1}{2x} - \frac{1}{y} = -1, \frac{1}{x} + \frac{1}{2y} = 8$:
(a) $\frac{2}{3}, \frac{2}{5}$ (b) $\frac{1}{4}, \frac{1}{5}$ (c) $\frac{1}{6}, \frac{1}{4}$ (d) $-\frac{1}{6}, -\frac{1}{4}$

4. $\frac{2x}{a} + \frac{y}{b} = 2, \frac{x}{a} - \frac{y}{b} = 4$:
(a) $\frac{2}{a}, \frac{2}{b}$ (b) $2a, -2b$ (c) $-2a, 2b$ (d) $\frac{a}{2}, -\frac{b}{2}$

5. For what value of k, the following equations have no solutions?
$$9x + 4y = 9;\ 7x + ky = 5$$
(a) 3 (b) 4.7 (c) 28/9 (d) 9/28

6. For what value of k, the system of equations $kx + 2y = 2$ and $3x + y = 1$ will be coincident?
(a) 2 (b) 3 (c) 5 (d) 6

7. For what value of k, will the equations $2x + 3y - 5 = 0$, $6x + ky - 15 = 0$ have an infinite number of solutions?
(a) 0 (b) 9 (c) 2 (d) 3

8. The total cost of 8 buckets and 5 mugs is ₹92 and the total cost of 5 buckets and 8 mugs is ₹77. Find the cost of 2 mugs and 3 buckets.
(a) ₹ 35 (b) ₹ 70 (c) ₹ 30 (d) ₹ 38

9. The sum of two numbers is 8. If their sum is four times their difference, find the numbers.
(a) 6, 2 (b) 7, 1 (c) 5, 3 (d) 6, 3

10. The numerator of a fraction is 4 less than its denominator. If the numerator is decreased by 2 and the denominator is increased by 1, then the denominator is eight times the numerator. Find the fraction.
(a) 3/7 (b) 4/8 (c) 2/7 (d) 3/8

11. Points A and B are 90 km apart from each other on a highway. A car starts from A and another from B at the same time. If they go in the same direction, they meet in 9 hours and if they go in opposite directions, they meet in 9/7 hours. Find their speed (in km/h).
(a), 25, 45 (b) 20, 50 (c) 30, 40 (d) 35, 65

12. Priyanka has only 25 paise coins and 50 paise coins in her purse. If in all she has 40 coins totalling ₹12.75, how many coins of 25 paise does she have?
(a) 30 (b) 29 (c) 32 (d) 26

13. Astha has pens and pencils which together are 40 in number. If she has 5 more pencils and 5 less pens, the number of pencils would have become 4 times the number of pens. Find the original number of pens with Astha.
(a) 11 (b) 12 (c) 13 (d) 14

14. A father is three times as old as his son. After twelve years, his age will be twice as that of the age of his son, then find their present ages.
(a) 10 y, 30 y (b) 12 y, 36 y
(c) 6 y, 36 y (d) 124 y, 24 y

15. Five years ago, A was three times as old as B and ten years later, A shell be twice as old as B. What are the present ages of A and B (in years)?
(a) 45, 15 (b) 30, 40 (c) 50, 30 (d) 50, 20

16. Astha and Saumya each have certain number of oranges. Astha says to Saumya, "If you give me 10 of your oranges, I will have twice the number of oranges left with you. "Saumya replies, "If you give me 10 of your oranges, I will have the same number of oranges as left with you." Find the number of oranges with Astha and Saumya respectively.
(a) 60, 40 (b) 70, 50 (c) 60, 80 (d) 70, 90

17. Shubham travels 760 km to his home partly by train and partly by car. He takes 8 hours if he travels 160 km by train and the rest by car. He takes 12 minutes more if he travels 240 km by train and the rest by car. Find the speed of the train and the car respectively (in km/hr.).
(a) 40, 80 (b) 60, 120 (c) 80, 100 (d) 100, 120

18. A person invested some amount at the rate of 12% simple interest and some other amount at the rate of 10% simple interest. He received yearly interest of ₹130. But if he had interchanged the amounts invested he would have received ₹ 4 more as interest. How much amount did he invest at 10% simple interest?
(a) ₹ 700 (b) ₹ 500 (c) ₹ 800 (d) ₹ 400

19. The solution of the equations
$\frac{3x-y+1}{3} = \frac{2x+y+2}{5} = \frac{3x+2y+1}{6}$ given by :
(a) $x = 2, y = 1$ (b) $x = 1, y = 1$
(c) $x = -1, y = -1$ (d) $x = 1, y = 2$

20. The course of an enemy submarine as plotted on a set of rectangular axes gives the equation $2x + 3y = 5$. On the same axes, the course of destroyer is indicated by $x - y = 10$. The point (x, y) at which the submarine can be destroyed is :
(a) $(-3, 7)$ (b) $(7, -3)$ (c) $(-7, 3)$ (d) $(3, -7)$

21. Let a, b, c be the positive numbers. The following system of equations in x, y and z.

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1; \frac{x^2}{a^2} - \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$$

$$-\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1, \text{ has}$$

(a) no solution
(b) unique solution
(c) infinitely many solutions
(d) finitely many solutions

22. If the system of equations, $x - ky - z = 0$, $kx - y - z = 0$, $x + y + z = 0$, has a non zero solution, then the possible values of k are :
(a) $-1, 2$ (b) $1, 2$ (c) $0, 1$ (d) $-1, 1$

CAT-Test

Questions Helping you bell the CAT

LEVEL 01 > BASIC LEVEL EXERCISE

1. If $a + b + c = 13$, what is the maximum value of $(a - 3)(b - 2)(c + 1)$?
(a) 26 (b) 27
(c) 30 (d) 19

2. If $abcd = 81$, what is the minimum value of $a + b + c + d$?
(a) 18 (b) 9
(c) 12 (d) 36

3. Which one of the following is correct?
(a) $x + \frac{1}{x} \le -2$ (b) $x + \frac{1}{x} = 0$
(c) $x + \frac{1}{x} \ge 2$ (d) both (a) and (c)

4. If a, b and c are all distinct positive numbers, then $(a + b)(b + c)(c + a)$:
(a) less than 4 (b) less than $4abc$
(c) greater than $8abc$ (d) greater than $(abc)^3$

5. If a, b and c are the distinct positive numbers, then $(a + b + c)(ab + bc + ac)$ is :
(a) greater than $9abc$ (b) less than $8abc$
(c) equal to $10abc$ (d) greater than $25abc$

6. If $x + y = 25$ and $x^2y^3 + y^2x^3 = 25$, what is the value of xy?
(a) 0 (b) ± 1
(c) 5 (d) 4

7. If x and y are both positive, then the minimum value of $(x + y)\left(\frac{1}{x} + \frac{1}{y}\right)$ is :
(a) 0 (b) 1 (c) 2 (d) 4

8. If a, b, c and d are four positive numbers such that $a + b + c + d = 4$, then what is the maximum value of $(a + 1)(b + 1)(c + 1)(d + 1)$?
(a) 32 (b) 8 (c) 16 (d) 81

9. If x, y and z are three distinct positive real numbers such that $x + y + z = 1$, then the value of $\left(\frac{1}{x} - 1\right)\left(\frac{1}{y} - 1\right)\left(\frac{1}{z} - 1\right)$ is :
(a) 16 (b) 8 (c) 4 (d) 1

10. If x, y and z are real numbers such that $x + y + z = 4$ and $x^2 + y^2 + z^2 = 6$, then x, y, z lie in :
(a) $\left[\frac{3}{2}, 2\right]$ (b) $\left[\frac{2}{3}, 2\right]$
(c) $\left[0, \frac{2}{3}\right]$ (d) none of these

11. If $x = 7 + 4\sqrt{3}$ and $xy = 1$, then the value of $\left(\frac{1}{x^2} + \frac{1}{y^2}\right)$ is
(a) 194 (b) 57 (c) $85\sqrt{3}$ (d) $\frac{7 + 4\sqrt{3}}{7 - 4\sqrt{3}}$

12. If a, b and c are positive real numbers, the least value of $(a+b+c)\left(\frac{1}{a}+\frac{1}{b}+\frac{1}{c}\right)$ is :
(a) 1 (b) 9
(c) 12 (d) none of these

13. If $a>0$, $b>0$ and $ab=1$, then the least value of the expression $(1+a)(1+b)$ is :
(a) 2 (b) 4
(c) 1 (d) 1/4

14. If a, b, c are all positive and not equal, then the value of $\frac{(a+b+c)(ab+bc+ca)}{abc}$ is :
(a) less than 9 (b) greater than 9
(c) less than or equal to 9 (d) can't be determined

15. If a, b, c are all positive, then the minimum value of the expression $\frac{(a^2+a+1)(b^2+b+1)(c^2+c+1)}{abc}$ is :
(a) 3 (b) 9
(c) 27 (d) 1

16. If $1 \le x \le 3$ and $2 \le y \le 4$, what is the maximum value of $\left(\frac{x}{y}\right)$?
(a) $\frac{2}{3}$ (b) 4
(c) $\frac{3}{2}$ (d) 2

17. If $a+b+c=3$, $a^2+b^2+c^2=6$ and $\frac{1}{a}+\frac{1}{b}+\frac{1}{c}=1$ where a, b, c are all non-zero, then abc is :
(a) $\frac{1}{3}$ (b) $\frac{2}{3}$
(c) $\frac{3}{2}$ (d) 1

18. $2^x=4^y=8^z$ and $xyz=288$, then value of $\frac{1}{2x}+\frac{1}{4y}+\frac{1}{8z}$ is :
(a) $\frac{11}{12}$ (b) $\frac{11}{96}$
(c) $\frac{29}{96}$ (d) none of these

19. If $a^x=b$, $b^y=c$, $c^z=a$, then the value of xyz is :
(a) 3 (b) 0
(c) 1 (d) can't be determined

20. Let $x, y \in N$ and $7x+12y=220$. The number of solutions is :
(a) 1 (b) 2
(c) 3 (d) infinitely many

21. If $a^x=(x+y+z)^y$, $a^y=(x+y+z)^z$, $a^z=(x+y+z)^x$, then :
(a) $3(x+y+z)=a$ (b) $2a=x+y+z$
(c) $x+y+z=0$ (d) $x=y=z=\frac{a}{3}$

22. If $\frac{x}{a}=\frac{y}{b}=\frac{z}{c}$, then $xy+yz+zx$ is equal to :
(a) $\frac{(a+b+c)^2}{x^2+y^2+z^2}$
(b) $\frac{x^2(a+b+c)^2-a^2(x^2+y^2+z^2)}{2a^2}$
(c) $\frac{ax+by+cz}{(a+b+c)^2}$
(d) none of the above

23. In the farm-house of Bhuwan Kisan, there were total 14 deer and ducks. One day a thief entered secretely in the farm- house and after killing all the deer and ducks he took away all the stuff except their legs. When Bhuwan noticed it he has found there 38 legs of deer and ducks. The number of deer in the farm house was :
(a) 5 (b) 8 (c) 9 (d) 10

24. In an autofair at Pragati Maidan, New Delhi, there are 600 vehicles consisting of only two wheelers and four wheelers. A world renowned tyre agency visits the fair to survey the tyre market which finds that there are total 2000 tyres are fixed in all the 600 vehicles, but without any stepney (or spare tyre). The number of two wheelers in the autofair is :
(a) 300 (b) 400 (c) 180 (d) 200

25. In the battle of Mahabharat Veer Arjun destroyed all the 125 raths (horse-carts). Out of which few were driven by 3 horses each and rest were driven by 5 horses each. Thus, he captured 125 damaged raths along with 575 horses. The raths which were driven by 5 horses belonged to the Kaurav and the raths which were driven by 3 horses belonged to the allied army of Kaurav. It is known that no any horse was injured in the battle. The number of raths originally belonged to the Kaurav (not to their allied army) is :
(a) 60 (b) 25 (c) 75 (d) 100

26. In an electric appliances shop there were some fans and coolers containing 3 blades and 4 blades each respectively along with a motor each. The cost of a fan is ₹ 1200 and that of cooler is ₹ 3000. One day due to short circuit the shop caught the fire. After extinguishing the fire, shopkeeper has estimated that 90 sets of motor bodies and 320 blades were burned and then nothing was left useful in his shop. What is the loss incurred from the coolers alone?
(a) ₹ 1,50,000 (b) ₹ 12,000
(c) ₹ 4800 (d) can't be determined

27. In the air talent show in the eve of independence day 90 aircraft (only Sukhoi and Mig-21) participated. It is known that for every one hour flight a Sukhoi and a Mig-21 consume 2 litres and 3 litres of fuel respectively. The price of fuel for Sukhoi is $ 10 per litre and price for the fuel of Mig-21 is $ 15 per litre. Thus, all the aircrafts accounted $ 3050 for the fuel in one hour show. The number of Sukhoi planes is :
(a) 20 (b) 30 (c) 40 (d) 50

Directions (for Q. Nos. 28 to 30) *In the fruit market adjacent to IIM Lucknow, a fruit vendor has total 20 kg of fruits containing only mangoes and apples. The vendor told to Ritika, an 11M student, that one kg apple contains only 7 apples while 1 kg of mangoes contains 10 mangoes and it is known that all the mangoes and apples are uniform in size individually. The vendor has initially 176, pieces of apples and mangoes, in all. Ritika purchased 55 fruits to distribute equally among the group of 11 students, irrespective of the kind of fruit i.e., mango or apple, and then the vendor is left with only 13 kg of fruits.*

28. The number of apples remaining with the vendor when Ritika has purchased 7 kg of fruits, is :
(a) 21 (b) 35
(c) 80 (d) none of these

29. If the selling price of mangoes and apples be ₹ 35 per kg and ₹ 40 per kg respectively, then how many rupees Ritika has spent for the 7 kg of fruits?
(a) ₹ 262.5 (b) ₹ 255 (c) ₹ 270 (d) ₹ 155

30. If the vendor has received 16.66% profit in selling of mangoes and 33.33% profit in the selling of apples to Ritika, but for the rest of the selling he exchanges the profit per cent between mangoes and apples. What is his overall profit per cent for the rest of the fruits? (Data can be used from the previous question if necessary)
(a) 29.48% (b) 5.92%
(c) no any profit (d) can't be determined

31. One day my assistant Rajesh went to a stationary shop to purchase marker pens. He purchased the pens for ₹ 52 and he gave a ₹ 100 note to the shopkeeper. The shopkeeper offered Rajesh to take back ₹ 48 in the denominations of only ₹ 1, ₹ 2 and ₹ 5.
So, Rajesh received total 26 coins from the shopkeeper. Minimum number of ₹ 1 coins which Rajesh has with him if he has at least one coin of each denomination offered by the shopkeeper :
(a) 4 (b) 5
(c) 7 (d) 10

32. What is the solutions of the following simultaneous equations?
$x + y + z = 6, \quad x + 2y + 3z = 14, \quad x + 3y + z = 10$
(a) $x = 1, y = 2, z = 4$ (b) $x = 1, y = 2, z = 3$
(c) $x = 2, y = 1, z = 3$ (d) none of these

Hints & Solutions

☑ Introductory Exercise 13.1

1. Total score $= x + y + 40$

2. Quotient $= \frac{z}{4}$ $\therefore$ $3y \times \frac{z}{4} = \frac{3yz}{4}$

3. $6 \times p \times q \times r \times p \times p \times p = 6 \times p \times p \times p \times p \times q \times r$

$= 6 \times p^4 \times q \times r = 6p^4qr$

4. (i) $2x^2$ (ii) $-\frac{3}{x}$ (iii) $\frac{5}{x^2}$ (iv) 9

5. (i) $4xyz$ (ii) $-\frac{3}{x^2}$ (iii) $6xy^2$ (iv) $-5z^3$ (v) $6x$

6. $7 \times a + b \div 3 - c + b = 7a + \frac{b}{3} - c + b$

$\therefore$ (i) $7a$ (ii) $\frac{b}{3}$ (iii) $-c$ (iv) b

7. $\frac{-7xy^2z^3}{z^3} = -7xy^2$

9. $4x^3 \rightarrow$ degree 3

$2x^2y^3 \rightarrow$ degree $(2 + 3) = 5$

$6x^0y^0 \rightarrow$ degree 0

$\therefore$ The degree of whole expression is 5

10. $2x^2 + 3y^2 - 5xy + 5x^2 - y^2 + 6xy - 3x^2$

$= 2x^2 - 3x^2 + 5x^2 + 3y^2 - y^2 - 5xy + 6xy$

$= 4x^2 + 2y^2 + xy$

11. $(5x^2 + 3x - 1) - (3x^3 - 2x + 7)$

or

$$\begin{array}{r} 5x^2 + 3x - 1 \\ -3x^3 + 2x - 7 \\ \hline -3x^3 + 5x^2 + 5x - 8 \end{array}$$

(In subtraction we change the sign)

12. $\left(\frac{1}{2}a^2b - \frac{2}{3}ab^2 + 5\right) \times (6abc)$

$= \frac{1}{2}a^2b \times 6abc - \frac{2}{3}ab^2 \times 6abc + 5 \times 6abc$

$= 3a^3b^2c - 4a^2b^3c + 30abc$

13. $\left(\frac{1}{2}x^2 - \frac{1}{3}y^2\right) \times \left(\frac{1}{2}x^2 + \frac{1}{3}y^2\right)$

$= \frac{1}{2}x^2\left(\frac{1}{2}x^2 + \frac{1}{3}y^2\right) - \frac{1}{3}y^2\left(\frac{1}{2}x^2 + \frac{1}{3}y^2\right)$

$= \left(\frac{1}{2}x^2 \times \frac{1}{2}x^2 + \frac{1}{2}x^2 \times \frac{1}{3}y^2\right) - \frac{1}{3}y^2 \times \frac{1}{2}x^2 - \frac{1}{3}y^2 \times \frac{1}{3}y^2$

$= \frac{1}{4}x^4 + \frac{1}{6}x^2y^2 - \frac{1}{6}x^2y^2 - \frac{1}{9}y^4 = \frac{1}{4}x^4 - \frac{1}{9}y^4$

14. $\frac{36x^2y^5 + 42xy^3 - 24x^3y^2 - 12y^5}{-6y^2}$

$= \frac{36x^2y^5}{-6y^2} + \frac{42xy^3}{-6y^2} - \frac{24x^3y^2}{-6y^2} - \frac{12y^5}{-6y^2}$

$= -6x^2y^3 - 7xy + 4x^3 + 2y^3$

15. Since, divisor is $x + 3$

$\therefore$ $x + 3 = 0 \rightarrow x = -3$

$\therefore$ put $x = -3$ in the expression

$3x^3 + 8x^2 - 6x + 1 = 3(-3)^3 + 8(-3)^2 - 6(-3) + 1$

$= -81 + 72 + 18 + 1 = 10$

16. Put $x = -3$ in the given expression

$ax^3 + 9x^2 + 4x - 10$

$\because$ $a(-3)^3 + 9(-3)^2 + 4(-3) - 10 = 5$

$\therefore$ $-27a + 81 - 12 - 10 = 5$

$\Rightarrow$ $-27a = -54 \Rightarrow a = 2$

17. Put $x = -1$, then

$(-1)^3 + a(-1)^2 - b(-1) - 6 = 0$

or $-1 + a + b - 6 = 0$

or $a + b - 7 = 0$ ...(i)

and put $x = 2$, then

$(2)^3 + a(2)^2 - b(2) - 6 = 0$

$\Rightarrow$ $8 + 4a - 2b - 6 = 0$

$\Rightarrow$ $4a - 2b + 2 = 0$ ...(ii)

By solving eqs. (i) and (ii)

$a + b - 7 = 0 \Rightarrow a + b = 7$

and $4a - 2b + 2 = 0 \Rightarrow 2a - b = -1$

$\therefore$ $3a = 6 \Rightarrow a = 2$

Substituting $a = 2$ in eq. (i), we get $b = 5$

$\therefore$ $a = 2$ and $b = 5$

18. $\because A^2 - B^2 = (A + B) \cdot (A - B)$

$\therefore$ $(5x^2 + 14x + 2)^2 - (4x^2 - 5x + 7)^2$

$= (5x^2 + 14x + 2 + 4x^2 - 5x + 7)$

$\times (5x^2 + 14x + 2 - 4x^2 + 5x - 7)$

$= 9(x^2 + 19x - 5)(x^2 + x + 1)$

$\therefore \frac{(5x^2 + 14x + 2)^2 - (4x^2 - 5x + 7)^2}{(x^2 + x + 1)} = 9(x^2 + 19x - 5)$

$\therefore$ $q = 9(x^2 + 19x - 5)$ and $r = 0$.

19. Putting $x = -1$ in the given polynomial, we get

$(-1)^3 - 6(-1) + 7 = -1 + 6 + 7 = 12 \qquad (\because\ x + 1 = 0)$

20. Putting $x = 2$, we get $\qquad (\because\ x - 2 = 0)$

$(2)^4 - 3(2)^3 + 2(2)^2 - 5(2) + 7$

$= 16 - 24 + 8 - 10 + 7 = -3$

21. Since, divisor is $x^2 + 2$

$\therefore$ Substitute $x^2 = -2$, in the given expression

$x^3 + 5x^2 + 10k$ gives the remainder $-2x$

$(-2)x + 5(-2) + 10k = -2x$

$\Rightarrow \qquad k = 1$

22. Putting $x = -1$, we get

$(-1)^{11} + 1 = -1 + 1 = 0$

23. Putting $x = -3$, we get

$5(-3)^3 + 5(-3)^2 - 6(-3) + 9 = -135 + 45 + 18 + 9 = -63$

25. Best way is that to consider some appropriate value of x (say $x = 1$), then check through options :

Let $x = 1$, then

$x^3 - 2x^2 + px - q = 1 - 2 + p - q \rightarrow$ dividend

and $\qquad x - 6 = 1 - 6 = -5 \rightarrow$ remainder

and $\qquad x^2 - 2x - 3 = 1 - 2 - 3 = -4 \rightarrow$ divisor

$\therefore$ Now assume choice (c) as $p = -2$ and $q = 6$, then

$\dfrac{-1 + p - q}{-4} = \dfrac{-1 + (-2) - 6}{-4} = \dfrac{-9}{-4} \rightarrow$ Remainder -5

NOTE To avoid negative remainder you can assume $x = 7, 8, \ldots,$ etc.

Alternatively Divide the given expression as conventionally and then compare the actual remainder with obtained remainder.

$$x^2 - 2x - 3\overline{)x^3 - 2x^2 + px - q}\,(\times\times\times\times$$
$$\underline{\times \quad \times \quad \times \quad \times}$$

Remainder $= (p + 3)x - q$

$\therefore \qquad (p + 3)x - q = x - 6$

$\therefore \qquad p + 3 = 1 \quad$ and $\quad q = 6$

$\Rightarrow \qquad p = -2 \quad$ and $\quad q = 6$

26. Put $x = 2$ in the given expression as :

$x^2 + 3qx - 2q = 0$

$(2)^2 + 3q(2) - 2q = 0$

$\Rightarrow\ 4 + 6q - 2q = 0 \ \Rightarrow\ 4 + 4q = 0$

$\Rightarrow \qquad q = -1$

27. Put $x = -2$ in the given polynomial.

$(-2)^3 + 6(-2)^2 + 4(-2) + k = 0$

$\Rightarrow \qquad k = -8$

28. The best way is check by options. Let us consider choice (c). $(x - 2)$ is a factor of the given expression, then at $x = 2$ the given expression must be zero.

$\therefore \qquad (2)^4 - 5(2)^3 + 5(2)^2 - 10(2) + 24 = 0$

Hence, $(x - 2)$ is the factor of $x^4 - 5x^3 + 5x^2 - 10x + 24$.

29. Since, $(x + k)$ is a factor of each one of the given expression, $x = -k$ will make each zero.

$\therefore \qquad k^2 - pk + q = k^2 - lk + m = 0$

$\Rightarrow \qquad k = \dfrac{m - q}{l - p}$

30. Substitute $x = a$ in the given expression, since $(x - a)$ is a factor, which will make it equal to zero.

$\therefore \qquad (a)^3 - 3a^3 + 2a^3 + b = 0 \ \Rightarrow\ b = 0$

31. Go through options

32. Go through options

33. Put $x = -1$ in the given expression

34. Put $x = 1$ in the given expression

36. $\left(x + \dfrac{1}{x}\right)^2 = x^2 + \dfrac{1}{x^2} + 2x \cdot \dfrac{1}{x}$

$(2)^2 = x^2 + \dfrac{1}{x^2} + 2 \quad \left(\text{putting } x + \dfrac{1}{x} = 2\right)$

$\Rightarrow \qquad x^2 + \dfrac{1}{x^2} = 2$

37. $\left(x - \dfrac{1}{x}\right)^2 = x^2 + \dfrac{1}{x^2} - 2x \cdot \dfrac{1}{x}$

$(4)^2 = x^2 + \dfrac{1}{x^2} - 2$

$\Rightarrow \qquad x^2 + \dfrac{1}{x^2} = 18$

38. $\left(x + \dfrac{1}{x}\right)^3 = x^3 + \dfrac{1}{x^3} + 3x \cdot \dfrac{1}{x}\left(x + \dfrac{1}{x}\right)$

$\left(x + \dfrac{1}{x}\right)^3 = x^3 + \dfrac{1}{x^3} + 3\left(x + \dfrac{1}{x}\right)$

$\Rightarrow \qquad (2\sqrt{3})^3 = x^3 + \dfrac{1}{x^3} + 3(2\sqrt{3})$

$\Rightarrow \qquad x^3 + \dfrac{1}{x^3} = 18\sqrt{3}$

39. $\left(x + \dfrac{1}{x}\right)^3 = x^3 + \dfrac{1}{x^3} + 3x \cdot \dfrac{1}{x}\left(x + \dfrac{1}{x}\right)$

$(3)^3 = x^3 + \dfrac{1}{x^3} + 3(3)$

$\Rightarrow \qquad x^3 + \dfrac{1}{x^3} = 18$

40. $\left(x+\frac{1}{x}\right)^2 = x^2 + \frac{1}{x^2} + 2\cdot x\cdot\frac{1}{x}$

$(2)^2 = x^2 + \frac{1}{x^2} + 2$

$x^2 + \frac{1}{x^2} = 2$

Again, $\left(x^2+\frac{1}{x^2}\right)^3 = x^6 + \frac{1}{x^6} + 3x^2\cdot\frac{1}{x^2}\left(x^2+\frac{1}{x^2}\right)$

$(2)^3 = x^6 + \frac{1}{x^6} + 3(2)$

$\Rightarrow \quad x^6 + \frac{1}{x^6} = 2$

41. $\left(x-\frac{1}{x}\right)^2 = x^2 + \frac{1}{x^2} - 2x\cdot\frac{1}{x}$

$\left(x-\frac{1}{x}\right)^2 = 6-2$

$\left(x-\frac{1}{x}\right)^2 = 4$

$\Rightarrow \quad \left(x-\frac{1}{x}\right) = \pm 2$

42. $\left(x-\frac{1}{x}\right)^3 = x^3 - \frac{1}{x^3} - 3x\cdot\frac{1}{x}\left(x-\frac{1}{x}\right)$

$\left(x-\frac{1}{x}\right)^3 = 36 - 3\left(x-\frac{1}{x}\right)$

Let $\left(x-\frac{1}{x}\right) = P,$

then $P^3 = 36 - 3P$

or $P^3 + 3P = 36 \Rightarrow P^3 + 3P - 36 = 0$

Clearly $P = 3$ satisfies the equation.

$\therefore \quad x - \frac{1}{x} = 3$

Alternatively Go through options

43. $\left(x+\frac{1}{x}\right)^3 = x^3 + \frac{1}{x^3} + 3x\cdot\frac{1}{x}\left(x+\frac{1}{x}\right)$

$\Rightarrow \quad \left(x+\frac{1}{x}\right)^3 = x^3 + \frac{1}{x^3} + 3\left(x+\frac{1}{x}\right)$

Now, go through the given choices.

44. $x^4 + \frac{1}{x^4} = \left(x^2+\frac{1}{x^2}\right)^2 - 2$

$\therefore \quad 34 = \left(x^2+\frac{1}{x^2}\right)^2 - 2$

$\Rightarrow \quad \left(x^2+\frac{1}{x^2}\right)^2 = 36 \Rightarrow x^2 + \frac{1}{x^2} = 6$

Again, $\left(x-\frac{1}{x}\right)^2 = x^2 + \frac{1}{x^2} - 2$

$\Rightarrow \quad \left(x-\frac{1}{x}\right)^2 = 6-2=4$

$\Rightarrow \quad x - \frac{1}{x} = 2$

Alternatively Go through options.

45. $\left(x^2+\frac{1}{x^2}\right)^2 = x^4 + \frac{1}{x^4} + 2$

$\Rightarrow$ q $\quad \left(x^2+\frac{1}{x^2}\right)^2 = 121$

$\Rightarrow \quad x^2 + \frac{1}{x^2} = 11$

Again, $\left(x-\frac{1}{x}\right)^2 = x^2 + \frac{1}{x^2} - 2$

$\therefore \quad \left(x-\frac{1}{x}\right)^2 = 9 \Rightarrow x - \frac{1}{x} = 3$

$\therefore \quad \left(x-\frac{1}{x}\right)^3 = x^3 - \frac{1}{x^3} - 3x\cdot\frac{1}{x}\left(x-\frac{1}{x}\right)$

$(3)^3 = x^3 - \frac{1}{x^3} - 3(3)$

$\Rightarrow \quad x^3 - \frac{1}{x^3} = 36$

46. $\left(3x-\frac{2}{x}\right)^2 = 25$

$9x^2 + \frac{4}{x^2} - 12 = 25 \Rightarrow 9x^2 + \frac{4}{x^2} = 37$

Again, $9x^2 + \frac{4}{x^2} + 12 = 37 + 12 = 49$

$\Rightarrow \quad \left(3x+\frac{2}{x}\right)^2 = (7)^2 \Rightarrow 3x + \frac{2}{x} = 7$

$\therefore \quad \left(9x^2 - \frac{4}{x^2}\right) = \left(3x-\frac{2}{x}\right)\left(3x+\frac{2}{x}\right) = 5\times 7 = 35$

47. $m^2 - 4m + 1 = 0 \Rightarrow m^2 + 1 = 4m \Rightarrow \frac{m^2+1}{m} = 4$

$\Rightarrow \quad m + \frac{1}{m} = 4$

$\therefore \quad \left(m+\frac{1}{m}\right)^3 = m^3 + \frac{1}{m^3} + 3\left(m+\frac{1}{m}\right) = 64$

$\Rightarrow \quad m^3 + \frac{1}{m^3} = 52$

48. $(x+y)^2 = x^2 + y^2 + 2xy$

$169 = x^2 + y^2 + 2\times 40$

$\Rightarrow \quad x^2 + y^2 = 89$

49. $(x+y)^3 = x^3 + y^3 + 3xy(x+y)$

$2097 = x^3 + \frac{1}{x^3} + 3\times 36(13)$

$\Rightarrow \quad x^3 + \frac{1}{x^3} = 2097 - 1404$

$x^3 + \frac{1}{x^3} = 693$

50. $(x-y)^2 = (x+y)^2 - 4xy = 64 - 60 = 4$

$\Rightarrow \quad (x-y) = 2$

$\therefore \quad x^3 - y^3 = (x-y)^3 + 3xy(x-y)$

$= 8 + 45(2)$

$x^3 - y^3 = 98$

51. $(x^3 + y^3 + z^3 - 3xyz)$

$= (x+y+z)(x^2 + y^2 + z^2 - xy - yz - zx)$

$= (x+y+z)[(x+y+z)^2 - 3(xy+yz+zx)]$

$= 6 \times [36 - 3 \times 11] = 6 \times 3 = 18$

52. $x + y + z = 0 \quad \Rightarrow \quad x^3 + y^3 + z^3 = 3xyz.$

53. $\because \; x + y + z = 0 \quad \Rightarrow \quad x^3 + y^3 + z^3 = 3xyz$

$\therefore \quad a^{1/3} + b^{1/3} + c^{1/3} = 0$

$\Rightarrow \quad a + b + c = 3a^{1/3}b^{1/3}c^{1/3}$

$\therefore \quad (a+b+c)^3 = 27abc$

54. $2^x - \frac{2^x}{2} = 8 \quad \Rightarrow \quad k - \frac{k}{2} = 8 \quad \Rightarrow \quad k = 16$

$\therefore \quad 2^x = 16 \quad \Rightarrow \quad (\text{say } 2^x = k)$

$\Rightarrow \quad 2^x = 2^4 \quad \Rightarrow \quad x = 4.$

$\therefore \quad x^3 = (4)^3 = 64$

55. $3^x + 3^{x+1} = 36 \quad \Rightarrow \quad 3^x + 3.3^x = 36$

Let $3^x = k$

$\therefore \quad k + 3k = 36 \quad \Rightarrow \quad k = 9$

$\therefore \quad 3^x = 9 \quad \Rightarrow \quad x = 2$

$\therefore \quad x^x = 2^2 = 4.$

56. $\frac{(a+b)-(a-b)^2}{a^2b - ab^2} = \frac{(a^2 + b^2 + 2ab) - (a^2 + b^2 - 2ab)}{ab(a-b)}$

$= \frac{4ab}{ab(a-b)} = \frac{4}{(a-b)}$

57. Let $\frac{x}{(b-c)(b+c-2a)} = \frac{y}{(c-a)(c+a-2b)}$

$= \frac{z}{(a-b)(a+b-2c)} = k$, then

$x = k(b-c)(b+c-2a)$, $y = k(c-a)(c+a-2b)$,

$z = k(a-b)(a+b-2c)$

$\therefore \quad (x+y+z) = k[(b^2 - c^2 + c^2 - a^2 + a^2 - b^2)$

$- 2\{a(b-c) + b(c-a) + c(a-b)\}]$

$= 0$

58. $a^4 + 5a^3 + 6a^2 = a^2(a^2 + 5a + 6) = a^2(a+3)(a+2)$

60. $a^{3/2} - ab^{1/2} + a^{1/2}b - b^{3/2}$

$= a(a^{1/2} - b^{1/2}) + b(a^{1/2} - b^{1/2})$

$= (a+b)(a^{1/2} - b^{1/2})$

$\therefore \quad \frac{(a+b)(a^{1/2} - b^{1/2})}{(a^{1/2} - b^{1/2})} = (a+b)$

61. $x(y^2 - z^2) + y(z^2 - x^2) + z(x^2 - y^2)$

$= x^2(z-y) - x(z^2 - y^2) + yz(z-y)$

(Writing in descending power of x)

$= (z-y)[x^2 - x(z+y) + yz]$

$= (z-y)(x-z)(x-y)$

Alternatively Consider $x = 1$, $y = 2$ and $z = 3$ and then verify the correct option.

62. Since, $x^3 - y^3 = (x-y)(x^2 + y^2 + xy)$

$\therefore (a+b)^3 - (a-b)^3$

$= [(a+b) - (a-b)][(a+b)^2 + (a-b)^2 + (a+b)(a-b)]$

$= 2b[2(a^2 + b^2) + (a^2 - b^2)] = 2b(3a^2 + b^2)$

63. $(x^2 + 4) = (x^2 + 2^2) = (x)^2 + (2)^2 + 4x^2 - 4x^2$

$= (x^2 + 2)^2 - (2x)^2$

$= (x^2 + 2 + 2x)(x^2 + 2 - 2x)$

64. Best way is to go through options.

$(x-1)(x+3)(x-2) = (x^2 + 2x - 3)(x-2)$

$= x^3 + 2x^2 - 3x - 2x^2 - 4x + 6$

$= x^3 - 7x + 6$

Hence, option (a) is correct.

65. $(64x^3 - 216y^3) = (4x)^3 - (6y)^3$

$= (4x - 6y)[(4x)^2 + (6y)^2 + 24xy]$

66. $a^2 + 4b^2 + 4b - 4ab - 2a - 8$

$= a^2 + 4b^2 - 4ab + 4b - 2a - 8$

$= (a - 2b)^2 - 2(a - 2b) - 8$

$= k^2 - 2k - 8,$ where $k = a - 2b$

$= k^2 - 4k + 2k - 8$

$= k(k-4) + 2(k-4)$

$= (k-4)(k+2)$

$= (a - 2b - 4)(a - 2b + 2)$

67. Let $(a-b) = x$, $(b-c) = y$ and $(c-a) = z$

Then, $x + y + z = 0$

$\therefore \quad x^3 + y^3 + z^3 = 3xyz$

Hence, $(a-b)^3 + (b-c)^3 + (c-a)^3 = 3(a-b)(b-c)(c-a)$

68. $(a+b+c)^2 = a^2 + b^2 + c^2 + 2(ab + bc + ac)$

$0 = a^2 + b^2 + c^2 + 2(ab + bc + ac)$

$\therefore \; a^2 + b^2 + c^2 = -2(ab + bc + ac)$

69. First of all factorize the expression, then find the HCF or LCM as per the requirement.

(1) LCM of $10a^2b^2$, $15abc$, $20ab^2c^2$ is

$3 \times 2^2 \times 5a^2b^2c^2 = 60a^2b^2c^2$, Hence (a) is wrong.

(2) $(x^2 - 6x + 9) = (x - 3)^2$

and $(x^3 - 27) = (x - 3)(x^2 + 3x + 9)$

$\therefore$ HCF $= (x - 3)$

(3) $6x^2 - 7x - 3 = (2x - 3)(3x + 1)$

$(2x^2 + 11x - 21) = (x + 7)(2x - 3)$

$\therefore$ HCF $= (2x - 3)$.

Hence, 2 and 3 are correct.

70. $2x^2 - 3x - 2 = 2x^2 - 4x + x - 2$

$= (x - 2)(2x + 1)$

and $(x^3 - 4x^2 + 4x) = x(x^2 - 4x + 4) = x(x - 2)^2$

$\therefore$ LCM $= x(x - 2)^2(2x + 1)$

71. $2(x^2 - y^2) = 2(x - y)(x + y)$

and $5(x^3 - y^3) = 5(x - y)(x^2 + y^2 + xy)$

$\therefore$ HCF $= (x - y)$

72. $(x^4 - 4x^2 + 3) = x^4 - 3x^2 - x^2 + 3$

$= x^2(x^2 - 3) - 1(x^2 - 3)$

$= (x^2 - 3)(x^2 - 1)$

$= (x^2 - 3)(x - 1)(x + 1)$

and $x^4 - x^2 - 6 = x^4 - 3x^2 + 2x^2 - 6$

$= x^2(x^2 - 3) + 2(x^2 - 3)$

$= (x^2 - 3)(x^2 + 2)$

$\therefore$ HCF $= (x^2 - 3)$

73. $x^2 - 4 = (x + 2)(x - 2)$

$(x^2 - 5x - 6) = (x + 1)(x - 6)$

$(x^2 + x - 6) = (x - 2)(x + 3)$

Since, there is no any common factor. So, HCF is 1.

74. $x^2 - ax - (a + 1) = x^2 - (a + 1)x + x - (a + 1)$

$= (x + 1)(x - a + 1)$

and $ax^2 - x - (a + 1) = ax^2 - a - x - 1$

$= a(x^2 - 1) - 1(x + 1)$

$= (x + 1)(ax - a - 1)$

$\therefore$ HCF $= (x + 1)$

75. $P = (x - 2)(x + 1)^2(x + 3)^2$

and $Q = (x + 1)^2(x + 3)(x + 4)$

$\therefore$ LCM of P and $Q = (x - 2)(x + 1)^2(x + 3)^2(x + 4)$

76. $a^3 + b^3 = (a + b)(a^2 + b^2 - ab)$

$(a^4 - b^4) = (a - b)(a + b)(a^2 + b^2)$

$\therefore$ LCM $= (a - b)(a + b)(a^2 + b^2)(a^2 + b^2 - ab)$

$= (a - b)(a^2 + b^2)(a + b)(a^2 + b^2 - ab)$

$= (a - b)(a^2 + b^2)(a^3 + b^3)$

77. $(x^4 - 1) = (x - 1)(x + 1)(x^2 + 1)$

$(x^3 + x^2 + x + 1) = x^2(x + 1) + 1(x + 1) = (x^2 + 1)(x + 1)$

$\therefore$ HCF $= (x + 1)(x^2 + 1)$

78. $2x^2 - 4x = 2x(x - 2)$

$3x^4 - 12x^2 = 3x^2(x^2 - 4)$

$= 3x^2(x + 2)(x - 2)$

$2x^5 - 2x^4 - 4x^3 = 2x^3(x^2 - x - 2)$

$= 2x^3(x - 2)(x + 1)$

$\therefore$ HCF $= x(x - 2)$

79. Since, all the factors are distinct

80. $(x + 2)^2(x - 2)$ and $x^2 - 4x - 12 = (x - 6)(x + 2)$

$\therefore$ LCM $= (x - 6)(x + 2)^2(x - 2)$

81. $a^2 - ab - 2b^2 = (a^2 - b^2) - (ab + b^2)$

$= (a + b)(a - b - b) = (a + b)(a - 2b)$

and $2a^2 - ab - b^2 = (a^2 - ab) + (a^2 - b^2)$

$= (a - b)a + (a^2 - b^2) = (a - b)(2a + b)$

Since, there is no common factor, hence HCF = 1.

82. HCF $= a^2b^3c^3$

LCM $= a^5b^4c^4$

83. $\dfrac{(x + 3)}{(x - 2)} - \dfrac{(x + 1)}{(x - 3)} = \dfrac{(x + 3)(x - 3) - (x - 2)(x + 1)}{(x - 2)(x - 3)}$

$= \dfrac{(x^2 - 9) - (x^2 - x - 2)}{(x^2 - 5x + 6)} = \dfrac{x - 7}{(x^2 - 5x + 6)}$

84. $\dfrac{x + 1}{x - 1} + \dfrac{x - 1}{x + 1} = \dfrac{(x + 1)^2 + (x - 1)^2}{(x - 1)(x + 1)} = \dfrac{2(x^2 + 1)}{(x^2 - 1)}$

85. $\dfrac{x^2 - 5x + 6}{x^2 - 9x + 20} \div \dfrac{x^2 - 3x + 2}{x^2 - 5x + 4}$

$= \dfrac{x^2 - 5x + 6}{x^2 - 9x + 20} \times \dfrac{x^2 - 5x + 4}{x^2 - 3x + 2}$

$= \dfrac{(x - 2)(x - 3)}{(x - 4)(x - 5)} \times \dfrac{(x - 1)(x - 4)}{(x - 1)(x - 2)}$

$= \left(\dfrac{x - 3}{x - 5}\right)$

86. $\dfrac{2x^2 + 3}{x - 3} + \dfrac{x - 3}{2x^2 + 3}$

$= \dfrac{(2x^2 + 3)^2 + (x - 3)^2}{(x - 3)(2x^2 + 3)} = \dfrac{4x^4 + 9 + 12x^2 + x^2 + 9 - 6x}{2x^3 - 6x^2 + 3x - 9}$

$= \dfrac{4x^4 + 13x^2 - 6x + 18}{2x^3 - 6x^2 + 3x - 9}$

87. $\dfrac{(x-3)(x^2-5x+4)}{(x-4)(x^2-2x-3)} = \dfrac{(x-3)(x-1)(x-4)}{(x-4)(x-3)(x+1)} = \dfrac{(x-1)}{(x+1)}$

88. $\dfrac{(2x^2+1)(x+1)+(x-1)^2}{(x^2-1)} \times \dfrac{(x^2-1)}{2x}$

$= \dfrac{2x^3+2x^2+x+1+(x-1)^2}{(2x)} = \dfrac{2x^3+3x^2-x+2}{2x}$

89. $\sqrt{\dfrac{(x^2+3x+2)(x^2+5x+6)}{x^2(x^2+4x+3)}}$

$= \sqrt{\dfrac{(x+1)(x+2)(x+2)(x+3)}{x^2(x+1)(x+3)}}$

$= \sqrt{\dfrac{(x+2)^2}{x^2}} = \dfrac{x+2}{x}$

90. $\dfrac{1}{(a-b)(a-c)} + \dfrac{1}{(b-c)(b-a)} + \dfrac{1}{(c-a)(c-b)}$

$\dfrac{(b-c)(b-a)(c-a)(c-b)+(a-b)(a-c)(c-a)(c-b)}{+(a-b)(a-c)(b-c)(b-a)} = 0$

$(a-b)(a-c)(b-c)(b-a)(c-a)(c-b)$

91. $\dfrac{1}{(1-x)} + \dfrac{1}{(1+x)} + \dfrac{2}{(1+x^2)} + \dfrac{4}{(1+x^4)}$

$= \dfrac{(1+x)+(1-x)}{(1-x^2)} + \dfrac{2}{(1+x^2)} + \dfrac{4}{(1+x^4)}$

$= \dfrac{2}{(1-x^2)} + \dfrac{2}{(1+x^2)} + \dfrac{4}{(1+x^4)}$

$= \dfrac{4}{(1-x^4)} + \dfrac{4}{(1+x^4)} = \dfrac{8}{1-x^8}$

☑ Introductory Exercise 13.2

1. $x - y = \dfrac{9}{10}$ and $(x+y) = \dfrac{11}{2}$

$x - y = \dfrac{9}{10}$

$x + y = \dfrac{11}{2}$ } By addition

$2x = \dfrac{64}{10}$

$\Rightarrow \quad x = \dfrac{32}{10} = 3.2$

$\Rightarrow \therefore \quad y = \dfrac{23}{10} = 2.3$

2. $\dfrac{x+y}{xy} = 2 \Rightarrow \dfrac{1}{x} + \dfrac{1}{y} = 2$ …(i)

and $\dfrac{x-y}{xy} = 6 \Rightarrow \dfrac{1}{y} - \dfrac{1}{x} = 6$ …(ii)

By adding eqs. (i) and (ii), we get

$\dfrac{2}{y} = 8 \Rightarrow y = \dfrac{1}{4} \therefore x = -\dfrac{1}{2}$

$\therefore \quad x = -\dfrac{1}{2}$ and $y = \dfrac{1}{4}$

Alternatively

$x + y = 2xy$ and $x - y = 6xy$ …(i)

$\Rightarrow \quad 3(x+y) = 6xy$ and $x - y = 6xy$

$\Rightarrow \quad 3x + 3y = x - y$

$\Rightarrow \quad 2x = -4y$

$\Rightarrow \quad x = -2y$

Substituting $x = -2y$ in the Eq. (i), we get

$-3y = 6xy \Rightarrow x = -\dfrac{1}{2}$

and $\therefore \quad y = \dfrac{1}{4}$

3. $\dfrac{1}{2x} - \dfrac{1}{y} - 1$ and $\dfrac{1}{x} + \dfrac{1}{2y} = 8$

$\Rightarrow \quad \dfrac{1}{2x} - \dfrac{1}{y} = -1$ and $\dfrac{2}{x} + \dfrac{1}{y} = 16$

By adding these two equations, we get

$\dfrac{5}{2x} = 15 \Rightarrow x = \dfrac{1}{6}$

$\therefore \quad y = \dfrac{1}{4}$

4. $\dfrac{2x}{a} + \dfrac{y}{b} = 2$ …(i)

$\dfrac{x}{a} - \dfrac{y}{b} = 4$ …(ii)

Adding eqs. (i) and (ii), we get

$\dfrac{3x}{a} = 6 \Rightarrow \dfrac{x}{a} = 2 \Rightarrow x = 2a$

Now put $x = 2a$ in eq. (ii)

$\dfrac{y}{b} = -2$

$\therefore \quad x = 2a$ and $y = -2b.$

5. For no solution

$\dfrac{9}{7} = \dfrac{4}{k} \neq \dfrac{9}{5}$

$\Rightarrow \quad k = \dfrac{28}{9}$

6. Two linear equations will coincide if there are infinite number of solutions,

i.e., $\dfrac{a_1}{a_2} = \dfrac{b_1}{b_2} = \dfrac{c_1}{c_2}$

for $a_1x + b_1y = c_1$ and $a_2x + b_2y = c_2$

$\therefore \quad \dfrac{k}{3} = \dfrac{2}{1} = \dfrac{2}{1} \Rightarrow k = 6$

7. For an infinite number of solutions

$$\frac{2}{6}=\frac{3}{k}=\frac{-5}{-15} \Rightarrow k=9$$

8. $8B + 5M = 92$ …(i)

$5B + 8M = 77$ …(ii)

Multiply eq. (i) by 8 Eq. (ii) by 5, we get

$64B + 40M = 736$

$25B + 40M = 385$ [subtracting]

$39B = 351$

$B = 9$

$\therefore M = 4$

$\therefore 2M + 3B = 35$

$\therefore$ The required cost of 2 mugs and 3 buckets is ₹ 35.

(Here, $M \rightarrow$ Price of a mug and $B \rightarrow$ Price of a bucket)

9. Let the two numbers be x and y,

then $x + y = 8$

and $(x + y) = 4(x - y)$

$\Rightarrow x - y = 2$

$\therefore x + y = 8$ and $x - y = 2$

$2x = 10 \Rightarrow x = 5$

$\therefore y = 3$

10. Let numerator be x and denominator be y,

then $x = y - 4$ …(i)

$8(x - 2) = (y + 1)$ …(ii)

The above equations can be written as

$y - x = 4$ …(iii)

and $y - 8x = -17$

$7x = 21$

$\Rightarrow x = 3 \therefore y = 7$

$\therefore$ The required fraction $= \frac{x}{y} = \frac{3}{7}$

11. Distance = 90 km

Let the speeds of car be x km/h and y km/h

$\therefore$ Distance = Speed × Time

$\therefore 90 = (x + y) \times \frac{9}{7} \Rightarrow x + y = 70$

and $90 = (x - y) \times 9 \Rightarrow x - y = 10$

$\therefore x = 40$ and $y = 30$

$\therefore$ The required speeds of cars = 40 km/h and 30 km/h

12. Let there be x coins of 25 paise denomination and y coins of 50 paise denomination, then

$x + y = 40 \Rightarrow 25x + 25y = 1000$ …(i)

and $25x + 50y = 1275$ …(ii)

$\therefore$ Subtracting eqs. (i) from (ii), we get

$25y = 275 \Rightarrow y = 11$

$\therefore x = 29.$

13. Let there be x pencils and y pens, then

$\therefore x + y = 40 \Rightarrow 4x + 4y = 160$

$(x + 5) = 4(y - 5)$

$\Rightarrow x - 4y = -25$

$\therefore 4x + 4y = 160$

$x - 4y = -25$

$5x = 135$

$\Rightarrow x = 27 \therefore y = 13$

14. Let the present age of the son be 'x' years and the present age of his father be 'y' years.

Then, $y = 3x$ …(i)

Again, $(y + 12) = 2(x + 12)$ …(ii)

Substituting $y = 3x$ in eq. (ii), we get

$x = 12$

$\therefore y = 36$

15. Let the present age of A is x

and the present age of B is y (in years).

Then, $(x - 5) = 3(y - 5) \Rightarrow x - 3y = -10$ …(i)

$(x + 10) = 2(y + 10) \Rightarrow x - 2y = 10$ …(ii)

Subtracting eq. (ii) from eq. (i), we get

$-y = -20 \Rightarrow y = 20$

$\therefore x = 50$

16. Let Astha will have x number of oranges and

Saumya will have y number of oranges. Then,

$(x + 10) = 2(y - 10) \Rightarrow x - 2y = -30$ …(i)

and $(x - 10) = (y + 10) \Rightarrow x - y = 20$ …(ii)

Subtracting eq. (ii) from eq. (ii), we get

$-y = -50 \Rightarrow y = 50$

$\therefore x = 70$

17. Total distance = 760 km.

Let the speed of car be x km/h and the speed of train be y km/h

$\therefore$ Distance = Speed × Time

$\Rightarrow T = \frac{D}{S}$

$\therefore \frac{600}{x} + \frac{160}{y} = 8$ …(i)

and $\frac{520}{x} + \frac{240}{y} = 8\frac{1}{5}$ …(ii)

$\therefore$ eq. (i) can be written as

$600A + 160B = 8$ …(iii)

and eq. (ii) can be written as

$520A + 240B = \frac{41}{5}$ …(iv)

where, $\frac{1}{x} = A$ and $\frac{1}{y} = B$

$\therefore$ Solving eqs. (iii) and (iv), we get

$$1800A + 480B = 24$$
$$1040A + 480B = \frac{82}{5}$$
$$- \quad - \quad -$$
$$760A = \frac{38}{5}$$

$\Rightarrow \quad A = \frac{1}{100} \Rightarrow x = 100$ km/h

$\therefore \quad B = \frac{1}{80} \Rightarrow y = 80$ km/h

18. Let he has invested ₹ x at 12% S.I. and ₹ y at 10% SI

$\therefore \quad \left(\because \text{SI} = \frac{P \times r \times t}{100}\right)$

$$\frac{x \times 12 \times 1}{100} + \frac{y \times 10 \times 1}{100} = 130$$

$\Rightarrow \quad 12x + 10y = 13000 \quad \ldots(i)$

$\Rightarrow \quad 10x + 12y = 134000 \quad \ldots(ii)$

$\therefore \quad x = 500$ and $y = 700$

19. $\frac{3x - y + 1}{3} = \frac{2x + y + 2}{5}$

$\Leftrightarrow \quad 5(3x - y + 1) = 3(2x + y + 2)$

$\Leftrightarrow \quad 9x - 8y = 1 \quad \ldots(i)$

$\Leftrightarrow \quad \frac{2x + y + 2}{5} = \frac{3x + 2y + 1}{6}$

$\Leftrightarrow \quad 6(2x + y + 2) = 5(3x + 2y + 1)$

$\Leftrightarrow \quad 3x + 4y = 7 \quad \ldots(ii)$

Multiplying eq. (ii) by 2 and adding to eq. (i), we get

$$15x = 15 \quad \text{or} \quad x = 1$$

Putting $x = 1$ in (i), we get

$$9 \times 1 - 8y = 1 \Rightarrow y = 1.$$

20. Submarino can be destroyed when it meets the destroyer. Thus,

$$2x + 3y = 5 \quad \ldots(i)$$
$$x - y = 10 \quad \ldots(ii)$$

$\therefore \quad x = 7$ and $y = -3$.

So, the required point is $(7, -3)$

21. $\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1 \quad \ldots(i)$

$\frac{x^2}{a^2} - \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1 \quad \ldots(ii)$

$-\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1 \quad \ldots(iii)$

Adding eqs. (i), (ii) and (iii), we have

$\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 3 \quad \ldots(iv)$

$\therefore \quad \frac{x^2}{a^2} = 1 \Rightarrow x = \pm a$

$\frac{y^2}{b^2} = 1 \Rightarrow y = \pm b$

$\frac{z^2}{c^2} = 1 \Rightarrow z = \pm c$

Hence, (d) is correct.

☑ Level 01 *Basic Level Exercise*

1 If $x + y + z$ is constant, the product xyz takes maximum value when each of x, y, z takes equal value.

$\because \quad a + b + c = 13$

$\therefore \quad (a - 3) + (b - 2) + (c + 1) = 13 - 3 - 2 + 1 = 9$

For the maximum value of $(a - 3)(b - 2)(c + 1)$

$$= (a - 3) = (b - 2) = (c + 1) = \frac{9}{3} = 3$$

So, $(a - 3)(b - 2)(c + 1) = 3 \times 3 \times 3 = 27$

2 If xyz is constant, then the sum of x, y, z (*i.e.,* $x + y + z$) takes minimum value when each of x, y, z takes equal value.

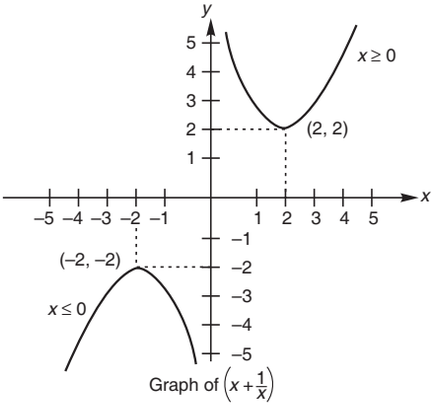
$\therefore$ Minimum value of $a + b + c + d$ for given constant product $abcd$ will be when $a = b = c = d$

$\therefore \quad a = b = c = d = 3$

$\therefore$ Minimum value of $a + b + c + d = 3 + 3 + 3 + 3 = 12$

3 For $x \geq 0$, $x + \frac{1}{x} \geq 2$

and for $x \leq 0$, $x + \frac{1}{x} \leq 2$



4 This is the standard inequality formula.

5 This is the standard inequality formula.

NOTE The result can be proved by considering suitable values.

6 $x^2y^3 + y^2x^3 = 25$

$\Rightarrow \quad x^2y^2(x+y) = 25$

$\Rightarrow \quad (xy)^2(x+y) = 25$

$\Rightarrow \quad (xy)^2 = 1 \qquad (\because x+y = 25)$

$\Rightarrow \quad xy = \pm 1$

7 $x > 0$ and $y > 0$

$$\therefore \quad (x+y)\left(\frac{1}{x}+\frac{1}{y}\right) = 2 + \frac{x}{y} + \frac{y}{x}$$

$$= 2 + \left(k + \frac{1}{k}\right), \quad \text{where } k = \frac{x}{y}$$

Since, the minimum value of the expression $\left(k + \frac{1}{k}\right)$ is 2.

$\therefore$ Minimum value of the given expression is 4.

8 If $a+b+c+d$ is constant, then the product $abcd$ is maximum when $a = b = c = d$.

$\therefore \quad (a+1) = (b+1) = (c+1) = (d+1)$

Given that $(a+1)+(b+1)+(c+1)+(d+1) = 8$

$\therefore \quad 4(a+1) = 8$

$\Rightarrow \quad (a+1) = 2$

$\therefore \quad$ Maximum value $= 2 \times 2 \times 2 \times 2 = 16$

9 As $x + y + z = 1$

$$\left(\frac{1}{x}-1\right)\left(\frac{1}{y}-1\right)\left(\frac{1}{z}-1\right) = \frac{y+z}{x}\cdot\frac{z+x}{y}\cdot\frac{x+y}{z}$$

But $\frac{y+z}{2} \geq yz$ etc.

Hence, $\text{LHS} \geq \frac{8xyz}{xyz} = 8$

10 $x + y + z = 4$ and $x^2 + y^2 + z^2 = 6$

$\therefore \quad y + z = 4 - x$

and $\quad y^2 + z^2 = 6 - x^2$

$$yz = \frac{1}{2}\{(y+z)^2 - (y^2+z^2)\}$$

$$= \frac{1}{2}\{(4-x)^2 - (6-x^2)\}$$

$\Rightarrow \quad yz = x^2 - 4x + 5$

Hence, y and z are the roots of

$$t^2 - (4-x)t + (x^2 - 4x + 5) = 0$$

Since, the roots y and z are real

$$(4-x)^2 - 4(x^2 - 4x + 5) \geq 0$$

$\Rightarrow \quad 3x^2 - 8x + 4 \leq 0$

$\Rightarrow \quad (3x-2)(x-2) \leq 0$

$\Rightarrow \quad x \in \left[\frac{2}{3}, 2\right]$

By symmetry y, z also $\in \left[\frac{2}{3}, 2\right]$.

11 $\frac{1}{x^2} + \frac{1}{y^2} = \frac{x^2+y^2}{(xy)^2}$

$$= \frac{(7+4\sqrt{3})^2 + (7-4\sqrt{3})^2}{[(7+4\sqrt{3})(7-4\sqrt{3})]^2} = \frac{2(49+48)}{(1)^2} = 194$$

12 $\text{AM} \geq \text{GM} \quad \Rightarrow \quad \frac{a+b+c}{3} \geq (abc)^{1/3}$

(AM $\rightarrow$ Arithmetic mean, GM $\rightarrow$ Geometric mean)

and $\quad \frac{1}{3}\left(\frac{1}{a}+\frac{1}{b}+\frac{1}{c}\right) \geq \left(\frac{1}{abc}\right)^{1/3}$

$$\Rightarrow \quad \frac{1}{3}(a+b+c)\frac{1}{3}\left(\frac{1}{a}+\frac{1}{b}+\frac{1}{c}\right) \geq (abc)^{1/3}\left(\frac{1}{abc}\right)^{1/3} = 1$$

$$\Rightarrow \quad (a+b+c)\left(\frac{1}{a}+\frac{1}{b}+\frac{1}{c}\right) \geq 9$$

Putting $a = b = c = 1$, expression takes the value 9, which is therefore, its least value.

13 If ab is constant, then $(a+b)$ takes minimum value when $\quad a = b$

$\therefore \quad a = b = 1$

$\therefore \quad (1+a)(1+b) = (1+1)(1+1) = 4$

14 $$\frac{(a+b+c)(ab+bc+ac)}{abc} = (a+b+c)\left(\frac{ab}{abc}+\frac{bc}{abc}+\frac{ac}{abc}\right)$$

$$= (a+b+c)\left(\frac{1}{c}+\frac{1}{a}+\frac{1}{b}\right)$$

$$= (a+b+c)\left(\frac{1}{a}+\frac{1}{b}+\frac{1}{c}\right) > 9$$

(See the problem number 12 in this exercise.)

15 The expression will have minimum value of the expression when $a = b = c$.

Therefore, the required minimum value

$$= \frac{(1+1+1)}{1} \times \frac{(1+1+1)}{1} \times \frac{(1+1+1)}{1} = 27$$

16 $\text{Max}\left(\frac{x}{y}\right) = \frac{\text{Max}(x)}{\text{Min}(y)} = \frac{3}{2}$

17 $\frac{1}{a}+\frac{1}{b}+\frac{1}{c} = 1$

$\Rightarrow \quad \frac{bc+ac+ab}{abc} = 1$

$\Rightarrow \quad bc + ac + ab = abc \qquad \ldots(\text{i})$

Again, $\quad (a+b+c)^2 = a^2+b^2+c^2+2(ab+bc+ac)$

$$(a+b+c)^2 = a^2+b^2+c^2+2abc$$

$$(3)^2 = 6 + 2abc \quad \Rightarrow \quad abc = \frac{3}{2}$$

18 $2^x = 4^y = 8^z \Rightarrow 2^x = 2^{2y} = 2^{3z}$

$\Rightarrow x = 2y = 3z = k$ (say)

Then, $xyz = \frac{k^3}{6} = 288 \Rightarrow k = 12$

$\therefore x = 12, \quad y = 6, \quad z = 4$

$\Rightarrow \frac{1}{2x} + \frac{1}{4y} + \frac{1}{8z} = \frac{11}{96}$

19 $a = c^z$

$\Rightarrow a = (b^y)^z \quad (\because c = b^y)$

$\Rightarrow a = b^{yz}$

$\Rightarrow a = (a^x)^{yz} \quad (\because b = a^x)$

$\Rightarrow a = a^{xyz}$

$\Rightarrow a^1 = a^{xyz} \Rightarrow xyz = 1$

20 $7x + 12y = 220 \Rightarrow 7x = 220 - 12y$

$$x = \frac{220 - 12y}{7} = \frac{4(55 - 3y)}{7}$$

It means $55 - 3y$ must be divisible by 7. Since, 4 is not divisible by 7.

$\therefore$ at $y = 2, 9, 16$

we get $x = 28, 16, 4$

Thus, we have 3 solutions of x, y

$(x, y) = (28, 2), (16, 9)$ and $(4, 16)$

21 $a^x \cdot a^y \cdot a^z = (x + y + z)^{x+y+z}$

$\Rightarrow a^{x+y+z} = (x + y + z)^{(x+y+z)}$

$\Rightarrow a = x + y + z \quad \ldots(i)$

$\therefore (x + y + z)^y = a^x = (x + y + z)^x$

$\Rightarrow x = y$

Similarly, $y = z$ and $z = x$

$\therefore x = y = z = \frac{a}{3}$ [using eq. (i)]

22 Let $\frac{x}{a} = \frac{y}{b} = \frac{z}{c} = k$

$\therefore x = ak, \quad y = bk, \quad z = ck$

$\therefore (x + y + z) = k(a + b + c)$

$\therefore (x + y + z)^2 = k^2 (a + b + c)^2$

$\therefore x^2 + y^2 + z^2 + 2(xy + yz + zx) = k^2 (a + b + c)^2$

$\therefore 2(xy + yz + zx) = k^2 (a + b + c)^2 - (x^2 + y^2 + z^2)$

$\therefore xy + yz + zx = \frac{k^2}{2}(a + b + c)^2 - \frac{1}{2}(x^2 + y^2 + z^2)$

$$= \frac{x^2 (a + b + c)^2 - a^2 (x^2 + y^2 + z^2)}{2a^2} \quad \left(\because k = \frac{x}{a}\right)$$

23 Let x and y be the number of deer and ducks respectively.

$\therefore x + y = 14 \quad \ldots(i)$

and $4x + 2y = 38 \quad \ldots(ii)$

($\because$ A deer has 4 legs and a duck has 2 legs)

By solving the above two eq. (i) and (ii), we get

$x = 5$ and $y = 9$

Thus, the number of deer is 5.

Alternatively Assume that there are only ducks (because a duck has less number of legs than that of deer). Hence, there must be $9 \times 2 = 2 = 18$ legs, but in this way there are 10 legs = $(28 - 18)$ more.

So, there must be some deer which fulfill this gap. Now this difference of 10 legs is compensated by 5 deer because a deer has 2 extra legs (*i.e.,* 2 more legs than a duck has).

Hence, there are 5 deer and $14 - 5 = 9$ ducks.

In short: Step 1. $2 \times 14 = 28$

Step 2. $38 - 28 = 10$

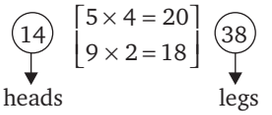
Step 3. $10 \div 2 = 5$

Step 4. $14 - 5 = 9$

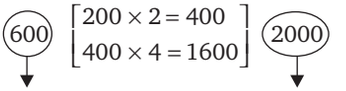
Hence, there were 5 deer and 9 ducks.

Alternatively Going through options. First of all option (d) is ruled out. Now we have to check just 3 options. Again we can leave option (b) and (c) also.

So, we can check the option (a).



24 Going through options, we find that option (d) is correct *i.e.,*



Alternatively

Step 1. $2 \times 600 = 1200$

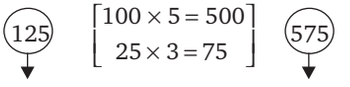
($2 \rightarrow$ number of tyres in two wheelers)

Step 2. $2000 - 1200 = 800$

Step 3. $800 \div 2 = 400 \rightarrow$ number of 4 wheelers

Step 4. $600 - 400 = 200 \rightarrow$ number of 2 wheelers

25 Go through options. Let us consider option (d).



Alternatively

Step 1. $3 \times 125 = 375$ → Number of horses in a rath carried by 3 horses

Step 2. $575 - 375 = 200$

Step 3. $200 \div 2 = 100$ → Number of extra horses in a rath carried by 5 horses.

Step 4. $125 - 100 = 25$

$\therefore$ Number of raths of Kaurav = 100

Number of raths of allied army of Kaurav = 25

26 Let us assume option (a) is correct

Then, the number of coolers

$$= \frac{150000}{3000} = 50$$

$\therefore$ the number of coolers = 50

and the number of fans = 40 = (90 − 50)

Now, $\textcircled{90}\begin{bmatrix}50\times 4 = 200\\ 40\times 3 = 120\end{bmatrix}\textcircled{320}$

Thus, the assumed option (a) is correct.

Alternatively Step 1. $3\times 90 = 270$
Step 2. $320 - 270 = 50$
Step 3. $50 \div 1 = 50$
Step 4. $90 - 50 = 40$

Hence, number of fans = 40
and number of coolers = 50

$\therefore$ Cost of coolers = $50 \times 3000 = 150000$

27 Let us assume option (c), then

$$\textcircled{90}\begin{bmatrix}40\times 2 = 80 \to 80\times 10 & 800\\ 50\times 3 = 150 \to 150\times 15 & 2250\end{bmatrix}\textcircled{3050}$$

Hence, assumed option (c) is correct.

Alternatively Per hour expenditure in fuel for Sukhoi
$= 2\times 10 = \$\ 20$

and per hour expenditure in fuel for Mig-21 = $3\times 15 = \$\ 45$

Now, Step 1. $90\times 20 = 1800$
Step 2. $3050 - 1800 = 1250$
Step 3. $1250 \div 25 = 50$ $(25 = 45 - 20)$
Step 4. $90 - 50 = 40$

Hence, the number of Sukhoi is 40.

28 Step 1. $20\times 7 = 140$

Step 2. $176 - 140 = 36$

Step 3. $36 \div 3 = 12 \to$ weight of mangoes, initially

Step 4. $20 - 12 = 8 \to$ weight of apples, initially

$\therefore$ Number of mangoes = $12\times 10 = 120$

and Number of apples = $8\times 7 = 56$

Again, since she is left with 13 kg of mangoes and apples containing 121 fruits (176 − 55 = 121)

$\therefore$ Step 1. $13\times 7 = 91$
Step 2. $121 - 91 = 30$
Step 3. $30 \div 3 = 10 \to$ weight of mangoes
Step 4. $13 - 10 = 3 \to$ weight of apples

Thus, the number of apples left with vendor
$= 3\times 7 = 21.$

Alternatively In the first instance option (c) is ruled out Since,

$$\frac{80}{7} + \frac{41}{10} \neq 13 \qquad 176 - 55 = 121 \text{ and } 121 - 80 = 41$$

Again, $\frac{35}{7} + \frac{86}{10} \neq 13$ kg, option (b) is wrong.

Once again $\frac{21}{7} + \frac{100}{10} = 13$ kg

Hence, option (a) is correct.

29 Since, we know that Ritika has purchased 2 kg mangoes and 5 kg apples. Thus, she has spent $(2\times 35 + 5\times 40) = ₹\ 270$.

30

	Mangoes	Apples
SP	35	40
CP	30	30
New SP	40	35

Therefore, CP = $30\times 10 + 30\times 3 = 390$

and New SP = $40\times 10 + 35\times 3 = 505$

$\therefore$ Profit = 505 − 390 = 115

and Profit percentage = $\frac{115}{390}\times 100 = 29.48\%$

31 **Solving with the help of options:** In this type of questions we start with least valued options and tend towards higher valued option.

Option (a): If we take 4 coins of ₹ 1, then

$(5\times 1) + (2\times 21) = 47 \neq 44$ $(48 - 4 = 44)$

$5\times 2 + 2\times 20 = 50 \neq 44$ and $(26 - 4 = 22)$

Thus, we need to move further since the value of money is exceeding.

Option (b): If we take 5 coins of ₹ 1, then

$5\times 1 + 2\times 20 = 45 \neq 43$ $(43 = 48 - 5)$

$5\times 2 + 2\times 19 = 48 \neq 43$ and $(21 = 26 - 5)$

Option (c): If we take 7 coins of ₹ 1, then

$$5\times 1 + 2\times 18 = 41 = 41 \quad \begin{Bmatrix}(48 - 7 = 41)\\ \text{and } (26 - 7 = 19)\end{Bmatrix}$$

Thus, the option (c) is correct.

Alternatively

$5a + 2b + c = 48$ $\quad a \to$ ₹ 5 coin
$a + b + c = 26$ $\quad b \to$ ₹ 2 coin
$4a + b = 22$ $\quad c \to$ ₹ 1 coin

$(a, b) \to (c)$
$(1, 18) \to 7$
$(2, 14) \to 10$
$(3, 10) \to 13$
$(4, 6) \to 16$
$(5, 2) \to 19$

32 Go through options.

CHAPTER 14

Theory of Equations

As per the past years CAT papers, on an average two-three questions are being asked. The problems of this chapter are not so much difficult to solve. Since this chapter is concerned with secondary level syllabus therefore it is important in JMET, XAT and SNAP etc. In this chapter we study quadratic equation, inequation and higher degree polynomial expressions.

14.1 Definition of the Standard Quadratic Expression

For the real numbers $\boldsymbol{a}, \boldsymbol{b}$ and $\boldsymbol{c}$, the expression $\boldsymbol{ax}^2 + \boldsymbol{bx} + \boldsymbol{c}$ is called the quadratic expression, if $a \neq 0$. Here a is the coefficient of x^2, b is the coefficient of x and c is a constant term.

(a) If $a = 0$, then quadratic expression $\boldsymbol{ax}^2 + \boldsymbol{bx} + \boldsymbol{c}$ will reduce to a linear expression $bx + \boldsymbol{c}$. That means if $\boldsymbol{a}$ (the coefficient of $\boldsymbol{x}^2$) is zero, the given expression will no longer be a quadratic expression.

(b) When we say that $\boldsymbol{a}$, $\boldsymbol{b}$ and $\boldsymbol{c}$ are real numbers, it means $\boldsymbol{a}$, $\boldsymbol{b}$ and $\boldsymbol{c}$ can be any sort of numbers like rational numbers or irrational numbers or fractions or integers.

Nomenclature	Format	Restrictions
Quadratic Expression	$ax^2 + bx + c$	—
Quadratic Function	$y = ax^2 + bx + c$	Any value
Quadratic Function	$f(x) = ax^2 + bx + c$	Any value
Quadratic Equation	$ax^2 + bx + c = 0$	Strictly equal to zero
Quadratic Inequation	$ax^2 + bx + c \geq 0$	Non-negative values
Quadratic Inequation	$ax^2 + bx + c > 0$	Positive values
Quadratic Inequation	$ax^2 + bx + c \leq 0$	Non-positive values
Quadratic Inequation	$ax^2 + bx + c < 0$	Negative values

Thus by substituting the arbitrary numbers in place of x in the function you can obtain various values of y or $f(x)$.

NOTE You can use y and $f(x)$ interchangeably as per the requirement or convenience. It means, conceptually, y and $f(x)$ both represent the same thing. Technically, the relation $y = f(x)$ represents a function, which means by substituting the values of x you can get the corresponding values of y.

Variants of the Quadratic Function

All of the following functions are quadratic functions since the degree of each equation is 2. That means in each function there is always a term x^2 or ax^2 for every non-zero value of a. Here x is a variable and a, b, c are the constant numbers.

$$y = x^2$$
$$y = ax^2$$
$$y = ax^2 + x$$
$$y = ax^2 + bx$$
$$y = ax^2 + c$$
$$y = ax^2 + x + c$$
$$y = ax^2 + bx + c$$

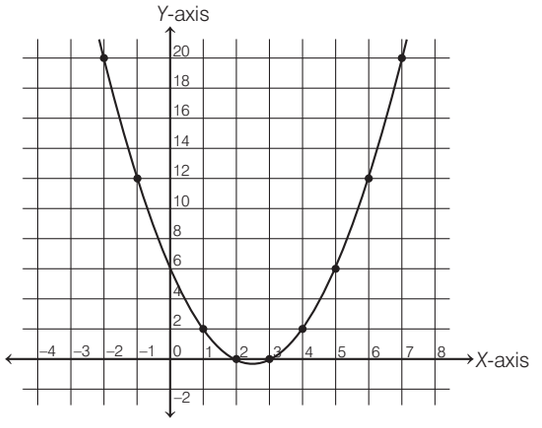
Graphical Illustration

Let us consider a quadratic function $y = x^2 - 5x + 6$. By substituting the arbitrary numerical values of x in the above function we get the corresponding values of y as shown in the following table

x	−2	−1	0	1	2	3	4	5	6	7
y	20	12	6	2	0	0	2	6	12	20

Now if we connect all the points (x, y) on the coordinate plane, we will get a quadratic graph as shown below.

Please take note of the fact that you can consider any real number for x to draw your graph.



Properties of the Quadratic Equations

1. The degree of any quadratic equation is always 2.
2. The value of x that satisfies the relation $ax^2 + bx + c = 0$ is called the root or zero or solution of this equation.
3. A quadratic equation has exactly two roots (or solutions or zeros).
4. A quadratic equation cannot have more than two different roots.
5. A quadratic equation can have either two or zero REAL roots.
6. If α is a root of the quadratic equation $ax^2 + bx + c = 0$, then $(x - \alpha)$ is a factor of $ax^2 + bx + c = 0$.
7. If α and β are the two roots of the quadratic equation $ax^2 + bx + c = 0$, then $ax^2 + bx + c = 0$ can be expressed as the product of two factors $(x - \alpha)$ and $(x - \beta)$ as following $ax^2 + bx + c = (x - \alpha)(x - \beta) = 0$

NOTE Even though there CANNOT be more than two roots of any given quadratic equation, however, from any two given roots you can have an infinite number of quadratic equations. To get all the possible quadratic equations with both the roots common, just multiply or divide the original (or basic) quadratic equation that you have. So it follows that $ax^2 + bx + c \Rightarrow k(x - \alpha)(x - \beta) = 0$; Where k is any real number.

Therefore, you have to use your own discretion with regard to the problem that k should be 1 or other values of k are possible/valid/required.

8. If $(x - \alpha)$ and $(x - \beta)$ are the two factors of the quadratic equation $ax^2 + bx + c = 0$, then $(x - \alpha)(x - \beta) = 0$

   $$(x - \alpha) = 0 \Rightarrow x = \alpha \quad \text{or} \quad (x - \beta) = 0 \Rightarrow x = \beta$$

   Where α and β are the roots of the equation $ax^2 + bx + c = 0$
9. If quadratic equation is satisfied by more than two distinct numbers (real or imaginary) then it becomes an identity *i.e.*, $a = b = c = 0$.

   Becoming an identity implies that whatever value you substitute for x, the equation will be satisfied for every value of x.

Practice Exercise

1. Which of the following is/are the solution(s) of $x^2 - 7x + 12 = 0$?
(a) 2 (b) 3
(c) 4 (d) both 3 and 4

2. A quadratic equation $ax^2 + bx + c = 0$ may have
(a) two real roots
(b) two non-real roots
(c) one real and one non-real root
(d) Either (a) or (b)

3. If 5 and −6 are the roots of the quadratic equation, then what will be the factors of the quadratic equation?
(a) $(x - 5)$ and $(x - 6)$ (b) $(x - 5)$ and $(x + 6)$
(c) $(x + 5)$ and $(x - 6)$ (d) $(x + 5)$ and $(x + 6)$

4. If 3/2 and 4 are the two roots of a quadratic equation, then which one of the following is not the correct quadratic equation?
(a) $2x^2 - 11x + 6 = 0$ (b) $6x^2 - 33x + 18 = 0$
(c) $-10x^2 - 55x - 30 = 0$ (d) $4x^2 - 41x + 24 = 0$

5. If $(x-7)$ and $(x-17)$ are the factors of a quadratic equation, then which one of the following is the correct equation?
(a) $x^2-10x+24=0$
(b) $x^2-33x+119=0$
(c) $x^2+24x-119=0$
(d) $x^2-24x+119=0$

6. For what value of p, the equation $(p-1)(2p+1)x^2+(p^2-1)x+(p-1)(p-3)=0$ is an identity (or has more than two solutions)?
(a) -1 (b) $-1/2$
(c) 1 (d) 1/3

7. In the given equation ax^2+bx+c, if $a=0$ and $b\neq 0$, then
(a) The equation represents a linear equation
(b) The equation represents a quadratic equation
(c) The equation represents a bi-quadratic equation
(d) none of the above

Answers

14.2 Characteristics of the Graph of the Quadratic Function

1. A graph of a quadratic equation is exactly a parabola as shown below.
2. The parabola is always symmetric.
3. The line that splits the parabola through the middle is called the "axis of symmetry".
4. Axis of symmetry is obtained by $x=-b/2a$. It implies that how far the axis of symmetry is from the Y-axis.
5. The axis of symmetry may or may not overlap the Y-axis, which depends on the quadratic function. But axis of symmetry is always parallel to Y-axis.
6. The point on the axis of symmetry that bisects the parabola is called the "vertex", and it is the point where the curvature is greatest.
7. The parabola can open UP or DOWN only.
8. If the parabola opens up, the vertex will be the lowest point and if it opens down, the vertex will be the highest point of the graph.
9. The lowest point of the graph is called the minimum (plural is minima) and the highest point of the graph is called the maximum (plural is maxima).
10. The vertex of the quadratic graph is obtained by $y=\dfrac{(4ac-b^2)}{4a}$.
It implies that how far the vertex is from the X-axis. The positive (or negative) value of vertex y indicates that the vertex is above (or below) the X-axis.
11. The parabolic graph must intersect Y-axis but only once; except in rare cases where the values of $x=0$ is not allowed, it may not intercept. It implies that the graph of quadratic function, in general, may exist anywhere across the whole X-axis, depending on the quadratic function.

NOTE For more info about the axis and Cartesian plane you can refer Coordinate Geometry.

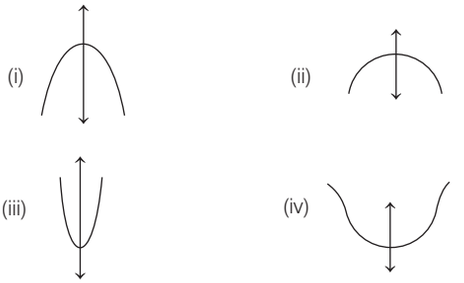
Fig (ii)

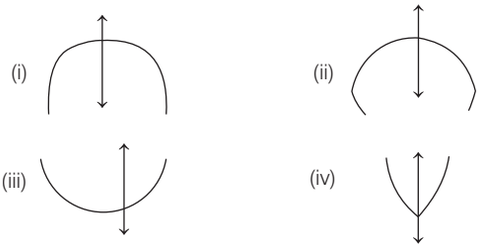
Practice Exercise

1. Which of the following is not a graph of a quadratic equation?



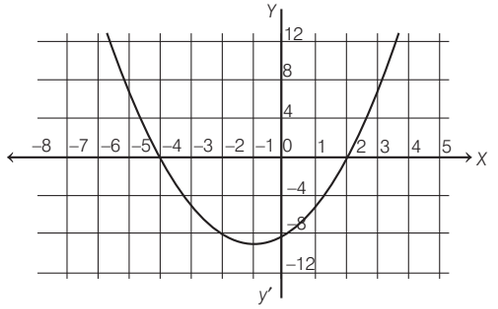
(a) only (iii) (b) (i) and (iii) (c) (ii) and (iv) (d) only (iv)

2. Which of the following is a correct graph of a quadratic equation, where the vertical line represents the axis of symmetry?



(a) Only (iii)
(b) (i) and (iii)
(c) (i) and (iv)
(d) none of the graphs

3. Consider the following graph of a quadratic function. Then which of the following facts are true regarding this quadratic graph?



(i) *Y*–intercept is –8 (ii) *X*–intercepts are –4 and 2.
(iii) a>0 (iv) D>0
(v) D>32a (vi) b = 2a
(vii) Vertex of the graph is less than –8.
(viii) The difference between the *Y*-axis and axis of symmetry is 1 unit.
(ix) The equation of axis of symmetry is $x = -1$.
(x) The value of y is same, if it is equidistant from $x = -1$.
(a) (i), (ii), (iii) and (vi) (b) (ii), (iii), (iv) and (x)
(c) Except (v), (vi) and (x) (d) all of these

4. For the quadratic equation $3x^2 + 12x + 10 = 0$, what is the distance between the *Y*-axis and the axis of symmetry of the quadratic graph?
(a) 2 units (b) 4 units (c) 3 units (d) 6 units

5. The two roots of a quadratic equation are –6 and 12, what is the distance between the axis of symmetry of the quadratic graph and the *Y*-axis?
(a) 6 units (b) 1unit (c) 2 units (d) 18 units

6. For the quadratic equation $x^2 + 6x - 16 = 0$, what will be the position of the axis of symmetry of the quadratic graph with reference to the *Y*-axis?
(a) 2 units left (b) 3 units right
(c) 3 units left (d) can't be determined

7. The axis of symmetry, of a quadratic graph, is always parallel to
(a) *X*-axis (b) *Y*-axis
(c) *Z*-axis (d) none of these

8. For a quadratic graph, the axis of symmetry and *Y*-axis coincide (or overlap) then,
(a) $a - b = c$ (b) $2a - b = 0$
(c) $b = 0$ (d) $c = 0$

9. For the quadratic equation $3x^2 + 12x + 10 = 0$, what is the vertex of the graph?
(a) $y = -2$ (b) $y = -4$ (c) $y = 3$ (d) 6

10. For the quadratic equation $x^2 + 12x + 20 = 0$, how far is the vertex from the *X*-axis?
(a) 8 unit (b) 16/3 unit (c) 16 unit (d) 8/3 unit

11. For the quadratic equation $x^2 - 11x + 24 = 0$, what will be the position of the vertex of the quadratic graph with reference to the X-axis?
(a) 25/4 units below (b) 25/4 units above
(c) 21/4 units below (d) can't be determined

12. For the quadratic equation $x^2 + 9x + 18 = 0$, what will be the position of the vertex of the quadratic graph with reference to the origin (or intersection of both the axes)?
(a) 9/2 units left, 113/4 units below
(b) 9/2 units left, 113/4 units above
(c) 9 units right, 81 units below
(d) 9 units right, 9 units below

13. Find the value of y where the graph of $3x^2 + 19x - 18 = 0$ intersects the *Y*-axis.
(a) –18 (b) 0
(c) 4 (d) 16

14. Which of the following is false?
(i) If only the positive values of *x* are taken, the quadratic graph does not intersect the *Y*-axis.
(ii) If only negative values are taken, the quadratic graph does not intersect the *Y*-axis.
(iii) The interception of *Y*-axis can be known when we substitute $x = 0$, in the quadratic function.
(iv) There can be minimum zero and maximum two *x*-intercepts.
(a) (i) and (iv) (b) (i), (iii), (iv)
(c) (ii), (iii), (iv) (d) none of these

15. If *D* be the discriminant of the quadratic equation $ax^2 + bx + c = 0$, what will be the coordinates of its vertex?
(a) $-b/2a, -D/4a$ (b) $-b/2a, D/4a$
(c) $b/2a, -D/2a$ (d) $-b/2a, \sqrt{D}/4a$

14.3 Different Ways to Express the Quadratic Equation

A quadratic equation can be expressed in the following forms

(1) $ax^2 + bx + c = 0$

(2) $x^2 + \left(\frac{b}{a}\right)x + \left(\frac{c}{a}\right) = 0;$

where a, b and c are the standard notations.

(3) $x^2 - (\alpha + \beta)x + (\alpha\beta) = 0$; where α and β are the roots of the equation.

Exp.) We can express a quadratic equation in three different forms, whose roots are (–2) and (1/2).

(1) $2x^2 + 3x - 1 = 0$

(2) $x^2 + \left(\frac{3}{2}\right)x + \left(-\frac{1}{2}\right) = 0$; where $a = 2,\ b = 3,\ c = -1$

$\Rightarrow \quad x^2 + \frac{3}{2}x - \frac{1}{2} = 0$

(3) $x^2 - \left(-\frac{3}{2}\right)x + \left(-\frac{1}{2}\right) = 0$; where $\alpha = -2, \beta = \frac{1}{2}$

$\Rightarrow \quad x^2 + \frac{3}{2}x - \frac{1}{2} = 0$

Discriminant of the Quadratic Equations

For the given quadratic equation $ax^2 + bx + c = 0$, the discriminant is denoted by D and expressed as $D = b^2 - 4ac$.

Exp.) Determine the discriminant of the following quadratic equations.

(i) $x^2 + 10x + 6$ (ii) $8x + 17 + 5x^2$

(iii) $-x^2 - 8x + 15$ (iv) $x^2 + 6x$

(v) $x^2 - 16$ (vi) $9x^2$

Solution (i) Discriminant of the equation $x^2 + 10x + 6$ is

$$10^2 - 4 \times 1 \times 6 = 76$$

(ii) Discriminant of the equation $5x^2 + 8x + 17$ is

$$8^2 - 4 \times 5 \times 17 = -276$$

(iii) Discriminant of the equation $-x^2 - 8x + 15$ is

$$(-8)^2 - 4 \times (-1) \times 15 = 124$$

(iv) Discriminant of the equation $x^2 + 6x$ is $6^2 - 4 \times 1 \times 0 = 36$

(v) Discriminant of the equation $x^2 - 16$ is $0^2 - 4 \times 1 \times -(16) = 64$

(vi) Discriminant of the equation $9x^2$ is $0^2 - 4 \times 9 \times 0 = 0$

Condition that the Quadratic Equation is Factorisable into two Linear Factors

When the discriminant $D \geq 0$, then the equation $ax^2 + bx + c = 0$ is factorisable into two linear factors. That is $ax^2 + bx + c = 0$

$\Rightarrow (x - \alpha)(x - \beta) = 0$; where α and β are the roots of the quadratic equation.

Exp.) Which of the following quadratic expressions are factorisable into two linear factors?

(i) $2x^2 + 10x + 6$ (ii) $5x^2 + 8x + 17$

(iii) $x^2 - 16$ (iv) $9x^2$

Solution

(i) Discriminant of the equation $x^2 + 10x + 6$ is $76 > 0$, so it is factorisable into two linear factors as $x^2 + 10x + 6 = (x + \sqrt{19})(x - \sqrt{19})$.

(ii) Discriminant of the equation $5x^2 + 8x + 17$ is $-276 < 0$, so it cannot be factorised into two linear factors.

(iii) Discriminant of the equation $x^2 - 16$ is $64 > 0$, so it is factorisable into two linear factors as $x^2 - 16 = (x + 4)(x - 4)$

(iv) Discriminant of the equation $9x^2$ is 0, so it is factorisable into two linear factors as $9x^2 = (3x)(3x)$ or $9x^2 = x(9x)$.

How to Factorize a Given Quadratic Equation

Step 1 First of all write down the given quadratic equation in its standard form of $ax^2 + bx + c = 0$

Step 2 If any of the coefficients a, b and c is a rational number, make it integer by multiplying whole equation by the denominator of that rational number.

Step 3 Find the product ac.

Step 4 Find all the factor pairs of ac, such that the product of any pair is equal to ac.

Step 5 Choose one such pair, say (m, n), such that if ac is positive then $m + n = b$ and if ac is negative then $m - n = -b$, provided $m \leq n$.

Step 6 Write down the expression as $ax^2 + (m + n) + c = 0$ or $ax^2 + (m - n) + c = 0$, as per the nature of b.

Step 7 Now make two pairs out of four terms considering there will be something common in the pairs as shown below. If $ax^2 + (m + n) + c = 0$

$\Rightarrow \quad (ax^2 + m) + (n + c) = 0$

or $\quad (ax^2 + n) + (m + c) = 0$

If $\quad ax^2 + (m - n) + c = 0$

$\Rightarrow \quad (ax^2 + m) + (-n + c) = 0$

or $\quad (ax^2 - n) + (m + c) = 0$

Step 8 Take out common if any, and then simplify.

NOTE This technique has some limitations that you will come across when you try to find the factors of an equation whose roots are irrational. Therefore, you may use other techniques to find the factors, like using *sum and product of roots* method or *Sridharacharya's* method.

Exp. 1) Factorize the given quadratic equation $2x^2 + 3x - 9 = 0$.

Solution Product $a \cdot c = 2 \times -9 = -18$

Now, $\quad 18 = 1 \times 18$ or 2×9 or 3×6

Since $a \cdot c$ is negative, therefore we will take the difference of 3 and 6 and which is $3 = b$. Therefore we choose 3 and 6.

Now we write the equation, as following $2x^2 + 3x - 9 = 0$

$\Rightarrow \quad 2x^2 + (6x - 3x) - 9 = 0 \Rightarrow (2x^2 + 6x) - (3x + 9) = 0$

$\Rightarrow \quad 2x(x + 3) - 3(x + 3) = 0 \Rightarrow (x + 3)(2x - 3) = 0$

Exp. 2) Factorize the given quadratic equation

$$3-\frac{5}{2}x-3x^2=0.$$

Solution The given quadratic equation can be expressed in the standard form as $-3x^2-\frac{5}{2}x+3=0$

Since the value of b is a rational number therefore we will multiply the whole equation by the denominator of b that is 2 and then we will get the whole equation with integer coefficients $-6x^2-5x+6=0$. Since product $a\cdot c=-6\times 6=-36$

Therefore, $36=1\times 36$ or 2×18 or 3×12 or 4×9 or 6×6

Now, since $a\cdot c$ is negative, therefore we will take the difference of 4 and 9 which is $5=b$. Therefore, we choose 4 and 9. Now, we write the equation as following

$$-6x^2-5x+6=0\Rightarrow -6x^2+(4x-9x)+6=0$$

$$\Rightarrow (4x-6x^2)+(6-9x)=0$$

$$\Rightarrow 2x(2-3x)+3(2-3x)=0\Rightarrow (2-3x)(2x+3)=0$$

Exp. 3) Factorize the given biquadratic equation

$$x^4+2x^2-8=0.$$

Solution The given biquadratic equation can be expressed in the standard form as $(x^2)^2+2x^2-8=0$

Product $a\cdot c=1\times -8=-8$

Now, $8=1\times 8$ or 2×4

Since $a\cdot c$ is negative, therefore we will take the difference of 2 and 4 and which is $2=b$. Therefore, we choose 2 and 4.

Now we write the equation as following $(x^2)^2+2x^2-8=0$

$$\Rightarrow (x^2)^2+(2x^2-4x^2)-8=0$$

$$\Rightarrow [(x^2)^2+2x^2]+(-4x^2-8)=0$$

$$\Rightarrow x^2(x^2+2)-4(x^2+2)=0\Rightarrow (x^2+2)(x^2-4)=0$$

$$\Rightarrow (x^2+2)(x+2)(x-2)=0$$

Exp. 4) Factorize the given quadratic equation

$$x^6+6x^3+5=0.$$

Solution The given quadratic equation can be expressed in the standard form as $(x^3)^2+6x^3+5=0$. Product $a\cdot c=1\times 5=5$

Now, $5=1\times 5$ is the only pair, so it has got to be easy.

Since $a\cdot c$ is positive, therefore we will take the addition of 1 and 5 and which is $6=b$. Now we write the equation as following

$$(x^3)^2+6x^3+5=0$$

$$\Rightarrow (x^3)^2+(x^3+5x^3)+5=0$$

$$\Rightarrow [(x^3)^2+x^3]+(5x^3+5)=0$$

$$\Rightarrow [(x^3)^2+x^3]+(5x^3+5)=0$$

$$\Rightarrow x^3(x^3+1)+5(x^3+1)=0$$

$$\Rightarrow (x^3+5)(x^3+1)=0$$

$$\Rightarrow (x^3+5)(x^3+1^3)=0$$

$$\Rightarrow (x^3+5)(x+1)(x^2-x+1)=0$$

Practice Exercise

Find the facrtors of following equations.

1. $x^{2/3}-x^{1/3}-56$
2. $x+9x^{1/2}+8$
3. $4x^4-81$
4. $(x-3)^4+2(x-3)^2-8$
5. $6x^2-xy-12y^2$
6. $20x^2+17x-91$
7. $35x+84-21x^2$

Answers

1. Assume $x^{\frac{1}{3}}=p$, then the given equation will become like

$$p^2-p-56$$

Then, $p^2-p-56=p^2-8p+7p-56$

$$=(p+7)(p-8)$$

Therefore, $x^{2/3}-x^{1/3}-56=(x^{1/3}+7)(x^{1/3}-8)$

2. Assume $x^{\frac{1}{2}}=p$, then the given equation will become like

$$p^2+9p+8$$

Then, $p^2+9p+8=p^2+p+8p+8=(p+8)(p+1)$.

Therefore, $x+9x^{1/2}+8=(x^{1/2}+8)(x^{1/2}+1)$

3. We can apply $(a^2-b^2)=(a+b)(a-b)$

$$4x^4-81\Rightarrow (2x)^2-9^2=(2x^2+9)(2x^2-9)$$

4. Assume $(x-3)^2=p$, then the given equation will become like p^2+2p-8.

Then, $p^2+2p-8=p^2+4p-2p-8=(p+4)(p-2)$.

5. $6x^2-xy-12y^2=6x^2-9xy+8xy-12y^2$

Then find a pair of factors of 6×12, such that their difference is 1. That is $6\times 12=9\times 8$

$$=3x(2x-3y)+4y(2x-3y)$$

$$=(2x-3y)(3x+4y).$$

6. Multiply 20 and 91. That is $2\times 2\times 5\times 7\times 13$. Then split these prime factors in two groups such that the difference of these two factors is 17. That is,

$$(2\times 2\times 13)(5\times 7)=52\times 35$$

Now, we have, $20x^2+17x-91$

$$=20x^2+(52x-35x)-91$$

$$=(4x-7)(5x+13)$$

7. $35x+84-21x^2=-21x^2+35x+84$

$$=-7(3x^2-5x-12)$$

Now multiply 3 and 12. That is $3\times 2\times 2\times 3$

Then find the pair of factors of $3\times 2\times 2\times 3$ such that the difference of these two factors is 5.

That is

$$3\times 2\times 2\times 3=4\times 9.$$

Now, $-21x^2+35x+84$

$$=-7(3x^2-5x-12)$$

$$=-7(3x^2-9x+4x-12)$$

$$=-7[(x-3)(3x+4)]$$

14.4 Solutions or Roots of the Quadratic Equations

The value of x that satisfies the relation $ax^2 + bx + c = 0$ is called the root or solution of this equation. Simply, the root of the quadratic function $y = ax^2 + bx + c = 0$ is the value of x for which y becomes 0.

NOTE It is preferable to use the term zero while referring a quadratic function and use the term root while referring to a quadratic equation.

Exp. 1) The roots of the quadratic equation $x^2 - 8x + 15 = 0$ are 3 and 5. As, by substituting 3 or 5 in place of x, both sides of the equation become 0.

Exp. 2) The roots of the quadratic function $y = x^2 - 8x + 15$ are 3 and 5. As by substituting 3 or 5 in place of x, the value of y becomes 0.

Exp. 3) The roots of the quadratic equation $x^2 - 8x + 22 = 7$ are 3 and 5. The given equation can be simplified as $x^2 - 8x + 15 = 0$. As, by substituting 3 or 5 in place of x, both sides of the equation become 0.

Exp. 4) The roots of the quadratic equation $x^2 + 9x - y = 17x - 15$ are 3 and 5. The given equation can be simplified as $y = x^2 - 8x + 15$.

As, by substituting 3 or 5 in place of x, the value of y becomes 0.

Sum and Product of the Roots of a Quadratic Equation

If the two roots of the quadratic equation $ax^2 + bx + c = 0$ are α and β,

(i) Sum of the roots $= (\alpha + \beta) = \dfrac{-b}{a}$

(ii) Product of the roots $= (\alpha\beta) = \dfrac{c}{a}$

Exp. 1) Find the sum and product of the roots of the quadratic equation $x^2 - 11x + 28 = 0$.

Solution Comparing the given equation with the standard form of the quadratic equation $ax^2 + bx + c = 0$, we get $a = 1,\ b = -11,\ c = 28$. Therefore, sum of roots $= \dfrac{-b}{a} = \dfrac{-(-11)}{1} = 11$ and product of the roots $= \dfrac{c}{a} = \dfrac{28}{1} = 28$.

Exp. 2) Find the sum and product of the roots of the quadratic equation $3x^2 + 15x + 12 = 0$.

Solution Comparing the given equation with the standard form of the quadratic equation $ax^2 + bx + c = 0$, we get $a = 3,\ b = 15,\ c = 12$. Therefore, sum of roots $= \dfrac{-b}{a} = \dfrac{-15}{3} = -5$ and product of the roots $\dfrac{c}{a} = \dfrac{12}{3} = 4$.

Exp. 3) If the sum of the roots of the quadratic equation $ax^2 + bx + c = 0$ is equal to the sum of the squares of their reciprocals, show that bc^2, ca^2, ab^2 are in Arithmetic Progression (AP). It is well known that if any three consecutive terms, form a sequence, are such that the difference between any two consecutive terms is same, then they are in AP.

For Example if x, y, z are in AP, then $z - y = y - x = d$ (say).

Solution If α and β be the roots of the quadratic equation $ax^2 + bx + c = 0$, then $\alpha + \beta = \dfrac{-b}{a}$ ...(i)

$$\alpha\beta = \frac{c}{a} \quad \text{...(ii)}$$

Given that, $\alpha + \beta = \dfrac{1}{\alpha^2} + \dfrac{1}{\beta^2}$

$$\Rightarrow \quad \alpha + \beta = \frac{\alpha^2 + \beta^2}{(\alpha\beta)^2} \quad \Rightarrow \alpha + \beta = \frac{(\alpha + \beta)^2 - 2\alpha\beta}{(\alpha\beta)^2}$$

$$\Rightarrow \quad \frac{-b}{a} = \frac{\left(\frac{-b}{a}\right)^2 - 2\left(\frac{c}{a}\right)}{\left(\frac{c}{a}\right)^2} \Rightarrow \frac{-b}{a} = \frac{b^2 - 2ac}{c^2}$$

$$\Rightarrow \quad bc^2 + ab^2 = 2ca^2 \quad \Rightarrow bc^2 - ca^2 = ca^2 - ab^2$$

Therefore bc^2, ca^2, ab^2 are in Arithmetic Progression.

NOTE For better understanding of Arithmetic Progression you may refer the chapter Sequence, Series and Progression.

Practice Exercise

1. If one root of a quadratic equation is zero, which one of the following is correct?
(a) $ax^2 + bx + c = 0$ (b) $ax^2 + c = 0$
(c) $ax^2 + bx = 0$ (d) $bx + c = 0$

2. If both the roots of a quadratic equation are equal in magnitude but opposite in nature, which one of the following is correct?
(a) $x^2 + \left(\dfrac{b}{a}\right)x - \left(\dfrac{c}{a}\right) = 0$ (b) $ax^2 + bx = 0$
(c) $x^2 = 0$ (d) $ax^2 + c = 0$

3. If both the roots of a quadratic equation are coincident, which one of the following is not correct?
(a) $x^2 - 2\sqrt{c}x + c = 0$ (b) $x^2 + 2kx + k^2 = 0$
(c) $x^2 - 2bx - b^2 = 0$ (d) $x^2 - 2kx + k^2 = 0$

4. If one root of the equation is reciprocal to the other root, which of the following is correct?
(a) $ax^2 + bx = 0$ (b) $ax^2 + bx + 1 = 0$
(c) $ax^2 - bx = 0$ (d) $x^2 + x - c = 0$

5. If one root of the quadratic equation $x^2 - x - 1 = 0$ is α, the other root is
(a) $\alpha^3 + 3\alpha$ (b) $\alpha^3 - 3\alpha$ (c) $\alpha^2 + 3$ (d) $\alpha^2 - 3$

Answers

1. (c) | **2.** (d) | **3.** (c) | **4.** (b) | **5.** (b)

14.5 Methods of Solving the Quadratic Equation

(1) Factorization Method
(2) Sridharacharya Method
(3) Square Completion Method
(4) Sum and Product of Roots Method

Factorization Method

Step 1 If the equation is not given in the standard form then express the given equation in the standard form of $ax^2 + bx + c = 0$.

Step 2 Factorize the equation $ax^2 + bx + c = 0$ into two linear factors.

Step 3 Equate each linear factor with zero.

Step 4 Simplify each linear factor.

Exp.) Find the roots of $\frac{55}{24}x + x^2 - 1 = 0$.

Solution The given expression can be written as $x^2 + \frac{55}{24}x - 1 = 0$

$\Rightarrow \quad 24x^2 + 55x - 24 = 0 \Rightarrow (3x + 8)(8x - 3) = 0$

$\Rightarrow \quad \left(x + \frac{8}{3}\right)\left(x - \frac{3}{8}\right) = 0 \Rightarrow x + \frac{8}{3} = 0 \text{ or } x - \frac{3}{8} = 0$

$\Rightarrow \quad x = \frac{-8}{3} \text{ or } x = \frac{3}{8}$

Therefore, there are two roots $-\frac{8}{3}$ and $\frac{3}{8}$.

Sridharacharya Method

Step 1 If the equation is not given in the standard form then express the given equation in the standard form of $ax^2 + bx + c = 0$.

Step 2 Substitute the values of a, b and c in the formula $\frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$.

Step 3 Then one root (say α) is equal to $\frac{-b + \sqrt{b^2 - 4ac}}{2a}$ and another root (say β) is equal to $\frac{-b - \sqrt{b^2 - 4ac}}{2a}$

Exp.) Find the roots of $\frac{55}{24}x + x^2 - 1 = 0$.

Solution The given expression can be written as $x^2 + \frac{55}{24}x - 1 = 0$

$\Rightarrow \quad 24x^2 + 55x - 24 = 0$

Here, $a = 24$, $b = 55$ and $c = -24$.

Now, $\frac{-b \pm \sqrt{b^2 - 4ac}}{2a} = \frac{-55 \pm \sqrt{55^2 - 4 \times 24 \times (-24)}}{2 \times 24}$

$\Rightarrow \quad \frac{-55 \pm \sqrt{5329}}{48} = \frac{-55 \pm 73}{48}$

$\Rightarrow \quad \frac{-55 + 73}{48} \text{ and } \frac{-55 - 73}{48}$

$\Rightarrow \quad -\frac{8}{3} \text{ and } \frac{3}{8}.$

Square Completion Method

Step 1 If the equation is not given in the standard form then express the given equation in the standard form of $ax^2 + bx + c = 0$.

Step 2 Modify the equation as $ax^2 + bx = -c$

Step 3 If $a \neq 1$, divide the whole equation by a

Step 4 Add $\left(\frac{b}{2}\right)^2$ to both the sides.

Step 5 Find the square root of both the sides.

Step 6 Simplify the resulting equation.

Exp. 1) Find the roots of $\frac{55}{24}x + x^2 - 1 = 0$.

Solution The given expression can be written as $x^2 + \frac{55}{24}x = 1$.

Then, $x^2 + \frac{55}{24}x + \left(\frac{55}{48}\right)^2 = 1 + \left(\frac{55}{48}\right)^2$

$\Rightarrow \quad x^2 + 2\left(\frac{55}{48}\right)x + \left(\frac{55}{48}\right)^2 = \left(\frac{73}{48}\right)^2$

$\Rightarrow \quad \left(x + \frac{55}{48}\right)^2 = \left(\frac{73}{48}\right)^2$

$\Rightarrow \quad x + \frac{55}{48} = \pm\frac{73}{48} \Rightarrow x = -\frac{55}{48} \pm \frac{73}{48}$

$\Rightarrow \quad x = -\frac{128}{48} \text{ and } \frac{18}{48} \Rightarrow x = -\frac{8}{3} \text{ and } \frac{3}{8}$

Exp. 2) Find the roots of $2x^2 - 3x - 1 = 0$.

Solutions The given expression can be written as $x^2 - \frac{3}{2}x - \frac{1}{2} = 0$.

$\Rightarrow \quad x^2 - \left(\frac{3}{2}\right)x - \frac{1}{2} = 0 \Rightarrow x^2 - 2\left(\frac{3}{4}\right)x = \frac{1}{2}$

$\Rightarrow \quad x^2 - 2\left(\frac{3}{4}\right)x + \left(\frac{3}{4}\right)^2 = \frac{1}{2} + \left(\frac{3}{4}\right)^2$

$\Rightarrow \quad \left(x - \frac{3}{4}\right)^2 = \frac{17}{16} \quad \Rightarrow \left(x - \frac{3}{4}\right) = \pm\frac{\sqrt{17}}{4}$

$\Rightarrow \quad x = \frac{3}{4} \pm \frac{\sqrt{17}}{4}$

$\Rightarrow \quad x = \frac{3}{4} + \frac{\sqrt{17}}{4} \text{ and } \frac{3}{4} - \frac{\sqrt{17}}{4}$

$x = \frac{3 + \sqrt{17}}{4} \text{ and } \frac{3 - \sqrt{17}}{4}$

Exp. 3) Find the roots of $x^2+2x+5=0$.

Solution The given expression can be written as $x^2+2x=-5$.

$\Rightarrow \quad x^2+2x+1=-5+1$

$\Rightarrow \quad (x+1)^2=-4 \Rightarrow (x+1)=\pm\sqrt{-4}$

$\Rightarrow \quad (x+1)=\pm 2i \Rightarrow x=-1\pm 2i$

$\Rightarrow \quad x=-1+2i$ and $-1-2i$

Sum and Product of Roots Method

Step 1 If the equation is not given in the standard form then express the given equation in the standard form of $ax^2+bx+c=0$.

Step 2 Find sum of the roots $(\alpha+\beta)=-\frac{b}{a}$ and product of the roots $(\alpha\beta)=\frac{c}{a}$.

Step 3 Substitute the values of $\alpha+\beta$ and $\alpha\beta$ in the formula $(\alpha-\beta)^2=(\alpha+\beta)^2-4\alpha\beta$.

Step 4 Find the value of $\alpha-\beta$.

Step 5 Solve the equations $\alpha+\beta$ and $\alpha-\beta$ to get the roots α and β.

Exp.) Find the roots of $\frac{55}{24}x+x^2-1=0$.

Solution The given expression can be written as $x^2+\frac{55}{24}x-1=0$.

The sum of the roots $=\alpha+\beta=-\frac{55}{24}$ and the product of the roots $=\alpha\beta=-1$.

Therefore using $(\alpha-\beta)^2=(\alpha+\beta)^2-4\alpha\beta$, we get

$$(\alpha-\beta)^2=\left(\frac{-55}{24}\right)^2-4(-1) \Rightarrow \alpha-\beta=\pm\frac{73}{24}$$

Solving $\alpha+\beta$ and $\alpha-\beta$, we will get $(\alpha,\beta)=\left(-\frac{8}{3},\frac{3}{8}\right)$.

Solutions of Equations Reducible to Quadratic Form

Equation which are not quadratic at a glance but can be reduced to quadratic equations by suitable transformations. Some of the common types are :

Type 1. $ax^4+bx^2+c=0$. This can be reduced to a quadratic equation by substituting $x^2=y$.

i.e., $ay^2+by+c=0$

Tpye 2. $px+\frac{q}{x}=r$, $p(x-a)+\frac{q}{(x-b)}=r$. Multiply both sides by the LCD of LHS to get a quadratic equation $px+\frac{q}{x}=r \Rightarrow px^2-rx+q=0$

and $p(x-a)+\frac{q}{(x-b)}=r$

$\Rightarrow \quad p(x-a)(x-b)-r(x-b)+q=0$

Type 3. $\sqrt{a-x^2}=bx+c$. Square both sides and simplify.

i.e., $a-x^2=b^2x^2+2bcx+c^2$

$\Rightarrow \quad (1+b^2)x^2+2bcx+(c^2-a)=0$

Type 4. $\sqrt{ax+b}+\sqrt{cx+d}=e$ Transform one of the radicals to RHS and square $\sqrt{ax+b}=e-\sqrt{cx+d}$, such equations may require squaring and your solution must satisfy $ax+b\geq 0$ and $cx+d\geq 0$.

Type 5. $a\left(x^2+\frac{1}{x^2}\right)+b\left(x+\frac{1}{x}\right)+c=0$ For this type of equations we use the following identity

$$x^2+\frac{1}{x^2}=\left(x+\frac{1}{x}\right)^2-2$$

Thus $a\left[\left(x+\frac{1}{x}\right)^2-2\right]+b\left(x+\frac{1}{x}\right)+c=0$

Now put $x+\frac{1}{x}=y$ to get a quadratic equation

i.e., $ay^2+by+(c-2a)=0$

Type 6. $a\left(x^2+\frac{1}{x^2}\right)+b\left(x-\frac{1}{x}\right)+c=0$

Use the following identity $x^2+\frac{1}{x^2}=\left(x-\frac{1}{x}\right)^2+2$

Thus, $a\left[\left(x-\frac{1}{x}\right)^2+2\right]+b\left(x-\frac{1}{x}\right)+c=0$, put $x-\frac{1}{x}=y$ to get a quadratic equation in y.

i.e., $ay^2+by+(c-2a)=0$

Type 7. (i) $x^{2a}+x^a+b=0$ (ii) $x^a+x^{-a}=b$

Put $x^a=y$ to get a quadratic equation in y,

i.e., (i) $y^2+y+b=0$ (ii) $y+\frac{1}{y}=b$

NOTE In all the equations involving radical signs, the answer must be checked by substituting in the original equation.

Type 8. $(x+a)(x+b)(x+c)(x+d)+k=0$. When sum of the quantities a, b, c, d is equal to the sum of the other two, can be solved as shown in example 16.

Exp. 1) Solve for $y: 9y^4 - 29y^2 + 20 = 0.$

Solution $9y^4 - 29y^2 + 20 = 0$

Put $y^2 = x.$

$9x^2 - 29x + 20 = 0 \Rightarrow 9x^2 - 20x - 9x + 20 = 0$

$\Rightarrow (x-1)(9x-20) = 0 \Rightarrow x = 1$ or $x = \frac{20}{9}$

$\Rightarrow y^2 = 1$ or $y^2 = \frac{20}{9} \Rightarrow y = \pm 1$ and $y = \pm \frac{2\sqrt{5}}{3}$

Exp. 2) Solve for $x: x^6 - 26x^3 - 27 = 0.$

Solution $x^6 - 26x^3 - 27 = 0$

Let $x^3 = y$

then, $y^2 - 26y - 27 = 0$

$\Rightarrow y^2 - 27y + y - 27 = 0 \Rightarrow (y+1)(y-27) = 0$

$\Rightarrow y = -1$ or $y = 27 \Rightarrow x^3 = -1$ or $x^3 = 27$

$\Rightarrow x = -1$ or $x = 3$

Exp. 3) Solve : $2x - \frac{3}{x} = 5.$

Solution $2x - \frac{3}{x} = 5 \Rightarrow 2x^2 - 3 = 5x \Rightarrow (2x+1)(x-3) = 0$

$\Rightarrow x = -\frac{1}{2}$ or $x = 3.$

Exp. 4) Solve $\sqrt{2x+9} + x = 13.$

Solution $\sqrt{2x+9} + x = 13 \Rightarrow \sqrt{2x+9} = 13 - x$

Squaring both sides $2x + 9 = (13-x)^2 \Rightarrow x^2 - 28x + 160 = 0$

$\Rightarrow (x-8)(x-20) = 0 \Rightarrow x = 8, \quad x = 20$

NOTE Here we must have $2x + 9 \geq 0$ thus for $x = 8, \sqrt{2x+9} > 0$

Also for $x = 20, \sqrt{2x+9} > 0$

$\therefore$ Both the values satisfy the condition.

Exp. 5) Solve $\sqrt{2x+9} - \sqrt{x-4} = 3.$

Solution $\sqrt{2x+9} - \sqrt{x-4} = 3$

$\Rightarrow \sqrt{2x+9} = 3 + \sqrt{x-4}$

Squaring both sides and simplifying, we get

$x + 4 = 6\sqrt{x-4}$

Again squaring both sides,

$(x+4)^2 = 36(x-4)$

$\Rightarrow x^2 - 28x + 160 = 0 \Rightarrow (x-8)(x-20) = 0$

$\Rightarrow x = 8, \quad x = 20$

Verification: $2x + 9 \geq 0$

and $x - 4 \geq 0 \Rightarrow x \geq \frac{-9}{2}$

and $x \geq 4$

Since the values $x = 8$ and 20 satisfy both these conditions

$\therefore x = 8, \quad x = 20$

Exp. 6) Solve for $x: 2\left(x^2 + \frac{1}{x^2}\right) - 9\left(x + \frac{1}{x}\right) + 14 = 0.$

Solution Put $x^2 + \frac{1}{x^2} = \left(x + \frac{1}{x}\right)^2 - 2$

$\therefore 2\left(x^2 + \frac{1}{x^2}\right) - 9\left(x + \frac{1}{x}\right) + 14 = 0$

$\Rightarrow 2\left[\left(x + \frac{1}{x}\right)^2 - 2\right] - 9\left(x + \frac{1}{x}\right) + 14 = 0$

Substitute $x + \frac{1}{x} = y$

$\therefore 2(y^2 - 2) - 9y + 14 = 0 \Rightarrow 2y^2 - 4 - 9y + 14 = 0$

$\Rightarrow (y-2)(2y-5) = 0 \Rightarrow y = 2$ or $y = \frac{5}{2}$

Since $x + \frac{1}{x} = 2 \Rightarrow x^2 - 2x + 1 = 0$

$\Rightarrow (x-1)^2 = 0 \Rightarrow x = 1$

Also, $y = \frac{5}{2} \Rightarrow x + \frac{1}{x} = \frac{5}{2}$

$\Rightarrow 2x^2 - 5x + 2 = 0 \Rightarrow x = 2$ or $x = \frac{1}{2}$

$\therefore x = \frac{1}{2}, 1, 2$

Exp. 7) Solve $6\left(x^2 + \frac{1}{x^2}\right) - 25\left(x - \frac{1}{x}\right) + 12 = 0.$

Solution Put $x^2 + \frac{1}{x^2} = \left(x - \frac{1}{x}\right)^2 + 2$

$\therefore 6\left[\left(x - \frac{1}{x}\right)^2 + 2\right] - 25\left(x - \frac{1}{x}\right) + 12 = 0$

Let $x - \frac{1}{x} = y \Rightarrow 6(y^2 + 2) - 25y + 12 = 0$

$\Rightarrow y = \frac{3}{2}, \quad y = \frac{8}{3}$

Since $y = x - \frac{1}{x}$ and $x - \frac{1}{x} = \frac{8}{3}$

$\therefore x - \frac{1}{x} = \frac{3}{2}$ and $x = -\frac{1}{3}, \quad x = 3$

$\Rightarrow x = -\frac{1}{2}$ and $x = 2$

$\therefore x = -\frac{1}{3}, -\frac{1}{2}, 2, 3$

Exp. 8) Solve for $x: \sqrt{x^2 + x - 6} - x + 2.$

$= \sqrt{x^2 - 7x + 10}, x \in R$

Solution $\sqrt{x^2 + x - 6} - x + 2 = \sqrt{x^2 - 7x + 10}$

$\sqrt{(x+3)(x-2)} - (x-2) = \sqrt{(x-5)(x-2)}$

$\Rightarrow \sqrt{(x-2)}\,[\sqrt{(x+3)} - \sqrt{(x-2)} - \sqrt{(x-5)}] = 0$

Either $\sqrt{(x-2)} = 0 \Rightarrow x = 2$

or $\sqrt{(x+3)} - \sqrt{(x-2)} - \sqrt{(x-5)} = 0$

$\Rightarrow \sqrt{(x+3)} - \sqrt{(x-2)} = \sqrt{x-5}$

Squaring both sides

$x^2 + 12x + 36 = 4(x^2 + x - 6)$

$\Rightarrow x = 6, \quad x = -\frac{10}{3}$

Since the equation involves radical therefore substituting $x = 2, 6$ and $-\frac{10}{3}$ in the original equation, we find that $x = -\frac{10}{3}$ does not satisfy the equation.

$\therefore x = 2, 6$

Exp. 9) Solve for x : $3^{x+2} + 3^{-x} = 10$.

Solution $3^{x+2} + 3^{-x} - 10 = 0 \Rightarrow 3^x \cdot 3^2 + \frac{1}{3^x} - 10 = 0$

Let $3^x = y \Rightarrow 9y + \frac{1}{y} - 10 = 0$

$\Rightarrow 9y^2 - 10y + 1 = 0$

$\Rightarrow (9y - 1)(y - 1) = 0$

$\Rightarrow y = \frac{1}{9}$ or $y = 1$

When $y = \frac{1}{9} \Rightarrow 3^x = \frac{1}{3^2} \Rightarrow x = -2$

when $y = 1 \Rightarrow 3^x = 1$

$\Rightarrow x = 0$

$\therefore x = -2, 0$

Exp. 10) Solve for x : $(x+1)(x+2)(x+3)(x+4) = 24$.

Solution $(x+1)(x+2)(x+3)(x+4) = 24$

$\Rightarrow [(x+1)(x+4)][(x+2)(x+3)] = 24$

$\Rightarrow (x^2 + 5x + 4)(x^2 + 5x + 6) = 24$

Let $x^2 + 5x = y$

$\therefore (y+4)(y+6) = 24 \Rightarrow y^2 + 10y = 0$

$\Rightarrow y = 0$ and $y = -10$

Now, $y = x^2 + 5x$

When $y = 0, x^2 + 5x = 0 \Rightarrow x = 0, x = -5$

Again when $y = -10, x^2 + 5x = -10$

$\Rightarrow x^2 + 5x + 10 = 0$

Since LHS expression cannot be factorized, therefore we should use the formula for finding the value of x.

Here $D = b^2 - 4ac = 25 - 4 \times 1 \times 10 = -15$

Since $D < 0$, the equation $x^2 + 5x + 10 = 0$ has no real solution.

$\therefore x = 0, -5$

Practice Exercise

Find the solutions of the following equations.

1. $x^4 - 7x^2 + 12 = 0$ **2.** $x^{\frac{2}{3}} - 2x^{\frac{1}{3}} - 15 = 0$

3. $p^{-6} - 9p^{-3} + 8 = 0$ **4.** $t - 9\sqrt{t} + 14 = 0$

5. $y^{-4} - 4 = 0$ **6.** $2x^{10} - x^5 - 4 = 0$

7. $x = \sqrt{x+6}$ **8.** $x + \sqrt{x-4} = 4$

9. $m + \sqrt{2m-3} = 1$ **10.** $y = \sqrt{5y+6} - 2$

11. $\sqrt{2h-1} - \sqrt{h-4} = 2$ **12.** $\sqrt{3-r} = \sqrt{r+7} + 2$

Answers

9. There is no solution. **10.** –1 and 2

11. 5 and 13 **12.** –6

14.6 Formation of a Quadratic Equation

If you know the two roots, say α and β, then you can form the possible quadratic equation using these two roots. Why I'm saying ''possible'' quadratic equation because there can be innumerable (or infinite) number of quadratic equations having the same two roots. The underlying logic is that if you multiply or divide a given quadratic equation by any non-zero real number, the equation gets changed (*i.e.,* the coefficients/constants get multiplied or divided), however, the roots remain the same for every such quadratic equation. So it implies that the roots of $ax^2 + bx + c = 0$ and $k[ax^2 + bx + c] = 0$ are same.

Now to form a quadratic equation from the known roots you can use the following approach. If α and β are the two roots then possible quadratic equation will be $(x - \alpha)(x - \beta) = 0$.

But since you are working backward, that is from roots to equation, therefore you never know about the exact quadratic equation these roots belong to. Thus to include all the possibilities you can multiply the above equation by any non-zero real number as it's given below

$\Rightarrow k(x - \alpha)(x - \beta) = 0$; Where k is a non-zero real number.

$\Rightarrow k[x^2 - (\alpha + \beta)x + \alpha\beta] = 0$

$\Rightarrow k[x^2 - (\text{sum of the roots})\, x + (\text{product of the roots})\,] = 0$

Exp. 1) Form the quadratic equation whose roots are –7 and 3/2.

Solution Sum of the roots $= -7 + \left(\frac{3}{2}\right) = \frac{-11}{2}$ and product of the roots $= \frac{-21}{2}$. Therefore, the possible required equation is

$$k\left[x^2 - \left(-\frac{11}{2}\right)x + \left(\frac{-21}{2}\right)\right] = 0$$

$$\Rightarrow \quad k[2x^2 + 11x - 21] = 0$$

Here k is a non-zero real number.

Exp. 2) Form the quadratic equation whose roots are $5 + 2\sqrt{7}$ and $5 - 2\sqrt{7}$.

Solution Sum of the roots $= 5 + 2\sqrt{7} + 5 - 2\sqrt{7} = 10$ and product of the roots $= 5^2 - (2\sqrt{7})^2 = -3$.

Therefore, the required equation is

$$K[x^2 - (10)x + (-3)] = 0$$

$$K[x^2 - 10x - 3] = 0$$

Here, k is a non-zero real number.

Exp. 3) Form the quadratic equation whose roots are $5 + 2\sqrt{7}$ and $5 - 2\sqrt{7}$ and the constant term is 45.

Solution Sum of the roots $= 5 + 2\sqrt{7} + 5 - 2\sqrt{7} = 10$ and product of the roots $= 5^2 - (2\sqrt{7})^2 = -3$.

Therefore, the required equation is $k[x^2 - (10)x + (-3)] = 0$

$\Rightarrow \quad k[x^2 - 10x - 3] = 0$

$\Rightarrow 15x^2 - 150x - 45 = 0$; (since the constant term is 45)

Exp. 4) If α and β are the roots of the equation $ax^2 + bx + c = 0$, find the values of the following expressions in terms of a, b and c.

(a) $\alpha^2 + \beta^2$ (b) $\frac{1}{\alpha} + \frac{1}{\beta}$ (c) $\alpha^4 - \beta^4$

Solution

(a) Let $ax^2 + bx + c = 0$ and α, β be the roots of the equation,

then $\alpha + \beta = -\frac{b}{a}, \quad \alpha\beta = \frac{c}{a}$

$$\therefore \quad \alpha^2 + \beta^2 = (\alpha + \beta)^2 - 2\alpha\beta$$

$$= \left(-\frac{b}{a}\right)^2 - \frac{2c}{a} = \frac{b^2}{a^2} - \frac{2c}{a}$$

$$= \frac{b^2 - 2ac}{a^2}.$$

(b) $\frac{1}{\alpha} + \frac{1}{\beta} = \frac{\alpha + \beta}{\alpha\beta} = \frac{-b/a}{c/a} = -\frac{b}{c}$

(c) $\alpha^4 - \beta^4 = (\alpha^2 + \beta^2)(\alpha + \beta)(\alpha - \beta)$

$$= [(\alpha + \beta)^2 - 2\alpha\beta](\alpha + \beta)\sqrt{(\alpha + \beta)^2 - 4\alpha\beta}$$

$$= \left(\frac{b^2 - 2ac}{a^2}\right)\left(-\frac{b}{a}\right)\sqrt{\frac{b^2}{a^2} - 4\frac{c}{a}}$$

$$= -\frac{b}{a^4}(b^2 - 2ac)\sqrt{b^2 - 4ac}$$

Exp. 5) If α, β are the roots of the equation $2x^2 - 3x + 2 = 0$, form the equation whose roots are α^2, β^2.

Solution $2x^2 - 3x + 2 = 0$, and α, β are the roots $\alpha + \beta = \frac{3}{2}, \alpha\beta = 1$

For the new equation, roots are α^2 and β^2

$\therefore$ Sum of the roots $\alpha^2 + \beta^2 = (\alpha + \beta)^2 - 2\alpha\beta$

$$= \left(\frac{3}{2}\right)^2 - 2(1)$$

$$= \frac{9}{4} - 2 = \frac{1}{4}$$

and product of the roots $= \alpha^2\beta^2 = (\alpha\beta)^2 = (1)^2 = 1$

$\therefore$ the required equation is

$$x^2 - (\text{sum of roots})\,x + \text{product of roots} = 0$$

$$\Rightarrow \quad x^2 - \frac{1}{4}x + 1 = 0$$

$$\Rightarrow \quad 4x^2 - x + 4 = 0$$

Exp. 6) Two candidates attempt to solve a quadratic equation of the form $x^2 + px + q = 0$. One starts with a wrong value of p and finds the roots to be 2 and 6. The other starts with a wrong value of q and finds the roots to be 2 and –9. Find the correct roots and the equation.

Solution When p is wrong *i.e.*, $\frac{-b}{a}(= \alpha + \beta)$ is wrong but $\frac{c}{a}(= \alpha \cdot \beta)$ is correct.

Hence $\alpha\beta = \frac{c}{a} = 2 \times 6 = 12.$

Again when q is wrong *i.e.*, $\frac{c}{a} = (\alpha\beta)$ is wrong

but $\frac{-b}{a} = \alpha + \beta$ is correct.

$$\therefore \quad \frac{-b}{a} = \alpha + \beta = 2 + (-9) = -7$$

$\therefore$ the required correct quadratic equation is

$$x^2 - (\alpha + \beta)\,x + \alpha\beta = 0$$

$$x^2 - (-7)x + 12 = 0$$

$$\Rightarrow \quad x^2 + 7x + 12 = 0$$

and the correct roots of this equation are $-3, -4$.

Practice Exercise

1. If the two roots of a quadratic equation are $\frac{-3}{2}$ and $\frac{-5}{3}$, which one of the following is the concerned quadratic equation?
(a) $6x^2+19x+15$ (b) $19x+6x^2+15$
(c) $30x^2+95x+75$ (d) both (a) and (c)

2. If the two roots of any quadratic equation are $\sqrt{3}$ and $-\sqrt{3}$, how many such equations are possible?
(a) 0 (b) 1
(c) 2 (d) infinite

3. If the two factors of any quadratic equation are $(x+\sqrt{3})$ and $(x-\sqrt{3})$, how many such equations are possible?
(a) 0 (b) 1 (c) 2 (d) infinite

4. If a quadratic equation is multiplied by 4, the roots of the new equation will be multiplied by
(a) 16 (b) 4
(c) 2 (d) 1

5. If one root is $3-\sqrt{5}$ and the other root is $3+\sqrt{5}$, find the possible sum of coefficients of x^2 and x.
(a) –20 (b) –6
(c) 14 (d) 11

Answers

1. (d) | **2.** (d) | **3.** (d) | **4.** (d) | **5.** (a)

14.7 Nature of the Roots of the Quadratic Equation

For a quadratic equation $ax^2+bx+c=0$; where a, b, c are real numbers and $a\neq 0$, the nature of the roots can be easily determined by knowing the value of the discriminant $(D=b^2-4ac)$ of the above quadratic equation.

D < 0	**D = 0**	**D > 0** (*D* is a perfect square)	**D > 0** (D is not a perfect square)
Complex Non-zero imaginary parts Unequal (Conjugate pairs)	Real Rational Equal	Real Rational Unequal	Real Irrational Unequal (Conjugate Pairs)

1. Roots are real only when D is non-negative.
2. Roots are complex (or imaginary) when D is negative.
3. Roots are rational only when D is a perfect square number like 0, 1, 4, 9, 16, …… etc.
4. Roots are equal only when $D=0$.
5. The equal roots are called Double Root.
6. When the roots are irrational they are in conjugate pairs as if one root is $p+\sqrt{q}$, the other root will be $p-\sqrt{q}$. Here, $\sqrt{q}$ is the irrational part of the root.
7. When the roots are complex they are in conjugate pairs as if one root is $p+iq$, the other root will be $p-iq$. Here iq is the imaginary part of the root.
8. If $D>0$; $a=1$; $b, c\in Z$ (integer numbers) and roots are rational, the roots are integers.
9. If a quadratic equation has one real root and $a, b, c\in R$, other root is also real.
10. If the roots are real and equal, the graph will touch the X-axis.
11. If the roots are real and unequal, the graph will intercept the X-axis.
12. If the roots are non-real, the graph does not touch the X-axis.
13. The points on the X-axis, where the quadratic graph touches or intercepts are called the x-intercepts.

Graphical Illustration

Following graphs are depicted on the Cartesian plane, where horizontal arrow and vertical arrow represent X-axis and Y-axis, respectively. In these illustrative graphs my main consideration is the position of parabolic graph with relation to X-axis. In order to avoid complications I have not discussed about position of Y-axis and which is out of context as well.

	D < 0	**D = 0**	**D > 0**
When a > 0, graph will open upward and its vertex will be the lowest point of the graph.			When a < 0, graph will open downward and its vertex will be the highest point of the graph.			
(i) The points, where parabola (quadratic graph) meets the X-axis, are called the real roots of the equation.
(ii) When roots are real, the parabolic graph must touch or intersect the X-axis.
(iii) When roots are non-real, the parabolic graph will not touch or pass through the X-axis.
(iv) Either both the roots will be real or both the roots will be non-real.

(v) When both the roots are equal, the vertex of parabolic graph tangentially passes through the X-axis.

(vi) Double root has a multiplicity of 2. That means two roots are same and this is the reason why the quadratic graph just kisses the X-axis and bounces back to the same side of X-axis.

(vii) In case of real roots when the roots are unequal the parabolic graph intersect the X-axis at two different points. These points are called the X-intercepts.

(viii) The quadratic graph does not intersect the Y-axis more than once. Also the quadratic graph does not intersect the X-axis more than two times.

Exp. 1) Find the nature of the roots of the quadratic equation $(a-b)x^2+(b-c)x+(c-a)=0$ without really knowing the exact values of the roots.

(a) Rational (b) Irrational
(c) Non-real (d) Both (a) and (b)

Solution Let us consider $x=1$, therefore

$$(a-b)+(b-c)+(c-a)=0$$

It implies that $x=1$ is a root of the given equation. Since one root of this equation is real and rational, so the other root definitely has to be real and rational. As the non-real roots and irrational roots occur in pairs only so there is no scope for the other root to be non-real or irrational.

Hence choice (a) is the answer.

Alternatively Let us consider $a=3$, $b=2$, $c=1$ keeping in mind that a, b, c are rational numbers.

Then $(a-b)x^2+(b-c)x+(c-a)=0 \Rightarrow x^2+x-2=0$

The discriminant (D) of the above quadratic equation

$$=(1)^2-4(1\times-2)=9$$

We know that when D is a perfect square number the roots are real and rational.

Exp. 2) If $(a+b+c=0)$, find the nature of the roots of the equation $(c^2-ab)x^2-2(a^2-bc)x+(b^2-ac)=0$.

(a) Imaginary (b) Real and equal
(c) Non-real (d) Irrational

Solution Since it is given that $a+b+c=0$, we can consider

$$a=-1,\ b=0,\ c=1$$

Now, we have $(c^2-ab)x^2-2(a^2-bc)x+(b^2-ac)=0$

$\Rightarrow$ $x^2-2x+1=0$

The discriminant (D) of the above equation $=(-2)^2-4(1\times1)=0$

We know that when $D=0$, the roots of the quadratic equation are real, rational and equal. Hence, choice (b) is the correct one.

Exp. 3) Determine k for which the roots of the equation $9x^2+2kx+4=0$ are equal.

Solution Let the roots be α and α.

$\therefore$ Sum of roots $=\alpha+\alpha=2\alpha=-\dfrac{2k}{9}$

$\Rightarrow$ $\alpha=-\dfrac{k}{9}$

and product of the roots $=\alpha^2=\dfrac{4}{9}$

$\therefore$ $\left(-\dfrac{k}{9}\right)^2=\dfrac{4}{9} \Rightarrow \dfrac{k^2}{81}=\dfrac{4}{9}$

$\Rightarrow$ $k^2=36 \Rightarrow k=\pm 6.$

Alternatively In order that roots of a quadratic equation are equal, its discriminant must be zero.

i.e., $b^2-4ac=0$

$\therefore$ $(2k)^2-4\times9\times4=0$

$\Rightarrow$ $k=\pm 6.$

Exp. 4) Which of the following quadratic expression can be expressed as a product of real linear factors?

(a) x^2-2x+3
(b) $3x^2-\sqrt{2}x-\sqrt{3}$
(c) $2x^2+3x-4$
(d) $\sqrt{2}x^2-\sqrt{5}x+3$

Solution (a) $D=b^2-4ac<0$ cannot be expressed
(b) $D=b^2-4ac>0$ can be expressed
(c) $D=b^2-4ac>0$ can be expressed
(d) $D=b^2-4ac<0$, can't be expressed.

NOTE If $D<0$, then the quadratic equation cannot be expressed into two linear factors.

Exp. 5) Find the set of values of p for which the quadratic equation has real linear factors.

$$9x^2-px+4$$

Solution For any quadratic polynomial to have real linear factors, we must have $D\geq0$

$\therefore$ $b^2-4ac\geq0$

$$p^2-4\times9\times4\geq0$$

$\Rightarrow$ $p^2-144\geq0$

$\Rightarrow$ $p^2\geq144$

$\Rightarrow$ $p\geq\pm12$

Therefore, either $p\leq-12$ or $p\geq12$.

Practice Exercise

1. If the roots of a quadratic equation are real and rational, which one of the following best describes the value of the discriminant D ?
(a) $D > 0$ (b) $D = 0$
(c) $D < 0$ (d) $D \geq 0$

2. If the roots of a quadratic equation are real and unequal, which one of the following is necessarily true?
(a) $D < 0$ (b) $D = 0$
(c) $D > 0$ (d) $D \geq 0$

3. If the roots of a quadratic equation are unequal, which one of the following cannot be true?
(a) $D > 0$ (b) $D < 0$
(c) $D = 0$
(d) Roots are conjugate also

4. Which one of the following is a correct statement?
(a) When roots are real, these are definitely equal.
(b) When roots are rational, these are definitely real.
(c) When roots are unequal, these are definitely complex roots.
(d) When roots make the conjugate pair, these are either real or complex ones.

5. If one root of the quadratic equation is $2 + 5\sqrt{7}$, find the other root of this equation.
(a) $5 + 2\sqrt{7}$ (b) $-2 + 5\sqrt{7}$
(c) $-2 - 5\sqrt{7}$ (d) none of these

6. If one root of the quadratic equation is $3 - 2i$, find the sum of the roots.
(a) 0 (b) 9 (c) 6 (d) $-4i$

7. Given the two roots $\sqrt{3}$ and $-3\sqrt{3}$, how many quadratic equations can be formed?
(a) 2 (b) 1
(c) 0 (d) none of these

8. If one root of a quadratic equation is $\sqrt{8}$, then what would, definitely, be the other root?
(a) $\sqrt{-8}$ (b) $2\sqrt{2}$
(c) $i\sqrt{8}$ (d) none of these

9. Roots can be conjugate except when
(a) $D < 0$ (b) $a < 0$
(c) $D > 0$ (d) $D = 0$

10. If the roots are complex conjugate, then the sum of the roots is
(a) An integer (b) An irrational
(c) An imaginary (d) none of these

11. If the roots are real and equal,then which of the following is always valid?
(a) $D > 0$ (b) $D < 0$
(c) $D = 0$ (d) D is a perfect square

12. If the roots are real and rational, then which of the following is the most appropriate one?
(a) $D > 0$ (b) $D < 0$
(c) $D = 0$ (d) D is a perfect square

13. If the two roots are real, equal and irrational, then which of the following is the most appropriate one?
(a) $D > 0$ (b) $D < 0$
(c) $D \leq 0$ (d) doesn't exist

14. If the roots of a quadratic equation are rational, which of the following cannot be the value of discriminant D?
(a) 0.01 (b) 6.25 (c) 0.036 (d) 1.44

15. A quadratic equation has double root, then
(a) the two roots lie on the different sides of the Y-axis.
(b) the quadratic equation cannot be expressed in the form of a perfect square.
(c) the product of the roots is always negative.
(d) the sum of the roots may be positive or negative.

16. If roots are real and irrational, then which of the following is the most appropriate one?
(a) $D > 0$, except rational numbers
(b) $D > 0$, except perfect squares
(c) $D \leq 0$, except rational numbers
(d) none of the above

17. If the roots are unequal, then the possible values of D is/are
(a) $D = 0$ (b) $D - \{0\}$
(c) $D > 0$ (d) $D < 0$

18. If $D = 7744$, then roots are
(a) equal and real (b) irrational
(c) conjugate pairs (d) rational and unequal

19. If $D = 4477$, then the roots are
(a) equal and real (b) irrational
(c) complex conjugate (d) rational and unequal

20. If a quadratic equation has one real root then the other root will necessarily be
(a) real (b) equal
(c) complex conjugate (d) rational and unequal

21. If the roots are same, then the roots must be
(a) negative (b) rational
(c) irrational (d) complex conjugate

22. Which one of the following is false about the equation $4x^2 - 12x + 9 = 0$?
(a) It can be expressed as a perfect square.
(b) The solution of this equation is a double root.
(c) The multiplicity of this equation is 2.
(d) The roots are 1.5 units away from the Y-axis in the left side.

23. When the parabola opens upward, then which of the following condition must be satisfied?
(a) $D > 0$ (b) $a < 0$ (c) $a > 0$ (d) $a > b > c$

24. When the parabola kisses the X-axis then which of the following condition must be satisfied?
(a) $D > 0$ (b) $a > 0$ (c) $D = 0$ (d) $b^2 < 4ac$

25. When the parabola never intersects the X-axis, then which of the following is certainly true?
(a) $D > 0$ (b) $a < 0$ (c) $D = 0$ (d) $b^2 \leq 4ac$

26. The intersection of X-axis and parabola primarily depends on the value of
(a) D (b) a
(c) b (d) none of these

27. The parabola intersects the Y-axis at most
(a) 4 times (b) 3 times
(c) 2 times (d) 1 time

28. For a standard quadratic equation the parabola intersects the Y-axis at most
(a) 4 times (b) 3 times (c) 2 times (d) 1 time

29. If the quadratic graph opens downward, then the roots are always
(a) imaginary (b) real
(c) equal (d) cannot be determined

30. If the graph intersects X-axis at two distinct points, then the roots are necessarily
(a) complex (b) irrational
(c) rational (d) real

31. If a given quadratic equation is multiplied by –2, now the parabola will open
(a) upward (b) downward
(c) in the original direction only
(d) the direction will be reversed

32. If the comprehensive graph of quadratic function lies in all the four quadrants, then roots are necessarily
(a) real (b) non-real
(c) real and equal (d) equal and irrational

33. If the graph intersects Y-axis below the X-axis then which of the following can be valid?
(a) Roots are real and parabola opens downward
(b) Roots are non-real and parabola opens upward
(c) Roots are real only
(d) If the roots are real then parabola opens upward and if the roots are non-real then parabola opens downward

34. If the quadratic graph intersects both the X and Y axes at the same point, which of the following is not correct?
(a) Roots are imaginary
(b) Roots are neither negative nor positive
(c) $b = c = 0$
(d) Graph may open in either side–up and down

35. If the two real roots are distinct, then which of the following may be correct?
(a) Both are negative
(b) One is positive and another one is negative
(c) Both are positive
(d) all of the above

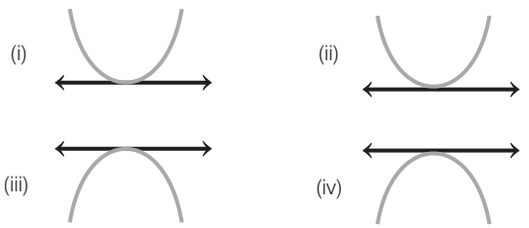
36. The graph of a quadratic equation is symmetrical about Y-axis, which ones of the following can't be the roots of a quadratic equation?
(a) (0, 0) (b) $\left(\frac{-2}{3}, \frac{2}{3}\right)$
(c) $(2\sqrt{3}, -2\sqrt{3})$ (d) $(4 + \sqrt{2}, 4 - \sqrt{2})$

37. If the roots of a quadratic equation are (4, 10), then what is the distance between Y-axis and the axis of symmetry of the pertinent graph?
(a) 7 unit
(b) 6 unit
(c) 5/2 units
(d) cannot be determined

38. The distance between Y-axis and the axis of symmetry is 4 and one of the two roots is –9, then what can be the other root?
(a) 9 or 19
(b) 4 or 14
(c) 1 or 17
(d) –5 or 13

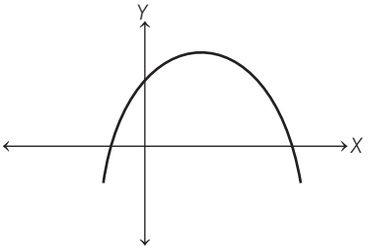
39. In a set of 200 quadratic equations, the discriminant D for different equations is such that $D = -99, -98 \ldots, 99, 100$. Then which one of the following is not true?
(a) There are exactly 45% equations that have irrational roots.
(b) There are at most 21 distinct rational roots.
(c) The roots of 66% equations are in conjugate pairs.
(d) Number of non-real roots is less than that of real roots.

40. Which one(s) of the following graphs is/are correctly sketched for the given quadratic equation which has double root (i.e., both the roots are equal), considering that all of these graphs appear considerably thick when seen with a magnifying lens? The horizontal lines, in these graphs, represent the X-axis.



(a) (i) and (ii) (b) (ii) and (iv)
(c) (i) and (iii) (d) (ii) and (iii)

41. Graph of the equation $ax^2 + bx + c = 0$ is shown below. If D denotes the discriminant of this equation; S and P denote the sum and product of the roots of this equation, respectively. Then which of the following facts is/are true pertaining to this graph?



(i) $D < 0$ (ii) $a < 0$

(iii) $S > 0$ (iv) $P < 0$

(v) $-\frac{b}{a} > 0$ (vi) $\frac{c}{a} > 0$

(a) (ii), (iii)and (iv)
(b) (ii), (iii) and (vi)
(c) Except (i) and (vi)
(d) none of the above

42. Some facts are given below for a quadratic equation $ax^2 + bx + c = 0$, and then four graphs are also drawn. If D denotes the discriminant of this equation; S and P denote the sum and product of the roots of this equation, respectively, which one of the following graphs is the best representative of all these facts?

(i) $D > 0$ (ii) $a < 0$

(iii) $S < 0$ (iv) $P < 0$

(v) $-\frac{b}{a} < 0$ (vi) $\frac{c}{a} < 0$

Sign of the Roots of a Quadratic Equation

A quadratic equation $ax^2 + bx + c = 0$ can be expressed using the roots (α, β) as following

$$ax^2 + bx + c = 0 \Rightarrow x^2 + \left(\frac{b}{a}\right)x + \left(\frac{c}{a}\right) = 0$$

$$\Rightarrow\ x^2 - \left(-\frac{b}{a}\right)x + \left(\frac{c}{a}\right) = 0 \Rightarrow x^2 - (\alpha + \beta)x + (\alpha\beta) = 0$$

Assume $|\alpha| < |\beta|$, then we have the four conditions as shown below, provided $a > 0$.

Case	$\alpha\beta$	$\alpha + \beta$	α	β
1	+	+	+	+
2	+	–	–	–
3	–	+	–	+
4	–	–	+	–

Exp. 1) If α and β are the roots of the quadratic equation $x^2 + 5x + 6 = 0$, what are the signs of the roots?

Solution Since $\alpha\beta$ is positive and $\alpha + \beta$ is negative, therefore both the roots are negative.

Exp. 2) If α and β are the roots of the quadratic equation $24x^2 + 55x - 1 = 0$, what are the signs of the roots?

Solution Since $(\alpha\beta)$ is negative and $(\alpha + \beta)$ is also negative, therefore one root is positive and another one is negative. More precisely, as we know $|\alpha| < |\beta|$ therefore α is positive and β is negative.

Practice Exercise

1. If sum of the roots is –2 and product of the roots is –15,
(a) both the roots lie on the right-side of the *Y*-axis.
(b) both the roots lie on the left-side of the *Y*-axis.
(c) roots lie on both the sides of the *Y*-axis.
(d) one root is zero and another root is imaginary number.

2. If sum of the roots is –11 and product of the roots is 24,
(a) both the roots lie right-side of the *Y*-axis
(b) both the roots lie left-side of the *Y*-axis.
(c) roots lie on both the sides of the *Y*-axis.
(d) one root is zero and another root is imaginary number.

3. If the quadratic equation is $x^2 - 34x + 93 = 0$.
(a) both the roots are positive.
(b) both the roots are negative.
(c) one root is positive and another one is negative.
(d) one root is rational and another root is irrational.

4. If the quadratic equation is $-x^2 + 28x + 93 = 0$,
(a) both the roots are positive.
(b) both the roots are negative.
(c) one root is positive and another one is negative.
(d) one root is rational and another root is irrational.

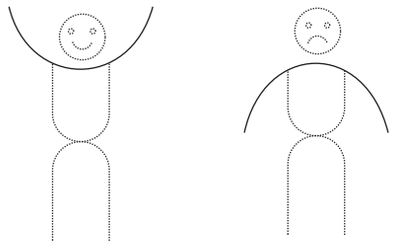
14.8 Maximum or Minimum Value of a Quadratic Equation

A quadratic equation, as you know, when drawn on a plane takes the shape of a parabola. This parabolic graph opens only in two directions –

(a) Upward (like hands-up) when a person is happy.

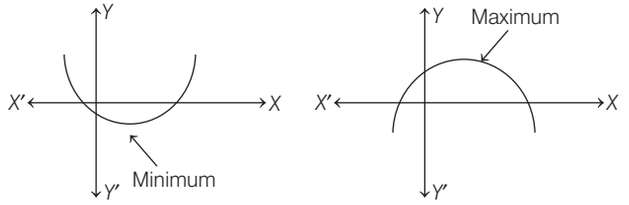
(b) Downward (like hands-down) when a person is sad.



Positive attitude; happy posture fig (i)

Negative attitude; sad posture fig (ii)

These graphs can be related with the situations as in a person is happy when his attitude a is positive and he is sad when his attitude a is negative. So when in the quadratic equation $y = ax^2 + bx + c$, the coefficient of x^2 *i.e., a* is positive the parabolic graph opens upward like the fig (i) and it gives the minimum value of y. Similarly, when in the quadratic equation $y = ax^2 + bx + c$, the coefficient of x^2 *i.e., a* is negative the parabolic graph opens downward like the fig (ii) and it gives the maximum value of y.



Graphically, the maxima (or minima) denote the maximum (or minimum) distance between X-axis and the vertex of the graph.

In the equation $y = ax^2 + bx + c$, **when a > 0**	Parabolic graph opens upward	Graph may continue upwards the infinitely, so you cannot determine the maximum value of y, unless the value of x is restricted.	Graph attains the minimum value of y and it cannot go below this **minimum value.**
In the equation $y = ax^2 + bx + c$, **when a < 0**	Parabolic graph opens downward	Graph may continue downwards the infinitely, so you cannot determine the minimum value of y, unless the value of x is restricted	Graph attains the maximum value of y and it cannot go above this **maximum value.**

NOTE Essentially a quadratic equation $y = ax^2 + bx + c$ either gives minimum or maximum value, but not both.

Both the minimum and maximum values can be obtained in a particular case only when there is a restriction on the values of x and that tells nothing but it tells the range of the quadratic function.

Techniques for Obtaining the Minimum/Maximum Value of a Quadratic Equation

At $x = -\frac{b}{2a}$, we get the minimum/maximum value of y, where $y = ax^2 + bx + c$.

Approach 1 By substituting the value of $x = -\frac{b}{2a}$, in the quadratic equation $y = ax^2 + bx + c$ we can get the minimum/maximum value of y.

Approach 2 By substituting the values of a, b, c in the following formula we can get minimum/maximum value of y.

The minimum/maximum value of

$$y = \frac{4ac - b^2}{4a}$$

Approach 3 Differentiation method of Calculus.

NOTE You don't have to use the calculus at all in order to avoid the unnecessary complications. Your objective is to get the answer quickly and simply. That's it.

Exp.) Consider the following quadratic expressions and determine

(i) Which of these quadratic expressions give minima and which of these give maxima?

(ii) The value of x at which these expressions will yield minimum or maximum value.

(iii) The minimum or maximum value of these quadratic expressions.

(1) $9x^2 + 28x - 4$

(2) $-7x^2 + 10x$

(3) $x^2 - 9x$

(4) $17x + 1 - 4x^2$

(5) $-2x^2 - 11x + 3$

(6) $10 + 9x - x^2$

(7) $x^2 - x$

(8) $x^2 + 16$

(9) $-\frac{3}{2}x^2 + 7x - 1$

(10) $6x - 9x^2$

(11) $-x^2 + 8x + 10$

(12) x^2

Solution Consider the following table for the answers of all the 12 problems.

		(i)	(ii)	(iii)
Answer Number	**Value of coefficient**	**Minima / Maxima**	**Value of x for which equation gives minimum / maximum value of y**	**Minimum/ Maximum value of y**
1.	9	Minima	$x=-\frac{b}{2a}=-\frac{14}{9}$	$y_{\min}=\frac{-232}{9}$
2.	–7	Maxima	$x=-\frac{b}{2a}=\frac{5}{7}$	$y_{max}=\frac{25}{7}$
3.	1	Minima	$x=-\frac{b}{2a}=\frac{9}{2}$	$y_{\min}=\frac{-81}{4}$
4.	–4	Maxima	$x=-\frac{b}{2a}=\frac{17}{8}$	$y_{max}=\frac{305}{16}$
5.	–2	Maxima	$x=-\frac{b}{2a}=\frac{11}{-4}$	$y_{max}=\frac{145}{8}$
6.	–1	Maxima	$x=-\frac{b}{2a}=\frac{9}{2}$	$y_{max}=\frac{121}{4}$
7.	1	Minima	$x=-\frac{b}{2a}=\frac{1}{2}$	$y_{\min}=\frac{-1}{4}$
8.	1	Minima	$x=-\frac{b}{2a}=0$	$y_{\min}=16$
9.	$\frac{-3}{2}$	Maxima	$x=-\frac{b}{2a}=\frac{7}{3}$	$y_{max}=\frac{43}{6}$
10.	9	Minima	$x=-\frac{b}{2a}=\frac{1}{3}$	$y_{\min}=1$
11.	–1	Maxima	$x=-\frac{b}{2a}=4$	$y_{max}=26$
12.	9	Minima	$x=-\frac{b}{2a}=0$	$y_{\min}=0$

NOTE Practice to get the min/max value of a quadratic function through both the techniques for superior confidence and better speed of calculation.

Practice Exercise

1. What is the minimum distance between the vertex of the quadratic graph and X-axis when the roots are equal?
(a) 0 (b) 1
(c) ∞ (d) data insufficient

2. What is the minimum distance between the vertex of the quadratic graph and X-axis when the roots are real and irrational?
(a) 1 (b) 0
(c) –1 (d) data is sufficient

3. The axis of symmetry is 3 units away from Y-axis and the minimum is 4 units, then what is the minimum distance between minimum (extremum) of the graph and origin?
(a) 1 (b) –1 (c) 5 (d) none

4. If the quadratic equation has negative real roots and its maximum (extremum) of the graph is 10 unit, then the distance between the X-axis and maximum of the graph is
(a) 10 (b) –10
(c) 10 and –10 both (d) data is insufficient

5. If the minimum value of the quadratic function is 0, then which of the following is not definitely true about the roots?
(a) Real (b) Non-Real
(c) Equal (d) Rational

6. If one of the roots is 0 and another one is real positive, then which of the following is certainly incorrect?
(a) minimum value of the function is –1
(b) maximum value of the function is 1
(c) minimum of the graph is at X-axis
(d) the graph intersects Y-axis below the X-axis

7. For a quadratic equation $ax^2 + bx + c = 0$, if you have double roots and positive coefficient of x^2, then the minimum value of y is
(a) any negative real number
(b) the lowest negative number
(c) the lowest whole number
(d) cannot be determined

8. For a quadratic equation $ax^2 + bx + c = 0$, if you have equal roots and negative coefficient of x^2, then the maximum value of y is
(a) the highest non-positive integer
(b) the lowest negative number
(c) depends on roots
(d) none of the above

9. There are two quadratic equations; none of them has integer or complex roots. If each root of a quadratic equation is three times the root of another quadratic equation, then the maximum of this equation will be m times to that of the other equation. What's the value of m?
(a) 1 (b) 3
(c) $\sqrt{3}$ (d) 9

10. There are two quadratic equations E_1 and E_2. Each root of E_1 is four times to that of E_2, and the minimum of E_1 will be m times to that of E_2. Then m is
(a) 0
(b) 2
(c) 16
(d) Cannot be determined uniquely

11. The two roots of a quadratic equation are –7 and –3, what will be the maximum value of this equation?
(a) 1
(b) –1
(c) 4
(d) Cannot be determined uniquely

12. Given the two certain roots of any quadratic equation, what is the locus of the vertices of all such quadratic graphs?
(a) Circle (b) Parabola
(c) Axis of symmetry (d) A line parallel to X-axis

13. What is the locus of the vertices of all the quadratic equations whose roots are m times the certain given roots, say α and β?
(a) Polygon (b) Parabola
(c) A line parallel to X-axis (d) Nothing can be said

14. The factors of a quadratic equation are $(x - 4)$ and $(x - 8)$, what will be the vertex of the quadratic graph?
(a) –4 (b) 4
(c) 6 (d) –6

15. For a quadratic equation, the roots are (–1, 3) and the minimum is 4 units, then the triangle formed by connecting the roots and the minimum value of y is
(a) right angle triangle
(b) scalene triangle
(c) equilateral triangle
(d) isosceles triangle

16. For a quadratic equation, the roots are (–3, 3) and the maximum of y is $3\sqrt{3}$ units, then the triangle formed by connecting the roots and the maximum value of y is
(a) right angle triangle (b) scalene triangle
(c) equilateral triangle (d) isosceles triangle

17. If the roots are (–3, 9), then the highest/lowest value of y will be attained at x equal to
(a) –27 (b) 6
(c) –3 (d) 3

18. For all the non-negative real x, what is the minimum and maximum non-negative value of y, where $y = -x^2 + 8x + 20$?
(a) 0, 36 (b) 18, 36
(c) 0, 20 (d) none of these

19. For the non-positive real x, such that $x \geq -11$, what is the minimum and maximum value of y, where $y = x^2 + 12x + 27$?
(a) –9, 16 (b) –9, 27
(c) 0, 27 (d) none of these

20. If $y = 2x^2 + 12x + 35$, the distance between the Y-axis and the minimum of y is
(a) 1 (b) –1 (c) 0.5 (d) 1.5

21. For $\frac{-8}{3} \leq x \leq \frac{8}{3}$, the minimum and maximum values of $f(x) = x^2 - 6x + 18$ are
(a) $81, \frac{370}{9}$ (b) $\frac{11}{9}, \frac{26}{9}$ (c) 83, 173 (d) $\frac{82}{9}, \frac{370}{9}$

22. For $-3 < x < 2$, find the range of $y = -3x^2 + 10x - 21$.
(a) $\left(-78, -\frac{38}{3}\right)$ (b) $[-78, -13]$
(c) $\{-78, -13\}$ (d) none of these

23. The minimum and maximum values of $(7 - x)^2 - 8$ are
(a) –8, 15 (b) –15, 15
(c) –8, 41 (d) none of these

24. The maximum value of $49 - (7 - x)^2$ is
(a) 49 (b) 42
(c) 0 (d) none of these

25. The equation $x^2 - 3(x - 3)^2 - 2 = 0$ has
(a) one minimum point
(b) one maximum point
(c) Both maximum and minimum points
(d) None of the above

26. A quadratic equation which attains its minimum –4 at $x = 5$ and its y-intersect is 21, the largest root of this equation must be less than
(a) 10 (b) 5
(c) 6 (d) 3

27. A quadratic equation which attains its maximum 4 at $x = -4$, and $y = 3$ at $x = -3$ what will be the value of equation at $x = -5$?
(a) 5 (b) 2
(c) 3 (d) none of these

28. A quadratic equation attains minimum at $x = \frac{3}{2}$. Also, $y = \frac{3}{4}$ at $x = \frac{1}{2}$, what's the value of the equation when $x = \frac{5}{2}$?
(a) 3/4 (b) 5/4
(c) 1/4 (d) cannot be determined

29. If one root of a quadratic equation is –2. At $x = -5$, $y = 27$ and at $x = 7$, $y = 27$. Then what's the minimum value of the equation?
(a) 5 (b) 0
(c) –9 (d) none of these

14.9 *Condition for Common Roots Between Two Quadratic Equations*

Consider two quadratic equations,

$ax^2 + bx + c = 0$; (where $a \neq 0$) …(i)

And $a'x^2 + b'x + c' = 0$; (where $a' \neq 0$) …(ii)

(A) If one root is common, then the following condition must be satisfied.

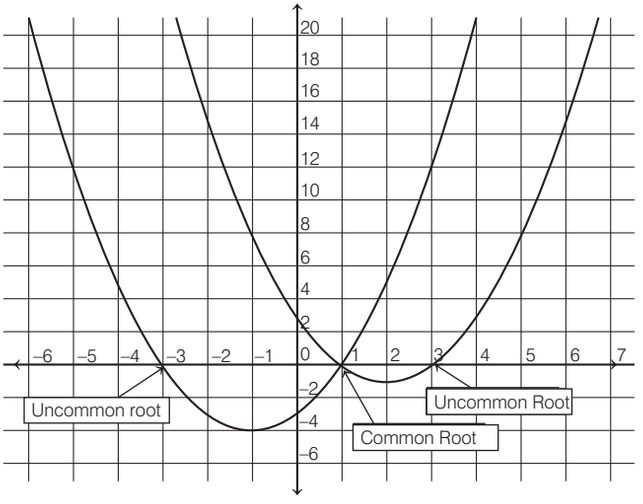
$$(ab' - a'b)(bc' - b'c) = (ca' - c'a)^2$$

(B) If both the roots are common, then the following condition must be satisfied.

$$\frac{a}{a'} = \frac{b}{b'} = \frac{c}{c'}$$

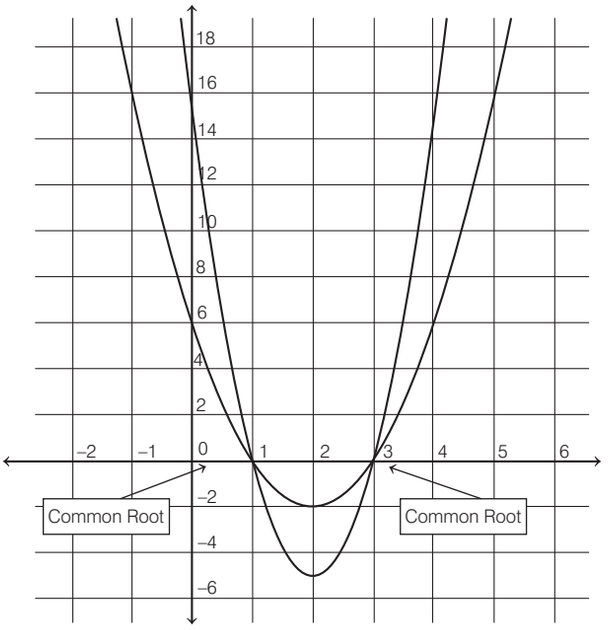
Please note that the above techniques help in determining the common roots without explicitly determining the individual roots of the two quadratic equations.

Graphical Illustration 1 The two quadratic equations $x^2 + 2x - 3$ and $x^2 - 4x + 3$ have two roots each where one root is common in both of them.



When exactly one root is common, then the graphs of two quadratic equations intersect at exactly one point on a co-ordinate plane.

Graphical Illustration 2 The two quadratic equations $3x^2 - 12x + 9$ and $5x^2 - 20x + 15$ have two roots each where both the roots are common in both of them.



When both the roots are common in the two given quadratic equations, then the graphs of two quadratic equations intersect at exactly two points on the same coordinate plane. It means the two graphs (parabolas), which have both the roots common they do not overlap necessarily except at the roots; and the two parabolas can open in opposite directions or even in the same direction with different degree of stretching.

Additional Points about Common Roots

Case 1 When $c = c' = 0$, then the equations reduce to

$$ax^2 + bx = 0 \text{ and } a'x^2 + b'x = 0$$

$$\Rightarrow \quad x(ax + b) = 0 \text{ and } x(a'x + b') = 0$$

This implies that $x = 0$ is a common root.

The other root for the first equation is $x = -\frac{b}{a}$ and for the second equation is $x = -\frac{b'}{a'}$

Case 2 When $\frac{a}{a'} = \frac{b}{b'}$, but $\frac{a}{a'} = \frac{b}{b'} \neq \frac{c}{c'}$, then no root is common.

Finding the Common Root

When α is the common root, then this root must satisfy both the equations

$$a\alpha^2 + b\alpha + c = 0 \quad ...(i)$$

And $$a'\alpha^2 + b'\alpha + c' = 0 \quad ...(ii)$$

$$\therefore \quad \frac{\alpha^2}{(bc' - b'c)} = \frac{\alpha}{(ca' - c'a)} = \frac{1}{(ab' - a'b)}$$

From Eqs. (i) and (ii), we get

$$\alpha = \frac{(bc' - b'c)}{(ca' - c'a)}$$

And from the second and third we get

$$\alpha = \frac{(ca' - c'a)}{(ab' - a'b)}$$

Finally by equating both the values of α, we get the condition for a common root. That is

$$(ab' - a'b)(bc' - b'c) = (ca' - c'a)^2$$

Exp. 1) Determine that whether there is any common root exists between the following quadratic equations :

$$x^2 - 8x + 15 = 0 \quad ...(i)$$
$$x^2 - 9x + 18 = 0 \quad ...(ii)$$

Solution Assuming that one root is common, then

$$(-9 + 8)(-144 + 135) = (15 - 18)^2$$
$$\Rightarrow \quad (-1)(-9) = (-3)^2$$
$$\Rightarrow \quad 9 = 9$$

This proves that one root is common in between the given quadratic equation.

Again assuming that both the roots of the given quadratic equations are common, then

$$\frac{1}{1} \neq \frac{8}{9} \neq \frac{15}{18}$$

This proves that both the roots are not common.

Thus we find that only one root is common.

Exp. 2) Determine the value of the common root of the quadratic equations :

$$x^2 - 8x + 15 = 0 \quad ...(i)$$
$$x^2 - 9x + 18 = 0 \quad ...(ii)$$

Solution Since one root (or solution) is common in between the two equations, therefore

$$x^2 - 8x + 15 = x^2 - 9x + 18$$
$$\Rightarrow \quad x = 3$$

Therefore, the value of the common root is 3.

Exp. 3) If the equations $x^2 + px + q = 0$ and $x^2 + qx + p = 0$ have a common root, which of the following can be true?

(a) $p - q = 0$ (b) $p + q = -1$ (c) $pq = -1$ (d) $pq = 0$

Solution Since one root is common, then

$$(q - p)(p^2 - q^2) = (q - p)^2$$
$$\Rightarrow \quad (p^2 - q^2) = (q - p)$$
$$\Rightarrow \quad [(p + q)(p - q)] = -(p - q)$$
$$\Rightarrow \quad [(p + q)(p - q)] + (p - q) = 0$$
$$\Rightarrow \quad (p - q)[p + q + 1] = 0$$

This implies that either $p - q = 0$

or $\quad p + q + 1 = 0$

Therefore, (a) and (b) are valid relations.

Exp. 4) If the equations $x^2 + px + q = 0$ and $x^2 + qx + p = 0$ have a common root, which of the following can be the common root?

(a) 1 (b) –1

(c) –2 (d) $\frac{-1}{2}$

Solution Let us say α is the common root, then

$$\alpha^2 + p\alpha + q = \alpha^2 + q\alpha + p$$
$$\Rightarrow \quad p\alpha + q = q\alpha + p$$
$$\Rightarrow \quad \alpha(p - q) = (p - q)$$
$$\Rightarrow \quad \alpha = 1$$

Therefore choice (a) gives the appropriate answer.

Exp. 5) If the equations $x^2 + bx + c = 0$ and $x^2 + dx + e = 0$ have a common root, which of the following can be the common root?

(a) $\frac{c - e}{d - b}$ (b) $\frac{be - cd}{c - e}$

(c) $\frac{c - e}{be - cd}$ (d) $\frac{d - b}{c - e}$

Solution Since one root is common, then

$$(d - b)(be - cd) = (c - e)^2$$
$$\frac{be - cd}{c - e} = \frac{c - e}{d - b} \quad ...(i)$$

Let us say α is the common root, then

$$\alpha^2 + b\alpha + c = \alpha^2 + d\alpha + e$$
$$\Rightarrow \quad b\alpha + c = d\alpha + e$$
$$\Rightarrow \quad \alpha(b - d) = (e - c)$$
$$\Rightarrow \quad \alpha = \frac{e - c}{b - d} \Rightarrow \alpha = \frac{c - e}{d - b}$$

Now from the Eq. (i), we get

$$\alpha = \frac{c - e}{d - b} = \frac{be - cd}{c - e}$$

Therefore (a) and (b) are valid relations.

Exp. 6) Find the value of m if the equations $x^2 + 2x + 3m = 0$ and $2x^2 + 3x + 5m = 0$ have a common root.

(a) 15 (b) 8 (c) 2 (d) –1

Solution Since one root is common, then

$$(3-4)(10m-9m) = (6m-5m)^2$$

$$\Rightarrow \quad -m = m^2 \quad \Rightarrow m = -1$$

Therefore choice (d) gives the appropriate answers.

Exp. 7) For any real numbers a, b and c the equations $ax^2 + bx + c = 0$ and $bx^2 + cx + a = 0$ have a common root, which of the following relations is NOT true?

(a) $abc = 1$ (b) $a + b + c = 0$

(c) $a = b = c$ (d) $a^3 + b^3 + c^3 = 3abc$

Solution Since one root is common, therefore

$$(ac - b^2)(ab - c^2) = (bc - a^2)^2$$

$$\Rightarrow \quad a(a^3 + b^3 + c^3 - 3abc) = 0$$

But $a \neq 0$;

$$\therefore \quad a^3 + b^3 + c^3 - 3abc = 0 \qquad \ldots(i)$$

$$\Rightarrow (a + b + c)(a^2 + b^2 + c^2 - ab - bc - ac) = 0$$

$$\therefore \quad a + b + c = 0 \qquad \ldots(ii)$$

Or $a^2 + b^2 + c^2 - ab - bc - ac = 0$

$$\Rightarrow \quad 2a^2 + 2b^2 + 2c^2 - 2ab - 2bc - 2ac = 0$$

$$\Rightarrow \quad (a-b)^2 + (b-c)^2 + (c-a)^2 = 0$$

$$\Rightarrow \quad a - b = 0,\ b - c = 0,\ c - a = 0$$

$$\Rightarrow \quad a = b = c \qquad \ldots(iii)$$

Therefore choice (a) is appropriate one.

Hint $a^3 + b^3 + c^3 - 3abc = (a + b + c)$
$(a^2 + b^2 + c^2 - ab - bc - ac)$

Exp. 8) If the equation $x^2 - ax + b = 0$ and $x^2 - a'x + b' = 0$, have one root in common and the second equation has equal roots, then which one of the following is a valid relation?

(a) $2(b' - b) = aa'$ (b) $2(a + a') = bb'$

(c) $2(a' - a) = bb'$ (d) $2(b + b') = aa'$

Solution Since the equation $x^2 - a'x + b' = 0$ has equal roots, we can consider them α and α, then

$$\text{Sum of the roots} = \alpha + \alpha = 2\alpha = a' \Rightarrow \alpha = \frac{a'}{2}$$

$$\text{And product of the roots} = \alpha \cdot \alpha = \alpha^2 = b'$$

Now since one root is common, then

$$\alpha^2 - a\alpha + b = \alpha^2 - a'\alpha + b'$$

$$\Rightarrow \quad \alpha(-a + a') = (b' - b) \Rightarrow \alpha(a' - a) = (b' - b)$$

$$\Rightarrow \quad a'(a' - a) = 2(b' - b) \qquad \left(\text{since } \alpha = \frac{a'}{2}\right)$$

$$\Rightarrow \quad (a')^2 - aa' = 2(b' - b)$$

$$\Rightarrow \quad 4\alpha^2 - aa' = 2(b' - b) \qquad (\text{since } a' = 2\alpha)$$

$$\Rightarrow \quad 4b' - aa' = 2(b' - b) \qquad (\text{since } \alpha^2 = b')$$

$$\Rightarrow \quad aa' = 2(b + b')$$

Therefore choice (d) is valid.

Exp. 9) If each pair of the three equations $x^2 + b_1x + c_1 = 0$, $x^2 + b_2x + c_2 = 0$ and $x^2 + b_3x + c_3 = 0$ have a common root, which one of the following is true?

(a) $(b_1^2 + b_2^2 + b_3^3) = 2(b_1 \cdot b_2 + b_2 \cdot b_3 + b_3 \cdot b_1) - 4(c_1 + c_2 + c_3)$

(b) $(b_1^2 + b_2^2 + b_3^3)$
$= 2(b_1 \cdot b_2 + b_2 \cdot b_3 + b_3 \cdot b_1) + 4(c_1 + c_2 + c_3)$

(c) $(b_1^2 + b_2^2 + b_3^3)$
$= 2(c_1 \cdot c_2 + c_2 \cdot c_3 + c_3 \cdot c_1) - 4(b_1 + b_2 + b_3)$

(d) $(b_1^2 + b_2^2 + b_3^3)$
$= 4(b_1 \cdot b_2 + b_2 \cdot b_3 + b_3 \cdot b_1) - 2(c_1 + c_2 + c_3)$

Solution The three equations are

$$x^2 + b_1x + c_1 = 0 \qquad \ldots(i)$$

$$x^2 + b_2x + c_2 = 0 \qquad \ldots(ii)$$

$$x^2 + b_3x + c_3 = 0 \qquad \ldots(iii)$$

Let (α, β), (β, γ) and (γ, α) be the roots of Eqs. (i), (ii) and (iii) respectively, then

$$\alpha + \beta = -b_1 \text{ and } \alpha \cdot \beta = c_1 \qquad \ldots(iv)$$

$$\beta + \gamma = -b_2 \text{ and } \beta \cdot \gamma = c_2 \qquad \ldots(v)$$

$$\gamma + \alpha = -b_3 \text{ and } \gamma \cdot \alpha = c_3 \qquad \ldots(vi)$$

From eqs. (iv), (v) and (vi), we get

$$\alpha + \beta + \gamma = -\frac{1}{2}(b_1 + b_2 + b_3)$$

$$\text{and } (\alpha \cdot \beta + \beta \cdot \gamma + \gamma \cdot \alpha) = c_1 + c_2 + c_3 \qquad \ldots(vii)$$

Now, $(\alpha + \beta)^2 + (\beta + \gamma)^2 + (\gamma + \alpha)^2 = b_1^2 + b_2^2 + b_3^2$

$$\Rightarrow 2(\alpha^2 + \beta^2 + \gamma^2) + 2(\alpha \cdot \beta + \beta \cdot \gamma + \gamma \cdot \alpha) = b_1^2 + b_2^2 + b_3^2$$

$$\Rightarrow 2[(\alpha + \beta + \gamma)^2 - 2(\alpha \cdot \beta + \beta \cdot \gamma + \gamma \cdot \alpha)] + 2(\alpha \cdot \beta + \beta \cdot \gamma + \gamma \cdot \alpha) = b_1^2 + b_2^2 + b_3^2$$

$$\Rightarrow \quad 2(\alpha + \beta + \gamma)^2 - 2(\alpha \cdot \beta + \beta \cdot \gamma + \gamma \cdot \alpha) = b_1^2 + b_2^2 + b_3^2$$

$$\Rightarrow \quad 2\left[-\frac{1}{2}(b_1^2 + b_2^2 + b_3^2)\right]^2 - 2(c_1 + c_2 + c_3) = b_1^2 + b_2^2 + b_3^2$$

$$\Rightarrow \quad \frac{1}{2}[(b_1^2 + b_2^2 + b_3^2) + 2(b_1 \cdot b_2 + b_2 \cdot b_3 + b_3 \cdot b_1)] - 2(c_1 + c_2 + c_3) = b_1^2 + b_2^2 + b_3^2$$

$$\Rightarrow \quad \frac{1}{2}(b_1^2 + b_2^2 + b_3^2) + (b_1 \cdot b_2 + b_2 \cdot b_3 + b_3 \cdot b_1) - 2(c_1 + c_2 + c_3) = (b_1^2 + b_2^2 + b_3^2)$$

$$\Rightarrow \quad (b_1^2 + b_2^2 + b_3^2) + 2(b_1 \cdot b_2 + b_2 \cdot b_3 + b_3 \cdot b_1) - 4(c_1 + c_2 + c_3) = 2(b_1^2 + b_2^2 + b_3^2)$$

$$\Rightarrow \quad (b_1^2 + b_2^2 + b_3^2) = 2(b_1 \cdot b_2 + b_2 \cdot b_3 + b_3 \cdot b_1) - 4(c_1 + c_2 + c_3) = (b_1^2 + b_2^2 + b_3^2).$$

Therefore choice (a) is the appropriate one.

Hint $(a + b + c)^2 = (a^2 + b^2 + c^2) + 2(a \cdot b + b \cdot c + c \cdot a)$

Exp. 10) Find the value of $\frac{q}{p}$, if $px^2 + x - 15 = 0$ and $18x^2 + 3x + q = 0$ have both the roots common.

(a) $\frac{-15}{2}$ (b) -9 (c) $-\frac{27}{4}$ (d) $\frac{14}{3}$

Solution Since both the roots are common, therefore

$$\frac{p}{18} = \frac{1}{3} = \frac{-15}{q} \quad \Rightarrow p = 6 \text{ and } q = -45$$

Therefore choice (a) is the appropriate one.

Exp. 11) If the equation $x^2 + px + qr = 0$ and $x^2 + qx + rp = 0$ have a common root, the other roots, which are not common in these equations, will be the roots of the equation :

(a) $x^2 + pqx + r = 0$ (b) $x^2 - rx - pq = 0$

(c) $px^2 + rx + q = 0$ (d) $x^2 + rx + pq = 0$

Solution The given equations are

$$x^2 + px + qr = 0 \quad \ldots(i)$$

$$x^2 + qx + rp = 0 \quad \ldots(ii)$$

Let (α, β) and (α, γ) be the roots of eqs. (i) and (ii) respectively, then

$$\alpha^2 + p\alpha + qr = \alpha^2 + q\alpha + rp \Rightarrow p\alpha + qr = q\alpha + rp$$

$$\Rightarrow \quad \alpha = r \quad \ldots(iii)$$

Since the given eqs. (i) and (ii) have a common root, then

$$(q - p)(p^2r - q^2r) = (qr - rp)^2$$

$$\Rightarrow \quad (q - p)r\,(p^2 - q^2) = r^2(q - p)^2 \Rightarrow (p^2 - q^2) = r(q - p)$$

$$\Rightarrow \quad r = \frac{(p^2 - q^2)}{-(p - q)} = -(p + q) \Rightarrow r = -(p + q) \quad \ldots(iv)$$

Now from the eq. (i), the product of the roots $= \alpha\beta = qr$

But since one of the roots is $\alpha = r$, it means the other root $\beta = q$.

Similarly from the eq. (ii) the product of the roots $= \alpha\gamma = rp$

But since one of the roots is $\alpha = r$, it means the other root

$$\gamma = p$$

Therefore the new equation whose roots are β and γ is

$$x^2 - (\beta + \gamma)x + \beta\gamma = 0 \Rightarrow x^2 - (p + q)x + pq = 0$$

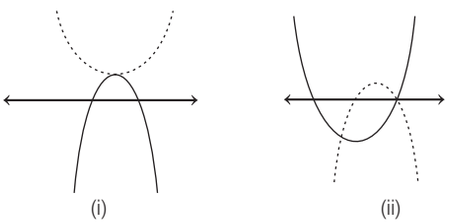
$$\Rightarrow \quad x^2 + rx + pq = 0$$

Therefore choice (d) is the appropriate one.

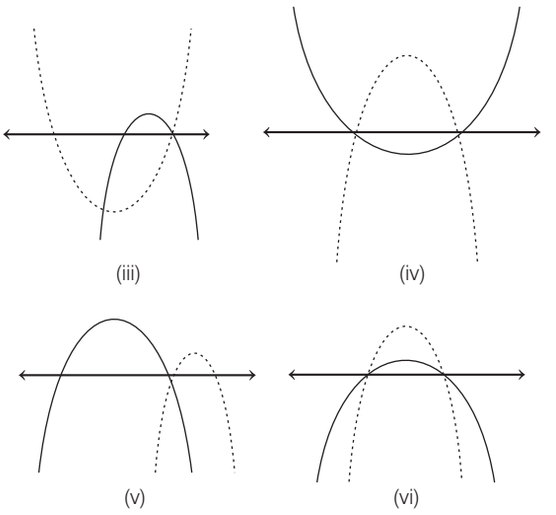
Exp. 12) There are six pairs of quadratic equations as mentioned below.

1. $-x^2 - x + 6 = 0$ and $-x^2 + 7x - 10 = 0$
2. $x^2 + 3x - 4 = 0$ and $-x^2 - x + 2 = 0$
3. $-x^2 + 8x - 12 = 0$ and $x^2 - 3x - 18 = 0$
4. $-x^2 + 5x - 4 = 0$ and $-3x^2 + 15x - 12 = 0$
5. $x^2 - x - 6 = 0$ and $-4x^2 + 4x + 24 = 0$
6. $4 - 2x^2 = 0$ and $x^2 + 4$

And there are six sets of representative quadratic graphs as shown below, where the solid parabola depicts the first equation and dotted parabola depicts the second equation for each pair of quadratic equations.



(i) (ii)



(iii) (iv) (v) (vi)

Then which one of the following is correct?

(a) 1-iv, 2-iii, 3-ii, 4-vi, 5-v, 6-i

(b) 1-v, 2-ii, 3-iii, 4-vi, 5-iv, 6-i

(c) 1-ii, 2-iii, 3-i, 4-v, 5-vi, 6-iv

(d) 1-v, 2-ii, 3-iii, 4-iv, 5-vi, 6-i

Solution Use the following tricks to figure out the right match.

Both the coefficients of x^2 in pair (1) are negative; it means the parabolas will open downwards. But since there is only one root common in the equations of pair (1) so the appropriate graphs are given by graph (v).

Similarly, both the coefficients of x^2 in pair (1) are negative; it means the parabolas will open downwards. But since both the roots are common in the equations of (4) so the right graphs are given by graph (vi).

Equations in pair (5) have both the roots common and one has positive and another has negative coefficient of x^2, so the graphs will open in opposite directions. Thus the appropriate graphs are represented by graph (iv).

In pair (6) one equation has non-real roots and another one has real roots. Also, one equation has minimum 4 and another has maximum 4. Also, the axes of symmetry for both the equations are Y-axis only; whereas the axis of symmetry is given by $x = \frac{-b}{2a}$. Thus the graph (i) is appropriate for pair (6).

Now, in pair (2) only one root is common and the first equation gives minimum and the second equation gives maximum, therefore graph (ii) is the appropriate match for pair (2).

Lastly, in pair (3) only one root is common and the first equation gives maximum and the second equation gives minimum, therefore graph (iii) is the appropriate match for pair (3).

Hence, choice (b) is correct.

14.10 Basics of Inequality

1. Square of any real quantity is always non-negative. In general, even power of any real quantity is always non-negative.

   That means for every real number R, $R^{2n} \geq 0$; where n is any natural number.
2. If a, b, c are three real numbers such that $a \geq b$, then $a \pm c \geq b \pm c$.
3. (i) If a, b, c are three real numbers such that $a \geq b$ and $c > 0$, then $ac \geq bc$.

   (ii) If a, b, c are three real numbers such that $a \leq b$ and $c > 0$, then $ac \leq bc$.
4. (i) If a, b, c are three real numbers such that $a \geq b$ and $c < 0$, then $ac \leq bc$.

   (ii) If a, b, c are three real numbers such that $a \leq b$ and $c < 0$, then $ac \geq bc$.
5. (i) If a and b are two real numbers and $ab > 0$, then either each of a and b are positive or each of them are negative.

   (ii) If a and b are two real numbers and $ab < 0$, then a and b are of opposite signs *i.e.,* either $a > 0$ and $b < 0$ or $a < 0$ and $b > 0$.

Quadratic Inequality

Essentially a quadratic expression is said to be a quadratic inequation when $ax^2 + bx + c \neq 0$. Thus $ax^2 + bx + c > 0$ and $ax^2 + bx + c < 0$ are the quadratic inequations. A quadratic equation talks about the zeros of y, while a quadratic inequation talks about either positive values of y or negative values of y.

For $y = ax^2 + bx + c$		
$y > 0$	y is strictly greater than 0.	Quadratic inequation
$y \geq 0$	y is greater than or equal to 0.	Quadratic inequation
$y = 0$	y is strictly equal to 0.	Quadratic equation
$y \leq 0$	y is less than or equal to 0.	Quadratic inequation
$y < 0$	y is strictly less than 0.	Quadratic inequation

Graphically speaking a quadratic inequation states the position of the quadratic graph either above or below the X-axis. To know the nature (or position) of y we need to know the following things

(i) Whether the discriminant D is positive, negative or zero

(ii) Whether the coefficient of x^2 is positive or negative

(iii) Roots of the given quadratic equation, in case of real and distinct roots.

For $ax^2 + bx + c$, Such that $a > 0$		
$D > 0$		$y > 0$, for $x < \alpha$ and $x > \beta$ $y \geq 0$, for $x \leq \alpha$ and $x \geq \beta$ $y < 0$, for $\alpha < x < \beta$ $y \leq 0$, for $\alpha \leq x \leq \beta$ Where $y = ax^2 + bx + c$ Assuming α and β are the two roots such that $\alpha < \beta$.
$D = 0$		$y > 0$, for all the values of x, except $x = \alpha = \beta$ $y \geq 0$, for all the values of x Where $y = ax^2 + bx + c$ Assuming α and β are the two roots but they are always equal when $D = 0$.
$D < 0$		$y > 0$, for all the values of x Where $y = ax^2 + bx + c$

For $ax^2 + bx + c$, such that $a < 0$		
$D > 0$		$y > 0$, for $\alpha < x < \beta$ $y \geq 0$, for $\alpha \leq x \leq \beta$ $y < 0$, for $x < \alpha$ and $x > \beta$ $y \leq 0$, for $x \leq \alpha$ and $x \geq \beta$, Where $y = ax^2 + bx + c$ Assuming α and β are the two roots such that $\alpha < \beta$.
$D = 0$		$y < 0$, for all the values of x, except $x = \alpha = \beta$ $y \leq 0$, for all the values of x, Where $y = ax^2 + bx + c$ Assuming α and β are the two roots but they are always equal when D = 0.
$D < 0$		$y < 0$, for all the value of x, Where $y = ax^2 + bx + c$

Sign of Quadratic Expression $ax^2 + bx + c$

In the preceding discussion you must have seen that sometimes graph intersects the X-axis and therefore some part of the graph is above the X-axis and rest of the graph is below the X-axis. So here our objective is to determine that in general when the graph $[y = f(x)]$ is positive and when it is negative.

1. If $D < 0$, *i.e.,* α and β are imaginary, then $ax^2 + bx + c > 0$, if $a > 0$ and $ax^2 + bx + c < 0$, if $a < 0$
2. If $D = 0$, *i.e.,* α and β are real and equal, then $ax^2 + bx + c \geq 0$, if $a > 0$ and $ax^2 + bx + c \leq 0$, if $a < 0$
3. If $D > 0$, *i.e.,* α and β are real and unequal ($\alpha < \beta$), then the sign of the expression $ax^2 + bx + c, x \in R$ is determined as follows :

Exp. 1) If $a > 0$ and roots are $5 + 2i$ and $5 - 2i$, determine the nature of the quadratic graph.

Solution Since roots are imaginary and $a > 0$, therefore all the values of the quadratic function will be positive for every value of x.

Exp. 2) For a quadratic equation, $a < 0$ and $b^2 = 4ac$, determine the nature of the graph.

Solution Since $D = 0$ and $a < 0$, therefore all the values of the function will be negative except the maximum value and that will be equal to 0.

Exp. 3) For a quadratic equation $10x^2 + x - 21 = 0$, what is sign of the function for every $x < -\frac{3}{2}$?

Solution The roots of the equation are $\frac{-3}{2}$ and $\frac{7}{5}$ and $D = 841 > 0$. Also $a > 0$, therefore all the values of function will be positive for every $x < -\frac{3}{2}$.

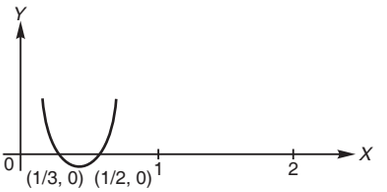
Exp. 4) Find the sign of $6x^2 - 5x + 1$ for all real values of x.

Solution $\because$ $D = b^2 - 4ac \Rightarrow D = 25 - 4 \times 6 \times 1 = 1$

$\because$ The roots are real and different and the roots are $\frac{5 \pm \sqrt{25-24}}{12}$ *i.e.,* $\frac{1}{2}$ and $\frac{1}{3}$

$\therefore$ The given expression has the same sign as the coefficient of x^2,

i.e., positive for all real values of x except for those which lie between $\frac{1}{3}$ and $\frac{1}{2}$



Solutions of Quadratic Inequations

Remember that in quadratic equation we are interested in knowing that for what values of x, the value of y will be zero but in quadratic inequation we are interested in knowing that for what values of x, the value of y will be positive or negative.

	Objective	**Condition**
Quadratic Equation	To know the values of x	So that $y = 0$
Quadratic Inequation	To know the values of x	So that $y > 0$ or $y < 0$

By having a look at the previous graphs, you can summarize the following facts regarding the quadratic expression $ax^2 + bx + c$ whose roots are α and β and R is the set of real numbers.

Discriminant	**Coefficient of x**	**Values of y**	**Values of x**	**Alternative forms of expressing the values of x**
$D < 0$	$a > 0$	$y > 0$	for every x	R
	$a < 0$	$y < 0$	for every x	R
$D = 0$	$a > 0$	$y > 0$	for every x, except $x = \alpha$	$R - \{\alpha\}$ or $(-\infty, \alpha) \cup (\alpha, \infty)$
		$y \geq 0$	for every x	R
	$a < 0$	$y < 0$	for every x, except $x = \alpha$	$R - \{\alpha\}$ or $(-\infty, \alpha) \cup (\alpha, \infty)$
		$y \leq 0$	for every x	R
$D > 0$	$a > 0$	$y > 0$	for $x < \alpha$ and $x > \beta$	$R - [\alpha, \beta]$ or $(-\infty, \alpha) \cup (\beta, \infty)$
		$y \geq 0$	for $x \leq \alpha$ and $x \geq \beta$	$R - (\alpha, \beta)$ or $(-\infty, \alpha] \cup [\beta, \infty)$
		$y < 0$	for $\alpha < x < \beta$	(α, β)
		$y \leq 0$	for $\alpha \leq x \leq \beta$	$[\alpha, \beta]$
	$a < 0$	$y > 0$	for $\alpha < x < \beta$	(α, β)
		$y \geq 0$	for $\alpha \leq x \leq \beta$	$[\alpha, \beta]$
		$y < 0$	for $x < \alpha$ and $x > \beta$	$R - [\alpha, \beta]$ or $(-\infty, \alpha) \cup (\beta, \infty)$
		$y \leq 0$	for $x \leq \alpha$ and $x \geq \beta$	$R - (\alpha, \beta)$ or $(-\infty, \alpha] \cup [\beta, \infty)$

So essentially when $D > 0$, then only you have to use the following methods to know that for what values of x, the value of y will be positive or negative. In other cases like $D < 0$ or $D = 0$, just by looking at the value (positive/negative) of a, you can tell the answer. Basically there are following three methods to determine the values of x for a quadratic inequation.

(A) Graphical Method (B) Interval Method (C) Algebraic Method

(A) *Graphical Method*

Step 1 Draw the graph (parabola)

Step 2 Determine the roots (intersections at X-axis)

Step 3 Consider the appropriate values of x corresponding to the given y (or $ax^2 + bx + c$) as shown in the diagram by shading the X-axis.

In the following diagrams :

The sign ○ indicates that $x = \alpha$ and $x = \beta$ are excluded. The sign ● indicates that $x = \alpha$ and $x = \beta$ are included.

Inequality	Coefficient of x^2	
	$a > 0$	$a < 0$
$ax^2 + bx + c > 0$	$x < \alpha$ and $x > \beta$ 	$\alpha < x < \beta$ $ax^2 + bx + c \geq 0$	$x \leq \alpha$ and $x \geq \beta$ 	$\alpha \leq x \leq \beta$ $ax^2 + bx + c < 0$	$\alpha < x < \beta$ 	$x < \alpha$ and $x > \beta$ $ax^2 + bx + c \leq 0$	$\alpha \leq x \leq \beta$ 	$x \leq \alpha$ and $x \geq \beta$ 
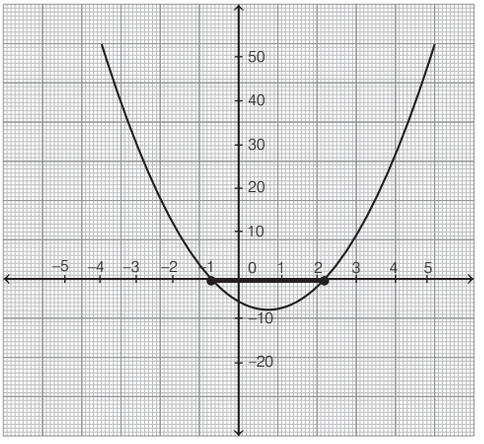
Exp.) Find the values of x for $3x^2 - 3x - 6 \leq 0$.

Solution Let's consider for a while that $3x^2 - 3x - 6 = 0$. Then the roots of this equation are -1 and 2. Now sketch the graph as shown below. Since $a = 3$, that means $a > 0$, therefore the parabola will open up and it will pass through the points -1 and 2.



Now you have to see where the graph of $f(x) \leq 0$. Looking at the above graph you can figure out that when $-1 \leq x \leq 2$, then $3x^2 - 3x - 6 \leq 0$.

(B) *Interval Method*

Step 1 Find the roots, α and β, of the given quadratic inequations considering for a while that the given quadratic expression is equal to zero.

Step 2 Draw a number line and mark the roots on it as you do it on the X-axis; smaller root on the left hand side and bigger root on the right hand side.

Step 3 These two roots divide the number line in 3 contiguous regions as shown below.

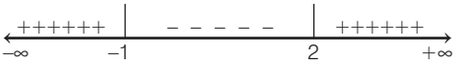
Step 4 Follow the table for the final steps.

	For, $a > 0$	**For, $a < 0$**
		$y > 0$	Consider the positive region. (That means all the values less than α and all the values greater than β.)	Consider the positive region. (That means all the values between α and β).
$y < 0$	Consider the negative region. (That means all the values between α and β.)	Consider the negative region. (That means all the values less than α and all the values greater than β.)

Exp. 1) Find the values of x for the following inequations.

(i) $3x^2 - 3x - 6 \le 0$ (ii) $3x^2 - 3x - 6 < 0$ (iii) $3x^2 - 3x - 6 \ge 0$ (iv) $3x^2 - 3x - 6 > 0$

Solution The roots of given equations are –1 and 2. Now, mark the roots on the number line then the line will be divided into 3 sections (or intervals) one section is before –1, and second section is between –1 and 2, and the third section is after 2. Since $a > 0$, therefore the outer sections will be positive and the section lying between roots will be negative, so mark the sections appropriately using + and – signs.



(i) Since you are required to find the values of x, on the number line, for which $3x^2 - 3x - 6 \le 0$. That means you are looking for non-positive region. So, it is obvious from the above that $x \ge -1$ and $x \le 2$. It implies that $-1 \le x \le 2$.

(ii) In this case, it is a strict inequality, so you have to exclude the roots. For the inequation $3x^2 - 3x - 6 < 0$, the possible values are $-1 < x < 2$.

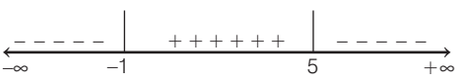
(iii) Since, you are required to find the values of x on the number line, for which $3x^2 - 3x - 6 \ge 0$. That means you are looking for non-negative region. So, it is obvious from the above that $x \le -1$ and $x \ge 2$. It implies that x is $(-\infty, -1] \cup [2, \infty)$ or you can say $x \in R - (-1, 2)$.

(iv) In this case, it is a strict inequality so you have to exclude the roots. For the inequation $3x^2 - 3x - 6 > 0$, the possible values are $x < -1$ and $x > 2$. It implies that x is $(-\infty, -1) \cup (2, \infty)$ or you can say $x \in R - [-1, 2]$.

Exp. 2) Find the values of x for the following inequations.

(i) $-2x^2 + 8x + 10 \ge 0$ (ii) $-2x^2 + 8x + 10 \le 0$

Solution The roots of this equation are –1 and 5. Now, mark the roots on the number line then the line will be divided into 3 sections (or intervals) : one section is before –1, and second section is between –1 and 5, and the third section is after 5. Since $a < 0$, therefore the outer sections will be negative and the section lying between roots will be positive, so mark the sections appropriately using + and – signs.



(i) Since you are required to find the values of x, on the number line, for which $-2x^2 + 8x + 10 \ge 0$. That means you are looking for non-negative region. So it is obvious from the above that $x \ge -1$ and $x \le 5$. It implies that $-1 \le x \le 5$.

(ii) Since, you are required to find the values of x on the number line, for which $-2x^2 + 8x + 10 \le 0$. That means you are looking for non-positive region. So it is obvious from the above that $x \le -1$ and $x \ge 5$. It implies that x is $(-\infty, -1] \cup [5, \infty)$ or you can say $x \in R - (-1, 5)$.

(C) *Algebraic Method*

As far as CAT is concerned, I won't recommend this method at all because it is slightly tedious and more time consuming in comparison to the previously discussed methods. So please avoid this method for competitive exams. However, this method may not be so oblivious to you because it has been inadvertently used on several occasions without specifying the name of it.

NOTE Once you understand the nature of a quadratic graph your most of the problem is solved. You are just expected to visualize and draw a rough sketch of a quadratic graph just by looking at certain things of a quadratic function (or equation or inequality) like the sign of a(+ or –) value of D ($D > 0$ or $D = 0$ or $D < 0$), value of roots etc. Then looking at the graph – its position, intersections at X-axis and opening direction – you can tell a lot about the quadratic equation/inequation/function.

Practice Exercise

Directions (for Q. Nos. 1 to 11) *Find the values of x for which of the following equations are satisfied.*

1. $x^2 - 4x + 3 \geq 0$

(a) $[1, 3]$ (b) $(-\infty, -3] \cup [1, \infty)$
(c) $(-\infty, 1) \cup (3, \infty)$ (d) $R - (1, 3)$

2. $-x^2 + 2x + 8 \geq 0$

(a) $(-2, 6)$ (b) $(2, -4)$
(c) $[-2, 4]$
(d) $(-\infty, -2] \cup (-2, 4) \cup [4, \infty)$

3. $-x^2 + 2x + 8 < 0$

(a) $[-\infty, -2) \cup (4, \infty]$ (b) $(-\infty, -2) \cup (4, \infty)$
(c) $(-2, 4)$ (d) $(-\infty, -4) \cup (2, \infty)$

4. $2x^2 + 5x - 3 > 0$

(a) $(-\infty, -3] \cup \left(\frac{1}{2}, \infty\right)$ (b) $(-\infty, -3] \cup [2, \infty]$
(c) $R - \left[-3, \frac{1}{2}\right]$ (d) $R - \left(-3, \frac{1}{2}\right)$

5. $x^2 + 2x + 5 > 0$

(a) $(-\infty, \infty)$ (b) $[-\infty, \infty]$
(c) $(-\infty, 0) \cup (0, \infty)$ (d) $(-\infty, -2) \cup (-5, \infty)$

6. $x^2 + x - 12 < 0$

(a) $-\infty < x - 4$ and $3 < x < \infty$ (b) $[-4, 3]$
(c) $(-\infty, 4) \cup (3, \infty)$ (d) $(-4, 3)$

7. $x^2 - 4 < 0$

(a) $-2 \leq x \leq 2$ (b) $-2 < x < 2$
(c) $(-4, 4)$ (d) none of these

8. $x^2 + 1 < 0$

(a) $-1 \leq x \leq 1$ (b) $-1 < x < 0$
(c) Does not exist (d) none of these

9. $9 - x^2 \geq 0$

(a) $-\sqrt{3} \leq x \leq \sqrt{3}$ (b) $-3 \leq x \leq 3$
(c) $0 < x \leq 3$ (d) $R - (-3, 3)$

10. $9x^2 - 30x + 25 \leq 0$

(a) $-3 \leq x \leq 5$ (b) $-5 \leq x \leq 3$
(c) $\frac{5}{3}$ (d) $x \leq \frac{5}{3}$

11. $x^2 - 10x - 1 \geq 0$

(a) $(-\infty, \infty)$ (b) $[5 - \sqrt{26}, 5 + \sqrt{26}]$
(c) $(-\infty, -10) \cup (-1, \infty)$
(d) $(-\infty, 5 - \sqrt{26}] \cup [5 + \sqrt{26}, \infty)$

12. For a quadratic inequation $ax^2 + bx + c < 0$, having negative discriminant, the values of x that satisfy the given inequation

(a) R^- (b) R
(c) R^+ (d) can't be determined

13. For a quadratic inequation $ax^2 + bx + c > 0$, having negative discriminant, the values of x that satisfy the given inequation

(a) R
(b) only positive real numbers
(c) does not exist
(d) Either R or none

14. For a quadratic inequation $ax^2 + bx + c \geq 0$; $D < 0$ and $a < 0$, the values of x that satisfy the given inequation

(a) R^+ (b) R^-
(c) $R - \{0\}$ (d) does not exist

15. For a quadratic inequation $ax^2 + bx + c > 0$, if you have double roots, the values of x that satisfy the given inequation

(a) $-\infty \leq x \leq \infty$
(b) $R - \{\alpha, \beta\}$ where α is twice of β
(c) $-\infty < x < \infty$
(d) all the real values except one value

16. For a quadratic inequation $ax^2 + bx + c \geq 0$, if you have double roots, the values of x that satisfy the given inequation

(a) $-\infty \leq x \leq \infty$
(b) $R - R^-$
(c) $-\infty < x < \infty$
(d) all the real numbers except one value

17. Find the valid interval of x for the inequality $-6 \leq x^2 - 5x \leq 6$.

(a) $[-1, 2] \cup [3, 6]$ (b) $(-\infty, 2] \cup [3, \infty)$
(c) $[-1, 6]$ (d) none of these

18. Find the values of x that satisfy the inequation $x^4 - 13x^2 + 36 \leq 0$.

(a) $[-3, -2] \cup [2, 3]$ (b) $[-3, 3]$
(c) $[-2, 2]$ (d) $(-\infty, -3] \cup [3, \infty)$

19. Find the values of x that satisfy the inequation $x^6 - 19x^3 - 216 > 0$.

(a) $[-3, -2] \cup [2, 3]$ (b) $(-\infty, -2] \cup [3, \infty)$
(c) $(-\infty, -2) \cup (3, \infty)$ (d) $(-\infty, -8] \cup [27, \infty)$

20. Find the values of m that satisfy the inequation $m + 3\sqrt{m} - 4 > 0$.

(a) $m \leq -4$ and $m \geq 1$
(b) $m > 1$
(c) $(-\infty, -4) \cup (1, \infty)$
(d) $(-\infty, -16] \cup [1, \infty)$

Answers

1. (d)	**2.** (c)	**3.** (b)	**4.** (c)	**5.** (a)
6. (d)	**7.** (b)	**8.** (c)	**9.** (b)	**10.** (c)
11. (b)	**12.** (d)	**13.** (b)	**14.** (d)	**15.** (d)
16. (c)	**17.** (a)	**18.** (a)	**19.** (c)	**20.** (b)

Hints

5. $(-\infty, \infty)$. Since a, the coefficient of x^2, is positive and the roots are non-real. So, for all the values of x, the inequation is positive.

6. $(-4, 3)$ **7.** $-2 < x < 2$

8. Does not exist; since x^2 is always positive and so $x^2 + 1$ is also positive.

9. $-3 \le x \le 3$

12. Since the whole graph will lie below the X-axis and we need just the opposite.

13. Double roots means both the roots are same and since you need to obey the 'strict inequality'. So, you have to EXCLUDE the zeros (roots) of this quadratic.

16. Maximum value of this expression can't be determined as it is keep on increasing when $x < 7$ or $x > 7$. However, minimum value is determinable which is attained at $x = 7$ making $(7 - x)^2 = 0$, the minimum possible value of a perfect square. Thus, the minimum value of the whole expression is -8.

17. When $(7 - x)^2$ is minimum, i.e. zero, then $49 - (7 - x)^2$ will be maximum.

14.11 Position of Roots of a Quadratic Equation with Respect to One or Two Real Numbers

Before moving towards the core of the topic the first thing you need to be sure of is quadratic function. As in, how does a change in x, the change in function $f(x)$ occurs. The quadratic function $f(x)$ is defined as $f(x) = ax^2 + bx + c$, where $a \neq 0$. For example consider an arbitrary quadratic function $f(x) = x^2 - 8x + 12$. Now put some arbitrary numerical values, preferably integers to enjoy the convenience in the given function and then notice the values of $f(x)$.

$x = 0, x^2 - 8x + 12 = 12 \Rightarrow f(0) = 12$ $\quad$ $x = 1, x^2 - 8x + 12 = 5 \Rightarrow f(1) = 5$

$x = 2, x^2 - 8x + 12 = 0 \Rightarrow f(2) = 0$ $\quad$ $x = 3, x^2 - 8x + 12 = -3 \Rightarrow f(3) = -3$

$x = 4, x^2 - 8x + 12 = -4 \Rightarrow f(4) = -4$ $\quad$ $x = 5, x^2 - 8x + 12 = -3 \Rightarrow f(5) = -3$

$x = 6, x^2 - 8x + 12 = 0 \Rightarrow f(6) = 0$ $\quad$ $x = 7, x^2 - 8x + 12 = 5 \Rightarrow f(7) = 5$

$x = 8, x^2 - 8x + 12 = 12 \Rightarrow f(8) = 12$

It can be easily seen that $f(2) = f(6) = 0$. These are zeros of the function. And, $f(0) > 0, f(1) > 0, f(7) > 0, f(8) > 0$. These are the positive values of the function. And, $f(3) < 0, f(4) < 0, f(5) < 0$. These are the negative values of the function.

Now, the actual point that I'm going to discuss is how to determine the position of a root (or both the roots) with respect to one (or two) given point(s) on the X-axis. Let $f(x) = ax^2 + bx + c$, where $a, b, c \in R, a \neq 0$. Let α, β be the two roots of this equation such that $\alpha < \beta$. Let $k, k_1, k_2 \in R$ such that $k_1 < k_2$.

1. Position of real roots with respect to one real number k:

	For, $a > 0, (\alpha < \beta)$	For, $a < 0, (\alpha < \beta)$
If $k < \alpha < \beta$			(i) $D \ge 0$ (ii) $af(k) > 0$ (iii) $k < -\frac{b}{2a}$	(i) $D \ge 0$ (ii) $af(k) > 0$ (iii) $k < -\frac{b}{2a}$
If $\alpha < \beta < k$			(i) $D \ge 0$ (ii) $af(k) > 0$ (iii) $K > -\frac{b}{2a}$	(i) $D \ge 0$ (ii) $af(k) > 0$ (iii) $k > -\frac{b}{2a}$
If $\alpha < k < \beta$			(i) $D > 0$ (ii) $af(k) < 0$	(i) $D > 0$ (ii) $af(k) < 0$

2. Position of real roots with respect to two real numbers k_1, k_2:

	For, $a > 0, (\alpha < \beta)$	For, $a < 0, (\alpha < \beta)$
If $k_1 < \alpha < k_2 < \beta$ Or $\alpha < k_1 < \beta < k_2$			(i) $D > 0$ (ii) $f(k_1) \cdot f(k_2) < 0$	(i) $D > 0$ (ii) $f(k_1) \cdot f(k_2) < 0$
If $k_1 < \alpha < \beta < k_2$			(i) $D \geq 0$ (ii) $af(k_1) > 0, af(k_2) > 0$ (iii) $k_1 < -\frac{b}{2a} < k_2$	(i) $D \geq a$ (ii) $af(k_1) > 0, af(k_2) > 0$ (iii) $k_1 < -\frac{b}{2a} < k_2$
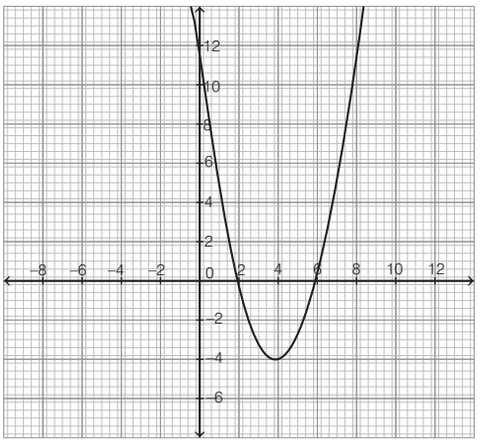
If $\alpha < k_1 < k_2 < \beta$			(i) $D > 0$ (ii) $af(k_1) < 0, af(k_2) < 0$	(i) $D > 0$ (ii) $af(k_1) < 0, af(k_2) < 0$

Now, if we consider the above example and sketch a quadratic graph, we can better understand the significance of the above discussion.



In this function $f(x) = x^2 - 8x + 12$, $a = 1, D > 0$. Suppose you have to determine whether a particular point (say 8) is in between the roots or outside the roots, then by doing some simple calculation you will be able to figure out the relative position. Since a > 0,

(i) $D > 0$ (ii) $af(k) = 1 \cdot f(8) = 1 \cdot 12 = 12 \Rightarrow af(k) > 0$ (iii) $k = 8$ and $-\frac{b}{2a} = -\frac{-8}{2} = 4 \Rightarrow k > -\frac{b}{2a}$

It implies that 8 is greater than both the roots (*i.e.,* 2 and 6), which is same as shown in the above graph.

Practice Exercise

1. What are the essential conditions to get assured that a randomly chosen particular point k, lies between the roots of the quadratic equation $ax^2 + bx + c = 0$?

(i) $D > 0$ (ii) $D \geq 0$

(iii) $af(k) < 0$ (iv) $af(k) > 0$

(v) $K > -\frac{b}{2a}$ (vi) $k < -\frac{b}{2a}$

(a) (i), (iii) and (v) only (b) (i) and (iv) only

(c) (i) and (iii) only (d) (ii), (iv) and (vi) only

2. What can be the correct possible set of factors that determines the location of roots of $ax^2 + bx + c = 0$ of a quadratic equation which has a double root with respect to a randomly chosen point k on the X-axis?

(a) $D \geq 0$, $af(k) < 0$, $k < -\frac{b}{2a}$

(b) $D \geq 0$, $af(k) < 0$, $k > -\frac{b}{2a}$

(c) $D > 0$, $af(k) < 0$

(d) $D \geq 0$, $af(k) > 0$, $k < -\frac{b}{2a}$

3. Which of the following may not be a possible set of determinants of relative position of roots of a quadratic equation $ax^2 + bx + c = 0$ with respect to a randomly chosen point k on the X-axis ?

(a) $D \geq 0$, $af(k) > 0$, $k < -\frac{b}{2a}$

(b) $D \geq 0$, $af(k) < 0$, $k > -\frac{b}{2a}$

(c) $D > 0$, $af(k) < 0$

(d) $D \geq 0$, $af(k) > 0$, $k < -\frac{b}{2a}$

4. Which of the following facts are the most essential to know if both the roots of $ax^2 + bx + c = 0$ are either greater or less than the randomly chosen number k ?

(i) D (ii) $a \cdot f(k)$

(iii) Equation of axis of symmetry of the graph

(iv) Equation of the vertex of the graph

(v) Average of the real roots

(a) (i), (ii) and (iv)

(b) (i), (ii) and (iii) or (v)

(c) (i), (ii), (iii) and (iv)

(d) Only (i) and (ii)

5. If the randomly chosen point k lies between the roots of the equation $ax^2 + bx + c = 0$, then which of the following is correct ?

(a) $af(k) > 0$ (b) $af(k) \geq 0$

(c) $af(k) < 0$ (d) all of these

6. If both the roots of the equation $ax^2 + bx + c = 0$ lie inside the randomly chosen real points k_1, k_2 then which of the following facts are the most appropriate and valid ones?

(i) $af(k_1) > 0$, $af(k_2) > 0$ (ii) $f(k_1) \cdot f(k_2) < 0$

(iii) $af(k_1) < 0$, $af(k_2) < 0$ (iv) $D \geq 0$

(v) $D > 0$ (vi) $k_1 < -\frac{b}{2a} < k_2$

(vii) $f(k_1) \cdot f(k_2) > 0$

(a) (i), (v) and (vi) (b) (i), (iv) and (vi)

(c) (iii), (iv) and (vii) (d) (ii) and (v) only

7. The following facts assure that the roots of the equation $ax^2 + bx + c = 0$ lie inside the randomly chosen real points k_1, k_2, then which of the following facts are the most appropriate and valid ones ?

(a) $af(k_1) > 0$, $af(k_2) > 0$ (b) $f(k_1) \cdot f(k_2) > 0$

(c) $af(k_1) < 0$, $af(k_2) < 0$ (d) all of these

8. Which of the following facts are correct if only one of the roots of the equation $ax^2 + bx + c = 0$ lies inside the randomly chosen real points k_1, k_2?

(i) $D \geq 0$ (ii) $D > 0$

(iii) $f(k_1) \cdot f(k_2) < 0$ (iv) $f(k_1) \cdot f(k_2) > 0$

(v) $k_1 < -\frac{b}{2a} < k_2$

(a) (i), (iii) and (iv) only (b) (i), (iv) and (v) only

(c) (ii) and (iv) only (d) (ii) and (iii) only

9. The value of axis of symmetry of the quadratic graph of $ax^2 + bx + c = 0$ is required to know the position of roots with respect to one or two real points when

(a) the randomly chosen point is either side of the roots

(b) if both the roots lie inside the randomly chosen points

(c) both (a) or (b)

(d) There are more possibilities other than those mentioned in (a) and (b)

10. While determining the position of the roots with respect to one or two randomly chosen real point(s), the discriminant D is strictly greater than zero for the quadratic equation $ax^2 + bx + c = 0$ when

(a) the randomly chosen point lies between both the roots

(b) the randomly chosen both the points lie between the roots

(c) only one root lies between the two randomly chosen points

(d) all of the above

11. Find all the parameters p for which both the roots of the equation $x^2 - 6px + (3 - 4p + 9p^2) = 0$ exceed the number 4.

(a) $p > \frac{3}{4}$ (b) $p > \frac{4}{3}$ (c) $p < 1$ (d) $p > \frac{19}{9}$

12. Find all the values of p for which both roots of the equation $x^2 + x + p = 0$ exceed the quantity p.

(a) $p < -\frac{1}{2}$ (b) $p < \frac{1}{4}$ (c) $p > 0$ (d) $p < -2$

13. Determine all the values of p for which both roots of the equation $(p^2 + p - 2)x^2 - (p + 5)x - 2 = 0$ exceed the greatest negative integer.

(a) $(-\infty, -2) \cup (-1, -\frac{1}{2}) \cup (1, \infty)$

(b) $(-\infty, -2) \cup (1, \infty)$

(c) $(-\infty, -1) \cup (-\frac{1}{2}, \infty)$

(d) $(-\infty, -1) \cup (1, \infty)$

14. Find the value of p for which one root of the equation $x^2 - (p + 1)x + p^2 + p - 8 = 0$ is more than 2 and another root is less than 2.

(a) $[2, 3]$ (b) $\left(-\frac{11}{3}, 3\right)$

(c) $\left(-\frac{11}{3}, -2\right)$ (d) $-2 < p < 3$

15. Find all the values of p for which roots of the quadratic equation $(p^2 + p + 1)x^2 + (p - 1)x + p^2 = 0$ are located on either side of 4.

(a) $p > -1$ (b) $-17 < p < 1$

(c) $-\frac{17}{12} < p < 20$ (d) none of these

16. Find the set of values of u for which exactly one root of the equation $x^2 - ux + (u^2 + 6u) = 0$ lies in $(-2, 0)$.

(a) $(-6 - 2) \cup (-2, 0)$ (b) $(-8, 0)$

(c) $(-6, -2) \cup \{2\}$ (d) none of these

17. If α, β are the zeros of the quadratic function $f(x) = x^2 + 2(p - 3)x + 9$ such that $\alpha \neq \beta$ and $-6 < \{a, \beta\} < 1$, then find the value of p.

(a) $\left(-4, \frac{27}{4}\right)$ (b) $\left(-2, \frac{27}{4}\right)$

(c) $\left(6, \frac{27}{4}\right)$ (d) $(6, \infty)$

18. Find all the values of m for the equation $(m - 4) - 2mx + (m - 5)x^2 = 0$, so that one root is less than 1 and another one is greater than 2.

(a) $\left(\frac{20}{9}, 24\right)$ (b) $(6, 24)$

(c) $(5, 24)$ (d) $\left(\frac{20}{9}, \infty\right)$

19. Find the values of w for which the equation $x^2 + 2(w - 1)x + w + 5 = 0$ has at least one positive root.

(a) $(-\infty, -5) \cup (-5, -1]$ (b) $w \leq -1$

(c) $W < 1$ (d) $(-\infty, -5) \cup (4, \infty)$

20. Find the number of integral values of p if the roots of the equation $2x^2 + p^2 - (5x + 6p) + 8 = 0$ are of opposite sign.

(a) 1 (b) 2 (c) 3 (d) 6

21. For what values of p exactly one root of the equation $2^p x^2 - 4^p x + 2^p - 1 = 0$ lies between 1 and 2 ?

(a) $\left[2 - \left(\frac{5 - \sqrt{17}}{4}\right)\right] < p < \left[2 - \left(\frac{5 + \sqrt{17}}{4}\right)\right]$

(b) $\log_2\left(\frac{5 - \sqrt{17}}{4}\right) < p < \log_2\left(\frac{5 + \sqrt{17}}{4}\right)$

(c) $\log_5\left(\frac{5 - \sqrt{17}}{4}\right) < p < \log_5\left(\frac{5 + \sqrt{17}}{4}\right)$

(d) $\frac{-5 + \sqrt{17}}{4} < p < \frac{5 + \sqrt{17}}{4}$

Hints

11. Since both the roots exceed the arbitrary point k (or greater than k) then you must have to satisfy the following three conditions.

(i) $D \geq 0$ (ii) $af(k) > 0$ (iii) $k < -\frac{b}{2a}$

So here it goes $(-6p)^2 - 4 \times 1 \times (3 - 4p + 9p^2) \geq 0$

$\Rightarrow \quad 36p^2 - 12 + 16p - 36p^2 \geq 0 \Rightarrow 16p \geq 12$

$\Rightarrow \quad p \geq \frac{3}{4}$ . ...(i)

And $a \cdot f(k) > 0 \Rightarrow 1 \cdot f(4) > 0$

$\Rightarrow \quad 1 \times (16 - 24p + 3 - 4p + 9p^2) > 0$

$\Rightarrow \quad 9p^2 - 28p + 19 > 0 \Rightarrow (p - 1)(9p - 19) > 0$

$\Rightarrow \quad p \in (-\infty, 1) \cup \left(\frac{19}{9}, \infty\right)$ ...(ii)

And $k < -\frac{b}{2a} \Rightarrow 4 < -\frac{-6p}{2} \Rightarrow 4 < 3p \Rightarrow p > \frac{4}{3}$ ...(iii)

The intersection of (i), (ii) and (iii) is $p > \frac{19}{9}$.

Hence choice (d) is the answer.

12. Since both the roots exceed the arbitrary point k (or greater than k) then you must have to satisfy the following three conditions.

$D \geq 0 \Rightarrow 1^2 - 4 \times 1 \times p \geq 0 \Rightarrow p \leq \frac{1}{4}$ ...(i)

$af(k) > 0$

$\Rightarrow \quad 1 \times f(p) > 0 \quad \Rightarrow p^2 + 2p > 0 \Rightarrow p(p + 2) > 0$

$\Rightarrow \quad p \in (-\infty, -2) \in (0, \infty)$ ...(ii)

$k < -\frac{b}{2a} \Rightarrow p < -\frac{1}{2}$ ...(iii)

The intersection of (i), (ii) and (iii) is $p < -2$.

Hence choice (d) is the answer.

13. Since both the roots exceed the arbitrary point k (or greater than k) then you must have to satisfy the following three conditions $[-(p + 5)]^2 - 4 \times (p^2 + p - 2) \times (-2) \geq 0$

$\Rightarrow \quad (p + 1)^2 \geq 0 \Rightarrow p \in (-\infty, -1) \cup (-1, \infty)$

And $af(k) > 0 \Rightarrow (p^2 + p - 2) \cdot f(-1) > 0$

$\Rightarrow \quad (p^2 + p - 2) \cdot (p^2 + 2p + 1) > 0$

$\Rightarrow \quad (p + 2)(p - 1)(p + 1)(p + 1) > 0$

$\Rightarrow \quad (p + 2)(p - 1)(p + 1)^2 > 0$

$\Rightarrow \quad p \in (-\infty, -2) \cup (1, \infty)$ ...(ii)

And $k < -\frac{b}{2a} \Rightarrow -1 < -\frac{-(p + 5)}{2(p^2 + p - 2)}$

$\Rightarrow \quad -2(p^2 + p - 2) < (p + 5)$

$\Rightarrow \quad 2p^2 + 3p + 1 > 0$

$\Rightarrow \quad (p + 1)(2p + 1) > 0$

$\Rightarrow \quad p \in (-\infty, -1) \cup (-\frac{1}{2}, \infty)$

The intersection of (i), (ii) and (iii) is $p \in (-\infty, -2) \cup (1, \infty)$.

Hence choice (b) is the answer.

14. Since one root is less than 2 and another is greater than 2. It implies that 2 lies between the roots, then it must satisfy the following two conditions.

$D > 0$

$\Rightarrow \quad [-(p + 1)]^2 - 4 \times 1 \times (p^2 + p - 8) > 0$

$\Rightarrow \quad -3p^2 - 2p + 33 > 0$ ...(i)

$\left\{\frac{-11}{3} < p < 3\right\}$

And $af(k) < 0 \Rightarrow 1 \cdot f(2) < 0$

$\Rightarrow \quad p^2 - p - 6 < 0 \Rightarrow -2 < p < 3$

The intersection of (i) and (ii) is $-2 < p < 3$

Hence choice (d) is the answer.

15. Since 4 lies between the roots, then it must satisfy the following two conditions.

(i) $af(k) < 0$ (ii) $D > 0$

Now, $af(k) < 0$

Where $a = p^2 + p + 1$

The discriminant of $p^2 + p + 1$ is negative and the coefficient of p^2 is positive, it means $p^2 + p + 1 > 0 \Rightarrow a > 0$.

Similarly, $f(4) = 17p^2 + 20p + 12$

The discriminant of $17p^2 + 20p + 12$ is negative and the coefficient of p^2 is positive, it means $17p^2 + 20p + 12 > 0$

$\Rightarrow f(4) > 0$.

Since $a > 0$ and $f(4) > 0$. It implies that $af(4) > 0$.

As $af(k) \not< 0$, so 4 does not lie between the two roots.

Hence choice (d) is the answer.

16. Since exactly one root lies between two randomly chosen points, then it must satisfy the following conditions.

(i) $D > 0$ (ii) $f(k_1) \cdot f(k_2) < 0$

Then we have,

$D > 0 \Rightarrow (-u)^2 - 4 \times 1 \times (u^2 + 6u) > 0$

$\Rightarrow \quad -3u^2 - 24u > 0$

$\Rightarrow \quad -3(u^2 + 8u) > 0$

$\Rightarrow \quad u^2 + 8u < 0 \Rightarrow u(u + 8) < 0$

$\Rightarrow \quad u \in (-8, 0)$ ...(i)

And $f(k_1) \cdot f(k_2) < 0 \Rightarrow f(-2) \cdot f(0) < 0$

$\Rightarrow \quad (u^2 + 4u + 4)(u^2 + 6u) < 0$

$\Rightarrow \quad (u + 2)^2 (u^2 + 6u) < 0$

$\Rightarrow \quad u \in (-6 - 2) \cup (-2, 0)$ ...(ii)

The intersection of (i) and (ii) is $(-6 - 2) \cup (-2, 0)$

Hence choice (a) is the answer.

17. Since both the roots lie between k_1 and k_2 therefore the following conditions must be satisfied.

(i) $D > 0$, since it is given that $\alpha \neq \beta$.

(ii) $af(k_1) > 0$, $af(k_2) > 0$

(iii) $k_1 < -\frac{b}{2a} < k_2$

Then we have $D > 0 \Rightarrow [2(p - 3)]^2 - 4 \times 1 \times 9 > 0$

$\Rightarrow \quad p(p-6)>0$ ...(i)

$\Rightarrow \quad p\in(-\infty,0)\cup(6,\infty)$

And $af(k_1)>0 \Rightarrow 1.\ f(-6)>0$

$\Rightarrow \quad 36+2(p-3)\times(-6)+9>0$

$\Rightarrow \quad p<\frac{27}{4}$ ...(ii)

Also $af(k_2)>0$

$\Rightarrow \quad 1\cdot f(1)>0$

$\Rightarrow \quad 1+2(p-3)+9>0$

$\Rightarrow \quad p>-2$ ...(iii)

And $-\frac{b}{2a}=-\frac{2(p-3)}{2}=-(p-3)$

So, $k_1<-\frac{b}{2a}<k_2$

$\Rightarrow \quad -6<-(p-3)<1 \Rightarrow \quad 2<p<9$ ...(iv)

The intersection of (i), (ii), (iii) and (iv) is $\left(6,\frac{27}{4}\right)$.

Hence choice (c) is the answer.

18. Since one root is less than k_1 and another root is greater than k_2, then the following conditions must be satisfied.

(i) $D>0$ (ii) $af(k_1)<0,\ af(k_2)<0$

Then we have

$D>0\Rightarrow(-2m)^2-4(m-5)(m-4)>0$

$\Rightarrow \quad m>\frac{20}{9}$ ...(i)

And $af(k_1)<0\Rightarrow(m-5)\,f(1)<0$

$\Rightarrow \quad (m-5)(-9)<0\Rightarrow\ m>5$ ...(ii)

Also $af(k_2)>0$

$\Rightarrow \quad (m-5)f(2)<0$

$\Rightarrow \quad (m-5)(m-24)<0$

$\Rightarrow \quad 5<m<24$ ...(iii)

The common values of m from (i), (ii) and (iii) is (5, 24).

Hence choice (c) is the answer.

19. Since roots are real, so discriminant cannot be negative. That is $D\geq 0$.

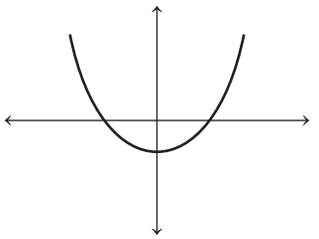
$\therefore\ [2(w-1)]^2-4\times1(w+5)\geq0$

$\Rightarrow \quad w\in(-\infty,-1]\cup[4,\infty)$ ...(i)

Case 1 When exactly one root is positive. That means exactly one root is greater than 0. Then

$af(0)<1\Rightarrow1\cdot f(0)$

$\Rightarrow w+5<0\Rightarrow w<-5$



Case 2 When both the roots are positive. That means both the roots are greater than 0. Then following three conditions must be satisfied.

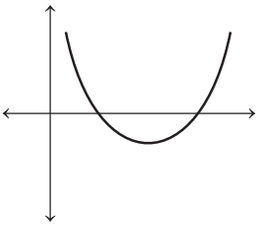
(i) $af(0)>0$ (ii) $-\frac{b}{2a}>0$

Then we have,

$1\cdot f(0)>0\Rightarrow w+5>0\Rightarrow w>-5$ ...(iii)

And $\left(-\frac{b}{2a}=\frac{-2(w-1)}{2}=1-w\right)-\frac{b}{2a}>0\Rightarrow\ 1-w>0$

$\Rightarrow \quad w<1$ ...(iv)



Combining (iii) and (iv) we get $w\in(-5,1)$ ...(v)

Now the intersection of (i), (ii) and (v) is $w\in(-\infty,-1]$

Hence choice (b) is the answer.

20. The given equation $2x^2+p^2-(5x+6p)+8=0$ can be expressed as $2x^2-5x+p^2-6p+8=0$

Since, one root is greater than 0 and another one is less than 0, therefore the given equation must satisfy the following condition.

(i) $D>0\Rightarrow(-5)^2-4\times2\times(p^2-6p+8)>0$

$\Rightarrow -8p^2+48p-39>0 \ \Rightarrow 3-\frac{\sqrt{66}}{4}<p<3+\frac{\sqrt{66}}{4}$

(ii) $af(k)<0\Rightarrow 2f(0)<0\Rightarrow 2(p^2-6p+8)<0\Rightarrow 2<p<4$

Now the intersection (or common) values of (i) and (ii) will hold true. Thus the required value of p is (2, 4). That is 3 is the only one integral value that satisfy the required condition. Hence choice (a) is correct.

21. Let's assume $f(x)=2^p x^2-4^p x+2^p-1$.

Since exactly one root lies between 1 and 2, so $f(1)(2)<0$.

Therefore, $(2^p-4^p+2^p-1)=(2^p2^2-4^p\cdot2+2^p-1)<0$

$\Rightarrow(-4^p+2\cdot2^p-1)(2^p\cdot4-2^{2p}\,2+2^p-1)<0$

$\Rightarrow \quad -(4^p-2\cdot2^p+1)(2^p\cdot5-2^{2p}2-1)<0$

$\Rightarrow \quad (4^p-2\cdot2^p+1)(2\cdot2^{2p}-5\cdot2^p+1)<0$

$\Rightarrow \quad (2^p-1)^2(2\cdot2^{2p}-5\cdot2^p+1)<0$

$\Rightarrow(2\cdot2^{2p}-5\cdot2^p+1)<0$; since $(2^p-1)^2$ in non negative.

$\Rightarrow[2(2^p)^2-5\cdot(2^p)+1]<0$

$\Rightarrow \quad \left[2^p-\left(\frac{5+\sqrt{17}}{4}\right)\right]\left[2^p-\left(\frac{5-\sqrt{17}}{4}\right)\right]<0$

$\left(\frac{5-\sqrt{17}}{4}<2^p<\frac{5+\sqrt{17}}{4}\right)$

$\Rightarrow \quad \log_2\left(\frac{5-\sqrt{17}}{4}\right)<p<\log_2\left(\frac{5+\sqrt{17}}{4}\right)$

Hence choice (b) is the answer.

14.12 Relation Between The Roots of Two Quadratic Equations

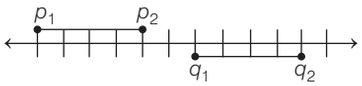
Let us assume that there are two quadratic equations $ap^2+bp+c=0$ and $uq^2+vq+w=0$. Now, there can be any of the five possibilities between p and q

(a) $p<q$ (b) $p>q$ (c) $p\le q$ (d) $p\ge q$ (e) $p=q$

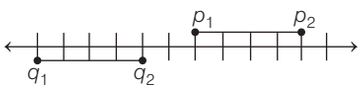
If none of the above conditions are met, we cannot find a conclusive relation between p and q. In order to determine the relation between p and q, we can follow the following method. First of all find the real roots of the equation $ap^2+bp+c=0$ as $\{p_1, p_2\}$ such that $p_1 \le p_2$ and the real roots of the equation $uq^2+vq+w=0$ as $\{q_1, q_2\}$ such that $q_1 \le q_2$. Now, place the roots on the number line and connect the smallest root with the largest root of each equation. It gives us two sections - one is p_1p_2 and another one is q_1q_2.

Now, compare the two sections created between the smallest and the largest roots of each quadratic equation, as shown below.

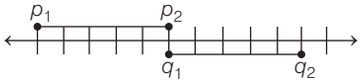
Case 1 In this case, $p<q$, as all the roots of first equation are smaller than all the roots of second equation. That is no any point is common between these two sections. So clearly each value of p is less than each value of q.



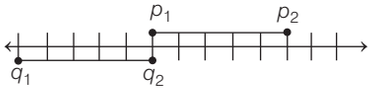
Case 2 In this case, $p>q$, as all the roots of first equation are greater than all the roots of second equation. That is no any point is common between these two sections. So clearly each value of p is greater than each value of q



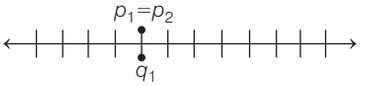
Case 3 In this case, $p\le q$, as the largest root of the first equation is equal to the smallest root of the second equation and except this no other part of the two sections is common.



Case 4 In this case, $p\ge q$, as the smallest root of the first equation is equal to the largest root of the second equation and except this no other part of the two sections is common.



Case 5 In this case, $p=q$, as all the four roots of both the equations are same. It is a unique case when each equation has double root and not only this the value of these double roots is same.

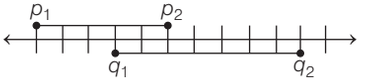


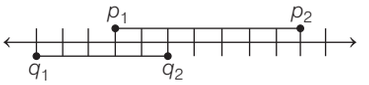
Thus, we have learnt that when no value is common between two sections, we can say either $p<q$ or $p>q$. And, when nothing is common on the number line except one value, we can say $p=q$. If more than one value is common the answer becomes indeterminable. This is where the challenge of comparing the two sections arises.

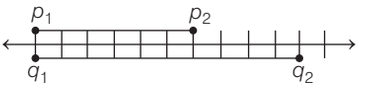
There are following possibilities of such situations where we cannot conclude the exact relation between the two sections.

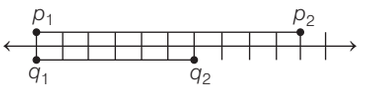
In each such situation, either one or both the roots of a quadratic equation lie(s) between the two roots of the other quadratic equation. Essentially, whenever there is more than one point common between two quadratic equations, we cannot determine whether $p<q$ or $p>q$ or $p\le q$ or $p\ge q$.

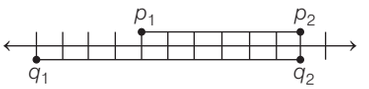
When relation is uncertain, we can express it by the symbol $\lessgtr$ to denote the relationship between p and q. If we don't want to use that symbol we can write it as $\{\ p=q$ or $p\lessgtr q\}$.

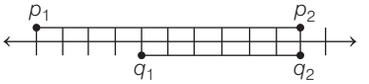


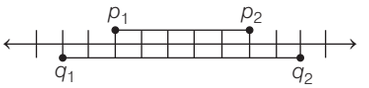


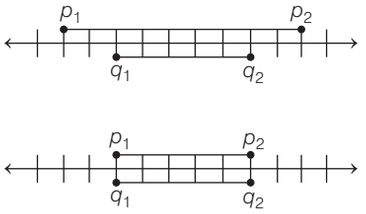












So you see, whenever there is overlapping, the relation between p and q cannot be determined. In other words, this kind of relation can be expressed by $p \lesseqgtr q$. Also, when the roots of any or both of the equations are non-real, we cannot find the exact relation between p and q.

Tricks to Identify the Signs of the Roots Let us consider a quadratic equation $ax^2 + bx + c = 0$, whose roots are α and β such that $(x-\alpha)(x-\beta) = 0$. The signs of the two roots will depend upon the signs of b and c, where b denotes the coefficient of x and c denotes the constant term of the quadratic equation.

b	c	Signs of Roots	α	β
+	+	Both are always negative	–	–
+	–	One is positive and another one is negative	–	+
–	+	Both are always positive.	+	+
–	–	One is positive and another one is negative	+	–

Tricks to Determine the Relation Between the Roots of Two Quadratic Equations

It is very useful when the given equations are such that their roots are difficult to obtain. Let us consider two quadratic equations:

(i) $ap^2 + bp + c = 0$ (ii) $rq^2 + sq + t = 0$

I. If any or both the roots of a quadratic equation lie between the two roots of another quadratic equation, the relation between the roots of the two quadratic equations cannot be established.

II. If the signs of both the constant terms c and t are negative, the relation between the roots of the two quadratic equations cannot be established.

III. If the roots of any or both the quadratic equation(s) are non-real, the relation between the roots of the two quadratic equations cannot be established.

IV. When the constant terms of both the equations are positive and the sign of coefficients of p and q are opposite, we can definitely determine the relation between p and q. If the sign of the coefficient of p is positive and sign of the coefficient of q is negative, then we have $p < q$.

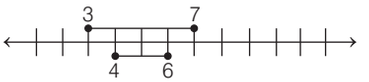
Exp. 1) There are two quadratic equations. Solve these equations and find the relation between p and q.

I. $p^2 - 10p + 21 = 0$ II. $q^2 - 10q + 24 = 0$

(a) $p < q$
(b) $p > q$
(c) $p \le q$
(d) Cannot be determined

Solution Let us find roots of the equations.

$$p^2 - 10p + 21 = 0$$
$$\Rightarrow \quad (p-3)(p-7) = 0 \Rightarrow p = \{3, 7\}$$
$$q^2 - 10q + 24 = 0 \Rightarrow (q-4)(q-6) = 0$$
$$\Rightarrow \quad q = \{4, 6\}$$



As we see that the two roots of the second equation lie between the two roots of the first equation. Therefore, we cannot determine the relation between p and q.

Hence choice (d) is correct.

Alternatively Create a table as shown below and compare the values.

	$q_1 = 4$	$q_2 = 6$
$p_1 = 3$	$p_1 < q_1$	$p_1 < q_2$
$p_2 = 7$	$p_2 > q_1$	$p_2 > q_2$

Since there is no clarity whether $p < q$ or $p > q$, we cannot determine the exact relation between p and q.

This method of using table can be applied in every problem to test the relationship between the values of two quadratic equations.

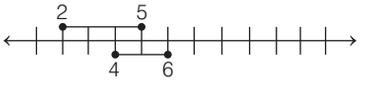
Exp. 2) There are two quadratic equations. Solve these equations and find the relation between p and q.

I. $p^2 - 7p + 10 = 0$ II. $q^2 - 10q + 24 = 0$

(a) $p < q$
(b) $p > q$
(c) $p \le q$
(d) Cannot be determined

Solution Let us find the roots of the equations.

$$p^2 - 7p + 10 = 0$$
$$\Rightarrow \quad (p-2)(p-5) = 0 \Rightarrow p = \{2, 5\}$$
$$q^2 - 10q + 24 = 0$$
$$\Rightarrow \quad (q-4)(q-6) = 0$$
$$\Rightarrow \quad q = \{4, 6\}$$



As we see that the one root of the one equation lies between the two roots of the other equation. Therefore, we cannot determine the relation between p and q.

Hence choice (d) is correct.

Exp. 3) There are two quadratic equations. Solve these equations and find the relation between p and q

I. $p^2 - 12p + 32 = 0$ II. $q^2 - 10q + 24 = 0$

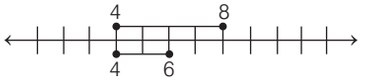
(a) $p < q$ (b) $p > q$

(c) $p \le q$ (d) Cannot be determined

Solution Let us find the roots of the equations $p^2 - 12p + 32 = 0$

$\Rightarrow$ $(p-4)(p-8) = 0 \Rightarrow p = \{4, 8\}$

$q^2 - 10q + 24 = 0 \Rightarrow (q-4)(q-6) = 0 \Rightarrow q = \{4, 6\}$



As we see that the one root of the second equation lies between the two roots of the first equation. Therefore, we cannot determine the relation between p and q. Hence choice (d) is correct.

Exp. 4) There are two quadratic equations. Solve these equations and find the relation between p and q.

I. $p^2 + 2p - 15 = 0$ II. $q^2 - 4q - 12 = 0$

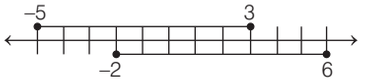
(a) $p < q$ (b) $p > q$

(c) $p \le q$ (d) Cannot be determined

Solution Let us find the roots of the equations $p^2 + 2p - 15 = 0$

$\Rightarrow$ $(p+5)(p-3) = 0 \Rightarrow p = \{-5, 3\}$

$q^2 - 4q - 12 = 0 \Rightarrow (q+2)(q-6) = 0 \Rightarrow q = \{-2, 6\}$



As we see that the one root of the one equation lies between the two roots of the other equation. Therefore, we cannot determine the relation between p and q.

Hence choice (d) is correct.

Alternatively Since the signs of the constant terms of both the equations are negative, therefore we can definitely say that each equation has one positive and one negative root. It implies that at least one root of the one equation will definitely lie between the two roots of the other equation, as these roots lie on the both the sides of the Y-axis. That's why their sections will overlap.

Exp. 5) There are two quadratic equations. Solve these equations and find the relation between p and q.

I. $-p^2 + 14p - 45 = 0$ II. $2q^2 - 28q + 90 = 0$

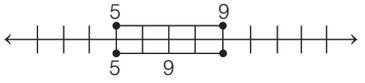
(a) $p < q$ (b) $p > q$

(c) $p \le q$ (d) Cannot be determined

Solution Let us find the roots of the equations.

$-p^2 + 14p - 45 = 0 \Rightarrow (p-5)(p-9) = 0 \Rightarrow p = \{5, 9\}$

$2q^2 - 28q + 90 = 0 \Rightarrow (q-5)(q-9) = 0 \Rightarrow q = \{5, 9\}$



As we see that there is more than one point common between the two sections, it means the relation between p and q is indeterminable. Therefore, we cannot determine the relation between p and q. Hence choice (d) is correct.

Alternatively Create a table as shown below and compare the values.

	$q_1 = 5$	$q_2 = 9$
$p_1 = 5$	$p_1 = q_1$	$p_1 < q_2$
$p_2 = 9$	$p_2 > q_1$	$p_2 = q_2$

Since there is no clarity whether $p < q$ or $p = q$ or $p > q$, we cannot determine the exact relation between p and q.

Exp. 6) There are two quadratic equations. Solve these equations and find the relation between p and q.

I. $3p^2 + 5p + 5 = 0$ II. $q^2 - 4q - 12 = 0$

(a) $p < q$ (b) $p > q$

(c) $p \le q$ (d) Cannot be determined

Solution Let us find the roots of the equations.

Since the discriminant of the $3p^2 + 5p + 5 = 0$ is -35, which is negative. So it does not give us real roots. Therefore, we cannot determine the relation between p and q.

Hence choice (d) is correct.

Exp. 7) There are two quadratic equations. Solve these equations and find the relation between p and q.

I. $p^2 - 8p + 15 = 0$ II. $q^2 + 8q + 12 = 0$

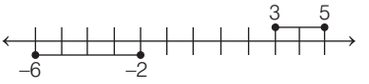
(a) $p < q$ (b) $p > q$

(c) $p \le q$ (d) Cannot be determined

Solution Let us find the roots of the equations $p^2 - 8p + 15 = 0$

$\Rightarrow$ $(p-3)(p-5) = 0 \Rightarrow p = \{3, 5\}$

$q^2 + 8q + 12 = 0 \Rightarrow (q+6)(q+2) = 0 \Rightarrow q = \{-6, -2\}$



As we see that both the roots of the first equation are greater than both the roots of the second equation. Therefore, we can conclude that $p > q$. Hence choice (b) is correct.

Alternatively Since the constant terms of both the equations are positive and the sign of coefficients of p and q are opposite, we can definitely determine the relation between p and q. Further, since the sign of the coefficient of p is negative and sign of the coefficient of q is positive, then we have $p > q$.

Exp. 8) There are two quadratic equations. Solve these equations and find the relation between p and q.

I. $p^2 - 5p + 4 = 0$ II. $q^2 + 5q - 6 = 0$

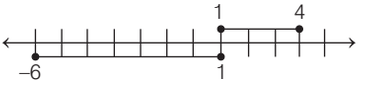
(a) $p \le q$ (b) $p > q$

(c) $p \ge q$ (d) Cannot be determined

Solution Let us find the roots of the equations $p^2 - 5p + 4 = 0$

$\Rightarrow$ $(p-1)(p-4) = 0 \Rightarrow p = \{1, 4\}$

$q^2 + 5q - 6 = 0 \Rightarrow (q+6)(q-1) = 0 \Rightarrow q = \{-6, 1\}$



As we see that all the values of p are greater than all the values of q, except one value. Therefore, we can conclude that $p \ge q$.

Hence, choice (c) is correct.

Practice Exercise

Directions (for Q. Nos. 1 to 15) *In each of these questions, two equations (I) and (II) are given. You have to solve both the equations and give answer regarding the relationship between p and q.*

1. I. $p^2 - 361 = 0$ II. $q^2 - 40q + 399 = 0$
(a) $p < q$ (b) $p > q$ (c) $p \le q$ (d) $p \ge q$
(e) $p = q$

2. I. $-p^2 + 529 = 0$ II. $2q^2 - 1058 = 0$
(a) $p < q$ (b) $p > q$ (c) $p \le q$ (d) $p \ge q$
(e) cannot be determined

3. I. $5p^2 - 120p + 720 = 0$ II. $3q - 16 = \frac{q^2}{8}$
(a) $p < q$ (b) $p > q$ (c) $p \le q$ (d) $p \ge q$
(e) $p = q$

4. I. $p^2 - 17161 = 0$ II. $q^2 + 17161 = 0$
(a) $p < q$ (b) $p > q$ (c) $p \le q$ (d) $p \ge q$
(e) cannot be determined

5. I. $225p^2 - 1740p + 2835 = 0$
II. $225q^2 + 690q - 2835 = 0$
(a) $p < q$ (b) $p > q$ (c) $p \le q$ (d) $p \ge q$
(e) $p \lesseqgtr q$

6. I. $p^4 - 1296 = 0$ II. $q^2 = \sqrt{1296}$
(a) $p < q$ (b) $p > q$ (c) $p \le q$ (d) $p \ge q$
(e) $p = q$ or $p \lesseqgtr q$

7. I. $p^3 - 9p^2 + 18p = 0$ II. $q^3 - q^2 = 0$
(a) $p < q$ (b) $p > q$ (c) $p \le q$ (d) $p \ge q$
(e) $p = q$ or $p \lesseqgtr q$

8. I. $14p^2 + 27p + 9 = 0$ II. $56q^2 - 3q - 9 = 0$
(a) $p < q$ (b) $p > q$ (c) $p \le q$ (d) $p \ge q$
(e) $p = q$

9. I. $p^2 - 42p - 343 = 0$ II. $\frac{16}{\sqrt{q}} + \frac{9}{\sqrt{q}} = 5\sqrt{q}$
(a) $p < q$ (b) $p > q$ (c) $p \le q$ (d) $p \ge q$
(e) $p \lesseqgtr q$

10. I. $7p^2 + 4\sqrt{7}p - 5 = 0$
II. $\sqrt{77}q^2 - (10\sqrt{7} + \sqrt{11})q + 10 = 0$
(a) $p < q$ (b) $p > q$ (c) $p \le q$ (d) $p \ge q$
(e) can't be determined

11. I. $p^5 - 74p^3 + 1225p = 0$ II. $q^2 + 14q + 48.99 = 0$
(a) $p < q$ (b) $p > q$
(c) $p \le q$ (d) $p \ge q$
(e) can't be determined

12. I. $25p^2 - 55\sqrt{11}p + 198 = 0$
II. $25p^2 + 55\sqrt{11}p + 198 = 0$
(a) $p < q$ (b) $p > q$ (c) $p \le q$ (d) $p \ge q$
(e) can't be determined

13. I. $25p^2 - 35\sqrt{11}p - 198 = 0$
II. $25p^2 + 35\sqrt{11}p - 198 = 0$
(a) $p < q$ (b) $p > q$
(c) $p \le q$ (d) $p \ge q$
(e) can't be determined

14. I. $p^2 - 8\sqrt{3} + 45 = 0$ II. $q^2 - 12\sqrt{3} + 105 = 0$
(a) $p < q$ (b) $p > q$
(c) $p \le q$ (d) $p \ge q$
(e) can't be determined

15. I. $p^2 + 2|p| + 35 = 0$ II. $q^2 + 2q + 35 = 0$
(a) $p < q$ (b) $p > q$
(c) $p \le q$ (d) $p \ge q$
(e) can't be determined

13. $p = \left\{-\frac{2\sqrt{11}}{5}, +\frac{9\sqrt{11}}{5}\right\}$ and $q = \left\{\frac{2\sqrt{11}}{5}, -\frac{9\sqrt{11}}{5}\right\}$

14. $p = \{3\sqrt{3}, 5\sqrt{3}\}$ and $q = \{5\sqrt{3}, 7\sqrt{3}\}$

15. $p = \{-5, 5\}$ and $q = \{-7, 5\}$

14.13 Polynomial Equations or Functions of Higher Degree

From the discussion of the previous topics and chapters we got to know that what a polynomial is and what the degree of a term or polynomial is. However, I will start the topic with some basic points.

Function	Standard Form	Degree	Terms
Zero Function	$f(x)=0$	Undefined	Undefined
Constant Function	$f(x)=a\,;(a\neq 0)$	0	1
Linear Function	$f(x)=ax+b;(a\neq 0)$	1	2
Quadratic Function	$f(x)=ax^2+bx+c;$ $(a\neq 0)$	2	3
Cubic Function	$f(x)=ax^3+bx^2$ $+cx+d\,;(a\neq 0)$	3	4
Bi-quadratic Function	$f(x)=ax^4+bx^3$ $+cx^2+dx+e;(a\neq 0)$	4	5
…	…	…	…
…	…	…	…

Thus the polynomial function of degree n is expressed in the standard form as shown below $f(x)=a_nx^n+a_{n-1}x^{n-1}+\ldots$

$$+a_3x^3+a_2x^2+a_1x+a_0\ (a_n\neq 0)$$

A polynomial function of degree n can be expressed as a product of linear factors (or product of quadratic factors may be along with linear factors) as following.

$$f(x)=(x-\alpha_1)(x-\alpha_2)(x-\alpha_3)$$

$\ldots(x-\alpha_{n-2})(x-\alpha_{n-1})(x-\alpha_n)$; where $\alpha_i\,(i=1,2\ldots n)$ is the root of the polynomial.

- The constants $a_n, a_{n-1},\ldots, a_3, a_2, a_1, a_0$ are the coefficients of the polynomial.
- The term a_nx^n is the leading term and a_0 is the constant term.
- The highest power of variable x is called the 'degree' and n is a non-negative integer.
- A polynomial function of degree n has at most $(n-1)$ local extrema (or lumps).
- A polynomial function of degree n has at most n zeros (or roots or solutions).

Properties of a Polynomial Graph

- The function is continuous. Thus the graph has no discrete jumps or breaks, or no sharp corners.
- It has at most n roots. Thus the graph cuts the X-axis in at most n points. In general, the graph cuts any X-axis in at most n points.
- The function has at most $n-1$ critical points. It follows that it has at most $n-1$ local extreme points, called extrema.
- The domain is the whole real line. In particular, the graph has no vertical asymptotes.
- The asymptotes are defined and explained in the upcoming topics.
- Since you have already learnt about the low degree polynomials such as linear and quadratic functions, so in the upcoming discussion I will primarily zero in on the polynomials of higher degree, such as degree 3, 4, 5, etc.

Deriving the Common Polynomials From the Standard Polynomial of Degree n

By substituting $n=1$ in the Standard Polynomial Expression you can obtain the linear function as shown below.

$$f(x)=a_1x+a_0\ (a_1\neq 0)$$

Similarly by substituting $n=2$ in the Standard Polynomial Expression you can obtain the quadratic function as shown below.

$$f(x)=a_2x^2+a_1x+a_0\ (a_2\neq 0)$$

Again, by substituting $n=3$ in the Standard Polynomial Expression you can obtain the cubic function as shown below.

$$f(x)=a_3x^3+a_2x^2+a_1x+a_0\ (a_3\neq 0)$$

Once again, by substituting $n=4$ in the Standard Polynomial Expression you can obtain the biquadratic function as shown below.

$$f(x)=a_4x^4+a_3x^3+a_2x^2+a_1x+a_0\ \ (a_4\neq 0)$$

In this way, using the standard polynomial function you can express the polynomial of any degree.

14.14 **End** (or Long Term) **Behaviour of a Polynomial Function**

If you look at any of the following polynomial graphs you will notice two vital things :

(1) The typical graph of a polynomial function looks like a **wave** because of the roots of the polynomials. These roots are responsible for this wave-like graph. However, this wave shape ceases to exist as soon as the graph moves beyond the region of roots. Here region of the roots imply the stretch (or section) of the X-axis that falls between the smallest and the largest root. The numerically smallest root is always the left-most root and the largest root is always the right-most root along the X-axis.

(2) As soon as the graph moves beyond the region of the roots (that means towards the extreme values of X-axis) the graph keeps on moving away from the X-axis and never returns back towards it. Thus it ends the phenomenon of wave-like graph after a certain point. And this is your area of interest at this time.

So you got it right that you are going to study that what happens or how does a graph behave when you keep on moving endlessly on the either side of the X-axis. The importance of this end behaviour of the graph is critical to sketch the complete graph (or to connect all the roots). If you know the end behaviour of a polynomial graph, it becomes pretty easy to sketch the complete graph; especially it becomes obvious to differentiate between peaks and valleys. The positive extrema are called the peaks and the negative extrema are called the valleys.

In this section you will get to know the tricks to find out the direction in which the two ends of the graph move - either both ends go up or both ends go down, or one end goes up and the other end goes down. Remember that we are here not interested in knowing that what happens between the two end roots (the smallest and the biggest root) of the polynomial.

The following illustrative graphs suggest that the long term behaviour of a polynomial function basically depends on the leading term $a_n x^n$ of the polynomial.

$$a_n x^n + a_{n-1} x^{n-1} + ... + a_2 x^2 + a_1 x + a_0.$$

n	$a_n > 0$	$a_n < 0$
Odd	 $f(x) = 2x^3 - x^2 - 16x + 5$ $\Rightarrow f(x) = 2(x+3)(x-1)\left(x - \frac{5}{2}\right)$	 $f(x) = -2x^3 + x^2 + 16x - 15$ $\Rightarrow f(x) = -2(x+3)(x-1)\left(x - \frac{5}{2}\right)$

n	$a_n > 0$	$a_n < 0$
Odd	 $f(x) = 8x^5 + 28x^4 - 64x^3 - 188x^2 + 56x + 160$ $\Rightarrow f(x) = 8(x+4)(x+2)(x+1)(x-1)\left(x-\frac{5}{2}\right)$	 $f(x) = -8x^5 - 28x^4 + 64x^3 + 188x^2 - 56x - 160$ $\Rightarrow \quad f(x) = -8(x+4)(x+2)(x+1)(x-1)\left(x-\frac{5}{2}\right)$

n	$a_n > 0$	$a_n < 0$
Odd	 $f(x) = 3x^7 + 12x^6 - 42x^5 - 168x^4 + 147x^3 + 588x^2 - 108x^2 - 422$ $\Rightarrow \quad f(x) = 3(x+4)(x+3)(x+2)(x+1)(x-1)(x-2)(x-3)$	 $f(x) = -3x^7 - 12x^6 + 42x^5 + 168x^4 - 147x^3 - 588x^2 + 108x + 422$ $\Rightarrow f(x) = -3(x+4)(x+3)(x+2)(x+1)(x-1)(x-2)(x-3)$

Even	 $f(x)=2x^4+3x^3-18x^2-17x+30$ $\Rightarrow f(x)=2(x+3)(x+2)(x-1)\left(x-\frac{5}{2}\right)$	 $\Rightarrow f(x)=-2x^4-3x^3+18x^2+17x-30$ $\Rightarrow f(x)=-2(x+3)(x+2(x-1)(x-5/2)$
Even	 $f(x)=12x^6-243x^4+54x^3+1071x^2-54x-840$ $\Rightarrow f(x)=12(x+4)(x+2)(x+1)(x-1)\left(x-\frac{5}{2}\right)\left(x-\frac{7}{2}\right)$	 $f(x)=-12x^6+243x^4-54x^3-1071x^2+54x+840$ $\Rightarrow f(x)=-12(x+4)(x+2)(x+1)(x-1)\left(x-\frac{5}{2}\right)\left(x-\frac{7}{2}\right)$

n	$a_n > 0$	$a_n < 0$
even			$f(x) = 2x^8 + x^7 - 56x^6 - 14x^5 + 490x^4 + 49x^3 - 1444x^2 - 36x + 1008$ $\Rightarrow f(x) = 2(x+4)(x+3)(x+2)(x+1)(x-1)(x-2)(x-3)(x-3)\left(x-\frac{7}{2}\right)$	$f(x) = -2x^8 + x^7 - 56x^6 - 14x^5 + 490x^4 + 49x^3 - 1444x^2 - 36x + 1008$ $\Rightarrow f(x) = 2(x+4)(x+3)(x+2)(x+1)(x-1)(x-2)(x-3)\left(x-\frac{7}{2}\right)$

The graphical description of the end behaviour of the graph can be summarised as below, where $a_n x^n$ is the leading term of the polynomial $y = a_n x^n + a_{n-1} x^{n-1} + \ldots\ldots + a_2 x^2 + a_1 x + a_0$.

x^n	$a_n > 0$	$a_n < 0$
n is ODD	As $x \to +\infty$, y increases As $x \to -\infty$, y decreases	As $x \to +\infty$, y decreases As $x \to -\infty$, y increases
n is EVEN	As $x \to +\infty$, y increases As $x \to -\infty$, y increases	As $x \to +\infty$, y decreases As $x \to -\infty$, y decreases

Sketchy Illustration

The circles in the following diagram hide all the real roots of the polynomial in order to give a clear picture of how the two ends of the graph move, when the values of x are extremely high on either side of the X-axis.

n	$a_n > 0$	$a_n < 0$
For extremely high values of x, when n **is ODD,** the two ends of the graph move in the **OPPOSITE direction**			Thus beyond the range of the roots when you increase x, then y will also increase and when you decrease x, then y will also decrease.	Thus beyond the range of the roots when you increase x, then y will decrease and when you decrease x, then y will increase.

n	$a_n > 0$	$a_n < 0$
For extremely high values of x, when n **is EVEN,** the two ends of the graph move in the **SAME direction.**	 Thus beyond the range of the roots when you either increase x, or decrease x, the value of y is always increase.	 Thus beyond the range of the roots when you either increase x, or decreases x, the value of y will always decrease.

Exp. 1) Determine the end behaviour of

$$f(x) = 10x + 2x^3 - 7x^2 + 24$$

Solution The end behaviour of any polynomial graph depends on the leading term which is supposed to be the term with the highest power, so for the purpose of convenience you may rearrange the terms in decreasing order as $f(x) = 2x^3 - 7x^2 + 10x + 24$.

Now since the power of leading term $2x^3$ is 3, *i.e.* odd, therefore the two ends of the graph will go in opposite directions. Further the coefficient of x^3 is 2 (*i.e.,* positive) therefore when x increases, y also increases and likewise when x decreases, y also decreases, provided x is considerably far from the roots.

Exp. 2) For the extremely high values of x, what will be the tendency of the graph of $-3x^4 - 2x - 11$?

Solution The end behaviour of any polynomial graph depends on the leading term, which is supposed to be the term with the highest power. Now since the power of leading term $-3x^4$ is 4 (*i.e.,* even) therefore the two ends of the graph will move in the same direction. Further the coefficient of x^4 is –3 (*i.e.,* negative) therefore either when x increases or it decreases, y always decreases, provided x is considerably far from the roots.

Exp. 3) When x approaches $-\infty$, then what will be the tendency of the graph of $5x^8 + 3x^7 - 18x^4 - 7x - 30$?

Solution The end behaviour of any polynomial graph depends on the leading term, which is supposed to be the term with the highest power. So for the purpose of convenience you may rearrange the terms in decreasing order as

$$f(x) = 5x^8 + 3x^7 - 18x^4 - 7x - 30$$

Now since the power of leading term $5x^8$ is 8 (*i.e.,* even) therefore the two ends of the graph will go in the same direction. Further the coefficient of x^8 is 5 (*i.e.,* positive) therefore when x decreases, y also decreases, provided x tends to $-\infty$.

Exp. 4) Which one of the following is true about the polynomial function $y = -7x^5 + 3x^3 - 18x^2 - 7x + 23$?

(a) $y \to +\infty$, when $x \to -\infty$ (b) $y \to -\infty$, when $x \to -\infty$

(c) $y \to +\infty$, when $x \to +\infty$ (d) none of the above

Solution The end behaviour of any polynomial graph depends on the leading term, which is supposed to be the term with the highest power.

Now since the power of leading term $-7x^5$ is 5, *i.e.* odd, therefore the two ends of the graph will go in opposite directions. Further the coefficient of x^5 is –7 (*i.e.,* negative) therefore when x increases, y decreases and likewise when x decreases, y increases, provided x is considerably far from the roots. Hence, choice (a) is true.

14.15 Solutions (or Roots) of a Polynomial Equation

The values of the variable satisfying the given polynomial equation are called its roots or solutions or zeros. That is α is a root of the polynomial equation $f(x) = 0$ if $f(\alpha) = 0$.

There are various methods to find out the roots of the polynomial equations, however in your competitive exams you are not expected to know these sophisticated methods at all.

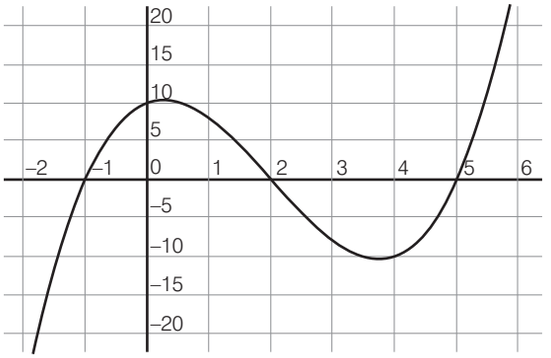
What all you are expected to do is use your reasoning, logic and common sense to figure out the correct answer regarding polynomial expressions.

Examiners are not interested in knowing the higher mathematics much into depth; rather they try to test your logical prowess in this kind of problems. That's why I'm not going to unnecessarily discuss the methods of finding the roots.

Exp. 1) In the following diagram you can see the graph of a cubic polynomial $f(x) = x^3 - 6x^2 + 3x + 10$. Since the degree of this polynomial is 3, therefore it has three roots namely –1, 2, 5.

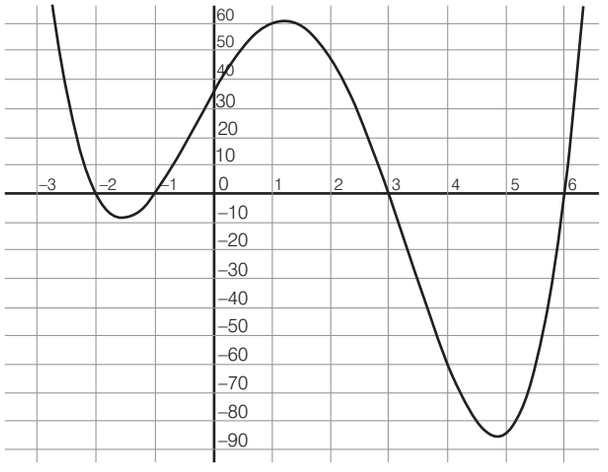
This shows that if you substitute $x = -1$ or 2 or 5 in the given function $f(x) = x^3 - 6x^2 + 3x + 10$, then you will get $f(x) = 0$.

And there are two local extrema too, one above the X-axis and one below the X-axis.



Exp. 2) In the following diagram you can see the graph of a biquadratic polynomial $f(x) = x^4 - 6x^3 - 7x^2 + 36x + 36$. Since the degree of this polynomial is 4, therefore it has four roots namely $-2, -1, 3, 6$.

This show that if you substitute $x = -2$ or -1 or 3 or 6 in the given function $f(x) = x^4 - 6x^3 - 7x^2 + 36x + 36$, then you will get $f(x) = 0$. And there are three local extrema too, one above the X-axis and two below the X-axis. That means there are one local maximum and two local minima.



Basic Properties of Roots

1. An equation of degree n has exactly n roots; may be all real or all imaginary or the combination of both.
2. Imaginary roots (also known as complex roots) occur in conjugate pairs. That is if $a + ib$ is a root of the polynomial, then $a - ib$ is also a root of that polynomial.
3. Irrational roots always occur in pairs. That means if $a + \sqrt{b}$ is a root of a polynomial equation then $a - \sqrt{b}$ is also a root of that polynomial.
4. Total number of roots n = Real roots (R) + Complex roots $(2K)$; where $K = 0, 1, 2, 3, \ldots \Rightarrow$ Number of real roots $= n - 2K$, since complex roots occur in pairs.
5. For an odd degree equation (*i.e.,* if n is odd) there must be at least one real root. Since n is odd and $2K$ is even.
6. For an even degree equation (*i.e.,* if n is even) whose constant term is negative and $a_n > 0$ (*i.e.,* the coefficient of highest degree term is positive) there must be at least two real roots, one positive and one negative.
7. A real root must intersect or touch the X-axis.
8. The number of intersections or touching points will always be less than or equal to the number of real roots. If it is less than the real roots, it means there is a multiplicity of the roots.

Exp. 1) If two of the roots of the polynomial equation $ax^4 + bx^3 + cx^2 + dx + e = 0,\ a \neq 0,$ are $7 + 5\sqrt{2}$ and $5 - 7\sqrt{2}$, then what will be the sum of all the roots of this polynomial?

Solution Since this a polynomial of degree four, so it will have maximum four roots. Further since there are two distinct irrational roots, it implies that there must be the conjugates of these two roots. The conjugate of these two roots will be $7 - 5\sqrt{2}$ and $5 + 7\sqrt{2}$ respectively. Therefore the sum of all the roots is 24.

Exp. 2) A polynomial equation of degree 5 has complex roots and irrational roots. How many real roots does this equation have?

Solution Since complex roots and irrational roots occur in conjugate pairs, so if there is minimum one pair of each, then there will be two complex roots and two irrational roots. Since there is only one root unknown, so it must be real and rational root. However since irrational roots are also the real roots. So there are total 3 real roots and two non-real roots.

Exp. 3) What cannot be the exact number of real roots in a polynomial of degree 9?

(a) 5 (b) 6 (c) 7 (d) 9

Solution Since the total number of roots are odd and the non-real roots (*i.e.,* complex roots) occur in pairs (*i.e.,* 0, 2, 4, 6...) therefore the number of real roots will be either 9 or 7 or 5 or 3 or 1, depending on the number of pairs of complex roots.

Refer the following table.

Total Number of Roots	Number of Complex Roots	Number of Real Roots
9	0	9
9	2	7
9	4	5
9	6	3
9	8	1

Thus, we can say that there cannot be exctly 6 real roots.

Multiplicity of a Root of a Polynomial Function

A normal polynomial equation in which all the roots are real and distinct can be expressed in the form of linear factors as

$$(x - \alpha_1)(x - \alpha_2)(x - \alpha_3) \ldots (x - \alpha_n).$$

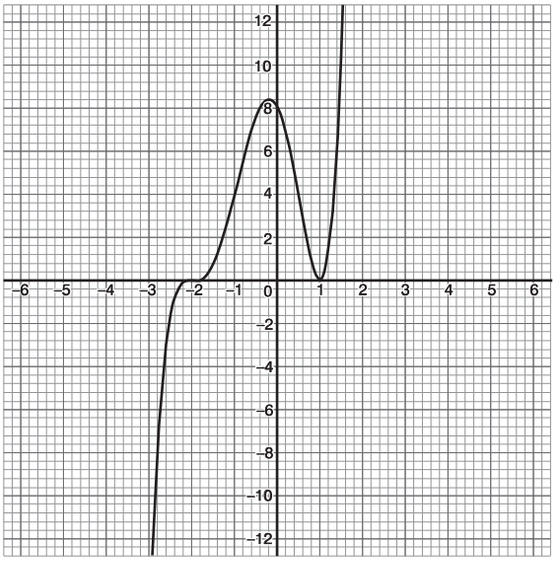
However when certain roots are same, *i.e.,* roots are repeated then we call it the multiplicity of the root. For example

$$(x-\alpha)(x-\alpha)(x-\alpha)(x-\alpha)(x-\beta)(x-\beta)(x-\beta)(x-\gamma_1).....(x-\gamma_k)$$
$$=(x-\alpha)^4\ (x-\beta)^3\ (x-\gamma_1).....(x-\gamma_k)$$

In the above example α occurs 4 times, so α is a root of multiplicity 4 and β occurs 3 times so β is a root of multiplicity 3.

Definition If f is a polynomial function and $(x-\alpha)^m$ is a factor of f but $(x-\alpha)^{m+1}$ is not, then α is a root of multiplicity m of f.

Exp.) The following graph shows the x-intercepts of $(x+2)^3\ (x-1)^2$. Even though there are five real roots, but due to multiplicity of roots you see that there are only two points on the *X*-axis where the graph intersects or touches the *X*-axis.



Odd Multiplicity If a polynomial function f has a real root α of odd multiplicity, then the graph of f crosses the *X*-axis at $(\alpha, 0)$ and the value of f changes sign at $x=\alpha$.

In the polynomial function $f(x)=(x+2)^3\ (x-1)^2$, $x=-2$ is a root of multiplicity 3, which is a root of odd multiplicity. Therefore at $x=-2$ the function (or graph) crosses the *X*-axis and changes the sign.

Even Multiplicity If a polynomial function f has a real root α of even multiplicity, then the graph of f does not cross the *X*-axis at $(\alpha, 0)$ and the value of f does not change the sign at $x=\alpha$. In the polynomial function $f(x)=(x+2)^3\ (x-1)^2$, $x=1$ is a root of multiplicity 2, which is a root of even multiplicity. Therefore at $x=1$ the function (or graph) does not cross the *X*-axis; however the graph kisses the *X*-axis and bounces back at $x=1$.

Sign Rules of a Polynomial Equation

For a polynomial of any degree written in the decreasing order – highest degree term first and lowest degree term in the last – you can determine the maximum possible positive and negative real roots by the following rules.

1. The maximum number of POSITIVE real roots of a polynomial equation $f(x)=0$ is the same (or less than by an even number) as the number of changes of signs – from positive to negative and/or negative to positive – in the coefficients of $f(x)$. If the maximum nuber of changes in the signs is p, the maximum number of positive real roots of this polynomial equation would be $p-2k\geq 0$, such that $k=0,1,2,3,.....$
2. The maximum number of NEGATIVE real roots of a polynomial equation $f(x)=0$ is the same (or less than by an even number) as the nuber of changes of signs-from positive to negative and/or negative to positive-in the coefficients of $f(-x)$. If the maximum number of changes in the signs is n, the maximum number of positive real roots of this polynomial equation would be $n-2k\geq 0$, such that $k=0,1,2,3,....$

Exp. 1) Find the possible number of positive and negative real roots of $x^4+7x^3-4x^2-x-7=0$.

Solution For positive real roots, you have to determine the number of times the change happens in the sign of coefficients of the given polynomial when written in the decreasing order of degree of its terms. So write down the signs of coefficients as shown below and mark the change in sign.

$$+\quad +\quad -\quad -\quad -$$
Change

Since there is only one change in sign, therefore there will be maximum one positive real root. Now if you try to replace the real roots with complex roots then you have to replace them in pairs. It means one positive real root cannot be replaced by 2 complex roots. So finally there will have to be exactly one real root. For negative real roots, you have to determine the number of times the change occurs in sign of coefficients of the polynomial, where x is replaced by $-x$ and the terms are written in the decreasing order of degree.

So first you have to replace every x with $-x$ as shown blow.

$$(-x)^4+7(-x)^3-4(-x)^2-(-x)-7=0$$
$$\Rightarrow \qquad x^4-7x^3-4x^2+x-7=0$$

Now write down the signs of coefficients as shown below and mark the change in sign.

$$+\quad -\qquad -\quad +\quad -$$
Change Change Change

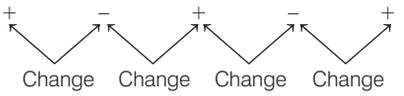
Since there are three changes in the sign, therefore there will be maximum three negative real roots. So finally there will be either 3 or 1 negative real root.

Total Number of Roots	Number of Complex Roots	Number of Positive Roots	Number of Negative Roots
4	0	1	3
4	2	1	1

NOTE Please take cognizance of the fact that if you consider 4 complex roots then you have to have 1 negative root, which is impossible.

Exp. 2) Find the possible number of positive and negative real roots of $2x^4 - x^3 + 4x^2 - 5x + 3 = 0$.

Solution For positive real roots, you have to determine the number of times the change happens in the sign of coefficients of the given polynomial when written in the decreasing order of degree of its terms. So write down the signs of coefficients as shown below and mark the change in sign.



Since there are only 4 changes in sign, therefore there will be maximum four positive roots. Thus there could be 4, or 2 or 0 positive real roots.

For negative real roots, you have to determine the number of times the change occurs in sign of coefficients of the polynomial, where x is replaced by $-x$ and the terms are written in the decreasing order of degree.

So first you have to replace every x with $-x$ as shown below.

$$2(-x)^4 - (-x)^3 + 4(-x)^2 - 5(-x) + 3 = 0$$

$$\Rightarrow \quad 2x^4 + x^3 + 4x^2 + 5x + 3 + 0$$

Now write down the signs of coefficients as shown below and mark the change in sign.

$$+ \quad + \quad + \quad + \quad +$$

Since there is no change in sign, so there won't be any negative real root.

Total Number of Roots	Number of Complex Roots	Number of Positive Roots	Number of Negative Roots
4	0	4	0
4	2	2	0
4	4	0	0

Exp. 3) Find the possible number of positive and negative real roots of $x^5 + x^4 + 4x^3 + 32x^2 + x + 1 = 0$.

Solution For positive real roots, you have to determine the number of times the change happens in the sign of coefficients of the given polynomial when written in the decreasing order of degree of its terms. So write down the signs of coefficients as shown below and mark the change in sign.

$$+ \quad + \quad + \quad + \quad + \quad +$$

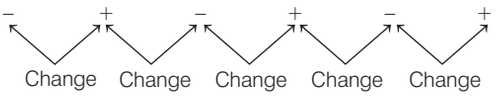
Since there is no change in sign, so there won't be any positive real root. For negative real roots, you have to determine the number of times the change occurs in sign of coefficients of the polynomial, where x is replaced by $-x$ and the terms are written in the decreasing order of degree.

So first you have to replace every x with $-x$ as shown bleow.

$$(-x)^5 + (-x)^4 + 4(-x)^3 + 3(-x)^2 + (-x) + 1 = 0$$

$$\Rightarrow \quad -x^5 + x^4 - 4x^3 + 3x^2 - x + 1 = 0.$$

Now write down the signs of coefficients as shown below and mark the change in sign.



Since there are five changes in the sign, therefore there will be maximum five negative real roots. So finally there will be either 5 or 3 or 1 negative real root.

Total Number of Roots	Number of Complex Roots	Number of Positive Real Roots	Number of Negative Real Roots
5	0	0	5
5	2	0	3
5	4	0	1

Exp. 4) Find the possible number of positive and negative real roots of $x^5 - x^4 + 3x^3 + 9x^2 - x + 5 = 0$.

Solution For positive real roots, you have to determine the number of times the change happens in the sign of coefficients of the given polynomial when written in the decreasing order of degree of its terms. So write down the signs of coefficients as shown below and mark the change in sign.

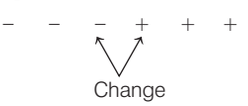
Since there are four changes in sign, so there will be at most four positive real roots. Thus finally there will be either 4 or 2 or 0 positive real root. For negative real roots, you have to determine the number of times the change occurs in sign of coefficients of the polynomial, where x is replaced by $-x$ and the terms are written in the decreasing order of degree.

So first you have to replace every x with $-x$ as shown below.

$$(-x)^5 - (-x)^4 + 3(-x)^3 + 9(-x)^2 - (-x) + 5 = 0$$

$$\Rightarrow -x^5 - x^4 - 3x^3 + 9x^2 + x + 5 = 0.$$

Now write down the signs of coefficients as shown below and mark the change in sign.



Since there is only one change in the sign, therefore there will be maximum one negative real root.

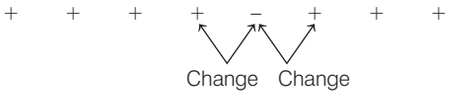
So finally there will be exactly 1 negative real root.

Total Number of Roots	Number of Complex Roots	Number of Positive Real Roots	Number of Negative Real Roots
5	0	4	1
5	2	2	1
5	4	0	1

Exp. 5) Find the possible number of positive and negative real roots of

$$4x^7 + 3x^6 + x^5 + 2x^4 - x^3 + 9x^2 + x + 1 = 0$$

Solution For positive real roots, you have to determine the number of times the change happens in the sign of coefficients of the given polynomial when written in the decreasing order of degree of its terms. So write down the signs of coefficients as shown below and mark the change in sign.



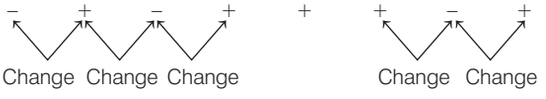
Since there are two changes in sign, so there will be at most two positive real roots. Thus finally there will be either 2 or 0 positive real root. For negative real roots, you have to determine the number of times the change occurs in sign of coefficients of the polynomial, where x is replaced by $-x$ and the terms are written in the decreasing order of degree.

So first you have to replace every x with $-x$ as shown blow.

$4(-x)^7 + 3(-x)^6 + (-x)^5 + 2(-x)^4 - (-x)^3 + 9(-x)^2 + (-x) + 1 + 0.$

$\Rightarrow -4x^7 + 3x^6 - x^5 + 2x^4 + x^3 + 9x^2 - x + 1 = 0$

Now write down the signs of coefficients as shown below and mark the change in sign.



Since there are five changes in the sign, therefore there will be maximum five negative real roots. So finally there will be either 5 or 3 or 1 negative real root.

Total Number of Roots	Number of Complex Roots	Number of Positive Real Roots	Number of Negative Real Roots
7	0	2	5
7	2	0	5
7	2	2	3
7	4	0	3
7	4	2	1
7	6	0	1

14.16 Polynomial Inequality

In a polynomial equation you have to find the values of x, which make $f(x)$ equal to zero. However, in a polynomial inequation you have to find the values of x which make $f(x)$ less than or greater than zero.

In a sense you have to find out the conditions when the graph (or function) will be positive, negative, non-negative, or non-positive. To get the valid values of x, first of all determine the real roots and mark them on the number line as per convention; means from left to right in increasing order.

Then you will get $n+1$ intervals, if there are n real roots. In the next step what you have to do is to pick any convenient number in each interval and substitute it for x in the given function and see whether this test gives a positive number or negative number.

Then you can decide which intervals are to be considered for your answer and it depends on your given inequation.

$f(x) > 0$	All positive values of x except the roots
$f(x) \geq 0$	All positive values of x including the roots
$f(x) < 0$	All negative values of x except the roots
$f(x) \leq 0$	All negative values of x including the roots

How to Express Intervals

When roots are to be included in the desired interval

$$[\alpha_1, \alpha_2] \text{ or } \alpha_1 \leq x \leq \alpha_2$$

When roots are not to be included in the desired interval:

$$(\alpha_1, \alpha_2) \text{ or } \alpha_1 < x < \alpha_2$$

When only root α_1 is to be included in the desired interval

$$[\alpha_1, \alpha_2) \text{ or } \alpha_1 \geq x > \alpha_2$$

When only root α_2 is to be included in the desired interval:

$$(\alpha_1, \alpha_2] \text{ or } \alpha_1 > x \geq \alpha_2$$

Infinity is not an exact point or position, so it's always expressed as $(-\infty, \infty)$ or $-\infty < x < \infty$.

How to Express Various Intervals and Individual Values Jointly

Let us assume that $\alpha_1 < \alpha_2 < \alpha_3 < \alpha_4 < \ldots < \alpha_n$.

$[\alpha_1, \alpha_2] \cup [\alpha_2, \alpha_3] = [\alpha_1, \alpha_3] = \alpha_1 \leq x \leq \alpha_3$

$(\alpha_1, \alpha_2) \cup (\alpha_2, \alpha_3) = (\alpha_1, \alpha_3) - \{\alpha_2\}$

$= \alpha_1 < x < \alpha_3$ except α_2

$(\alpha_1, \alpha_2) \cup \{\alpha_2\} \cup (\alpha_2, \alpha_3) = (\alpha_1, \alpha_3) = \alpha_1 < x < \alpha_3$

$(\alpha_1, \alpha_2] \cup [\alpha_2, \alpha_3) = (\alpha_1, \alpha_3) = \alpha_1 < x < \alpha_3$

$(\alpha_1, \alpha_2) \cup (\alpha_3, \alpha_4) = (\alpha_1, \alpha_4) - [\alpha_2, \alpha_3]$

$= \alpha_1 < x \leq \alpha_4$, except $\alpha_2 \leq x \leq \alpha_3$

$[\alpha_1, \alpha_2] \cup [\alpha_3, \alpha_4] = [\alpha_1, \alpha_4] - (\alpha_2, \alpha_3)$

$= \alpha_1 \leq x \leq \alpha_4$, except $\alpha_2 < x < \alpha_3$

$(-\infty, \alpha_1) \cup (\alpha_2, \infty) = (-\infty, \infty) - [\alpha_1, \alpha_2]$

$(-\infty, \alpha_1] \cup [\alpha_2, \infty) = (-\infty, \infty) - (\alpha_1, \alpha_2)$

$(-\infty, \alpha_1] \cup [\alpha_2, \infty) = [-\infty, \infty] - (\alpha_1, \alpha_2)$

$\{\alpha_1\} \cup \{\alpha_2\} \cup \{\alpha_3\} \cup \ldots \{\alpha_n\} = \{\alpha_1, \alpha_2, \alpha_3 \ldots \alpha_n\}$

Exp. 1) Find the values that satisfy the polynomial inequation $x(x+3)(x-5)>0$.

Solution The roots of this inequation are –3, 0 and 5. So, now you have to mark these roots on the number line. Since there are three real roots, so there will be four intervals on the number line as shown below.

The four intervals are $(-\infty,-3),(-3,0)$, $(0,5)$ and $(5,\infty)$. Now check the first interval. Consider any value, say–5 which lies in the first interval $(-\infty,-3)$, you will get $x(x+3)(x-4)=-5(-2)(-9)$ $=-90<0$. So the first intervval gives negative value.

Similarly you can consider $x=-1$ to test the second interval, since -1 lies in the second interval $(-3,0)$. This will give you $x(x+3)(x-4)=(-1)(2)(-5)=10>0$. So the second interval is positive. Again the third interval test yields negative values and the fourth interval test yields the positive values.

Therefore you see that the second interval and fourth interval satisfy the given inequality. Thus the required answer is $(-3,0)\cup(5,\infty)$ or $-3<x<0$ and $5<x<\infty$.

Exp. 2) Find the values that satisfy the polynomial inequation $(x+1)(x-3)^2>0$.

Solution The roots of this inequation are –1 and 3. So now you have to mark these roots on the number line. Since there are only two distinct real roots, so there will be exactly three intervals on the number line as shown below.

The three intervals are $(-\infty,-1)$, $(-1,3)$ and $(3,\infty)$. Now to check the first interval you may consider any value between that interval, say –2, then you will get $(x+1)(x-3)^2=(-1)(25)=-25<0$. So the first interval$(-\infty,-1)$ is negative.

Similarly you can consider any value from the second interval, say 0, then you will get $(x+1)(x-3)^2=(1)(9)=9>0$. It means the second interval $(-1,3)$ is positive.

Finally you have to test the third and last interval by considering any value from that interval, say 4, then you will get $(x+1)(x-3)^2=(5)(1)=5>0$. Thus the third interval is also positive.

Since you are looking for positive values of the function, therefore only second and third intervals satisfy the inequation. Thus the required answer is $(-1,3)\cup(3,\infty)$.

NOTE At $x=3$, the inequation is invalid. That's why you can't include 3 in this solution set.

Exp. 3) Find the values that satisfy the polynomial inequation $(x^2+7)(2x^2+1)>0$.

Solution The given inequation is $(x^2+7)(2x^2+1)>0$. Since $(x^2+7)>0$ for all real numbers. Similarly $(2x^2+1)>0$ for all real numbers. Therefore $(x^2+7)(2x^2+1)>0$ for all real numbers. Thus the desired values of x are $(-\infty,\infty)$.

Exp. 4) Find the values that satisfy the polynomial inequation $(x^2+7)(2x^2+1)<0$.

Solution Since $(x^2+7)>0$ for all real numbers, and, similarly $(2x^2+1)>0$ for all real numbers, therefore the product of two positive real numbers can never be negative. Therefore there is no solution for this inequation or you can say the solution set is empty. Graphically speaking the graph of this function never exists below the *X*-axis; even it does not touch or cross the *X*-axis at all.

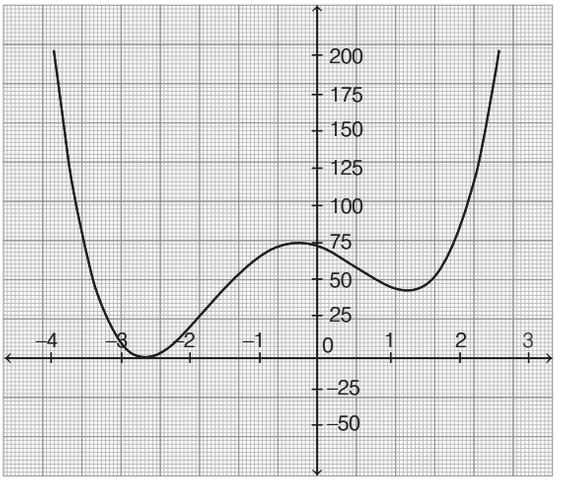
Exp. 5) Find the values that satisfy the polynomial inequation $(x^2-3x+3)(2x+5)^2\geq 0$.

Solution The given inequation is $(x^2-3x+3)(2x+5)^2\geq 0$. If you can assume for a while that it's an equation then there will be total 4 roots, out of them only one root $\left(x=\frac{-5}{2}\right)$ is a real root of multiplicity 2. The even multiplicity is an indicator of the fact that the graph at $x=\frac{-5}{2}$ will not intersect the *X*-axis, instead it will bounce back.

Further, if you simplify the expression then the leading term will be $4x^4$. The even power of x suggests that both the ends of the graph will move in the same direction, provided x is very-very large.

Further the coefficient of x^4 is 4, which is positive. That means when x approaches ∞, y also approaches ∞. Also, when x approach $-\infty$, y again approaches $+\infty$.

That means whole graph never goes below the *X*-axis. Therefore, for every x, such that $-\infty\leq x\leq\infty$ you will have $(x^2-3x+3)(2x+5)^2\geq 0$. Or other way round, the solution of $(x^2-3x+3)(2x+5)^2\geq 0$ is $-\infty\leq x\leq\infty$.



Alternatively You see that $(2x+5)^2=0$ for $x=\frac{-5}{2}$ and $(2x+5)^2\geq 0$ for all real numbers. And (x^2-3x+3) produces two complex roots. But the complex roots never change the sign, since they never intersect the *X*-axis.

Thus you can conclude that the graph of the product $(x^2 - 3x + 3)(2x + 5)^2$ never goes below the X-axis. Thus, $(x^2 - 3x + 3)(2x + 5)^2 \geq 0$, for all real numbers. That means $-\infty \leq x \leq \infty$.

Exp. 6) Find the value that satisfy the polynomial inequation $(x^2 - 3x + 3)(2x + 5)^2 > 0$.

Solution Since you know that $(x^2 - 3x + 3)(2x + 5)^2 \geq 0$ for every $x \in (-\infty, \infty)$ and $(x^2 - 3x + 3)(2x + 5)^2 = 0$ at $x = \frac{-5}{2}$.

Therefore $(x^2 - 3x + 3)(2x + 5)^2 > 0$

when $x \in (-\infty, \infty) - \left\{\frac{-5}{2}\right\}$

Exp. 7) Find the value that satisfy the polynomial inequation $2(x - 2)^3 (x + 3)^2 < 0$.

Solution The roots of this inequation are -3 and 2. So now you have to mark these roots on the number line. Since there are two roots, so there will be three intervals on the number line as shown below.

The three intervals are $(-\infty, -3)$, $(-3, 2)$, $(2, \infty)$. Now to check the first interval you may consider any value between that interval, say -4, then you will get $2(x - 2)^3(x + 3)^2 = 2(-216)(1) = -432 < 0$. So the first interval$(-\infty, -3)$ is negative.

Similarly you can consider any value from the second interval, say 0, then you will get $2(x - 2)^3 (x + 3)^2 = 2(-8)(9) = -144 < 0$. It means the second interval $(-3, 2)$ is also negative.

Finally you have to test the third and last interval by considering any value from that interval, say 4, then you will get $2(x - 2)^3 (x + 3)^2 = 2(8)(49) = 784$. Thus the third interval is positive.

Since you are looking for strictly negative values of the function, therefore only first and second intervals satisfy the inequation. Thus the required answer is $(-\infty, -3) \cup (-3, 2)$, which you can express as $(-\infty, 2) - \{-3\}$

Alternatively Here 2 is the root of multiplicity 3 (*i.e.,* odd multiplicity) so the graph will intercept at $x = 2$ that will lead to change in sign of the graph (or function). Again, -3 is the root of multiplicity 2 (*i.e.* even multiplicity) so the graph will bounce back at $x = -3$ that will not lead to any change in sign of the graph.

The leading term of this function is $2x^5$, which suggests that the one end of the graph will be below X-axis and one end will be above the X-axis. Further the coefficient of the leading term is positive, so the graph will be positive when x is positive and greater than 2. Similarly the graph will be negative when x is less than 2, except when x is -3. Thus it can be concluded that the graph will be negative for $x = (-\infty, 2) - \{-3\}$

Exp. 8) Find the values that satisfy the polynomial inequation $(x + 3)(x^2 + 1)(x - 4)^2 < 0$.

Solution The irreducible quadratic factor $(x^2 + 1)$ gives complex conjugate roots. The only two distinct real roots are -3 and 4. So now you have to mark these two real roots on the number line. Since there are two roots, so there will be three intervals on the number line as shown below.

The three intervals are $(-\infty, -3)$, $(-3, 4)$, $(4, \infty)$. Now to check the first interval you may consider any value between that interval, say -4, then you will get $(x + 3)(x^2 + 1)(x - 4)^2 = (-1)(17)(64)$ $= -1088 < 0$. So the first interval $(-\infty, -3)$ is negative. Similarly you can consider any value from the second interval, say 0, then you will get $(x + 3)(x^2 + 1)(x - 4)^2 = (3)(1)(16) = 48 > 0$. It means the second interval $(-3, 4)$ is positive.

Finally you have to test the third and last interval by considering any value from that interval, say 5, then you will get $(x + 3)(x^2 + 1)(x - 4)^2 = (8)(26)(1) = 208 > 0$. Thus the third interval is also positive.

Since you are looking for strictly negative values of the function, therefore only first interval satisfies the inequation. Thus the required answer is $(-\infty, -3)$.

Alternatively At $x = 4$, due to even multiplicity of the root the graph the graph touches the x- axis and bounces back retaining the sign. At $x = -3$, due to odd multiplicity the graph intersects the X-axis and changes the sign. Since the leading term, after simplification into standard polynomial form, is x^5, which implies that if x increases y also increases; and when x decreases y also decreases. Thus you can conclude that the graph will be negative when $x < -3$ and graph will be non-negative when $x > -3$. So the answer is $x < -3$.

Exp. 9) Find the values that satisfy the following polynomial inequation $(x + 5)^2 (x + 1)(x - 1) \leq 0$.

Solution This function gives three real distinct roots -5, -1 and 1. So now you have to mark these roots on the number line. Since there are three roots, so there will be four intervals on the number line as shown below.

The four intervals are $(-\infty, -5), (-5, -1), (-1, 1)(1, \infty)$.

Now check the first interval. Consider any value, say -6 which lies in the first interval $(-\infty, -5)$, you will get

$$(x + 5)^2 (x + 1)(x - 1) = (1)(-5)(-7) = 35 > 0$$

So the first interval gives positive value. Similarly you can consider $x = -2$ to test the second interval, since -2 lies in the second interval $(-5, -1)$.

This will give you $(x + 5)^2(x + 1)(x - 1) = (9)(-1)(-3) = 27 > 0$

So the second interval is also positive.

Again you can consider $x = 0$ to test the third interval, since 0 lies in the third interval $(-1, 1)$. This will give you $(x+5)^2(x+1)(x-1) = -25 < 0$.

So the third interval gives negative value. Finally you can consider $x = 2$ to test the fourth interval. since 2 lies in the fourth interval $(1, \infty)$.

It will give you $(x+5)^2(x+1)(x-1) = (49)(3)(1) = 147$.

So the forth interval is again positive. Therefore you see that the third interval and all the roots satisfy the given inequality. Thus the required answer is $\{-5\} \cup [-1, 1]$ or $x = -5$ and $-1 \le x \le 1$.

Alternatively At $x = -5$, due to even multiplicity of the root the graph touches the xaxis and bounces back retaining the sign. At $x = -1$, due to odd multiplicity the graph intersects the X-axis and changes the sign. Similarly at $x = 1$, due to odd multiplicity the graph intersects the X-axis and changes the sign once again.

Since the leading term, after simplification into standard polynomial form, is x^4, which implies that both the ends will move in the same direction when you move on the X-axis too far in either direction. Further if x increases y also increases; but when x decreases y increases. Thus you can conclude that the graph will be non-positive when $x = -5$ and $-1 \le x \le 1$ and graph will be positive when $x < -5$ and $-5 < x < -1$ and $x > 1$. So the answer is $\{-5\} \cup [-1, 1]$.

Exp. 10) Find the values that satisfy the polynomial inequation $3(x-2)^2 2(x+4)^3(-x^2-2) < 0$.

Solution You can modify the given inequation as, $-3(x-2)^2(x+4)^3(x^2+2)$. The given inequation if equated with zero, it gives only two real distinct roots -4 and 2. The irreducible quadratic factor $(x^2 + 2)$ yields only non real zeros, which don't affect the sign of the graph. So now you have to mark these two real roots on the number line. Since there are two roots, so there will be three intervals on the number line as shown below.

The three intervals are $(-\infty, -4), (-4, 2), (2, \infty)$. Now to check the first interval you may consider any value between that interval, say -5, then you will get

$-3(x-2)^2(x+4)^3(x^2+2) = -3(49)(-1)(27) = 3969 > 0$.

So the first interval $(-\infty, -4)$ is positive. Similarly you can consider any value from the second interval, say 0, then you will get $-3(x-2)^2(x+4)^3(x^2+2) = -3(4)(64)(2) = -1536 < 0$. It means the second interval $(-4, 2)$ is negative.

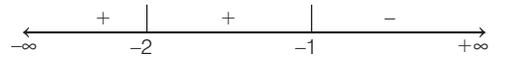
Finally you have to test the third and last interval by considering any value from that interval, say 3, then you will get $-3(x-2)^2(x+4)^3(x^2+2) = -3(1)(343)(11) = -11319 < 0$. Thus the third interval is also negative.

Since you are looking for negative values of the function, therefore only second and third intervals satisfy the inequation. Thus the required answer is $(-4, 2) \cup (2, \infty)$.

Alternatively At $x = -4$, due to odd multiplicity the graph intersects the X-axis and changes the sign. At $x = 2$, due to even multiplicity of the root the graph touches the X-axis and bounces back retaining the sign. Since the leading term, after simplification into standard polynomial form, is $-3x^7$ which implies that the two ends of the graph will be in opposite directions and if x increases y decreases; and when x decreases y increases. Thus you can conclude that the graph will be positive when $x < -4$ and it will be negative when $-4 < x < 2$ and $2 < x < \infty$. So the answer is $(-4, 2) \cup (2, \infty)$ or $(-4, \infty) - \{2\}$.

Exp. 11) Find the values that satisfy the following polynomial inequation $-(x+2)^4(x+1)(2x^2+x+1) \ge 0$.

Solution The given inequation if equated with zero, it gives only two real distinct roots -2 and -1. The irreducible quadratic factor $(2x^2 + x + 1)$ yields only non-real zeros, which don't affect the sign of the graph. So now you have to mark these two real roots on the number line. Since there are two roots, so there will be three intervals on the number line as shown below.



The three intervals are $(-\infty, -2), (-2, -1), (-1, \infty)$. Now after testing each of the three intervals for their respective signs you will get that the first and second intervals are positive and the last interval is negative; also the graph touches at $x = -2$. Since you are looking for non-negative values of the function, therefore only first and second intervals will satisfy the inequation. Thus the required answer is

$$(-\infty, -2) \cup \{-2\} \cup (-2, -1) \cup \{-1\} \text{ or } (-\infty, -1]$$

Alternatively At $x = -2$, due to even multiplicity of the root the graph touches the X-axis and bounces back retaining the sign. At $x = -1$, due to odd multiplicity the graph intersects the X-axis and changes the sign. Since the leading term, after simplification into standard polynomial form, is $-2x^7$ which implies that the two ends of the graph will be in opposite directions and if x increases y decreases; and when x decreases y increases. Thus you can conclude that the graph will be positive when $-\infty < x < -2$ and $-2 < x < -1$ and it will be negative when $x > -1$. So the answer is $(-\infty, -1]$.

Practice Exercise

1. Find the values that satisfy the polynomial inequation
$$x^4 + 4x^3 - 12x^2 \le 0.$$
2. Find the values that satisfy the polynomial inequation
$$x^4 + 4x^3 - 12x^2 < 0.$$
3. Find the values that satisfy the polynomial inequation
$$x^4 + 4x^3 - 12x^2 > 0.$$
4. Find the values that satisfy the polynimial inequation
$$x^4 + 4x^3 - 12x^2 \ge 0.$$

Answers

1. $[-6, 2]$ **2.** $(-6, 0) \cup (0, 2)$

3. $(-\infty, -6) \cup (2, \infty)$ **4.** $(-\infty, 6] \cup \{0\} \cup [2, \infty)$

14.17 Relation Between Roots and Coefficients in a Polynomial

If $f(x) = a_n x^n + a_{n-1}x^{n-1} + \ldots + a_3 x^3 + a_2 x^2 + a_1 x + a_0$

(where $a_n \neq 0$)

And if $\alpha_1, \alpha_2, \alpha_3, \ldots, \alpha_n$ be the roots of the polynomial, then

$$S_1 = \alpha_1 + \alpha_2 + \alpha_3 + \ldots + \alpha_n = \sum \alpha_i = -\frac{a_{n-1}}{a_n}$$

$$S_2 = \alpha_1\alpha_2 + \alpha_1\alpha_3 + \ldots \text{s} = \sum_{i \neq j} \alpha_i \alpha_j = (-1)^2 \frac{a_{n-2}}{a_n}$$

$$S_3 = \alpha_1\alpha_2\alpha_3 + \alpha_2\alpha_3\alpha_4 + \ldots = \sum_{i \neq j \neq k} \alpha_i \alpha_j \alpha_k = (-1)^3 \frac{a_{n-3}}{a_n}$$

$$\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots$$

$$\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots$$

$$S_{n-1} = \alpha_1\alpha_2\ldots\alpha_{n-1} + \alpha_2\alpha_3\ldots\alpha_n = \sum_{i \neq j \neq \ldots \neq (n-1)} \alpha_i \alpha_j \ldots \alpha_{n-1} = (-1)^{n-1} \frac{a_1}{a_n}$$

$$S_n = \alpha_1\alpha_2\alpha_3\ldots\alpha_n = \prod_{i=1}^{n} a_i = (-1)^n \frac{a_0}{a_n}$$

Thus a **quadratic equation** $ax^2 + bx + c = 0$, having the roots α and β, then

$$S_1 = \alpha + \beta = -\frac{b}{a} \text{ and } S_2 = \alpha\beta = \frac{c}{a}$$

Similarly, a **cubic equation** $ax^3 + bx^2 + cx + d = 0$, having the roots α, β and γ, then

$$S_1 = \alpha + \beta + \gamma = -\frac{b}{a} \text{ and } S_2 = \alpha\beta + \beta\gamma + \gamma\alpha = \frac{c}{a}$$

$$S_3 = \alpha\beta\gamma = -\frac{d}{a}$$

Similarly, a **biquadratic equation**

$$ax^4 + bx^3 + cx^2 + dx + e = 0$$

having α, β, γ and δ, then

$$S_1 = \alpha + \beta + \gamma + \delta = -\frac{b}{a}$$

$$S_2 = \alpha\beta + \alpha\gamma + \alpha\delta + \beta\gamma + \beta\delta + \gamma\delta = \frac{c}{a}$$

$$S_3 = \alpha\beta\gamma + \alpha\beta\delta + \alpha\gamma\delta + \beta\gamma\delta = -\frac{d}{a}$$

$$S_4 = \alpha\beta\gamma\delta = \frac{e}{a}$$

Formation of a Polynomial Equation from the Given Roots If $\alpha_1, \alpha_2, \alpha_3, \ldots, \alpha_n$ be the roots of the nth degree polynomial and S_k $(k = 1,2,3, \ldots n)$ denotes the sum of the products of roots taken k at a time, then the equation will be

$$x^n - S_1 x^{n-1} + S_2 x^{n-2} - S_3 x^{n-3} + \ldots + (-1)^n S_n = 0.$$

Formation of a Quadratic Equation from the Given Roots

$$x^2 - S_1 x + S_2 = 0 \Rightarrow x^2 - (\alpha + \beta)x + (\alpha\beta) = 0$$

Formation of a Cubic Equation from the Given Roots

$$x^3 - S_1 x^2 + S_2 x - S_3 = 0$$

$$\Rightarrow x^3 - (\alpha + \beta + \gamma)x^2 + (\alpha\beta + \alpha\gamma + \beta\gamma)x - (\alpha\beta\gamma) = 0$$

Formation of a Biquadratic Equation from the Given Roots

$$x^4 - S_1 x^3 + S_2 x^2 - S_3 x + S_4 = 0$$

$$\Rightarrow x^4 - (\alpha + \beta + \gamma + \delta)x^3 + (\alpha\beta + \alpha\gamma + \alpha\delta + \beta\gamma + \beta\delta + \gamma\delta)x^2 - (\alpha\beta\gamma + \alpha\beta\delta + \alpha\gamma\delta + \beta\gamma\delta)x + (\alpha\beta\gamma\delta) = 0$$

Exp. 1) Let $P(x) = x^3 + ax^2 + bx + c$ be a polynomial with real coefficients, $c \neq 0$ and x_1, x_2, x_3 be the roots of $P(x)$. Determine the polynomial $Q(x)$ whose roots are $\frac{1}{x_1}, \frac{1}{x_2}, \frac{1}{x_3}$.

Solution $x_1 + x_2 + x_3 = -a,\ x_1x_2 + x_2x_3 + x_3x_1 = b$

and $x_1x_2x_3 = -c$

$$\therefore \quad \frac{1}{x_1} + \frac{1}{x_2} + \frac{1}{x_3} = \frac{x_1x_2 + x_2x_3 + x_3x_1}{x_1x_2x_3} = -\frac{b}{c}$$

$$\frac{1}{x_1x_2} + \frac{1}{x_2x_3} + \frac{1}{x_3x_1} = \frac{x_1 + x_2 + x_3}{x_1x_2x_3} = \frac{a}{c}$$

and $$\frac{1}{x_1x_2x_3} = -\frac{1}{c}$$

Therefore $$Q(x) = x^3 - \left(\frac{-b}{c}\right)x^2 + \left(\frac{a}{c}\right)x - \left(-\frac{1}{c}\right)$$

$$\Rightarrow \quad Q(x) = cx^3 + bx^2 + ax + 1$$

Exp. 2) The real number x_1, x_2, x_3 satisfying the equation $x^3 - x^2 + bx + c = 0$ are in AP. Find the intervals in which b and c lie.

Solution Let the roots be $a - d, d, a + d$, then

Sum of roots $= (a - d) + (a) + (a + d) = 1$

$$\Rightarrow \quad a = \frac{1}{3}$$

and $(a - d)(a) + a(a + d) + (a - d)(a + d) = b$

$$\Rightarrow \quad 3a^2 - d^2 = b \Rightarrow 3\left(\frac{1}{9}\right) - d^2 = b$$

$$\Rightarrow \quad d^2 = \frac{1}{3} - b \quad \text{[since the minimum value of } d^2 = 0\text{]}$$

$$\Rightarrow \quad \frac{1}{3} - b \geq 0 \ \Rightarrow b \leq 1/3$$

Now product of roots $= (a - d)(a)(a + d) = -c$

$$\Rightarrow \quad a(a^2 - d^2) = -c$$

$$\Rightarrow \quad \frac{1}{3}\left(\frac{1}{9} - d^2\right) = -c$$

$$\Rightarrow \quad c = \frac{d^2}{3} - \frac{1}{27}$$

$$\Rightarrow \quad c \geq -\frac{1}{27}$$

[since the minimum value of $\frac{d^2}{3} = 0$]

Therefore $-\infty < b \leq 1/3$ and $-\frac{1}{27} \leq c < \infty$

14.18 Rational Polynomials

Conceptually, a rational polynomial function is a quotient of polynomials. Therefore a rational polynomial function $f(x)$ is expressed as following

$$f(x) = \frac{p(x)}{q(x)}$$

Where $p(x)$ and $q(x)$ are the polynomial functions, such that $q(x) \neq 0$.

- The rational function $f(x)$ is not defined for any x which is the root of $q(x)$.
- The numerator and denominator can be polynomials of any order.

Critical Numbers

The critical numbers for a rational function are all the values of x where the function $f(x)$ is zero or undefined, That is, all the x where the numerator $p(x)$ and denominator $q(x)$ are zero.

- A rational expression will be zero only when its numerator is zero and the denominator is not zero for the same value of x. That is $f(x) = 0$, if $p(x) = 0$ but $q(x) \neq 0$ for the same x.
- For critical points you have to consider only real numbers. So, if upon solving the polynomial in the numerator you will get non-real numbers, these non-real values won't be considered as critical points.
- It's not necessary that all the functions will have critical points; it may occur when a polynomial function has no real root and the denominator is defined for all the values of the given interval.
- However, in this course most of the functions that you will be looking at do have critical points. That is only because those problems make for more interesting examples. Do not let this fact lead you to expect that a function will always have critical points.

Exp. 1) Find the critical numbers of the rational polynomial $\frac{x^2 - 6x + 8}{x + 2}$.

Solution $\frac{x^2 - 6x + 8}{x + 2} = \frac{(x-2)(x-4)}{(x+2)}$

Since the roots of $x^2 - 6x + 8$ are {2, 4} and that of $x + 2$ is {–2}. Therefore the critical points are –2, 2 and 4.

Exp. 2) Find the critical numbers of the rational polynomial $\frac{x^2 + 4x + 3}{x^2 - x - 20}$.

Solution $\frac{x^2 + 4x + 3}{x^2 - x - 20} = \frac{(x+3)(x+1)}{(x+4)(x-5)}$

Since the roots of $x^2 + 4x + 3$ are {–3, –1} and that of $x^2 - x - 20$ are {–4, 5}. Therefore the critical points are –1,–4,–3 and 5.

Exp. 3) Find the critical numbers of the following rational polynomial $\frac{x^2 + 2x - 15}{x^2 - 9}$.

Solution $\frac{x^2 + 2x - 15}{x^2 - 9} = \frac{(x+5)(x-3)}{(x+3)(x-3)}$

Since the roots of $x^2 + 2x - 15$ are $(-5, 3)$ and that of $x^2 - 9$ are $(-3, 3)$. Therefore that critical points are –5, – 3 and 3.

Exp. 4) Find the critical numbers of the rational polynomial $\frac{x^2 + 1}{x^2 - x - 6}$.

Solution $\frac{x^2 + 1}{x^2 - x - 6} = \frac{(x^2 + 1)}{(x+2)(x-3)}$.

Since the roots of $x^2 + 1$ are non-real, so these are not considerable. But the roots of $x^2 - x - 6$ are (–2, 3), which are real. Therefore the critical points are –2 and 3.

Root or Solution of a Rational Polynomial Equation

The root of a rational polynomial equation $f(x) = 0$ is the value of x, for which $p(x) = 0$, but $q(x) \neq 0$.

NOTE The terms root, zero and solution of a rational polynomial can be interchangeably used for one another. And the root/zero/solution can be called x-intercept too, if the root/zero/solution is a real number.

Exp. 1) Find the roots of the rational polynomial equation $\frac{(2x+1)}{(x+3)(x-1)} = 0$.

Solution $\frac{(2x+1)}{(x+3)(x-1)} = 0 \Rightarrow 2x + 1 = 0 \Rightarrow x = -1/2$.

Therefore there is only one solution of the above rational equation, which is $x = -1/2$.

Exp. 2) Find the roots of the rational polynomial equation $\frac{x^2-6x+8}{x+2}=0$

Solution $\frac{x^2-6x+8}{x+2}=0 \Rightarrow \frac{(x-4)(x-2)}{(x+2)}=0$

$\Rightarrow \quad (x-2)(x-4)=0 \Rightarrow x=2$ or 4.

Therefore there are two solutions of the above rational equation, which are $x=2$ and 4 .

Exp. 3) Find the solutions of the rational polynomial equation $\frac{x^2-4}{x^3-x^2-6x}=0$

Solution $\frac{x^2-4}{x^3-x^2-6x}=0 \Rightarrow \frac{(x+2)(x-2)}{x(x+2)(x-3)} \Rightarrow 0$

$\Rightarrow \quad \frac{(x-2)}{x(x-3)}=0\ x$

$\Rightarrow \quad (x-2)=0$

$\Rightarrow \quad x=2$

Therefore there is only one solution of the above rational equation, which is $x=2$.

Exp. 4) Find the solutions of the rational equation

$$\frac{x^2(x^4-81)(x+2)^3}{x^5-x^4-6x^3}=0$$

Solution $\frac{x^2(x^4-81)(x+2)^3}{x^5-x^4-6x^3}=0$

$\Rightarrow \quad \frac{x^2(x^2+9)(x+3)(x-3)(x+2)^3}{x^3(x-3)(x+2)}=0$

$\Rightarrow \quad \frac{(x^2+9)(x+3)(x+2)^2}{x}=0$

$\Rightarrow \quad (x^2+9)(x+3)(x+2)^2=0$

$\Rightarrow \quad (x^2+9)=0$ or $(x+3)=0$ or $(x+2)^2=0$

If $x^2+9=0 \Rightarrow x=\pm 3i$, which are complex (*i.e,* non-real) roots. And if $x+3=0 \Rightarrow x=-3$ which is a real root.

Again , if $(x+2)^2=0 \Rightarrow x=-2$, which is a real root.

Therefore there are two non-real roots and two real roots of the above rational equation and thus there are total four solutions.

NOTE Whenever there is a non-real root, the graph or the function does not intersect or touch the X-axis.

Domain of a Rational Polynomial Equation

The domain of a rational function includes only points where both the numerator and the denominator are defined for real values of x.

Essentially, the domain of a rational function does not contain any value that would make the denominator equal to zero.

NOTE

1. Any value of x that makes both the numerator and denominator 0, simultaneosy, will either create a 'hole' a 'vertical asymptote'. And it happens when some factors are common between numerator and denominator.
2. A hole in the graph shows the absence of the graph or a miniscule break in the graph, without changing its direction.
3. The vertical asymptote is nothing but a virtual line that creates a boundary for the graph and thus the graph cannot cross the boundary and it runs parallel to this boundary. So a vertical asymptote changes the normal path of the graph apart from braking it.

Exp. 1) Find the domain of the rational polynomial $f(x)=\frac{x^2+x-20}{x^2-3x-18}$.

Solution $\frac{x^2+x-20}{x^2-3x-18}=\frac{(x+5)(x-4)}{(x+3)(x-6)}$

Since at $x=-3$ and 6, the denominator will be zero, *i.e.* the rational polynomial will be undefined at these points. So the domain of this polynomial will be all the real numbers except $x=-3$ and 6.

That is $R-\{-3,6\}$ or $(-\infty,-3)\ \mathrm{U}\ (-3,6)\ \mathrm{U}\ (6,\infty)$.

Exp. 2) Find the domain of the rational polynomial $f(x)=f(x)=\frac{2x^2-5x-3}{(x^2+4)}$.

Solution $\frac{2x^2-5x-3}{(x^2+4)}=\frac{(x-3)\left(x+\frac{1}{2}\right)}{(x^2+4)}$

Since (x^2+4) cannot be equal to zero for any real value of x. So this factor (x^2+4), in the denominator, gives non-real zeros and a non-real zero never affects the domain. So the domain of this rational function will include all the real numbers. That is R or $(-\infty,\infty)$.

Exp. 3) Find the domain of the rational polynomial $f(x)=\frac{x^2-1}{2x^2-5x}$.

Solution $\frac{x^2-1}{2x^2-5x}=\frac{(x+1)(x-1)}{x(2x-5)}$.

Since at $x=0$ and $5/2$, the denominator will be zero, *i.e.* the rational polynomial will be undefined at these points.

So the domain of this polynomial will be all the real numbers except

$$\mathrm{x}=0 \text{ and } \frac{5}{2}$$

That is $R-\left\{0,\frac{5}{2}\right\}$

or $(-\infty,0)\ \mathrm{U}\left(0,\frac{5}{2}\right)\mathrm{U}\left(\frac{5}{2},\infty\right)$.

Exp. 4) Find the domain of the rational polynomial $f(x)=\dfrac{x^2-4}{x^3-x^2-6x}$.

Solution. $\dfrac{x^2-4}{x^3-x^2-6x}=\dfrac{(x+2)(x-2)}{x\,(x+2)(x-3)}$

Since at $x=0,-2$ and 3, the denominator will be zero, *i.e.* the rational polynomial will be undefined at these points.
So the domain of this polynomial will be all the real numbers except $x=0,-2$ and 3.
That is $R-\{-2,0,3\}$
or $(-\infty,-2)\cup(-2,0)\cup(0,3)\cup(3,\infty)$.

Exp. 5) Find the domain of the rational polynomial $f(x)=\dfrac{x^3+2x^2-4x-8}{x^4-x^3-6x^2}$

Solution $f(x)=\dfrac{x^3+2x^2-4x-8}{x^4-x^3-6x^2}=\dfrac{(x+2)^2(x-2)}{x^2(x+2)(x-3)}$

Since at $x=0,-2$ or 3, the denominator will be zero, *i.e.* the rational polynomial will be undefined at these points.
So the domain of this polynomial will be all the real number except $x=0,-2$ and 3.
That is $R-\{0,-2,3\}$ or $(-\infty,0)\cup(0,-2)\cup(-2,3)\cup(3,\infty)$.

Exp. 6) Find the domain of the rational polynomial $f(x)=\dfrac{(x+3)(x+2)(x-2)^3}{(x+2)^2(x-2)(x-3)}$.

Solution $f(x)=\dfrac{(x+3)(x+2)(x-2)^3}{(x+2)^2(x-2)(x-3)}$

Since at $x=-2,2$ and 3, the denominator will be zero, *i.e.* the rational polynomial will be undefined at these points.
So the domain of this polynomial will be all the real numbers except $x=-2,2$ and 3.
That is $R-\{-2,2,3\}$ or $(-\infty,-2)\cup(-2,2)\cup(2,3)\cup(3,\infty)$.

Graphical Features of a Rational Polynomial

A rational function is a function that can be written as a fraction of two polynomials where the denominator is not zero.

Let the rational polynomial function be

$$f(x)=\frac{p(x)}{q(x)}=\frac{a_nx^n+a_{n-1}x^{n-1}+\ldots+a_1x+a_0}{b_mx^m+b_{m-1}x^{m-1}+\ldots+b_1x+b_0}$$

Or in the factor form a rational function can be expressed as

$$f(x)=\frac{(x-\alpha_1)(x-\alpha_2)\ldots(x-\alpha_{n-1})(x-\alpha_n)}{(x-\beta_1)(x-\beta_2)\ldots(x-\beta_{m-1})(x-\beta m)}$$

Where n is the degree of numerator $p(x)$ and m is the degree of denominator $q(x)$ remove comma and α_i and β_i are the roots of the polynomials $p(x)$ and $q(x)$, respectively.

Asymptote

An asymptote is an imaginary line that a curve approaches but does not touch. There are basically two types of asymptotes: vertical and non-vertical asymptotes. The non-vertical asymptotes are also called as end-behavior asymptotes.

Asymptote	Condition	Value of Asymptote
Vertical	Roots of the denominator of the rational polynomial, in the lowest term.	Vertical asymptote, $x=c$
Horizontal	If $n<m$	Horizontal asymptote, $y=0$
	If $n=m$	Horizontal asymptote, $y=a_n/b_m$
	If $n>m$	No horizontal asymptote
Oblique	If $n>m$, but $n=m+1$	Oblique asymptote, $y=k(x)$; where $p(x)=q(x)k(x)+r(x)$
Curvilinear	If $n>m$, but $n>m+1$	Curvilinear asymptote, $y=k(x)$; Where $p(x)=q(x)\,k(x)+r(x)$

NOTE A rational polynomial in the 'lowest term' implies that all the common factors have been cancelled out and thus there is no common factor between the numerator and denominator in the rational polynomial when it is in the reduced or lowest term.

Mind the fact the even after cancelling out the common factors the relation between n and m remains intact, since equal number of factors get cancelled out from the numerator and the denominator.

Vertical Asymptotes

1. A rational polynomial function may have none, one, or several vertical asymptotes.
2. The graph of the rational function never intersects the vertical asymptote.
3. The vertical asymptotes occur at all the zeros of the denominator when the rational function is expressed in the lowest term.
4. To determine the vertical asymptote factorize both the numerator and denominator. If there are any common factors between the numerator and denominator, then cancel out the common factors and then set the denominator equal to zero and solve. Any real solution will represent a vertical asymptote. The equation of a vertical asymptote is $x=c$.

Holes

Sometimes, as mentioned above, a factor may appear in both the numerator and the denominator. Then there is a possibility that there may not be a vertical asymptote and so it may create a hole in the graph. A **hole** is simply a single point on the graph that doesn't actually exist due to a restriction.

Let us assume that the factor $(x-c)^u$ is in the numerator and $(x-c)^v$ is the denominator. If

(i) $u < v$, there will be a vertical asymptote $x = c$.

(ii) $u > v$, there will be a hole in the graph on the X-axis at $x = c$. there is no vertical asymptote there.

(iii) $u = v$, there will be a hole in the graph at $x = c$, but not on the X-axis. The y-value of the hole can be found by cancelling the factors and substituting $x = c$ in the reduced function.

NOTE A rational function may have both - holes and vertical asymptotes-for different values of x. However, for a certain value of x the function cannot have both the hole and the vertical asymptote.

Exp. 1) Find all the vertical asymptotes and holes of $\dfrac{(x+3)(x-7)}{(2x-5)}$.

Solution Since $2x-5=0 \Rightarrow x=5/2$

Therefore there is only one vertical asymptotes, $x=5/2$.

Since there is no common factor in numerator and denominator, so there won't be any hole in the graph.

Exp. 2) Find all the vertical asymptotes and holes of

$$\frac{(2x+9)(5x-4)}{(x-3)(x-5)(2x-11)}$$

Solution Since $(x-3)(x-5)(2x-11)=0 \Rightarrow x = 3$ or 5 or $11/2$.

Therefore there are three vertical asymptotes, $x = 3$, $x=5$ and $x=11/2$.

Exp. 3) Find all the vertical asymptotes and holes of

$$\frac{(x+2)(x+1)(x-3)}{x^2(x-3)(3x+8)}.$$

Solution Since $(x-3)$ is common in both the numerator and denominator, so you have to cancel it out.

Then the simplified (or reduced) rational function is $\dfrac{(x+2)(x+1)}{x^2(3x+8)}$.

Now since $x^2(3x+8)=0 \Rightarrow x=0$ or $x=-8/3$.

Therefore there are two vertical asymptotes, $x=0$ and $x=-8/3$. If you look at the original rational function in which the power of x in the numerator is lower than that of denominator, so there will be no hole in the graph.

The other way to look at this issue is that the reduced function has no common factor in numerator and denominator, so there won't be any hole in the graph.

The possibility of hole arises only when numerator and denominator of the reduced function has some common factor. In this example, the reduced function has no common factor between numerator and denominator.

Exp. 4) Find the vertical asymptotes and holes of $\dfrac{3(2x+5)^3(8x-3)^2(x-3)}{2(8x-3)^2(2x+5)}$.

Solution. First of all cancel out all the common factors between the numerator and denominator.

Then the simplified rational function is

$$\frac{3(2x+5)^2(x-3)}{2}=\frac{3}{2}(2x+5)^2(x-3)$$

Since, there is no factor or root in the denominator of simplified polynomial. Therefore there is no vertical asymptote.

Since the power of $(2x+5)$ in the numerator is higher than that of denominator, so there will be a hole in the graph on the X-axis at $x=-5/2$. Again since the power of $(8x-3)$ in the numerator is same as that of denominator, so there will be a hole in the graph at $x=3/8$, but not on the X-axis. The y-value of the hole can be found by canceling the factors and substituting $x=3/8$ in the reduced function as following.

$$y=\frac{3}{2}(2x+5)^2(x-3)=\frac{3}{2}\left(2\times\frac{3}{8}+5\right)^2\left(\frac{3}{8}-3\right)$$

$$\Rightarrow \quad =\frac{-33327}{256}=-130.18$$

Exp. 5) Find all the vertical asymptotes and holes of $\dfrac{(x-3)^2(x-4)}{(x-5)(x-3)}$.

Solution. Since $(x-3)$ is common in both the numerator and denominator, so you have to cancel it out.

Then the simplified rational function is $\dfrac{(x-3)(x-4)}{(x-5)}$.

Now, since $(x-5)=0 \Rightarrow x=5$. Therefore there is only one vertical asymptote, $x=5$. Since the power of $(x-3)$ in the numerator is higher than that of denominator, so there will be a hole in the graph on the X-axis at $x=3$.

Exp. 6) Find all the vertical asymptotes and holes of $\dfrac{(x+2)(x+4)^3}{(x+4)(x+2)^3(2x+3)(x-4)}$.

Solution. First of all cancel out all the common factors between the numerator and denominator.

Then the simplified rational function is $\dfrac{(x+4)^2}{(x+2)^2(2x+3)(x-4)}$

Now, Since $(x+2)^2(2x+3)(x-4)=0$

$\Rightarrow \quad x=-2$

or $\quad x=-3/2$ or $x=4$.

Therefore there are three vertical asymptotes,

$x=-2, x=-3/2$ and $x=4$.

However, since the power of $(x+4)$ in the numerator is higher than that of denominator, so there will be a hole in the graph on the X-axis at $x=-4$.

Exp. 7) Find the vertical asymptotes and holes of $\frac{x(x+5)^4(x-2)^6}{(x+5)^6(x-2)^3(x-5)}$.

Solution. First of all cancel out all the common factors between the numerator and denominator.

Then the simplified rational function is $\frac{x(x-2)^3}{(x+5)^2(x-5)}$

Now, since $(x+5)^2(x-5)=0 \Rightarrow x=-5$ or $x=5$.

Therefore there are two vertical asymptotes, $x=-5$ and $x=5$.

However, since the power of $(x-2)$ in the numerator is higher than that of denominator, so there will be a hole in the graph on the X-axis at $x=2$.

Exp. 8) Find the vertical asymptotes and holes of $\frac{x^2(x+7)^2(x-2)^3}{x(x^2+7)}$.

Solution. First of all cancel out all the common factors between the numerator and denominator.

Then the simplified rational function is $\frac{x(x+7)^2(x-2)^3}{x(x^2+7)}$

Now, since $x^2+7=0 \Rightarrow x=\pm\sqrt{-7}$, which is not a real solution.

Therefore there is no vertical asymptote.

Looking at the original function we can say that the power of x in the numerator is higher than that of denominator, so there will be a hole in the graph on the X-axis at $x=0$.

Exp. 9) Find the vertical asymptotes and holes of

$$\frac{(x-10)(x-20)^2(x-30)^3(x-40)}{(x-10)^3(x-20)^2(x-30)(x-50)}.$$

Solution. First of all cancel out all the common factors between the numerator and denominator.

Then the simplified rational function is $\frac{(x-30)^2(x-40)}{(x-10)^2(x-50)}$

Now since $(x-10)^2(x-50)=0$

$\Rightarrow \quad x=10$ or $x=50$.

Therefore, there are two vertical asymptotes, $x=10$ and $x=50$.

Looking at the original function, we can say that the power of $(x-30)$ in the numerator is higher than that of denominator, so there will be a hole in the graph on the X–axis at $x=30$.

Again since the power of $(x-20)$ in the numerator is same as that of denominator, so there will be a hole in the graph at $x=20$, but not on the X-axis.

The y-value of the hole can be found by canceling out the common factors and substituting $x=20$ in the reduced function as following.

$$y=\frac{(x-30)^2(x-40)}{(x-10)^2(x-50)}=\frac{(20-30)^2(20-40)^2}{(20-10)^2(20-50)}$$

$$=\frac{2}{3}=0.67$$

Non-Vertical Asymptotes

(or End Behaviour Asymptotes)

Since the non-vertical asymptotes determines the end behaviour or long term behaviour of a rational function, that's why they are called as end behaviour asymptotes. These asymptotes give the glimpse of what a rational graph look like for higher values of x or in short these asymptotes give you a big picture of a rational function.

1. There are three types of End-behaviour asymptotes: Horizontal, Slant and Curvilinear.
2. A rational polynomial function may have at most one non-vertical asymptote.
3. The graph of the rational polynomial may intersect the non-vertical asymptote.

(a) Horizontal Asymptotes

The graph of a rational function may also have horizontal asymptote. To determine the horizontal asymptotes look for the highest power in the numerator $(i,e.,n)$ and denominator $(i,e.,m)$ of the rational function.

1. If the degree of the numerator is higher than that of denominator $(i,e.,n>m)$, then there is no horizontal asymptote.
2. If the degree of the numerator is less than the degree of denominator $(i.e.,n<m)$, then the X-axis is the horizontal asymptote. That means the horizontal asymptote is $y=0$
3. If the degree of the numerator and the denominator is same $(i.e.,n=m)$, then the horizontal asymptote is given by the following formula.

$$y=\left(\frac{\text{the coefficient of the highest power in the numerator}}{\text{the coefficient of the highest power in the denominator}}\right)$$

That means if the rational Function is

$$f(x)=\frac{P(x)}{q(x)}=\frac{a_nx^n+\ldots+a_1x+a_0}{b_mx^m+\ldots+b_1x+b_0}$$

Then the horizontal asymptote is $y=\frac{a_n}{b_m}$

Exp. 1) Find the horizontal asymptote of $\frac{(x+3)(x-7)}{(2x-5)}$

Solution. $\frac{(x+3)(x-7)}{(2x-5)}=\frac{x^2-4x-21}{2x-5}$.

Since $n=2$ and $m=1$. It implies that $n>m$. So there won't be any horizontal asymptote.

Exp. 2) Find the horizontal asymptote of

$$\frac{(2x+9)(5x-4)}{(x-3)(x-5)(2x-11)}$$

Solution. $\dfrac{(2x+9)(5x-4)}{(x-3)(x-5)(2x-11)} = \dfrac{10x^2+37x-36}{2x^3-27x^2+118x-165}$

Since $n=2$ and $m=3$. It implies that $n<m$. Then X-axis (*i.e.*, $y=0$) is the horizontal asymptote.

Exp. 3) Find all the vertical asymptotes of

$$\frac{(x-2)^2(x+2)(x+1)(x-3)}{x^3(x-3)(3x+8)}$$

Solution $\dfrac{(x-2)^2(x+2)\,(x+1)\,(x-3)}{x^3(x-3)\,(3x+8)} = \dfrac{7x^5+\ldots}{3x^5+\ldots}$

Since $n=5$ and $m=5$. It implies that $n=m$.

Then the horizontal asymptote is $y=\dfrac{7}{3}$.

Exp. 4) Find The horizontal asymptote of

$$\frac{(2x-3)^2(5x-4)}{x(3x-5)(7x-3)}$$

Solution $\dfrac{(2x-3)^2(5x-4)}{x(3x-5)(7x-3)} = \dfrac{20x^3+\ldots}{21x^3+\ldots}$

Since $n=3$ and $m=3$. it implies that $n=m$

Then the horizontal asymptote is $y=\dfrac{20}{21}$

(b) Slant (or Oblique) Asymptotes

The graph of a rational function may also have a slant asymptote. When the degree of the numerator is exactly one more than the degree of the denominator (*i.e.* $n=m+1$), the graph of the rational function will have an oblique asymptote.

To find the equation of the oblique asymptote, perform long division (or synthetic division if it works).

As x gets very large (this is the far left or far right position), the remainder portion becomes very small, almost zero. So, to find the equation of the oblique asymptote, perform the long division and discard the remainder. The slant asymptote is $y=k(x)$; where $p(x)=q(x)\,k(x)+r(x)$. Here $k(x)$ is a linear function.

Exp. 1) Find the slant asymptote of $\dfrac{(x+3)(x+7)}{(x-5)}$

Solution $\dfrac{(x+3)(x+7)}{(x-5)} = \dfrac{x^2+10x+21}{x-5}$

Since $n=2$ and $m=1$. It implies that $n=m+1$. So a slant asymptote is possible. After dividing the numerator by denominator you will get quotient $k(x)=x+15$. Therefore the slant asymptote is $y=x+15$.

Hint $x^2+10x+21=(x-5)(x+15)+96$

Exp. 2) Find the slant asymptote of

$$\frac{(x+3)(x-7)(2x+3)^2}{(x-5)^2(2x+3)}$$

Solution $\dfrac{(x+3)(x-7)(2x+3)^2}{(x-5)^2(2x+3)} = \dfrac{(x+3)(x-7)(2x+3)}{(x-5)^2}$

$$= \frac{2x^3-5x^2-54x-63}{x^2-10x+25}$$

Since $n=3$ and $m=2$. It implies that $n=m+1$. So a slant asymptote is possible. After dividing the numerator by denominator you will get quotient $k(x)=2x+15$, Therefore the slant asymptote is $y=2x+15$

Hint $2x^3-5x^2-54x-63=(x^2-10x+25)(2x+15)+(46x-438)$

(c) Curvilinear Asymptotes

The graph of a rational function may also have a curvilinear asymptote. When the degree of the numerator is higher than the degree of the denominator and the difference in the degree is more than one (*i.e.* $n>m+1$), the graph of the rational function will have a curvilinear asymptote.

To find the equation of the curvilinear asymptote, perform long division (or synthetic division if it works). As x gets very large (this is the far left or far right position), the remainder portion becomes very small, almost zero. So, to find the equation of the curvilinear asymptote, perform the long division and discard the remainder.

The slant asymptote is $y=k(x)$; where $p(x)=q(x)k(x)+r(x)$. Here $k(x)$ is a polynomial function of at least degree 2.

Exp. 1) Find the curvilinear asymptote of

$$\frac{(x-3)(x+7)(x-8)}{(x-5)}$$

Solution $\dfrac{(x+3)(x+7)(x-8)}{(x-5)} = \dfrac{x^3+2x^2-59x-168}{(x-5)}$

$$= (x^2+7x-24)+\frac{-288}{(x-5)}$$

Since $n=3$ and $m=1$, It implies that $n>m+1$. So a curvilinear asymptote is possible. After dividing the numerator by denominator you will get quotient $k(x)=x^2+7x-24$. Therefore the curvilinear asymptote is $y=x^2+7x-24$.

Hint $(x+3)(x+7)(x-8)=x^3+2x^2-59x-168$

$$=(x-5)(x^2+7x-24)-288.$$

Exp. 2) Find the curvilinear asymptote of

$$\frac{3x^5-x^4+2x^2+x+1}{(x^2+1)}$$

Solution $\dfrac{3x^5-x^4+2x^2+x+1}{(x^2+1)} = (3x^3-x^2-3x+3)+\dfrac{4x-2}{(x^4+1)}.$

Since $n = 5$ and $m = 2$. It implies that $n - m > 1$. So a curvilinear asymptote is possible. After dividing the numerator by denominator you will get quotient $k(x) = 3x^3 - x^2 - 3x + 3$.

Therefore the curvilinear asymptote is $y = 3x^3 - x^2 - 3x + 3$

Hint

$3x^5 - x^4 + 2x^2 + x + 1 = (x^2 + 1)(3x^3 - x^2 - 3x + 3) + (4x - 2)$

X-intercepts and Y-intercepts

These are the points where the rational polynomial graph intercepts the X–axis and Y–axis.

	***x*-intercepts**	***y*-intercepts**
What to determine	Values of x	Value of y
Favorable condition	at $p(x) = 0$	at $x = 0$
Restriction	but $q(x) \neq 0$, for the same x	if $q(0) \neq 0$

X-intercepts

These occur at the real zeros of the numerator, which are not the zeros of the denominator too. That is x-intercepts are the values of x when $p(x) = 0$, but $q(x) \neq 0$ for the same value of x. Graphically speaking, these are the points on the X–axis where the rational function intercepts or touches the X–axis.

Look at the given rational function, that is, original function in which you have not yet cancelled the common factors, if any, between numerator and denominator. So whenever there is a common factor between numerator and denominator of the given rational function there will be a discontinuity (either a Hole or a Vertical Asymptote) in the graph of the rational function. And, wherever, there is a Hole or a Vertical Asymptote there cannot be any x-intercept. Therefore, while finding the x-intercepts we need to be careful about the discontinuity of the graph. If there are holes and asymptotes coinciding with x-intercepts, please discard these holes and asymptotes, as they cannot be considered as the x-intercepts.

Exp. 1) Find all the x–intercepts of $\dfrac{(x+3)(x-7)}{(2x-5)}$.

Solution Fox x –intercepts $p(x) = 0$

That means $(x + 3)(x - 7) = 0$

$\Rightarrow$ $(x + 3) = 0$ or $(x - 7) = 0$ $\Rightarrow x = -3$ or $x = 7$

Therefore there are two x –intercepts namely -3 and 7.

Exp. 2) Find all the x –intercepts of

$$f(x) = \frac{(x+2)(x-1)(x-4)^2}{(x+2)^2(x-1)(x-4)}$$

Solution Given that $f(x) = \dfrac{(x+2)(x-1)(x-4)^2}{(x+2)^2(x-1)(x-4)}$

For x-intercepts, $f(x) = \dfrac{p(x)}{q(x)} = 0$, such that $p(x) = 0$. but for the same values of x $q(x) \neq 0$.

Now, we see that for $x = -2, 1, 4$ the numerator of the function is zero, but for all these values of $x = -2, 1, 4$ the denominator is also zero.

Therefore, we don't have any x-intercepts for the given function.

NOTE Since the power of $(x + 2)$ in the numerator is less than that of denominator, therefore at $x = -2$, there is a vertical asymptote.

Since the power of $(x - 4)$ in the numerator is higher than that of denominator, therefore at $x = 4$, there is a hole.

Since the power of $(x - 1)$ in the numerator is same as that of denominator, so there will be a hole in the graph at $x = 1$, but not on the X-axis.

The Y-value of the hole can be found by canceling the factors and substituting $x = 1$ in the reduced function as following.

$$y = \frac{(x-4)}{(x+2)}$$
$$= \frac{(1-4)}{(1+2)}$$
$$= \frac{-3}{3} = -1$$

Exp. 3) Find all the x- intercepts of $\dfrac{(x^2+2)(x^4+4)}{(2x-25)}$

Solution For x-intercepts $p(x) = 0$

That means $(x^2 + 2)(x^4 + 4) = 0$

$\Rightarrow$ $(x^2 + 2) = 0$ or $(x^4 + 4) = 0$

Now you can see that there are no real roots in the numerator.

Therefore there are no x-intercepts given by this function.

Exp. 4) Find all the x-intercepts of

$$f(x) = \frac{(x-3)^4(x-6)^4(x-4)(5x-8)}{(2x-5)(x-3)(x-6)^2}.$$

Solution Given that $f(x) = \dfrac{(x-3)^4(x-6)^4(x-4)(5x-8)}{(2x-5)(x-3)(x-6)^2}$

$\Rightarrow$ $f(x) = \dfrac{(x-3)^3(x-6)^2(x-4)(5x-8)}{(2x-5)}$

For x-intercepts $p(x) = 0$

That means $(x - 3)^3(x - 6)^2(x - 4)(5x - 8) = 0$

$\Rightarrow$ $(x - 3)^3 = 0$ or $(x - 6)^2 = 0$

or $(x - 4)$ or $(5x - 8) = 0$

$\Rightarrow$ $x = 3$ or $x = 6$

or $x = 4$ or $x = 8/5$

But $x = 3$ and $x = 6$ cannot be the x-intercepts, as when $x = 3$ and $x = 6$ the denominator of the given rational function becomes 0 (zero). Essentially, at $x = 3$ and $x = 6$, there are holes on the X-axis.

Thus there are only two x-intercepts namely 4 and $\dfrac{8}{5}$.

Y-intercept

This is the value of $f(0)$, if defined. Graphically speaking, this is the point on the Y-axis where the rational function intercepts the Y-axis.

Exp. 1) Find the y-intercept of $\dfrac{(x+3)(x-7)}{(2x-5)}$

Solution For y –intercept, $f(0)=\dfrac{(0+3)\times(0-7)}{(2\times0-5)}=\dfrac{21}{5}$

Therefore the y –intercept is $21/5$.

Exp. 2) Find the y –intercept of $\dfrac{(x+2)(x+1)(x-3)}{x^2(x-3)(3x+8)}$.

Solution For y-intercept $f(0)=\dfrac{(0+2)(0+1)(0-3)}{(0)^2(0-3)(3\times0+8)}=\dfrac{-6}{0}$

That means the given function is not defined at $x=0$.

Therefore there is no y-intercept for this rational function.

Exp. 3) Find the y -intercept of $\dfrac{x^2(x+7)^2(x-2)^3}{x(x^2+7)}$.

Solution For Y-intercept $f(0)=\dfrac{0(0+7)^2\times(0-2)^3}{0(0+7)}$

$$=\frac{0\times(49)(-8)}{0\times(7)}=\frac{0}{0}$$

That means the given function is not defined at $x=0$

Therefore there is no Y-intercept for this, rational function

Graphing the Rational Functions

To sketch the graph of a rational function you may need to follow the ensuing pointers in order to keep it infallible and glitch free.

1. Find the domain
2. Find the Vertical Asymptotes and holes
3. Find the Horizontal/Slant/Curvilinear asymptote
4. Find the X-intercepts and Y-intercepts
5. Find the points where graph intercepts the non-vertical asymptote
6. Finally determine where the graph will be positive or negative in different intervals to draw the graph then you can easily sketch it.

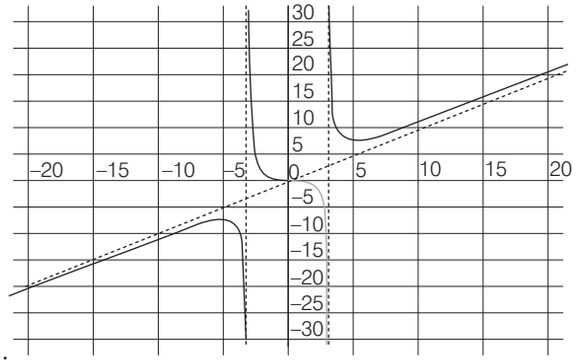
Exp. 1) Find the asymptotes, intercepts and sketch the graph of the function $f(x)=\dfrac{x^3}{x^2-9}$

Solution. Factoring the denominator, you will get the roots of the denominator –3 and 3. Consequently, $x=-3$ and $x=3$ are the vertical asymptotes of the given function $f(x)$.

The degree of the numerator is greater than the degree of the denominator by 1, so there will be a slant asymptote. Using polynomial long division, we obtain

$$f(x)=\frac{x^3}{x^2-9}=x+\frac{9x}{x^2-9}$$

So the quotient polynomial is $k(x)=x$. That is $y=x$ is a slant asymptote. The only zero (root) of the numerator is 0, as $f(0)=0$ and thus we see that the point (0,0) is the only x-intercept and the y-intercept of the graph of $f(x)$.



The graph of $f(x)$ in the above figure passes through (0,0) where $x=-3$ and $x=3$ are the vertical asymptotes and the slant asymptote is $y=x$.

Exp. 2) Find the asymptotes, intercepts and sketch the graph of the function $f(x)=\dfrac{2x+6}{x^2-2x-15}$.

Solution The given rational function can be expressed as following.

$$f(x)=\frac{2x+6}{x^2-2x-15}=\frac{2(x+3)}{(x+3)(x-5)}$$

(i) The Domain: $(-\infty,-3)\cup(-3,5)\cup(5,\infty)$. Since, at $x=-3$ and $x=5$, the given function is not defined.

(ii) Vertical Asymptotes/Holes: One asymptote is there at $x=5$. Also, there is one hole in the graph. Since the power of $(x+3)$ in the numerator is same as that of denominator, so there will be a hole in the graph at $x=-3$, but not on the X-axis. The y-value of the hole can be found by canceling out the common factors and substituting $x=-3$ in the reduced function as following.

$$y=\frac{2}{(x-5)}=\frac{2}{(-3-5)}=\frac{1}{-4}=0.25$$

(iii) Non-vertical Asymptote: Since the degree of numerator is less than that of denominator, therefore there will be a horizontal asymptote.

Then the horizontal asymptote is the X-axis itself, That is $y=0$.

(iv) X-intercepts: It is the value of x when $P(x)=0$, but $q(x)\neq0$, for the same value of x. Therefore, no x-intercept is there because at $x=-3$ the function $f(x)$ is not defined.

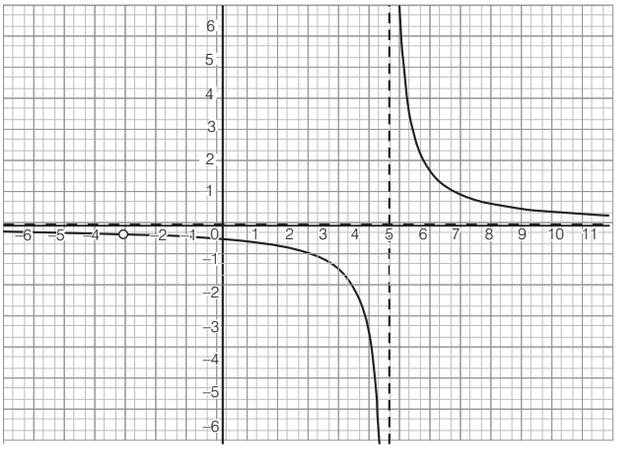
(v) Y-intercept: It is the value of y when the value of $x=0$.

Therefore y-intercept is $y=\dfrac{2(0+2)}{(0+3)(0-5)}=-\dfrac{6}{15}=-\dfrac{2}{5}$.

Thus the coordinates of y –intercept are $\left\{\dfrac{0,-2}{5}\right\}$.

(vi) Points where the graph intercepts the non-vertical asymptote: Since the horizontal asymptote is X-axis itself.

So the horizontal asymptote overlaps the X-axis. Now, since there are no x-intercepts, so there is no such point where graph intercepts the horizontal asymptote.



The above graph manifests that when $x = -3$ there is a hole in the graph at $y = -0.25$ and being a vertical asymptote at $x = 5$, the graph approaches the Y-axis but does not intercept it.

For, all the values of $x < 5$, all the values of $y < 0$ and for all the values of $x > 5$, all the values of $y > 0$.

Exp. 3) Find the asymptotes, intercepts and sketch the graph of the function $f(x) = \dfrac{x^2 - x - 6}{x - 3}$.

Solution The given rational function can be expressed as following.

$$f(x) = \frac{x^2 - x - 6}{x - 3} = \frac{(x+2)(x-3)}{(x-3)}$$

(i) The Domain: $(-\infty, 3) \cup (3, \infty)$. Since, at $x = 3$, the function is not defined.

(ii) Vertical Asymptotes/Holes: There is no vertical asymptote since after canceling out the common factors, there is no factor at all in the denominator.

$$f(x) = \frac{x^2 - x - 6}{x - 3} = \frac{(x+2)(x-3)}{(x-3)} = (x+2)$$

Since the power of $(x - 3)$ in the numerator is same as that of denominator, so there will be a hole in the graph at $x = 3$, but not on the X-axis. The value of the hole can be found by canceling out the common factors and substituting $x = 3$ in the reduced function as following.

$$y = (x+2) = (3+2) = 5$$

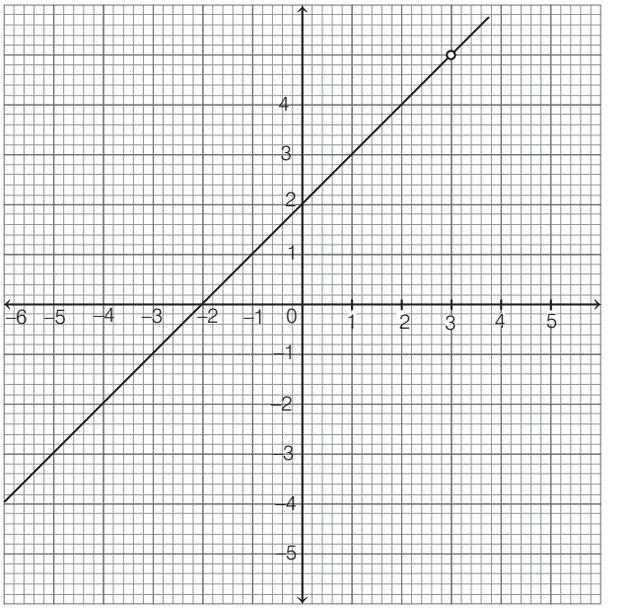
(iii) Non-vertical Asymptote: Since the degree of numerator is one more than the denominator, therefore the graph will experience a slant asymptote, not the horizontal one.

The value of the slant asymptote is equal to the quotient of the function when numerator is divided by the denominator. So, the quotient $= (x + 2)$. Therefore, the slant asymptote is also $y = (x + 2)$.

(iv) X-intercepts: It is the value of x when $p(x) = 0$, but $q(x) \neq 0$, for the same value of x. Therefore x-intercept is obtained at $x = -2$. Thus the coordinates of x-intercept are $\{-2, 0\}$.

(v) Y-intercept: It is the value of y when the value of $x = 0$. Therefore y-intercept is $y = (0 + 2) = 2$. Thus the coordinates of y-intercept are $\{0, 2\}$.

(vi) Points where the graph intercepts the non-vertical asymptote: Since the reduced function is same as the equation for slant asymptote, it implies that the graph of the given function will overlap the slant asymptote.



The only difference between the slant asymptote of the rational function and the rational function itself is that the rational function isn't defined at $x = 3$. To account for this, you have to leave an open circle in the graph corresponding to the point $x = 3$, which indicates that this point is not actually included on the graph, because of the zero in the denominator of the rational.

Exp. 4) Find the asymptotes, intercepts and sketch the graph of the function $f(x) = \dfrac{x^3 - 4x}{x^2 - 4x + 4}$.

Solution The given rational function can be expressed as following.

$$f(x) = \frac{x^3 - 4x}{x^2 - 4x + 4} = \frac{x(x+2)(x-2)}{(x-2)^2}$$

(i) The domain: $(-\infty, 2) \cup (2, \infty)$. Since, at $x = 2$, the given function is not defined.

(ii) Vertical Asymptotes/Holes: There is one vertical asymptote $x = 2$

(iii) Non-vertical Asymptote: Since the degree of numerator is one more than the denominator, therefore the graph will experience a slant asymptote, not the horizontal one.

The value of the slant asymptote is equal to the quotient of the function when numerator is divided by the denominator. Since

$$x^3 - 4x = (x^2 - 4x + 4)(x + 4) + (8x - 16),$$

so, the quotient is $(x + 4)$. Therefore, the slant asymptote is also $y = (x + 4)$.

(iv) X-intercepts: It is the value of x when $p(x) = 0$, but $q(x) \neq 0$, for the same value of x. Therefore x-intercept is obtained at $x = 0$ and $x = -2$. Thus the coordinates of x-intercept are $\{0,0\}$ and $\{-2,0\}$.

(v) Y-intercept: It is the value of y when the value of $x = 0$. Therefore y-intercept is

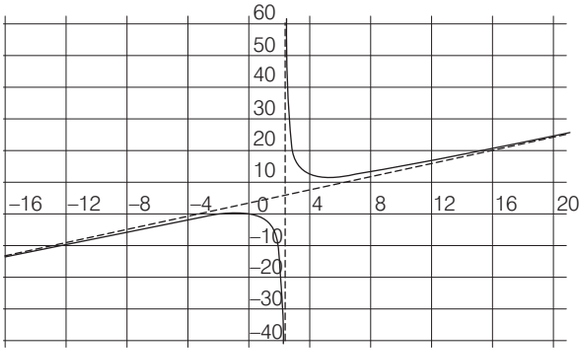
$$y = [0(0+2)(0-2)] / [(0-2)(0-2) = 0.$$

Thus the coordinates of y-intercept are $\{0,0\}$.

(vi) Points where the graph intercepts the non-vertical asymptote: To determine such points you need to equate the given function with the equation of slant asymptote.

Then $\dfrac{x^3 - 4x}{x^2 - 4x + 4} = x + 4$

Since you don't get any solution here, it shows that the graph never intersects the slant asymptote.



Exp. 5) Find the asymptotes, intercepts and sketch the graph of the function $f(x) = \dfrac{x^2 + 9}{x^2 - 6x + 9}$

Solution The given rational function can be expressed as following $f(x) = \dfrac{x^2 + 9}{x^2 - 6x + 9} = \dfrac{x^2 + 9}{(x - 3)^2}$

(i) The domain: $(-\infty, 3) \cup (3, \infty)$. Since, at $x = 3$, the given function is not defined.

(ii) Vertical Asymptotes/Holes: There is one vertical asymptote $x = 3$.

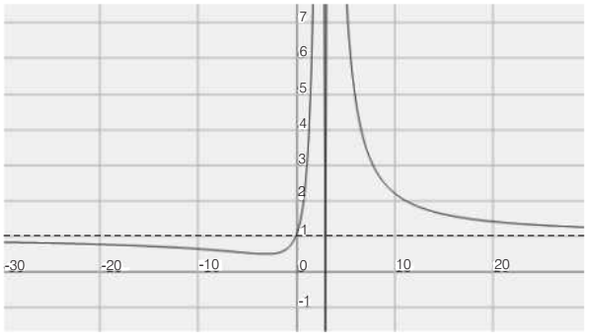
(iii) Non-vertical Asymptote: Since the degree of numerator and denominator is same, therefore there will be a horizontal asymptote $y = 1$.

(iv) X-intercepts: It is the value of x when $p(x) = 0$, but $q(x) \neq 0$, for the same value of x. Now, when $x^2 + 9 = 0$, you won't get the real roots, so there won't be any x-intercept by this graph.

(v) Y-intercept: It is the value of y when the value of $x = 0$. Therefore y-intercept is $y = 9 / 9 = 1$. Thus the coordinates of y-intercept are $\{0, 1\}$.

(vi) Points where the graph intercepts the non-vertical asymptote: To determine such points you need to equate the given function with the equation of horizontal asymptote. Then $\dfrac{x^2 + 9}{x^2 - 6x + 9} = 1 \Rightarrow x = 0$

Therefore the graph of the given function will intercept the horizontal asymptote at $\{0,1\}$.



Please mind the fact that this rational function has two non-real roots and no real roots. That's why in the absence of any real root the graph does not have any x-intercepts.

Exp. 6) Find the asymptotes, intercepts and sketch the graph of the function $f(x) = \dfrac{x^2 - 4}{x^3 - 4x^2}$.

Solution The given rational function can be expressed as following $f(x) = \dfrac{x^2 - 4}{x^3 - 4x^2} = \dfrac{(x+2)(x-2)}{x^2(x-4)}$

(i) The domain: $(-\infty, 0) \cup (0,4) \cup (4, \infty)$. Since, at $x = 0, 4$ the given function is not defined.

(ii) Vertical Asymptotes/Holes: There are two vertical asymptotes $x = 0$ and $x = 4$.

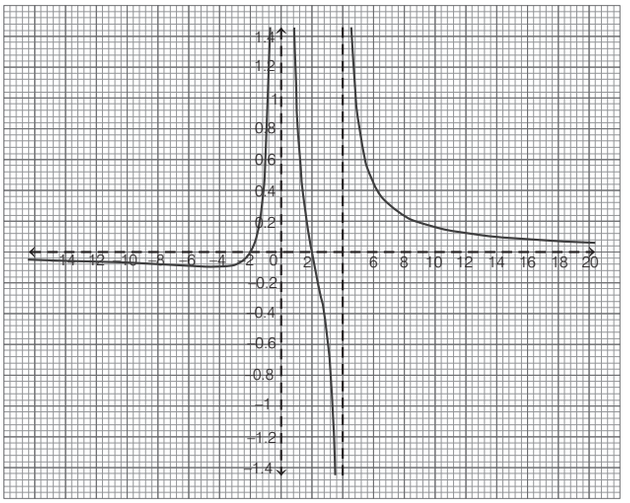
(iii) Non-vertical Asymptote: Since the degree of numerator is less than that of denominator, therefore there will be a horizontal asymptote $y = 0$.

(iv) X-intercepts: It is the value of x when $p(x) = 0$, but $q(x) \neq 0$, for the same value of x. Therefore x-intercept is obtained at $x = -2$ and $x = 2$. Thus the coordinates of X-intercept are $\{-2,0\}$ and $\{2, 0\}$.

(v) Y-intercept: It is the value of y when the value of $x = 0$. Since at $x = 0$, the function is not defined, therefore there won't be any y-intercept.

(vi) Points where the graph intercepts the non-vertical asymptote: To determine such points you need to equate the given function with the equation of horizontal asymptote.

Then $\dfrac{x^2 - 4}{x^3 - 4x^2} = 0 \Rightarrow x = \pm 2$



Therefore the graph of the given function will intercept the horizontal asymptote at {0,−2} and {0, 2}.

Exp. 7) Find the asymptotes, intercepts and sketch the graph of the function $f(x) = \dfrac{x^3 + 2x^2 - 59x - 168}{x - 5}$

Solution The given rational function can be expressed as following

$$f(x) = \frac{x^3 + 2x^2 - 59x - 168}{x - 5} = \frac{(x+3)(x+7)(x-8)}{(x-5)}$$

(i) The domain: $(-\infty, 5) \cup (5, \infty)$. Since, at $x = 5$ the given function is not defined.

(ii) Vertical Asymptotes/Holes: There is one vertical asymptote $x = 5$.

(iii) Non-vertical Asymptote: Since the degree of numerator is 2 more than that of denominator, therefore there will be a curvilinear asymptote. Now since

$$f(x) = \frac{x^3 + 2x^2 - 59x - 168}{x - 5} = (x^2 + 7x - 24) + \frac{-288}{(x-5)}$$

Therefore the curvilinear asymptote is $y = x^2 + 7x - 24$.

(iv) *X*-intercepts: It is the value of x when $p(x) = 0$, but $q(x) \neq 0$, for the same value of x .

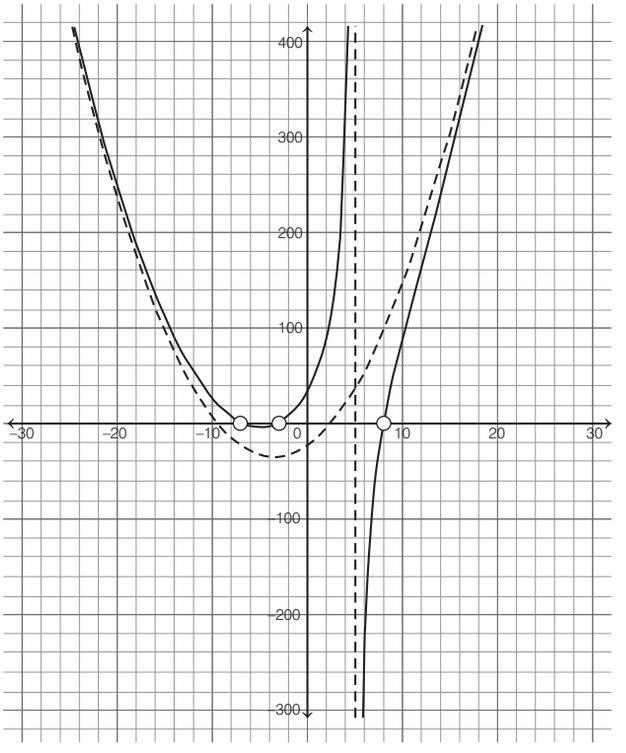
Therefore x-intercept is obtained at $x = -3, x = -7$ and $x = 8$. Thus the coordinates of x-intercept are $\{-3, 0\}, \{-7, 0\}$ and $\{8, 0\}$.

(v) *Y*-intercept: It is the value of y when the value of $x = 0$. Therefore the y-intercept is 168/5. And so the respective coordinates are {0, 168/5}.

(vi) Points where the graph intercepts the horizontal/slant/curvilinear asymptote: To determine such points you need to equate the given function with the equation of horizontal asymptote.

Then $$\frac{x^3 + 2x^2 - 59x - 168}{x - 5} = x^2 + 7x - 24$$

There is no solution for the above equation. Therefore the graph of the given function does not intercept the curvilinear asymptote.



Practice Exercise

1. Which of the following is not true about the features of a rational function?

(i) Can be written as a polynomial over polynomial (like a fraction)

(ii) Variables do not have fractional or imaginary exponents

(iii) A variable must at least be in the denominator of a ratio

(iv) Variables cannot be exponents themselves

(v) Variables cannot exist within absolute value delimiters

(vi) Variables cannot be applied to a trigonometric function

(a) (i) and (iii) (b) (iv) and (vi)

(c) (ii) and (v) (d) none of these

2. Which of the following is not true regarding a rational function?

(a) The equation of vertical asymptote is $x = k$, for some constant k

(b) The equation of horizontal asymptote is $y = k$, for some constant k

(c) The equation of slant asymptote is $y = mx + c$, for some constants m and c

(d) There can't be both the vertical and horizontal asymptotes together

3. Which of the following is not true regarding a rational function?

(a) There can be only one of the asymptotes, either horizontal or slant or curvilinear at a time

(b) It's not necessary that there is always a non-vertical asymptote

(c) There cannot be more than one non-vertical asymptote

(d) The rational graph cannot intersect a non-vertical asymptote

4. Which of the following is true for the following rational function?

$$f(x) = \frac{8x^7 - 32x^6 + 3x^5 - 12x^4 - 10x + 40}{2x^2 - 32}$$

(a) There is one vertical asymptote at $x = -4$

(b) The horizontal asymptote is $y = 4$.

(c) The slant asymptote is $y = 7/2$.

(d) There are two vertical asymptotes.

5. Which of the following is correct for the rational function

$$f(x) = \frac{3x^2 + 27x + 25}{3x + 4}$$

(a) The horizontal asymptote is y = 0

(b) The slant asymptote is $y - 1 = 0$

(c) The vertical asymptote is y = – 4/3

(d) The slant asymptote is x + 7.

6. The number of times the graph intercepts the horizontal asymptote of the following function.

$$f(x) = \frac{(x^2 - 4)(x^2 - 25)}{x^5(x^2 - 4x)}$$

(a) 0 (b) 1

(c) 4 (d) none of these

7. Which of the following is/are always true regarding a polynomial rational function?

(i) There is no need to know about the numerator since y-intercepts can be determined just by finding all the zeros of denominator.

(ii) All the roots of the numerator yield the x-intercepts of the rational function.

(iii) In case of the X-axis acting as the horizontal asymptote and you know the x-intercepts, then there is no need to further work out the points of interception between the graph and the horizontal asymptote as they are already known.

(iv) There is at most one point of interception between the graph of the rational function and horizontal/slant/curvilinear asymptote.

(v) Whenever the X-axis acts as a horizontal asymptote there would not be any x-intercept.

(a) Only (iv) (b) (ii) and (v)

(c) (i), (ii) and (iv) (d) Only (iii)

8. Which of the following is/are never true about the rational function?

(i) Wherever there is no domain there is either a vertical asymptote or a hole in the graph.

(ii) All the critical points either have x-intercept or vertical asymptote or a hole in the graph.

(iii) Wherever there is no domain there are vertical asymptotes and holes together for the same value of x.

(iv) Union of all the roots of numerator and denominator forms the set of critical numbers.

(v) A rational graph may intercept or touch the X-axis at $x = k$, even when there is a hole on the X-axis at $x = k$.

(a) (iv) and (v) (b) (iii), (iv) and (v)

(c) (i), (ii) and (iii) (d) (ii) and (iii)

9. For the following rational function which one of the given statements is/are incorrect?

$$f(x) = \frac{(x-1)(x-3)^2(x-7)^3}{(x-1)^3(x-3)^2(x-7)}$$

(i) Domain does not include $x = 1, 3$ and 7.

(ii) Critical points are $x = 1, 3, 7$

(iii) The only vertical asymptote is $x = 1$

(iv) There is one hole in the graph at $x = 7$ and another hole is at $\{x, y\} = \{3, 4\}$

(v) There is only one root or one x-intercepts at $x = 7$.

(vi) There is one horizontal asymptote $y = 1$.

(vii) The y-intercept is $y = 49$.

(a) (iii) and (iv)

(b) (v) and (vii)

(c) (iv) and (v)

(d) (v)

10. There are six different rational functions as shown below.

$$f(x) = \frac{x^2}{x}, g(x) = \frac{x}{x}, h(x) = \frac{x}{x^2}$$

$$j(x) = \frac{x^4 - 16}{x^2 + 4}, k(x) = \frac{x^2 + 4}{x^2 + 4}$$

$$l(x) = \frac{x^2 + 4}{x^4 - 16}$$

The following table gives the facts from (i) to (x) regarding the above functions. How many facts are correct for all the functions?

Facts	$f(x)$	$g(x)$	$h(x)$	$j(x)$	$k(x)$	$l(x)$
(i) Domain	$R - \{0\}$	$R - \{0\}$	$R - \{0\}$	R	R	$R - \{-2,2\}$
(ii) Critical points	0	0	0	$-2, 2$	No	$-2, 2$

(iv) Holes	$x = 0$ $\{x, y\} = \{0,1\}$		No	No	No	No
(v) Roots	No	No	No	$-2, 2, \pm 2i$	No	No
(vi) x-intercepts	No	No	No	$-2, 2, \pm 2i$	No	No
(vii) Horizontal asymptote	No	$y = 1$	$y = 0$	No	$y = 1$	$y = 0$
(viii) Slant asymptote	$y = x$	No	No	No	No	No
(ix) Curvilinear asymptote	No	No	No	$x^2 - 4$	No	No
(x) y-intercept $\{x, y\}$	No	No	No	$\{0,-4\}$	$\{0,1\}$	$\{0,-1/4\}$

(a) 6

(b) 7

(c) 8

(d) 10

11. There are some facts presented in the table regarding three different rational functions.

	Function $f(x)$	**Function** $g(x)$	**Function** $h(x)$
Critical points	$-5/2, -5/3$	$2/3, 3/5$	$-9, 0, 1, 6$
Domain	$R - \{-5/2, -5/3\}$	$R - \{2/3\}$	$R - \{-9, 0, 1\}$
Vertical asymptotes	$x = -5/2$	No	$x = \{-9, 1\}$
Holes	$x = -5/3$	$\{x, y\} = \{2/3, 1/242\}$	$x = 0$
Roots	$\pm 4i$	$3/5$	6
X-intercepts	No	$3/5$	6
Horizontal asymptote	$y = 0$	$y = 125$	No
Slant asymptote	No	No	No
Curvilinear asymptote	No	No	$y = x^2 - 5x - 14$
Y-intercept	4	$3/2$	No

Which of the following functions represent the given description correctly?

(a) $f(x) = \dfrac{(2x+5)(3x+5)^2(x^2+16)}{(3x+5)(2x+5)^3(x^4+64)}$,

$g(x) = \dfrac{(3x-2)(5x-3)^5}{(3x^4+34)(3x-2)}$, $h(x) = \dfrac{x^7 - 7x^6 + 6x^5}{(x^4 + 9x^3)(x-1)^2}$

(b) $f(x) = \dfrac{(2x+5)^2(3x+5)^2(x^2+16)^2}{(3x+5)(2x+5)^3(x^4+4)}$,

$g(x) = \dfrac{(3x-2)^3(5x-3)^4}{(4x^4+4)(3x-2)}$, $h(x) = \dfrac{x^7 - 7x^6 + 6x^5}{(x^3 + 9x^2)(x-1)}$

(c) $f(x) = \dfrac{(2x+5)(3x+5)^2(x^2+16)}{(3x+5)(2x+5)^2(x^4+4)}$,

$g(x) = \dfrac{(3x-2)(5x-3)^4}{(5x^4+54)(3x-2)}$,

$h(x) = \dfrac{x^7 - 7x^6 + 6x^5}{(x^3 + 9x^2)(x-1)^2}$

(d) $f(x) = \dfrac{(2x-5)(3x-5)^2(x^2-16)}{(3x+5)(2x+5)^2(x^4+4)}$,

$g(x) = \dfrac{(3x+2)(5x-3)^4}{(5x^4+54)(3x+2)}$, $h(x) = \dfrac{x^7 - 7x^6 - 6x^5}{(x^3 + 9x^2)(x-1)^2}$

14.19 Rational Polynomial Inequalities

There are four different ways of representing the rational polynomial inequations:

(i) $\frac{p(x)}{q(x)} > 0$ (ii) $\frac{p(x)}{q(x)} \geq 0$

(iii) $\frac{p(x)}{q(x)} < 0$ (iv) $\frac{p(x)}{q(x)} \leq 0$

Here $p(x)$ and $q(x)$ are polynomials of same or varying degrees:

Solving Rational Inequalities

1. First of all bring all the values towards the left side of the inequality sign and leave just 0 in the right side.
2. Now, simplify all the terms in the left side of the inequality sign making a single rational function.
3. Now what you need to do is to factorize numerator and denominator, assuming that the numerator and denominator each are equal to 0; and determine the critical points. Critical points are all those points which are either the real roots of the rational function or the points on the X-axis where the rational function is not defined.
4. Then mark all the critical points on the number line in the conventional order, which in turn these critical points will create intervals.
5. Now test these intervals for signs; which intervals give positive and which ones give negative values.
6. If your inequality is positive, choose all the positive intervals and if it is negative inequality, choose the negative intervals. And then combine all such desired intervals.
7. Do not forget to consider the limit of the interval; if it's a strict inequality, do not include limits of the interval and if it's not a strict inequality, include the limits of the interval.

NOTE Coincidently, you may notice that a critical point has alternating signs on the different sides of it. However, it is very uncommon in the rational functions. So make sure that you have tested the sign in each interval before concluding the results.

Exp. 1) Find the values of x which satisfy this rational inequation $\frac{x+5}{x-6} \leq 0$

Solution. The critical points of this rational function are -5 and 6.

After arranging the critical points on the number line, we are now supposed to test the sign in each interval.

Let us assume $x = -10$, then $\frac{x+5}{x-6} = \frac{-10+5}{-10-6} = \frac{5}{4}$

Therefore the given function is positive for the first interval. Again let us assume $x = 0$, then

$$\frac{x+5}{x-6} = \frac{0+5}{0-6} = -\frac{5}{6}$$

Therefore the given function is negative for the second interval. Now let us assume $x = 10$, then $\frac{x+5}{x-6} = \frac{10+5}{10-6} = \frac{15}{4}$

Therefore the given function is positive for the third and last interval. Since, our inequality is non-positive so we will not consider the first and the third intervals. Further since it's not a strict inequality, so we have to include the boundary values in the interval.

Therefore the required values of x are $[-5, 6)$ or $-5 \leq x < 6$.

NOTE Since at $x = 6$, the rational function is undefined so we cannot say that whether the function will be positive or negative. Therefore it's better to ignore this boundary value from the interval consideration. However at $x = 5$ the given function is zero, which is acceptable by the inequality so we have to include it.

Exp. 2) Find the values of x which satisfy this rational inequation $\frac{5}{x+3} < \frac{-3}{x-1}$.

Solution. The given inequality can be simplified as shown below.

$$\frac{5}{x+3} < \frac{-3}{x-1} \Rightarrow \frac{5}{x+3} + \frac{3}{x-1} < 0 \Rightarrow \frac{4(2x+1)}{(x+3)(x-1)} < 0$$

The critical points of this rational function are $-\frac{1}{2}$, -3 and 1.

After arranging the critical points on the number line, we are now supposed to test the sign in each interval.

Let us assume $x = -5$, then

$$\frac{4(-10+1)}{(-5+3)(-5-1)} = -3$$

Therefore the given function is negative for the first interval.

Again let us assume $x = -2$, then $\frac{4(-4+1)}{(-2+3)(-2-1)} = 4$

Therefore the given function is positive for the second interval.

Now let us assume $x = 0$, then $\frac{4(0+1)}{(0+3)(0-1)} = \frac{-4}{3}$

Therefore the given function is negative for the third interval.

Finally let us assume $x = 2$,

then $\frac{4(4+1)}{(2+3)(2-1)} = 4$

Therefore the given function is positive for the fourth and last interval.

Since, our inequality is negative so we will consider the first and the third intervals only. Further since it's a strict inequality, so we have to exclude the boundary values from the interval.

Therefore the required values of x are

$$(-\infty,-3) \cup \left(-\frac{1}{2},1\right)$$

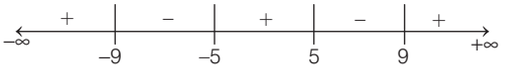
Exp. 3) Find the values of x which satisfy this rational inequation $\frac{x^2-81}{x^2-25} \le 0$.

solution The given inequality can be simplified as shown below.

$$\frac{x^2-81}{x^2-25} \le 0$$

$$\Rightarrow \quad \frac{(x+9)(x-9)}{(x+5)(x-5)} \le 0$$

The critical points of this rational function are -9, 9, -5, and 5.



Now testing each of the 5 intervals we get the results as shown in the above number line.

Here we need non-positive intervals so we exclude all the positive intervals and combine the others keeping in mind the restriction on limits of the intervals.

Therefore the valid values of x are $[-9,-5) \cup (5, 9]$.

NOTE The critical points -5, 5 are not included in the domain since the function is not defined there and -9, 9 are included since they satisfy the given relation.

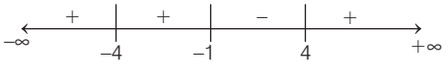
Exp. 4) Find the values of x which satisfy this rational inequation $\frac{x^2+5x+4}{x^2-16} \ge 0$.

Solution The given inequality can be simplified as shown below.

$$\frac{x^2+5x+4}{x^2-16} \ge 0$$

$$\Rightarrow \quad \frac{(x+4)(x+1)}{(x+4)(x-4)} \ge 0$$

The critical points of this rational function are -4,-1, and 4.



Now testing each of the 4 intervals we get the results as shown on the above number line.

Here we need non-negative intervals so we exclude all the negative intervals and combine the others keeping in mind the restriction on limits of the intervals. Therefore the valid values of x are

$$(-\infty,-4) \cup (-4,-1] \cup (4,\infty)$$

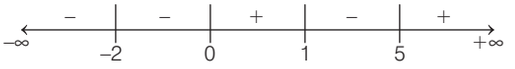
NOTE The critical points -4, 4 are not included in the domain since the function is not defined there and -1 is included since it satisfies the given relation.

Exp. 5) Find the values of x which satisfy this rational inequation $\frac{x^3+4x^2+4x}{x^2-6x+5} > 0$.

Solution The given inequality can be simplified as shown below.

$$\frac{x^3+4x^2+4x}{x^2-6x+5} > 0 \Rightarrow \frac{x(x+2)^2}{(x-1)(x-5)} > 0$$

The critical points of this rational function are -2, 0,1, and 5.



Now testing each of the 4 intervals we get the results as shown on the above number line.

Here we need positive intervals so we exclude all the negative intervals and combine the others keeping in mind the restriction on limits of the intervals.

Therefore the valid values of x are $(0, 1) \cup (5, \infty)$.

NOTE The critical points -1 and 5 are not included in the domain since the function is not defined there and the critical point 0 is also not included because there is a strict in equality.

Exp. 6) Solve the rational inequality

$$\frac{x-2}{x+2} > \frac{2x-3}{4x-1}$$

Solution The given inequality can be simplified as shows below

$$\frac{x-2}{x+2} > \frac{2x-3}{4x-1}$$

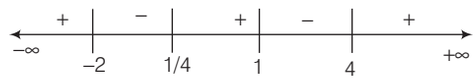
$$\Rightarrow \quad \frac{x-2}{x+2} - \frac{2x-3}{4x-1} > 0$$

$$\text{or} \quad \frac{(x-2)(4x-1)-(x+2)(2x-3)}{(x+2)(4x-1)} > 0$$

$$\text{or} \quad \frac{2(x^2-5x+4)}{(x+2)(4x-1)} > 0$$

$$\text{or} \quad \frac{2(x-1)(x-4)}{(x+2)(4x-1)} > 0$$

The critical points of this rational function are -2, $\frac{1}{4}$, 1 and 4.



Now testing each of the 5 intervals we get the results as shown on the above number line.

Here we need positive intervals so we exclude all the negative intervals and combine the others keeping in mind the restriction on limits of the intervals.

Therefore the valid values of x are $(-\infty, -2) \cup \left(\frac{1}{4}, 1\right) \cup (4, \infty)$.

NOTE The critical points -2 and 1/4 are not included in the domain since the function is not defined there. And, the critical point 1 and 4 are also not included because there is a strict inequality.

***Exp.* 7)** Determine the range of values of x for which $\frac{x^2-2x+5}{3x^2-2x-5} > \frac{1}{2}$.

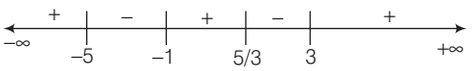
Solution The given inequality can be simplified as shown below

$$\frac{x^2-2x+5}{3x^2-2x-5} > \frac{1}{2} \quad \text{or} \quad \frac{x^2-2x+5}{3x^2-2x-5} - \frac{1}{2} > 0$$

or $\quad \frac{-x^2-2x+15}{3x^2-2x-5} > 0 \quad \Rightarrow \quad \frac{x^2+2x-15}{3x^2-2x-5}$

or $\quad \frac{(x+5)(x-3)}{(x+1)(3x-5)} < 0$

The critical points of this rational function are $-5, -1, \frac{5}{3}$ and 3.



Now testing each of the 5 intervals we get the results as shown on the above number line.

Here we need the negative intervals so we exclude all the positive intervals and combine the others keeping in mind the restriction on limits of the intervals. Therefore the valid values of x are $(-5, -1) \cup \left(\frac{5}{3}, 3\right)$

NOTE The critical points–1 and 5/3 are not included in the domain since the function is not defined there. And, the critical point –5 and 3 are also not included because there is a strict inequality.

***Exp.* 8)** Find all the real values of x for which

$$\frac{x-1}{(4x+5)} < \frac{x-3}{4x-3}.$$

Solution The given inequality can be simplified as shown below $\frac{x-1}{4x+5} < \frac{x-3}{4x-3} \Rightarrow \frac{x-1}{4x+5} - \frac{x-3}{4x-3} < 0$

$$\Rightarrow \quad \frac{(x-1)(4x-3)-(x-3)(4x+5)}{(4x-3)(4x+5)} < 0$$

or $\quad \frac{(4x^2-7x+3)-(4x^2-7x-15)}{(4x+5)(4x-3)} < 0$

or $\quad \frac{18}{(4x+5)(4x-3)} < 0$

The critical points of this rational function are $-5/4$ and $3/4$.

Now testing each of the 3 intervals we get the results as shown on the above number line.

Here we need the negative intervals so we exclude all the positive intervals and combine the others keeping in mind the restriction on limits of the intervals.

Therefore the valid values of x are $\left(-\frac{5}{4}, \frac{3}{4}\right)$.

NOTE The critical points –5/4 and 3/4 are not included in the domain since the function is not defined there.

Practice Exercise

Directions (for Q. Nos. 1 to 3) *Find the values of x for which of the following equations are satisfied.*

1. $\frac{x^2+4x+3}{x-1} > 0$ **2.** $\frac{x^2-16}{(x-1)^2} < 0$

3. $\frac{x-8}{x} + x \le 3$

Answers

1. $(-3,-1) \cup (1,\infty)$ **2.** $(-4,1) \cup (1, 4)$

3. $(-\infty, 2] \cup (0, 4]$

14.20
Maximum and Minimum Value of a Rational Expression

Exp. 1) For any real value of x, find the minimum value of the rational expression $\frac{x^2+x+1}{x^2-x+1}$.

(a) –1 / 6 (b) 1/3

(c) 2/9 (d) 1

Solution Let $\frac{x^2+x+1}{x^2-x+1} = k$

$\Rightarrow \quad x^2+x+1 = k(x^2-x+1) \Rightarrow (1-k)\,x^2+(1+k)x+(1-k) = 0$

Since x is a real number, so the discriminant $D \ge 0$. That is

$$(1+k)^2 - 4(1-k)(1-k) \ge 0$$

$\Rightarrow \quad -3k^2+10k-3 \ge 0 \Rightarrow 3k^2-10k+3 \le 0$

$\Rightarrow \quad (k-3)(3k-1) \le 0$

$\Rightarrow \quad \frac{1}{3} \le k \le 3$

Hence the minimum value of the given expression is 1/3.

Exp. 2) If x be real, find the maximum value of $\frac{(x+2)}{(2x^2+3x+6)}$.

Solution Let $y = \frac{x+2}{2x^2+3x+6}$

then $\quad 2x^2y + (3y-1)x + 6y - 2 = 0$

For x to be real, $(3y-1)^2 - 8y(6y-2) \ge 0$

or $(1+13y)(1-3y) \ge 0$ or $(13y+1)(3y-1) \le 0$

Putting each factor equal to zero, we get $y = -\frac{1}{13}, \frac{1}{3}$

If $\quad y < -\frac{1}{13}, \quad (1+13y)(1-3y) < 0$

If $\quad -\frac{1}{13} < y < \frac{1}{3}, \quad (1+13y)(1-3y) > 0$

If $\quad y > \frac{1}{3}, \quad (1+13y)(1-3y) < 0$

Thus, y will lie between $-\frac{1}{13}$ and $\frac{1}{3}$.

Hence the maximum value of y is $\frac{1}{3}$ and minimum value is $-\frac{1}{13}$.

Exp. 3) If x is real, prove that the value of the expression $\frac{(x-1)(x+3)}{(x-2)(x+4)}$ cannot be between $\frac{4}{9}$ and 1.

Solution Let $\frac{(x-1)(x+3)}{(x-2)(x+4)} = y$, then $x^2 + 2x - 3 = y(x^2 + 2x - 8)$

or $x^2(1-y) + 2x(1-y) + (8y-3) = 0$

For x to be real, its discriminant $D \geq 0$

or $[2(1-y)]^2 - 4(1-y)(8y-3) \geq 0$

or $(1-y)(4-9y) \geq 0$ or $(1-y)\left(\frac{4}{9} - y\right) \geq 0$

It shows that $(1-y)$ and $(4/9 - y)$ should be of the same sign.

$\therefore$ we get $y = \frac{4}{9}, 1$

If $y < \frac{4}{9}$, $(1-y)\left(\frac{4}{9} - y\right) > 0$

If $\frac{4}{9} < y < 1$, $(1-y)\left(\frac{4}{9} - y\right) < 0$

If $y > 1$ $(1-y)\left(\frac{4}{9} - y\right) > 0$

Hence for x to be real, y,(*i.e.,* the value of the given expression) cannot lie between $\frac{4}{9}$ and 1.

Introductory *Exercise 14.1*

Directions (for Q. Nos. 1 to 12) *Find the roots of the following equations.*

1. $15x^2 - 7x - 36 = 0$:

(a) $\frac{5}{9}, -\frac{4}{3}$ (b) $\frac{9}{5}, -\frac{4}{3}$

(c) $\frac{9}{5}, -\frac{3}{4}$ (d) none of these

2. $\sqrt{7}y^2 - 6y - 13\sqrt{7} = 0$:

(a) $\sqrt{7}, 2\sqrt{7}$ (b) $3, \frac{2}{\sqrt{7}}$

(c) $\frac{13}{\sqrt{7}}, -\sqrt{7}$ (d) none of these

3. $6x^2 + 40 = 31x$:

(a) $\frac{3}{8}, \frac{2}{5}$ (b) $\frac{3}{8}, \frac{3}{2}$ (c) $0, \frac{8}{3}$ (d) $\frac{8}{3}, \frac{5}{2}$

4. $6\left(\frac{y-3}{2y+1}\right) + 1 = 5\sqrt{\frac{y-3}{2y+1}}, y \neq \frac{1}{2}$:

(a) $4, \frac{13}{2}$ (b) $4, \frac{11}{2}$

(c) $\frac{13}{2}, \frac{9}{2}$ (d) none of these

5. $(x+2)(x-5)(x-6)(x+1) = 144$:

(a) $-1, -2, -3$ (b) $7, -3, 2$

(c) $2, -3, 5$ (d) none of these

6. $\sqrt{x+5} + \sqrt{x+21} = \sqrt{6x+40}$:

(a) 1 (b) 2 (c) 4 (d) 6

7. $2\left(x^2 + \frac{1}{x^2}\right) - 3\left(x + \frac{1}{x}\right) - 1 = 0$:

(a) $2, \frac{1}{2}$ (b) $-2, 4$ (c) $2, \frac{3}{2}$ (d) none

8. $\sqrt{\frac{x}{1-x}} + \sqrt{\frac{1-x}{x}} = \frac{13}{6}$:

(a) $\frac{13}{4}, 5$ (b) $\frac{4}{13}, \frac{9}{13}$ (c) $\frac{4}{13}, 6$ (d) none

9. $\sqrt{2x^2 - 2x + 1} - 2x + 3 = 0$:

(a) 2 (b) 3 (c) 4 (d) 5

10. $\sqrt{x^2 - 9x + 20} - \sqrt{x^2 - 12x + 32} = \sqrt{2x^2 - 25x + 68}$:

(a) 4, 9 (b) 3, 9 (c) 2, 4 (d) 2, 6

11. $\left(x - \frac{1}{x}\right)^2 + 8\left(x + \frac{1}{x}\right) = 29, x \neq 0$:

(a) $-5, 4$ (b) 3, 2

(c) 1, 3 (d) $\frac{3+\sqrt{5}}{2}, \frac{-11 \pm 3\sqrt{13}}{2}$

12. $\left(\frac{1}{x+1} + \frac{1}{x+5}\right) = \left(\frac{1}{x+2} + \frac{1}{x+4}\right)$:

(a) 7 (b) -3 (c) -5 (d) 4

13. Determine k such that the quadratic equation $x^2 + 7(3 + 2k) - 2x(1 + 3k) = 0$ has equal roots :

(a) 2, 7 (b) 7, 5

(c) $2, \frac{-10}{9}$ (d) none of these

14. Discriminant of the equation $-3x^2 + 2x - 8 = 0$ is :

(a) -92 (b) -29 (c) 39 (d) 49

15. The nature of the roots of the equation $x^2 - 5x + 7 = 0$ is

(a) no real roots (b) 1 real root

(c) can't be determined (d) none of these

16. The roots of $a^2x^2 + abx = b^2, a \neq 0$ are :

(a) equal (b) non-real

(c) unequal (d) none of these

17. The equation $x^2 - px + q = 0, p, q \in R$ has no real roots if:

(a) $p^2 > 4q$ (b) $p^2 < 4q$

(c) $p^2 = 4q$ (d) none of these

18. Determine the value of k for which the quadratic equation $4x^2 - 3kx + 1 = 0$ has equal roots :

(a) $\pm\left(\frac{2}{3}\right)$ (b) $\pm\left(\frac{4}{3}\right)$ (c) ± 4 (d) ± 6

19. Find the value of k such that the equation $x^2 - (k + 6)x + 2(2k - 1) = 0$ has sum of the roots equal to half of their product
(a) 3 (b) 4 (c) 7 (d) 10

20. Find the value of k so that the sum of the roots of the quadratic equation is equal to the product of the roots :
$$(k + 1)x^2 + 2kx + 4 = 0$$
(a) –2 (b) –4 (c) 6 (d) 8

21. If –4 is a root of the quadratic equation $x^2 - px - 4 = 0$ and the quadratic equation $x^2 - px + k = 0$ has equal roots, find the value of k :
(a) 9/4 (b) 1
(c) 2.5 (d) 3

22. Find the value of k such that the sum of the squares of the roots of the quadratic equation $x^2 - 8x + k = 0$ is 40 :
(a) 12 (b) 2 (c) 5 (d) 8

23. Find the value of p for which the quadratic equation $x^2 + p(4x + p - 1) + 2 = 0$ has equal roots :
(a) $-1, \frac{2}{3}$ (b) 3, 5 (c) $1, -\frac{4}{3}$ (d) $\frac{3}{4}, 2$

24. If α and β are the roots of the equation $3x^2 + 7x + 3 = 0$ Find the value of $\alpha\beta$:
(a) 1 (b) 0
(c) 2 (d) 3

25. If α and β are the roots of the equation $x^2 - 3x + 2 = 0$. Find the quadratic equation whose roots are $-\alpha$ and $-\beta$
(a) $x^2 - 3x + 2 = 0$ (b) $x^2 + 3x + 2 = 0$
(c) $x^2 + 3x - 2 = 0$ (d) none of these

26. Find the quadratic equation whose roots are $\sqrt{3}$ and $2\sqrt{3}$:
(a) $x^2 + 3\sqrt{3}x - 6 = 0$ (b) $x^2 - 3\sqrt{3}x + 6 = 0$
(c) $x^2 + 3\sqrt{3}x + 5 = 0$ (d) none of these

27. If α and β are the roots of equation $6x^2 + x - 2 = 0$, find the value of $\frac{\alpha}{\beta} + \frac{\beta}{\alpha}$:
(a) $-\frac{25}{12}$ (b) $-\frac{12}{75}$ (c) $-\frac{4}{9}$ (d) none

28. If a and c are such that the quadratic equation $ax^2 - 5x + c = 0$ has 10 as the sum of the roots and also as the product of the roots, find a and c respectively :
(a) $\frac{1}{2}, 6$ (b) $\frac{1}{2}, 5$
(c) $\frac{1}{2}, 8$ (d) none of these

29. If α and β are the roots of the equation $x^2 - x - 4 = 0$, find the value of $\frac{1}{\alpha} + \frac{1}{\beta} - \alpha\beta$:
(a) $\frac{16}{7}$ (b) $\frac{8}{5}$ (c) $\frac{15}{4}$ (d) none

30. If α and β are the roots of the equation $x^2 - 2x - 1 = 0$, find the value of $\alpha^2\beta + \alpha\beta^2$
(a) –8 (b) –5 (c) 6 (d) –2

31. If α and β are the roots of $x^2 - x - 2 = 0$, find the quadratic equation in x whose roots are $(2\alpha + 1)$ and $(2\beta + 1)$:
(a) $x^2 + 5x - 4 = 0$ (b) $x^2 - 4x - 5 = 0$
(c) $x^2 + 4x - 5 = 0$ (d) none of these

32. If α, β be the roots of the quadratic equation $3x^2 - 6x + 4 = 0$, find the value of
$$\left(\frac{\alpha}{\beta} + \frac{\beta}{\alpha}\right) + 2\left(\frac{1}{\alpha} + \frac{1}{\beta}\right) + 3\alpha\beta :$$
(a) 6 (b) 8 (c) 7 (d) 5

33. If α, β be the roots of the quadratic equation $x^2 - 5x + k = 0$, find the value of k such that $\alpha - \beta = 1$:
(a) 2 (b) 4 (c) 6 (d) 8

34. If one root of the quadratic equation $ax^2 + bx + c = 0$ is double the other then which one of the following is correct?
(a) $b^2 = 3ac$ (b) $2b^2 = 5ac$
(c) $2b^2 = 9ac$ (d) $2b^2 > 9ac$

35. The length of a hypotenuse of a right triangle exceeds the length of its base by 2 cm and exceeds twice the length of the altitude by 1 cm. Find the length of each side of the triangle (in cm) :
(a) 6, 8, 10 (b) 7, 24, 25
(c) 8, 15, 17 (d) 7, 40, 41

36. A two digit number is such that the product of its digits is 12. When 9 is addded to the number, the digits interchange their places, find the number :
(a) 62 (b) 34 (c) 26 (d) 43

37. A plane left 40 minutes late due to bad weather and in order to reach its destination, 1600 km away in time, it had to increase its speed by 400 km/h from its usual speed. Find the usual speed of the plane :
(a) 600 km/h (b) 750 km/h
(c) 800 km/h (d) none of these

38. The sum of the squares of two consecutive positive odd numbers is 290. Find the sum of the numbers :
(a) 14 (b) 24 (c) 28 (d) none

39. A shopkeeper buys a number of books for ₹ 80. If he had bought 4 more for the same amount, each book would have cost ₹ 1 less. How many books did he buy?
(a) 8 (b) 16 (c) 24 (d) 28

40. Two square have sides x cm and $(x + 4)$ cm. The sum of their areas is 656 cm^2. Find the sides of the square :
(a) 8 cm, 12 cm (b) 12 cm, 15 cm
(c) 6 cm, 10 cm (d) 16 cm, 20 cm

CAT-Test

Questions Helping you bell the CAT

LEVEL 01 › BASIC LEVEL EXERCISE

1 If p and $q\,(\neq 0)$ are the roots of the equation $x^2 + px + q = 0$, then the least value of $x^2 + px + q\,(x \in R)$ is :

(a) $-\frac{1}{4}$ (b) $\frac{1}{4}$ (c) $\frac{-9}{4}$ (d) $\frac{9}{4}$

2 The value of p for which the sum of the squares of the roots of the equation $x^2 - (p-2)x - p - 1 = 0$ assumes the least value is :

(a) –1 (b) 1 (c) 0 (d) 2

3 If the equation $x^2 + 2(p+1)x + 9p - 5 = 0$ has only negative roots, then :

(a) $p \le 0$ (b) $p \le -6$ (c) $p \ge 6$ (d) $p \ge 36$

4 The ratio of the roots of the equation $ax^2 + bx + c = 0$ is same as the ratio of the roots of the equation $px^2 + qx + r = 0$. If D_1 and D_2 are the discriminants of $ax^2 + bx + c = 0$ and $px^2 + qx + r = 0$, respectively, then $D_1 : D_2$ is equal to

(a) $\frac{a^2}{q^2}$ (b) $\frac{a^2}{p^2}$

(c) $\frac{b^2}{q^2}$ (d) none of these

5 If every pair from among the equations $x^2 + px + qr = 0$ $x^2 + qx + rp = 0$ and $x^2 + rx + pq = 0$ has a common root, then the sum of the three common roots is :

(a) $2(p+q+r)$ (b) $p+q+r$

(c) $-(p+q+r)$ (d) pqr

6 If the roots of the equation, $ax^2 + bx + c = 0$, are of the form $\frac{\alpha}{\alpha-1}$ and $\frac{\alpha+1}{\alpha}$ then the value of $(a+b+c)^2$ is :

(a) $b^2 - 2ac$ (b) $b^2 - 4ac$

(c) $2b^2 - ac$ (d) $4b^2 - 2ac$

7 Equation $ax^2 + 2x + 1$ has one double root if :

(a) $a = 0$ (b) $a = -1$

(c) $a = 1$ (d) $a = 2$

8 The number of quadratic equations, which remain unchanged by squaring their roots, is :

(a) 0 (b) 2

(c) 4 (d) infinitely many

9 The value of $\sqrt{6+\sqrt{6+\sqrt{6+\sqrt{6+\ldots\infty}}}}$ is :

(a) 2 (b) 3

(c) 4 (d) 5

10 If α, β, γ are the roots of the equation $x^3 + a_0x^2 + a_1x + a_2 = 0$, then $(1-\alpha^2)(1-\beta^2)(1-\gamma^2)$ is equal to :

(a) $(1-a_1)^2 + (a_0 - a_2)^2$ (b) $(1+a_1)^2 - (a_0 + a_2)^2$

(c) $(1+a_1)^2 + (a_0 + a_2)^2$ (d) none of these

11 If $x \in R$, and $K = \frac{(x^2 - x + 1)}{(x^2 + x + 1)}$, then :

(a) $x \le 0$ (b) $\frac{1}{3} \le k \le 3$

(c) $k \ge 5$ (d) none of these

12 If $x = \sqrt{2+\sqrt{2+\sqrt{2+\sqrt{2+\ldots\infty}}}}$ then x is :

(a) 1 (b) 2

(c) 3 (d) none of these

13 If α, β, γ are the roots of the equation $x^3 - 3x + 11 = 0$, then the equation whose roots are $(\alpha+\beta), (\beta+\gamma)$ and $(\gamma+\alpha)$ is :

(a) $x^3 + 3x + 11 + 0$

(b) $x^3 - 3x + 11 = 0$

(c) $x^3 + 3x - 11 = 0$

(d) $x^3 - 3x - 11 = 0$

14 If $x^2 - ax - 21 = 0$ and $x^2 - 3ax + 35 = 0$; $a > 0$ have a common root, then a is equal to :

(a) 1 (b) 2

(c) 4 (d) 5

15 If α, β, γ are such that $\alpha + \beta + \gamma = 2$, $\alpha^2 + \beta^2 + \gamma^2 = 6$, $\alpha^3 + \beta^3 + \gamma^3 = 8$, then $\alpha^4 + \beta^4 + \gamma^4$ is equal to :

(a) 10 (b) 12

(c) 18 (d) none of these

16 The real values of a for which the quadratic equation $2x^2 - (a^3 + 8a - 1)x + a^2 - 4a = 0$ possesses roots of opposite signs are given by :
(a) $a > 6$ (b) $a > 9$
(c) $0 < a < 4$ (d) $a < 0$

17 If α, β are the roots of $ax^2 + bx + c = 0$ and $\alpha + k, \beta + k$ are the roots of $px^2 + qx + r = 0$, then k is equal to
(a) $-\frac{1}{2}\left(\frac{a}{b} - \frac{p}{q}\right)$ (b) $\left(\frac{a}{b} - \frac{p}{q}\right)$
(c) $\frac{1}{2}\left(\frac{b}{a} - \frac{q}{p}\right)$ (d) $(ab - pq)$

18 If $\alpha, \beta \in R$ are the roots of the equation $ax^2 + bx + c = 0$, $k \in R$ lies between α and β, if :
(a) $a^2k^2 + bk + c < 0$ (b) $a^2k^2 + abk + ac < 0$
(c) $ak^2 + abk + ac > 0$ (d) None of these

19 If the equation $(3x)^2 + (27 \times 3^{1/k} - 15)x + 4 = 0$ has equal roots, then k is equal to
(a) –2 (b) $-\frac{1}{2}$
(c) $\frac{1}{2}$ (d) 0

20 The least possible integral value of a for which the equation $x^2 - 2(a-1)x + (2a+1) = 0$ has both the roots positive is :
(a) 1 (b) 3
(c) 4 (d) 6

21 The number of real solutions of the equation $2^{3x^2 - 7x + 4} = 1$ is :
(a) 0 (b) 4
(c) 2 (d) infinitely many

22 The number of real solutions of the equation $2|x|^2 - 5|x| + 2 = 0$ is :
(a) 0 (b) 4
(c) 2 (d) none of these

23 The number of real roots of the equation $(x-1)^2 + (x-2)^2 + (x-3)^2 = 0$:
(a) 0 (b) 2
(c) 3 (d) 6

24 The equation $\sqrt{x+1} - \sqrt{x-1} = \sqrt{4x-1}$ has :
(a) no solution
(b) one solution
(c) two solutions
(d) more than two solutions

25 If α, β are the roots of the equation $8x^2 - 3x + 27 = 0$, then the value of $[(\alpha^2/\beta)^{1/3} + (\beta^2/\alpha)^{1/3}]$ is :
(a) 1/3 (b) 1/4
(c) 1/5 (d) 1/6

26 The quadratic equation $3x^2 + 2(a^2 + 1)x + a^2 - 3a + 2 = 0$ possesses roots of opposite sign, then a lies in :
(a) $(-\infty, 0)$ (b) $(-\infty, 1)$ (c) (1, 2) (d) (4, 9)

27 The expression $\frac{(x-a)(x-b)}{(x-c)}$ will assume all real values for every $x \in R$, if :
(a) $a < b < c$ (b) $a > b > c$
(c) c lies between a and b (d) none of these

28 If α and β are the roots of the equation $ax^2 + bx + c$, where $(a, b, c) > 0$, then α and β are :
(a) rational numbers (b) real and negative
(c) negative real parts (d) none of these

29 The number of solutions of the equation $3^{x-1} + 5^{x-1} = 34$:
(a) 0 (b) 1
(c) 2 (d) none of these

30 If $(2+\sqrt{3})^{x^2 - 2x + 1} + (2-\sqrt{3})^{x^2 - 2x - 1} = \frac{2}{2-\sqrt{3}}$, then x is equal to :
(a) 0 (b) 1
(c) 2 (d) both (a) and (c)

31 The values of a for which the quadratic equations $(1 - 2a)x^2 - 6ax - 1 = 0$ and $ax^2 - x + 1 = 0$ have at least one root in common are :
(a) $\frac{1}{2}, \frac{2}{9}$ (b) $0, \frac{1}{2}$
(c) $\frac{2}{9}$ (d) $0, \frac{1}{2}, \frac{2}{9}$

32 The integer k for which the inequality $x^2 - 2(4k-1)x + 15k^2 - 2k - 7 > 0$ is valid for any x is :
(a) 2 (b) 3 (c) 4 (d) 6

33 The values of a for which $2x^2 - 2(2a+1)x + a(a+1) = 0$ may have one root less than a and other root greater than a are given by :
(a) $-1 < a < 0$ (b) $0 < a < 1$
(c) $a \geq 0$ (d) $a < -1$ or $a > 0$

34 The condition that $x^3 - ax^2 + bx - c = 0$ may have two of its roots equal to each other but of opposite signs is :
(a) $ab = c$ (b) $\frac{2}{3}a = bc$
(c) $a^2b = c$ (d) none of these

35 If the roots of $ax^2 + bx + c = 0$, $a > 0$, be each greater than unity, then :
(a) $a + b + c = 0$ (b) $a + b + c > 0$
(c) $a + b + c < 0$ (d) none of these

36 The number of real solutions of $x - \frac{1}{x^2 - 4} = 2 - \frac{1}{x^2 - 4}$ is :
(a) 0 (b) 1
(c) 2 (d) infinite

37 The number of real solutions of the equation $2^{x/2} + (\sqrt{2}+1)^x = (5+2\sqrt{2})^{x/2}$ is :
(a) one (b) four
(c) six (d) infinite

38 If $xy = 2(x+y)$, $x \le y$ and $x, y \in N$, the number of solutions of the equation :
(a) 2 (b) 3
(c) 0 (d) infinitely many

39 If $a, b, c \in R$ and equality $ax^2 + bx + c = 0$ has complex roots which are reciprocal to each other, then one has :
(a) $a = c$ (b) $|b| \le |c|$
(c) $|b| \le |a|$ (d) all of these

40 The equation $|x+1||x-1| = a^2 - 2a - 3$ can have real solutions for x if a belongs to :
(a) $(-\infty, -1] \cup [3, \infty)$
(b) $[1-\sqrt{5}, 1+\sqrt{5}]$
(c) $[1-\sqrt{5}, -1] \cup [3, 1+\sqrt{5}]$
(d) none of the above

41 $p, q, r \in R$ and k is a prime number such that $p + qk^{1/3} + rk^{2/3} = 0$, then :
(a) $p = \frac{q}{r}$ (b) $p = q^{1/3} \ne r^{2/3}$
(c) $p = q = r = 0$ (d) none of these

42 The expression $x^4 + 2px^3 + x^2 + 2px + 1 = 0$ has at least two distinct negative roots if :
(a) $p < 1$ (b) $p = 0$
(c) $p > \frac{3}{4}$ (d) $p \in \left(-\frac{1}{2}, \frac{1}{2}\right)$

43 The roots of the expression $x^2 - 2a|x-a| - 3a^2 = 0$; $a < 0$:
(a) $(1+\sqrt{2})a, (-1-\sqrt{6})a$ (b) $(1-\sqrt{2})a, (\sqrt{6}-1)a$
(c) $(1 \pm \sqrt{2})a$ (d) none of these

44 The possible values of x for the equation $2^{|x+2|} - |2^{x+1} - 1| - 2^{x+1} = 1$ is :
(a) $x = -3$ (b) $x \ge -1$
(c) $x = 0$ (d) $(x \ge -1) \cup (x = -3)$

45 The values of x which satisfy the expression :
$$(5+2\sqrt{6})^{x^2-3} + (5-2\sqrt{6})^{x^2-3} = 10$$
(a) $\pm 2, \pm\sqrt{3}$ (b) $\pm\sqrt{2}, \pm 4$
(c) $\pm 2, \pm\sqrt{2}$ (d) $2, \sqrt{2}, \sqrt{3}$

46 If $a, b \in \{1, 2, 3, 4\}$, then the number of quadratic equations of the form $ax^2 + bx + 1 = 0$, having real roots is :
(a) 6 (b) 7
(c) 8 (d) none of these

47 The minimum value of the expression $a + \frac{1}{a}$; $a > 0$ is :
(a) 0 (b) 1
(c) 2 (d) 4

48 If $a^2 + b^2 + c^2 = 1$, then $ab + bc + ac$ lies in the interval :
(a) $[1, 2/3]$ (b) $[-1/2, 1]$
(c) $[-1, 1/2]$ (d) $[2, -4]$

49 The integral values of x satisfying the equation $2^{|x+1|} - 2^x = |2^x - 1| + 1$ is :
(a) $(-\infty, 0)$ (b) $[1, \infty)$
(c) $[0, \infty)$ (d) $2n : n \in I$

50 Number of values of x satisfying the equation $(15+4\sqrt{14})^t + (15-4\sqrt{14})^t = 30$, where $t = x^2 - 2|x|$:
(a) 0 (b) 2 (c) 4 (d) 6

51 The inequality $|2x-3| < 1$ is valid when x lies in the interval :
(a) $(-4, 3)$ (b) $(-1, 2)$
(c) $(1, 2)$ (d) $(3, 4)$

52 Let α and β be the roots of the equation $x^2 + x + 1 = 0$. The equation whose roots are α^{19}, β^7 is :
(a) $x^2 - x - 1 = 0$ (b) $x^2 - x + 1 = 0$
(c) $x^2 + x - 1 = 0$ (d) $x^2 + x + 1 = 0$

53 The value of p for which the difference between the roots of the equation $x^2 + px + 8 = 0$ is 2 are :
(a) ± 2 (b) ± 4
(c) ± 6 (d) ± 8

54 If $x > 0$, $xy = 1$, minimum value of $x + y$ is :
(a) 1 (b) 0
(c) 2 (d) $\sqrt{2}$

55 If $x = 7 + 4\sqrt{3}$ and $xy = 1$, then the value of $\frac{1}{x^2} + \frac{1}{y^2}$ is :
(a) 64 (b) 128
(c) 184 (d) 194

56 If $x \in R$, and $\alpha = \frac{x^2}{(1+x^4)}$, then :
(a) $0 \le \alpha \le 2$ (b) $0 \le \alpha \le 1$
(c) $0 \le \alpha \le \frac{1}{4}$ (d) $0 \le \alpha \le \frac{1}{2}$

57 The set of values for which $x^3 + 1 \ge x^2 + x$ is :
(a) $x \ge 0$ (b) $x \le 0$
(c) $x \ge -1$ (d) $-1 \le x \le 1$

58 If $a^2 = 5a - 3$ and $b^2 = 5b - 3$, $(a \ne b)$ find the quadratic equation whose roots are $\frac{a}{b}$ and $\frac{b}{a}$.
(a) $3x^2 - 19x + 1 = 0$ (b) $2x^2 - 39x + 27 = 0$
(c) $3x^2 - 19x + 3 = 0$ (d) $3x^2 + 19x + 3 = 0$

59 If $f(x) = ax^2 + bx + c$ and $g(x) = -ax^2 + bx + c$, where $ac \ne 0$, the new equation $f(x) \cdot g(x) = 0$ has n real roots. Find the minimum value of n.
(a) 0 (b) 1 (c) 2 (d) 4

60 Given that $x^2 + ux + v = 0$ and $x^2 + jx + k$; where $uj = 2(v + k)$ and u, v, j, k are real numbers. Also, $f(x) = x^2 + ux + v$ and $g(x) = x^2 + jx + k$. Then which one of the following is always correct?
(a) $f(x)$ has real roots (b) $g(x)$ has real roots
(c) $f(x)$ and $g(x)$ both have real roots
(d) either $f(x)$ or $g(x)$ have real roots

61 If one root of a quadratic equation $ax^2 + bx + c = 0$ is equal to the nth power of the other, then
(a) $\left[(ac^n)^{\frac{1}{n+1}}\right] + \left[(ca^n)^{\frac{1}{n+1}}\right] + b^n = 0$
(b) $\left[(ac^n)^{\frac{1}{n+1}}\right] + \left[(ca^n)^{\frac{1}{n+1}}\right] - b = 0$
(c) $\left[(ac^n)^{\frac{1}{n+1}}\right] + \left[(ca^n)^{\frac{1}{n+1}}\right] + b = 0$
(d) $\left[(ac^n)^{\frac{1}{n+1}}\right] + \left[(ca^n)^{\frac{1}{n+1}}\right] + \frac{1}{b^{n+1}} = 0$

62 If r be the ratio of the roots of the equation $ax^2 + bx + c = 0$, then which one of the following is correct?
(a) $ac(1 + r)^2 = (rb)^2$ (b) $ac(1 + r)^2 = rb^2$
(c) $ab(1 + r)^2 = rc^2$ (d) $ac(1 + r)^2 = br^2$

63 If c, d are the roots of the quadratic equation $(x - a)(x - b) - k = 0$, then, a, b are the roots of the equation
(a) $(x - c)(x - d) - k = 0$ (b) $(x + c)(x + d) - k = 0$
(c) $(x - c)(x - d) + k = 0$ (d) $(x + a)(x + b) + k = 0$

64 In a quadratic polynomial $a_2x^2 + a_1x + a_0$, the roots are r_1 and r_2. Defining $S_k = r_1^k + r_2^k$ and $P = r_1r_2$. Then which one of the following relation is true?
(i) $S_1^3 = S_3 + 3PS_1$ (ii) $S_3 = S_1(S_1^2 - 3P)$
(a) only (i) is true (b) only (ii) is true
(c) both are true (d) none are true

65 The coefficient of x in the equation $x^2 + bx + c = 0$ was wrongly written as 17 in place of 13 and the roots thus found were -2 and -15. Find the roots of the correct equation.
(a) $-7, -3$ (b) $-13, 1$ (c) $-10, -3$ (d) $13, -1$

66 Find the possible value(s) of p if the equation $3x^2 - 2x + p = 0$ and $6x^2 - 17x + 12 = 0$ have a common root.
(a) $7, -12$ (b) $-8/3, -15/4$
(c) $-3/8, -4/15$ (d) data insufficient

67 If a, b, c belong to R; and equations $x^2 + 2x + 9 = 0$ and $ax^2 + bx + c = 0$ have a common root, then $a : b : c$ is
(a) 1:2:9 (b) 2:1:7 (c) 1:3:9 (d) 1:2:4

68 If $x^2 - ax - 45 = 0$ and $x^2 - 3ax + 27 = 0; (a > 0)$ has a common root then the value of a is
(a) 5 (b) ±7 (c) ±8 (d) 4

69 If the equations $x^2 - px + q = 0$ and $x^2 + qx - p = 0$ have only one common root, the which one of the following is necessarily true?
(a) $p - q = 1$ (b) $p + q = -1$
(c) $p - q = -1$ (d) $p + q = 1$

70 There are three quadratic equations $x^2 - 2m + 5 = 0$, $x^2 - 2n + 7 = 0$ and $x^2 - 2p + 35 = 0$. If each pair of equations has a common positive real root, find the value of $m + n + p$.
(a) 13 (b) 15 (c) 47 (d) 23

71 If $(a^2 - 1)x^2 + (a - 1)x + a^2 - 4a + 3 = 0$ be an identity in x, then find the value of a.
(a) -1 (b) 0
(c) 1 (d) 3

72 Consider the following equation.
$$\frac{(x + b)(x + c)}{(b - a)(c - a)} + \frac{(x + c)(x + a)}{(c - b)(a - b)} + \frac{(x + a)(x + b)}{(a - c)(b - c)} = 1$$
Then what is the most appropriate answer regarding the above equation?
(a) It has only two real roots
(b) It has no roots
(c) It's an identity
(d) none of the above

73 If a, b, c belong to $R, a \neq 0$, and the quadratic equation $ax^2 + bx + c = 0$ has no real roots. Then, which one of the following is correct?
(a) $(a + b + c)c > 0$ (b) $(a + b + c)c < 0$
(c) $(a + b + c)c = 0$ (d) $(a + b + c)c \leq 0$

74 Find the condition that the roots of the equation $x^3 - px^2 + qx - r = 0$ are in Harmonic Progression (HP).
It is known that if any three terms a, b, c have a common difference and are in increasing or decreasing order, they are in Arithmetic Progression (AP) and their reciprocals $\frac{1}{a}, \frac{1}{b}, \frac{1}{c}$ are in HP.
(a) $27r^2 - 9pqr - 2q^3 = 0$
(b) $27r^2 - 9pqr + 2q^3 = 0$
(c) $27r^2 - 9pqr + 3q^3 = 0$
(d) $27r^2 - 9pqr + 3p^3 = 0$

75 Find the equation whose roots are negative of the roots of the equation $x^3 - 3x^2 + x + 1 = 0$
(a) $x^3 + 3x^2 + x - 1 = 0$
(b) $x^3 - 3x^2 + x - 1 = 0$
(c) $x^3 + 3x^2 - x - 1 = 0$
(d) $-x^3 + 3x^2 + x + 1 = 0$

76 Find the equation whose roots are square of the roots of the equation $x^3 - 2x^2 + 3x + 1 = 0$

(a) $x^3 + 2x^2 + 13x - 1 = 0$

(b) $x^3 - 13x^2 + 2x - 1 = 0$

(c) $x^3 + 3x^2 - 12x - 1 = 0$

(d) $-x^3 + 2x^2 + 13x + 1 = 0$

77 Find the equation whose roots are cubes of the roots of the equation $ax^3 + bx^2 + cx + d = 0$

(a) $a^3x^3 + x^2(abd^2 + ab - cd) - x(3ad^2 - 3bcd - c^2) + d^3 = 0$

(b) $a^3x^3 + x^2(ab^2 + 4cd - ad) - x(3ad^2 - 3bcd - c^2) + d^3 = 0$

(c) $a^3x^3 + x^2(b - 4ac + abcd) - x(3ad^2 - 3bcd + c^2) + d^3 = 0$

(d) $a^3x^3 + x^2(3a^2d - 3abc + b^3) + x(3ad^2 - 3bcd + c^3) + d^3 = 0$

78 What are the values of x, if $(7 + 4\sqrt{3})^{x^2-8} + (7 - 4\sqrt{3})^{x^2-8} = 14$?

(a) $3, \sqrt{7}$ (b) $\pm 3, \pm 4$

(c) $\pm 3, \pm \sqrt{7}$ (d) $\pm 4, \pm \sqrt{6}$

79 If $a + b + c = 0$, then $3ax^2 + 2bx + c = 0$ has always

(a) real and distinct roots (b) imaginary roots

(c) rational roots (d) real and equal roots

80 Find the roots of the equation $2x^4 + x^3 - 11x^2 + x + 2 = 0$

(a) $\frac{-8-\sqrt{5}}{2}, \frac{-8+\sqrt{5}}{2}, \frac{1}{2}, 2$

(b) $\frac{-3-\sqrt{5}}{2}, \frac{-3+\sqrt{5}}{2}, -2, 2$

(c) $\frac{-3-\sqrt{7}}{2}, \frac{-3+\sqrt{7}}{2}, \frac{1}{2}, 2$

(d) $\frac{-3-\sqrt{5}}{2}, \frac{-3+\sqrt{5}}{2}, \frac{1}{2}, 2$

81 Find the solution of $(x)^2 = [x]^2 + 2x$; where (x) is the integer just less than or equal to x and $[x]$ is the integer just greater than or equal to x.

(a) $0, n + \frac{1}{2}$ (b) $0, n - \frac{1}{2}$

(c) $0, 1/2$ (d) none of these

82 For every a, b, c being real numbers the root of $ax^2 + 2bx + c = 0$ are real numbers. If m, n are real numbers such that $m^2 > n > 0$, then the roots of the equation $ax^2 + 2mbx + nc = 0$ are

(a) real

(b) complex

(c) both real and complex

(d) cannot be determined

83 If the graph of the function $16x^2 + 8(a + 5)x - 7a - 5 = 0$ is strictly above the X-axis, then

(a) $2 < a < 15$ (b) $-15 < a < -2$

(c) $17 < a < 30$ (d) $a > 0$

84 Find the value of x, if

$$x = 1 + \cfrac{1}{3 + \cfrac{1}{2 + \cfrac{1}{3 + \cfrac{1}{2 + \ldots \infty}}}}$$

(a) $\pm\sqrt{5/3}$ (b) $\pm\sqrt{5/2}$

(c) $\sqrt{5/3}$ (d) $\sqrt{8/5}$

85 The number of integral solutions of $y^4 = 2x^4 + 1402$.

(a) 4 (b) 2

(c) 1 (d) none

86 Let a, b, c be real, if $ax^2 + bx + c = 0$ has two real roots α and β, where $\alpha < -1$ and $\beta > 1$, then the value of $1 + \frac{c}{a} + \left|\frac{b}{a}\right|$ is

(a) less than zero (b) greater than zero

(c) equal to zero (d) equal to $b^2 - 4ac$

87 Find all the values x that satisfy $3x^3 = [(x^2 + \sqrt{18}x + \sqrt{32})(x^2 - \sqrt{18}x - \sqrt{32})] - 4x^2$

(a) $3 \pm \sqrt{17}, \frac{-3 \pm \sqrt{7}i}{2}$

(b) $3 \pm \sqrt{17}, \frac{-3 \pm \sqrt{17}i}{2}$

(c) $3 \pm \sqrt{7}, \frac{-3 \pm \sqrt{7}i}{2}$

(d) $3 \pm \sqrt{17}, \frac{3 \pm \sqrt{17}i}{2}$

88 For how many values of x, the following equation is an identity?

$$\frac{(x-a)(x-b)}{(c-a)(c-b)} + \frac{(x-b)(x-c)}{(a-b)(a-c)} + \frac{(x-c)(x-a)}{(b-c)(b-a)} = 1$$

(a) 0 (b) 6 (c) 2 (d) 3

89 The number of solutions of the following equation is

$$\frac{a^2(x-b)(x-c)}{(a-b)(a-c)} + \frac{b^2(x-c)(x-a)}{(b-c)(b-a)} + \frac{c^2(x-a)(x-b)}{(c-a)(c-b)} = x^2$$

(a) 0 (b) 2

(c) 3 (d) 4

90 Number of positive integral solutions of the following inequation

$$\frac{x^3(2x-3)^2(x-4)^6}{(x-3)^3(3x-8)^4} \le 0$$

(a) 0 (b) 3 (c) 5 (d) 4

91 Find the most appropriate solution of the following rational inequation.

$$\frac{x^2+6x-7}{|x+3|}<0$$

(a) $(-3,\ -1)\cup(-1,7)$
(b) $(-7,\ -3)\cup(-3,1)\cup(1,3)$
(c) $(-7,\ 3)\cup(3,1)$
(d) $(-7,\ -3)\cup(-3,1)$

92 If x is real, then find the minimum and maximum value of the following rational function $f(x)$

$$f(x)=\frac{x^2-3x+4}{x^2+3x+4}$$

(a) $1/7, 7$ (b) $-1/7, 7$
(c) $-1/7,\ -7$ (d) $-1, 1/7$

93 If one root of the equation $24x^3-14x^2-63x+45=0$ is double the other, then the third root of this equation is
(a) $-3/2$ (b) $3/2$
(c) $-5/3$ (d) $-7/2$

94 If sum of the two roots of the equation $4x^3+16x^2-9x-36=0$ is the first whole number, then the third root of this equation is:
(a) $-3/4$ (b) $3/2$ (c) $-3/2$ (d) -4

95 Find a cubic equation in which each root is greater by unity than a root of the equation $x^3-5x^2+6x-3=0$. Which of the following could be the required equation?
(a) $p^3-8p^2+19p-15=0$
(b) $p^3-19p^2+8p-15=0$
(c) $p^3-8p^2-19p-15=0$
(d) $p^3-19-8p+15=0$

96 Find a cubic equation in which each root is the cube of the roots of $x^3+3x^2+2=0$. Which of the following could be the required equation?
(a) $p^3+33p^2+12p+8=0$
(b) $p^3-19p^2+8p-15=0$
(c) $p^3-8p^2-19p-15=0$
(d) $p^3-19-8p+15=0$

97 Let a_1, a_2, a_3 be the roots of the polynomial x^3+x^2+3x+1. Find the value of $a_1+a_2+a_3+a_1a_2+a_2a_3+a_3a_1+a_1a_2a_3$
(a) 5 (b) 6
(c) 3 (d) 1

98 For a cubic polynomial, $a_3x^3+a_2x^2+a_1x+a_0$, the roots r_1, r_2, r_3 come in three symmetric combinations : $C_1=r_1+r_2+r_3, C_2=r_1r_2+r_2r_3+r_3r_1, C_3=r_1r_2r_3$. The sum of the k^{th} powers of the roots is defined as $S_k=r_1^k+r_2^k+r_3^k$. Then
(i) $a_3S_1+a_2=0$ (ii) $a_3S_2+a_2S_1+2a_1=0$
(a) only (i) is true (b) only (ii) is true
(c) both are true (d) none are true

99 Find the real a if the equation $x^3-3x^2+ax-1=0$ has three positive solutions, then
(a) 4 (b) 10/3 (c) −10/3 (d) 3

100 The equation $x^4+ax^3+bx^2-4x+1=0$ has four positive roots, then
(a) $a>b$ (b) $a>0$
(c) $a<0$ (d) $a-b>0$

101 If $f(x)=4x^2+px+(p-3)$ is negative for at least one x, find all possible values of p.
(a) $(-\infty,-12]\cup[-4,\infty)$ (b) $(-\infty,4]\cup[12,\infty)$
(c) $(4, 12)$ (d) $(-\infty,4)\cup(12,\infty)$

102 If $f(x)=(p^2+3)x^2+(p+2)x-5<0$, for at least one x, find all possible values of p.
(a) $(-\infty,-3)\cup(8,\infty)$ (b) $(-\infty,\infty)$
(c) $(-3,5)$ (d) none of these

103 Let $a, b, c\in R$ and $a\neq 0$. Let α,β be the roots of equation $ax^2+bx+c=0$, where $\alpha<-p$ and $\beta>p$. Then, for every $n\in N$, which one of the following is correct?

(a) $1+\frac{c}{ap^2}+\frac{1}{p}\left|\frac{b}{a}\right|<0$ (b) $1+\frac{c}{ap^2}+\frac{1}{p}\left|\frac{b}{a}\right|>0$

(c) $1+\frac{c}{ap^2}+\frac{1}{p}\left|\frac{b}{a}\right|\leq 0$ (d) $1+\frac{c}{ap^2}+\frac{1}{p}\left|\frac{b}{a}\right|\geq 0$

104 Let α be the root of $ax^2+bx+c=0$ and β be the root of $-ax^2+bx+c=0$; where $(\alpha,\beta\neq 0)$. Let there be a quadratic function $f(x)=\frac{a}{2}x^2+bx+c=0$. Then, which of the following is certainly correct?
(a) One root of $f(x)$ must lie between α and β
(b) Both the roots lie between α, β
(c) Both the roots are greater than α, β
(d) Both the roots are less than α, β

105 Find the number of solutions of the equation $x^2-3|x|+2=0$
(a) 0 (b) 2
(c) 4 (d) none of these

106 Find all the values of x that satisfy $3|x^2+4x+2|=5x+16$
(a) $\{1,-10/3\}$ (b) $(-2,1)$
(c) $\{-2,-11/3\}$ (d) $\{-2,1\}$

107 Find all the values of x that satisfy $2^{|x|}-|2^{x-1}-1|=2^{x-1}+1$
(a) $[-2,2]$
(b) $[2,8]$
(c) $[0,9)$
(d) $[-1,\infty)-(-1,1)$

108 Find all the values of x that satisfy
$(|x-1|-3)(|x+2|-5)<0$
(a) $(-7,-2)$ (b) $(3,4)$
(c) $(-7,4)-(-2,3)$ (d) $(-7,-2)\cup(3,4)$

109 Find all the values of x that satisfy the following inequation $\left|\frac{x^2-5x+4}{x^2-4}\right| \le 1$

(a) $(-2, 8/5) \cup [2, \infty)$
(b) $[0, 8/5] \cup [5/2, \infty]$
(c) $(-\infty, -2) \cup (0, \infty)$
(d) $(0, 8/5) \cup (2, 5/2) \cup (5/2, \infty)$

110 Find all the values of x that satisfy the following inequation $\left|\frac{x^2-3x-1}{x^2+x+1}\right| < 3$

(a) $(-\infty, -1) \cup (-2, \infty)$
(b) $(-\infty, -2) \cup (-1, \infty)$
(c) $(-\infty, \infty)$
(d) $(-9, 6)$

111 For a given quadratic/polynomial function $f(x)$ having all the real coefficients, if $f(p)$ and $f(q)$ have opposite signs, then $f(x) = 0$ have
(a) at least one real root between p and q
(b) all the real roots between p and q
(c) none of the roots between p and q
(d) none of the above

112 Consider the polynomial function $f(x) = (x-2)(x+3)(2x-1)^2(3x-10)^5$. Then, which of the following relations is/are incorrect regarding this polynomial.

(i) $f(-10^{10}) f(10^{10}) < 0$ (ii) $f(-2) f(3) < 0$
(iii) $f(-2) f(-4) > 0$ (iv) $f(-2) f(1) < 0$
(v) $f(-2) f(-1) < 0$ (vi) $f(1) f(3) f(5) < 0$

(a) only (ii), (iii) and (v)
(b) only (ii), (iv), (v) and (vi)
(c) Except (i), (iii) and (v)
(d) Except (i) and (ii)

113 Let α and β be the roots of $x^2 - 6x - 2 = 0$, with $\alpha > \beta$. If $a_n = \alpha^n - \beta^n$ for $n \ge 1$, then the value of the following rational function is:

$$f = \frac{a_{10} - 2a_8}{2a_9}$$

(a) 1 (b) 2
(c) 3 (d) 4

114 If $a > b$, where a and b are the roots of the equation $3x^3 - 8x - 14 = 0$ and $f_n = a^n - b^n$, find the value of $\frac{3f_9 - 14f_6}{f_7}$.

(a) 8 (b) 3
(c) 11 (d) 3/7

Directions (for Q. Nos. 115 and 116) *Answer the following questions on the basis of the information given below.*
Consider the cubic polynomial $f(x) = 4x^3 + 3x^2 + 2x + 1$.

115 At least one real root of $f(x)$ certainly lies in the interval
(a) $(-1/4, 0)$ (b) $(-11, -3/4)$
(c) $(-3/4, -1/2)$ (d) $(0, 1/4)$

116 The number of positive real roots is
(a) 2 (b) 1
(c) 0 (d) cannot be determined

117 Let p and q be real numbers such that $p \ne 0$, $p^3 \ne \pm q$. If α and β are nonzero complex numbers satisfying $\alpha + \beta = -p$ and $\alpha^3 + \beta^3 = q$, then a quadratic equation having $\frac{\alpha}{\beta}$ and $\frac{\beta}{\alpha}$ as its roots is
(a) $(p^3 + q)x^2 - (p^3 + 2q)x + (p^3 + q) = 0$
(b) $(p^3 + q)x^2 - (p^3 - 2q)x + (p^3 + q) = 0$
(c) $(p^3 - q)x^2 - (5p^3 - 2q)x + (p^3 - q) = 0$
(d) $(p^3 - q)x^2 - (5p^3 + 2q)x + (p^3 - q) = 0$

118 The maximum value of the function $f(x) = 2x^3 - 15x^2 + 36x - 48$ on the set $A = \{x \mid x^2 + 20 \le 9x\}$ is
(a) 7 (b) 6 (c) 9 (d) none

119 **Statement I (Assertion)** The curve $y = \frac{-x^2}{2} + x + 1$ is symmetric with respect to the line $x = 1$
Statement II (Reason) Because a parabola is symmetric about its axis.
(a) Statement I is true, statement II is true; statement II is a correct explanation for statement I.
(b) Statement I is true, statement II is true; statement II is not a correct explanation for statement I.
(c) Statement I is true; statement II is false.
(d) Statement I is False; statement II is true.

120 Consider the rational function $f(x) = \frac{x^2 - 6x + 5}{x^2 - 5x + 6}$
Match the conditions/expressions in **Column I** with statements in **Column II** where more than one item of column II can match with an item of column I.

	Column I		Column II
(P)	If $-1 < x < 1$, then $f(x)$ satisfies	(p)	$0 < f(x) < 1$
(Q)	If $1 < x < 2$, then $f(x)$ satisfies	(q)	$f(x) < 0$
(R)	If $3 < x < 5$, then $f(x)$ satisfies	(r)	$f(x) > 0$
(S)	If $x < 5$, then $f(x)$ satisfies	(s)	$f(x) < 1$

(a) P (p,r,s); Q(q, s); R(q,s); S(p, r, s)
(b) P(p,r); Q(q); R(q, s); S(r,s)
(c) P(p,s); Q(s); R(q); S(p, r, s)
(d) P(p); Q(q ,s); R(s); S(p,s)

121 For a, b, c and d are distinct numbers, if roots of the equation $x^2 - 10cx - 11d = 0$ are a, b and those of $x^2 - 10ax - 11b = 0$ are c, d, then the value of $a + b + c + d$ is
(a) 1221
(b) 1100
(c) 1210
(d) cannot be determined

122 Let $f(x) = ax^3 + bx^2 + cx + d$, then $f'(x) = 3ax^2 + 2bx + c$. Also, if $f'(k) = 0$ then $f(k)$ will give maxima/minima.
Also, if there are various peak values of a graph then the highest peak value is called the absolute or global maximum and rest are called the local maxima. Similarly absolute or global minimum and local minima too can be defined.
$f(x)$ is cubic polynomial which has local maximum at $x = -1$. If $f(2) = 18$, $f(1) = -1$, and $f'(x)$ has local minimum at $x = 0$. Then
(i) $f(x)$ has local minima at $x = 1$
(ii) Number of real roots are 3
(iii) $f(x)$ is increasing for $x = [1, 2\sqrt{5}]$
(iv) Sum of the roots is zero
(a) Only (ii) and (iv) are true
(b) Only (i) and (iii) are false
(c) All of the four statements are true
(d) None of the four statements are true

123 Let $f(x) = ax^3 + bx^2 + cx + d$, then $f'(x) = 3ax^2 + 2bx + c$. Also, if $f'(k) = 0$, then $f(k)$ will give maxima/minima.
Also, if there are various peak values of a graph then the highest peak value is called the absolute or global maximum and rest are called the local maxima. Similarly absolute or global minimum and local minima too can be defined.
$f(x)$ is cubic polynomial which has local maximum at $x = -1$. If $f(-1) = 10$, $f(1) = -6$, and $f'(x)$ has local minimum at $x = 1$. Find the distance between the local maximum and local minimum of the curve given by $f(x)$.
(a) $4\sqrt{65}$ (b) $7\sqrt{65}$ (c) $12\sqrt{35}$ (d) $65\sqrt{6}$

124 If α and β are the roots of $ax^2 + bx + c = 0$, and $\alpha + \beta, a^2 + \beta^2, \alpha^3 + \beta^3$ are in GP (Geometric Progression) and $\Delta = b^2 - 4ac$, then
(a) $\Delta \neq 0$ (b) $b\,\Delta = 0$ (c) $c\,\Delta = 0$ (d) $\Delta = 0$

125 Let $f(x) = ax^p + bx^q + cx + d$, then $f'(x) = p(ax^{p-1}) + q(bx^{q-1}) + cx^0$. Also, if $f'(k) = 0$, then $f(k)$ will give local maxima or local minima.
Also, if there are various peak values of a graph then the highest peak value is called the absolute or global maximum and rest are called the local maxima. Similarly absolute or global minimum and local minima too can be defined.
$f(x) = x^3 + bx^2 + cx + d$ is a cubic polynomial such that $0 < b^2 < c$, then in the interval of all the real numbers $(-\infty, \infty)$
(a) $f(x)$ is a strictly increasing function
(b) $f(x)$ is a strictly decreasing function
(c) $f(x)$ has a local maxima
(d) $f(x)$ has a local minima

126 If $f(x) = x^2 + 2bx + 2c^2$ and $g(x) = -x^2 - 2cx + b^2$ such that $\min f(x) > \max g(x)$, then the relation between b and c is
(a) No real value of b and c
(b) $0 < c < b\sqrt{2}$
(c) $|c| < |b|\sqrt{2}$
(d) $|c| > |b|\sqrt{2}$

127 If the roots of the equation $x^2 - 2ax + a^2 + a - 3 = 0$ are real and less than 3, then
(a) $a < 2$ (b) $2 \le a \le 3$
(c) $3 < a \le 4$ (d) $a > 4$

128 If $9 \le x \le 16$, then
(a) $(x-9)(x-16) \le 0$
(b) $(x-9)(x-16) \ge 0$
(c) $(x-9)(x-16) < 0$
(d) $(x-9)(x-16) > 0$

129 The quadratic equations $f(x) = 0$ and $g(x) = 0$ have a common root such that $f(2) = g(7) = 0$ and $f(4) \times g(9) = 24$. Which among the following give (s) all the correct values of the possible common root?
(i) 10, 3, -4, -9
(ii) -6.5, 10, 0, -4
(iii) -9, -8, -4.5, -4
(iv) $2\sqrt{2}$, $3\sqrt{3}$, 8, 27
(v) 3, 10, -5, -8
(a) Only I and IV (b) Only I
(c) Only V (d) Only II and III

LEVEL 02 > HIGHER LEVEL EXERCISE

1 The value of x satisfying the equation $|x-1|^{\log_3 x^2 - 2\log_x 9} = (x-1)^7$:
(a) $\sqrt{3}$ (b) 3^4
(c) 3 (d) $\log_4 3$

2 If the roots of $10x^3 - cx^2 - 54x - 27 = 0$ are in HP, then find the value of c :
(a) 2 (b) 6
(c) 9 (d) none of these

3 Find the number of pairs for (x, y) from the following equations :
$$\log_{100}|x+y| = \frac{1}{2}$$
$$\log_{10} y - \log_{10}|x| = \log_{100} 4$$
(a) 0 (b) 1
(c) 2 (d) none of these

4 The number of solutions for real x, which satisfy the equation $2\log_2 \log_2 x + \log_{1/2} \log_2 (2\sqrt{2}x) = 1$:
(a) 1 (b) 2
(c) 4 (d) none of these

5 The solution set for which the equation satisfies $|x^2 + 4x + 3| + 2x + 5 = 0$:
(a) $(-1+\sqrt{3}, -1-\sqrt{3})$ (b) $[-2, (-1+\sqrt{3})]$
(c) $[-4, (-1-\sqrt{3})]$ (d) none of these

6 The real numbers x_1, x_2, x_3 satisfying the equation $x^3 - x^2 + \beta x + \gamma = 0$ are in AP. Find the intervals in which β and γ lie, respectively :
(a) $(-\infty, 1/3]\,[-1/27, \infty)$
(b) $(-\infty, 3)$
(c) $(-1/3, 1/3)(-1/27, 1/27)$
(d) None of the above

7 For all $x \in (0, 1)$:
(a) $e^x < 1 + x$
(b) $\log_e (1+x) < x$
(c) $\sin x > x$
(d) $\log_e x > x$

8 Let $p \geq 3$ be an integer and α, β be the roots of $x^2 - (p+1)x + 1 = 0$, then the value of $\alpha^n + \beta^n$, where $n \in N$
(a) is divisible by 'p' (b) is an integer
(c) is a rational number (d) both (b) and (c)

9 Let a, b, c be real, if $ax^2 + bx + c = 0$ has two real roots α, β, where $\alpha < -1$ and $\beta > 1$, then the value of $1 + \frac{c}{a} + \left|\frac{b}{a}\right|$ is :
(a) less than zero
(b) greater than zero
(c) equal to zero
(d) equal to $b^2 - 4ac$

10 If p and q are the roots of $x^2 + px + q = 0$, then :
(a) $p = 1$
(b) $p = 1$ or 0
(c) $p = -2$
(d) $p = -2$ or 0

11 If p, q, r are positive and are in AP, the roots of quadratic equation $px^2 + qx + r = 0$ are real for :
(a) $\left|\frac{r}{p} - 7\right| \geq 4\sqrt{3}$ (b) $\left|\frac{p}{r} - 7\right| \geq 4\sqrt{3}$
(c) all p and r (d) no p and r

12 The sum of all the real roots of the equation $|x-2|^2 + |x-2| - 2 = 0$ is :
(a) 2 (b) 3
(c) 4 (d) none of these

13 Let p and q be the roots of the equation $x^2 - 2x + A = 0$ and let r and s be the roots of the equation $x^2 - 18x + B = 0$. If $p < q < r < s$ are in arithmetic progression, then A, B respectively equal to :
(a) 8, 17 (b) 3, 7
(c) –3, 11 (d) none of these

14 If the roots of the equation $x^2 - 2ax + a^2 + a - 3 = 0$ are real and less than 3, then :
(a) $a < 2$ (b) $2 \leq a \leq 3$
(c) $3 < a \leq 4$ (d) $a > 4$

15 If α and β $(\alpha < \beta)$, are the roots of the equation $x^2 + bx + c = 0$, where $c < 0 < b$, then :
(a) $0 < \alpha < \beta$ (b) $\alpha < 0 < \beta < |\alpha|$
(c) $\alpha < \beta < 0$ (d) $\alpha < 0 < |\alpha| < \beta$

16 If $b > a$, then the equation $(x-a)(x-b) - 1 = 0$ has :
(a) both roots in $[a, b]$
(b) both roots in $(-\infty, 0)$
(c) both roots in $(b, +\infty)$
(d) one root in $(-\infty, a)$ and other root in $(b, +\infty)$

17 Let α, β be the roots of $x^2 - x + p = 0$ and γ, δ be the roots of $x^2 - 4x + q = 0$. If $\alpha, \beta, \gamma, \delta$ are in GP, then the integral values of p and q respectively are :
(a) –2, – 32 (b) –2, 3
(c) –6, 3 (d) –6, – 32

18 If α, β are the roots of the equation $x^2 - px + q = 0$, then find the quadratic equation, the roots of which are $(\alpha^2 - \beta^2)(\alpha^3 - \beta^3)$ and $(\alpha^3\beta^2 + \alpha^2\beta^3)$:
(a) $px^2 - (5p + 7q)x - (p^6q^6 + 4p^2q^6) = 0$
(b) $x^2 - (p^5 - 5p^3q + 5pq^2)x + (p^6q^2 - 5p^4q^3 + 4p^2q^4) = 0$
(c) $x^2 - (p^3q - 5p^5 + p^4q) - (p^6q^2 - 5p^2q^6) = 0$
(d) all of the above

19 Given that α, γ are the roots of the equation $Ax^2 - 4x + 1 = 0$ and β, δ are the roots of the equation $Bx^2 - 6x + 1 = 0$, then the values of A and B respectively such that α, β, γ and δ are in HP :

(a) $-5, 9$ (b) $3/2, 5$

(c) $3, 8$ (d) none of these

20 Let α, β be the roots of the equation $(x-a)(x-b) = c$; $c \neq 0$, then the roots of the equation $(x-\alpha)(x-\beta) + c = 0$ are :

(a) a, c (b) b, c

(c) a, b (d) $a + c, b + c$

21 Let a, b, c be real numbers such that $a + b + c = 0$, then

(a) $\left(\frac{a^5+b^5+c^5}{5}\right) > \left(\frac{a^3+b^3+c^3}{3}\right)\left(\frac{a^2+b^2c^2}{2}\right)$

(b) $\left(\frac{a^5+b^5+c^5}{5}\right) < \left(\frac{a^3+b^3+c^3}{3}\right)\left(\frac{a^2+b^2+c^2}{2}\right)$

(c) $\left(\frac{a^5+b^5+c^5}{5}\right) = \left(\frac{a^3+b^3+c^3}{3}\right)\left(\frac{a^2+b^2+c^2}{2}\right)$

(d) $\left(\frac{a^5+b^5+c^5}{5}\right) = 6\left(\frac{a^3+b^3+c^3}{3}\right)\left(\frac{a^2+b^2+c^2}{2}\right)$

22 Given that p and q are prime, the equation $px^2 - qx + q = 0$ has

(a) No rational roots (b) one rational root

(c) Two rational roots (d) Either (b) or (c)

23 The equation $x^4 - px^3 + q = 0$ has an integral root. Find this only integral root if p and q are prime numbers.

(a) 6 (b) 5 (c) 7 (d) 1

24 If x, y, z ar real and distinct, then $x^2 + 4y^2 + pz^2 - 2xy - 6yz - 3zx$ is always

(a) Non-positive (b) non-negative

(c) negative (d) zero

25 The number of real solutions of $e^{\sin x} + e^{-\sin x} = 4$.

(a) 0 (b) 1

(c) 2 (d) 4

26 If α and β are the roots of $x^2 + ux + v = 0$ and $x^{2n} + u^n x^n + v^n = 0$, where n is an even integer. What are the roots of $x^n + 1 + (x+1)^n = 0$?

(a) $(\alpha^n + 1)$ and $(\beta^n + 1)$

(b) $\frac{1}{\alpha}$ and $\frac{1}{\beta}$

(c) $(\alpha + \beta)$ and $(\alpha - \beta)$

(d) $\frac{\alpha}{\beta}$ and $\frac{\beta}{\alpha}$

27 If sum of the roots of the equation $ax^2 + bx + c = 0$ is equal to the sum of the squares of their reciprocals, then bc^2, ca^2, ab^2 are in

(a) HP (b) GP

(c) AP (d) AGP

28 Let $f(x)$ be a quadratic expression, which is positive for all real x. Let $f(x) = ax^2 + bx + c$, $f'(x) = 2ax + b$, $f''(x) = 2a$; where $f'(x)$ and $f''(x)$ are the first and second derivatives of $f(x)$, respectively. If $g(x) = f(x) + f'(x) + f''(x)$, then for every real x

(a) $g(x) > 0$ (b) $g(x) < 0$

(c) $g(x) \geq 0$ (d) $g(x) \leq 0$

29 Find the values of x, if

$(x-1)^3 + (x-2)^3 + (x-3)^3 + (x-4)^3 + (x-5)^3 = 0$.

(a) $3, 2 \pm \sqrt{6}\,i$ (b) $3, 3 \pm \sqrt{6}\,i$

(c) $2, 3 \pm \sqrt{5}\,i$ (d) $0, 3 \pm \sqrt{5}\,i$

30 Find all the real solutions of $(x+3)^5 - (x-1)^5 \geq 244$.

(a) $(-\infty, -1] \cup [1, \infty)$ (b) $(-\infty, -2] \cup [0, \infty)$

(c) $(-\infty, -2) \cup (0, \infty)$ (d) none of these

31 If α, β are the roots of $x^2 + px + q = 0$ and α^n, β^n are the roots of $x^{2n} + p^n x^n + q^n = 0$, and if $\left(\frac{\alpha}{\beta}\right), \left(\frac{\beta}{\alpha}\right)$ are the roots of $x^n + 1 + (x+1)^n = 0$. Then n is

(a) an integer (b) an odd integer

(c) an even integer (d) an irrational number

32 If P_i and p_i are the real numbers, then the number of non-real roots of the following equation is

$$\frac{P_1^2}{(x-p_1)} + \frac{P_2^2}{(x-p_2)} + \ldots + \frac{P_k^2}{(x-p_k)} = x + 1$$

(a) 2 (b) 1

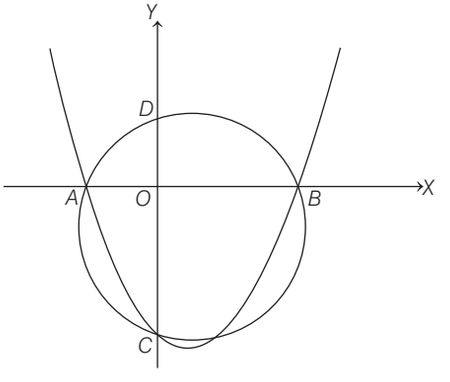
(c) 0 (d) data insufficient

33 If $a < b < c < d$ and $k \in R$, then the roots of the equation $(x-a)(x-c) + k(x-b)(x-d) = 0$ are

(a) real (b) non-real

(c) Either real or imaginary (d) none of these

34 For every $\{b, c\} \in R^{\oplus}$, the quadratic curve $y = x^2 - bx - c$ is drawn. The roots are denoted by A and B.



The curve intersects Y-axis at C and another point D is taken on the Y-axis such that A, D, B and C are concyclic. Find the coordinates of D.

(a) (0, 1) (b) (0, 3/2)

(c) (0, b/c) (d) cannot be determined

Hints & Solutions

☑ Introductory Exercise

1 ∵ $x = \dfrac{-b \pm \sqrt{b^2 - 4ac}}{2a}$

$\therefore \quad x = \dfrac{7 \pm \sqrt{49 - 4 \times 15 \times (-36)}}{2 \times 15} \Rightarrow x = \dfrac{7 \pm 47}{30}$

$\therefore \quad x = \dfrac{54}{30}$ or $x = \dfrac{-40}{30}$

$x = \dfrac{9}{5}$ or $x = \dfrac{-4}{3}$

NOTE (i) The above problem can also be solved by factorization.
(ii) The same problem can also be solved through options.

2 ∵ $x = \dfrac{-b \pm \sqrt{b^2 - 4ac}}{2a}$

$x = \dfrac{6 \pm \sqrt{36 - 4\sqrt{7} \times (-13\sqrt{7})}}{2 \times \sqrt{7}}$

$\Rightarrow \quad x = \dfrac{6 \pm \sqrt{36 + 364}}{2\sqrt{7}} \Rightarrow x = \dfrac{6 \pm 20}{2\sqrt{7}}$

$\therefore \quad x = \dfrac{13}{\sqrt{7}}$ or $x = \dfrac{-7}{\sqrt{7}} \Rightarrow x = \dfrac{13}{\sqrt{7}}$ or $x = -\sqrt{7}$

3 $6x^2 - 31x + 40 = 0$

$\Rightarrow \quad \left(x - \dfrac{8}{3}\right)\left(x - \dfrac{5}{2}\right) = 0 \Rightarrow x = \dfrac{8}{3}, \dfrac{5}{2}$

4 Consider $\sqrt{\dfrac{y-3}{2y+1}} = t$ then, $6t^2 + 1 = 5t$

$\Rightarrow \quad 6t^2 - 5t + 1 = 0 \quad \ldots(i)$

get the values of t by solving the eq. (i) and then substitute the value of t in the relation

$$t = \sqrt{\frac{y-3}{2y+1}} \quad \ldots(ii)$$

Solve the eq. (i) and then get the values of t and subsequently y.

5 $(x+2)(x-5)(x-6)(x+1) = 144$

$\Rightarrow \quad [(x+2)(x-6)][(x-5)(x+1)] = 144$

$\Rightarrow \quad (x^2 - 4x - 12)(x^2 - 4x - 5) = 144$

$\Rightarrow \quad \{(x^2 - 4x - 5) - 7\}\{x^2 - 4x - 5\} = 144$

Let $t = x^2 - 4x - 5 \quad \ldots(i)$

$\therefore \quad (t-7)(t) = 144 \quad \Rightarrow t^2 - 7t - 144 = 0$

$\Rightarrow (t-16)(t+9) = 0 \quad \Rightarrow t = 16$ or $t = -9$

Substituting the values of t in eq. (i), we get

$$x = 7, -3, 2$$

6 Check through options
Alternatively, square both the sides twice.

7 $2\left(x^2 + \dfrac{1}{x^2}\right) - 3\left(x + \dfrac{1}{x}\right) - 1 = 0$

$\Rightarrow \quad 2\left[x^2 + \dfrac{1}{x^2} + 2 - 2\right] - 3\left(x + \dfrac{1}{x}\right) - 1 = 0$

$\Rightarrow \quad 2\left[\left(x + \dfrac{1}{x}\right)^2 - 2\right] - 3\left(x + \dfrac{1}{x}\right) - 1 = 0$

$\Rightarrow \quad 2\left(x + \dfrac{1}{x}\right)^2 - 3\left(x + \dfrac{1}{x}\right) - 5 = 0$

$\Rightarrow \quad 2t^2 - 3t - 5 = 0 \qquad$ (Substituting $x + \dfrac{1}{x} = t$)

Now solve it and you will get, $t = -1$ and $t = \dfrac{5}{2}$

Now if $t = -1$, then $x + \dfrac{1}{x} = -1$.

$\Rightarrow \quad x^2 + 1 + x = 0 \Rightarrow x^2 + x + 1 = 0$

$\therefore \quad x = \dfrac{-1 \pm \sqrt{1-4}}{2} = \dfrac{-1 \pm \sqrt{-3}}{2}$

and if $t = \dfrac{5}{2}$ then $x + \dfrac{1}{x} = \dfrac{5}{2} \Rightarrow 2x^2 - 5x + 2 = 0 \Rightarrow x = \dfrac{1}{2}, 2$

8 Assume $\sqrt{\dfrac{x}{1-x}} = t$

$\therefore \quad \sqrt{\dfrac{1-x}{x}} = \dfrac{1}{t}$

$\therefore \quad t + \dfrac{1}{t} = \dfrac{13}{6}$

Now, solve it as in the previous problem.

9 $\sqrt{2x^2 - 2x + 1} = 2x - 3$

Square on both sides and simplify (**Hint** Type -3 problem)

10 **Hint** Type-3 problem. It requires double squaring.

Alternatively Go through options.

11 **Hint** Type 6 problem.

12 $\dfrac{1}{x+1} + \dfrac{1}{x+5} = \dfrac{1}{x+2} + \dfrac{1}{x+4}$

$\Rightarrow \quad \left(\dfrac{1}{x+1} - \dfrac{1}{x+4}\right) + \left(\dfrac{1}{x+5} - \dfrac{1}{x+2}\right) = 0$

$\Rightarrow \quad \dfrac{3}{(x+1)(x+4)} - \dfrac{3}{(x+5)(x+2)} = 0$

$\Rightarrow \quad \dfrac{3[(x^2 + 7x + 10) - (x^2 + 5x + 4)]}{(x+1)(x+4)(x+5)(x+2)} = 0$

$\Rightarrow \quad (x^2 + 7x + 10) - (x^2 + 5x + 4) = 0$

$\Rightarrow \quad 2x + 6 = 0 \quad \Rightarrow \quad x = -3$

13 For equal roots $D = 0$

i.e., $b^2 - 4ac = 0$

$\Rightarrow \quad [-2(1 + 3k)]^2 - 4 \times 1 \times 7 \times (3 + 2k) = 0$

Solve it and get the value of k.

14 $D = b^2 - 4ac = 4 - 4 \times (-3) \times (-8) = -92$

15 $D = b^2 - 4ac = 25 - 4 \times 1 \times 7 = -3$

Since $D < 0$, therefore roots are not real, *i.e.,* roots will be imaginary.

16 $a^2x^2 + abx - b^2 = 0$

$D = b^2 - 4ac = (ab)^2 - 4 \times a^2 \times (-b^2) = (ab)^2 + 4a^2b^2$

$= (ab)^2[1 + 4] = (ab)^2(5)$

$\therefore$ The roots are real and unequal

17 For non-real roots $D < 0$

$\therefore \quad b^2 - 4ac < 0$

$\therefore \quad (-p)^2 - 4 \times 1 \times q < 0$

$\Rightarrow \quad p^2 - 4q < 0 \Rightarrow p^2 < 4q$

18 $4x^2 - 3kx + 1 = 0 \quad \Rightarrow \quad D = b^2 - 4ac = 0$

$\therefore \quad 9k^2 - 4 \times 1 \times 4 = 0$

$\Rightarrow \quad k^2 = \frac{16}{9} \quad \Rightarrow \quad k = \pm \frac{4}{3}$

19 Let α, β be the roots of the equation, then

$\alpha + \beta = \frac{1}{2}\alpha\beta$ and $-\frac{b}{a} = \frac{1}{2} \cdot \frac{c}{a}$

$\Rightarrow \quad -b = \frac{c}{2} \Rightarrow (k + 6) = \frac{2(2k - 1)}{2} \Rightarrow k = 7$

20 $\alpha + \beta = \alpha\beta$

$\Rightarrow \quad \frac{-b}{a} = \frac{c}{a} \quad \Rightarrow \quad -b = c$

$\therefore \quad -2k = 4 \quad \Rightarrow \quad k = -2$

21 Since -4 is a root of $x^2 - px - 4 = 0$

$\therefore \quad (-4)^2 - p(-4) - 4 = 0$

$\Rightarrow \quad p = -3$

$\therefore$ The equation becomes $x^2 + 3x + k = 0$

Since both the roots of this equation are equal.

$\therefore$ Sum of the roots $(\alpha + \alpha) = 2\alpha = -3 \quad \Rightarrow \quad \alpha = -\frac{3}{2}$

$\therefore$ Product of the roots $(\alpha \cdot \alpha) = \alpha^2 = (-3/2)^2 = \frac{9}{4} = k$

$\therefore \quad k = \frac{9}{4}$

22 $\alpha^2 + \beta^2 = 40$

$\Rightarrow \quad (\alpha + \beta)^2 - 2\alpha\beta = 40 \Rightarrow (8)^2 - 2k = 40$

$\Rightarrow \quad k = 12$

23 For equal roots, $D = 0$

i.e., $b^2 - 4ac = 0$

But now $x^2 + p(4x + p - 1) + 2 = 0$

$\Rightarrow \quad x^2 + 4px + p^2 - p + 2 = 0$

$\Rightarrow \quad x^2 + 4px + (p^2 - p + 2) = 0$

$\therefore \quad (4p)^2 - 4 \times 1 \times (p^2 - p + 2) = 0$

$\Rightarrow 16p^2 - 4p^2 + 4p - 8 = 0 \Rightarrow 12p^2 + 4p - 8 = 0$

$\Rightarrow 12p^2 + 12p - 8p - 8 = 0 \Rightarrow 12p(p + 1) - 8(p + 1) = 0$

$\Rightarrow \quad (p + 1)(12p - 8) = 0 \Rightarrow p = -1 \quad \text{or} \quad p = \frac{8}{12} = \frac{2}{3}$

24 $\alpha\beta = \frac{c}{a} = \frac{3}{3} = 1$

25 $x^2 - 3x + 2 = 0$

$\Rightarrow \quad x^2 - x - 2x + 2 = 0$

$\Rightarrow \quad (x - 1)(x - 2) = 0 \Rightarrow \alpha = 1 \quad \text{and} \quad \beta = 2$

$\therefore \quad -\alpha = -1 \quad \text{and} \quad -\beta = -2$

$\therefore$ The required equation is

$[x - (-\alpha)][x - (-\beta)] = 0$

$\Rightarrow \quad (x + 1)(x + 2) = 0 \Rightarrow x^2 + 3x + 2 = 0$

26 **Method I.** If α and β be the roots of a quadratic equation, then the equation will be

$(x - \alpha)(x - \beta) = 0$

$\therefore \quad (x - \sqrt{3})(x - 2\sqrt{3}) = 0 \Rightarrow x^2 - 3\sqrt{3}x + 6 = 0$

Method II. The required equation

$x^2 - (\alpha + \beta)x + (\alpha \cdot \beta) = 0$

$\Rightarrow \quad x^2 - (\sqrt{3} + 2\sqrt{3})x + (\sqrt{3} \cdot 2\sqrt{3}) = 0$

$\Rightarrow \quad x^2 - 3\sqrt{3}x + 6 = 0$

27 $\alpha + \beta = \frac{-b}{a} = \frac{-1}{6} \Rightarrow \alpha\beta = \frac{c}{a} = -\frac{2}{6} = -\frac{1}{3}$

$\therefore \quad \frac{\alpha}{\beta} + \frac{\beta}{\alpha} = \frac{\alpha^2 + \beta^2}{\alpha\beta} = \frac{(\alpha + \beta)^2 - 2\alpha\beta}{\alpha\beta}$

$= \frac{(-1/6)^2 - 2(-1/3)}{-1/3} = \frac{\frac{1}{36} + \frac{2}{3}}{-\frac{1}{3}} = \frac{\frac{25}{36}}{-\frac{1}{3}} = -\frac{25}{12}$

Alternatively $6x^2 + x - 2 = 0$

$\Rightarrow \quad 6x^2 - 3x + 4x - 2 = 0$

$\Rightarrow \quad 3x(2x - 1) + 2(2x - 1) = 0$

$\Rightarrow \quad x = \frac{1}{2} \quad \text{or} \quad x = -\frac{2}{3}$

$\therefore \quad \frac{\alpha}{\beta} + \frac{\beta}{\alpha} = \frac{1/2}{-2/3} + \frac{-2/3}{1/2}$

$= -\frac{3}{4} - \frac{4}{3} = -\frac{25}{12}$

28 $\alpha+\beta=10$ and $\alpha\cdot\beta=10$

$\Rightarrow \quad -\frac{b}{a}=10$ and $\frac{c}{a}=10$

$\Rightarrow \quad \frac{5}{a}=10 \quad \Rightarrow \quad a=\frac{1}{2}$

$\therefore \quad \frac{c}{1/2}=10 \quad \Rightarrow \quad c=5$

$\therefore \quad a=\frac{1}{2}$ and $c=5$

29 $\alpha+\beta=-\frac{b}{a}=1$ and $\alpha\beta=\frac{c}{a}=-4$

$\therefore \quad \frac{1}{\alpha}+\frac{1}{\beta}-\alpha\beta=\frac{\alpha+\beta}{\alpha\beta}-\alpha\beta$

$=\frac{1}{-4}-(-4)=4-\frac{1}{4}=\frac{15}{4}$

30 $\alpha+\beta=2$ and $\alpha\beta=-1$

$\therefore \quad \alpha^2\beta+\alpha\beta^2=\alpha\beta(\alpha+\beta)=2(-1)=-2$

31 Sum of roots $=(2\alpha+1)+(2\beta+1)$

$=2\alpha+2\beta+2=2(\alpha+\beta)+2$

and product of roots $=(2\alpha+1)(2\beta+1)$

$=4\alpha\beta+2\alpha+2\beta+1=4\alpha\beta+2(\alpha+\beta)+1$

Now since $\alpha+\beta=1$

and $\alpha\beta=-2$

$\therefore$ Sum of roots $=2(\alpha+\beta)+2=2(1)+2=4$

and product of roots $=4\alpha\beta+2(\alpha+\beta)+1$

$=4\times(-2)+2(1)+1=-8+2+1=-5$

$\therefore$ Required equation is $x^2-4x-5=0$.

32 $\alpha+\beta=\frac{6}{3}=2$ and $\alpha\beta=\frac{4}{3}$

$\therefore \quad \left(\frac{\alpha}{\beta}+\frac{\beta}{\alpha}\right)+2\left(\frac{1}{\alpha}+\frac{1}{\beta}\right)+3\alpha\beta$

$=\frac{\alpha^2+\beta^2}{\alpha\beta}+2\left(\frac{\alpha+\beta}{\alpha\beta}\right)+3\alpha\beta$

$=\frac{(\alpha+\beta)^2-2\alpha\beta}{\alpha\beta}+2\left(\frac{\alpha+\beta}{\alpha\beta}\right)+3\alpha\beta$

$=\frac{4-8/3}{4/3}+2\left(\frac{2}{4/3}\right)+3\times\frac{4}{3}=\frac{4/3}{4/3}+3+4=8$

33 $\alpha+\beta=5 \Rightarrow \quad \alpha-\beta=1$

$\therefore \quad \alpha=3$ and $\beta=2$

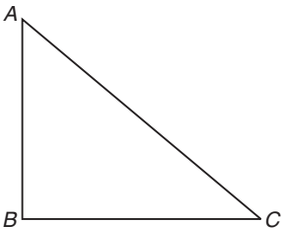
$\therefore \quad \alpha\beta=\frac{c}{a}=\frac{k}{1}=3\times2=6\Rightarrow k=6$

34 Let the one root be α and other root be β, then $\beta=2\alpha$.

$\therefore \quad \alpha+\beta=3\alpha=\frac{-b}{a} \quad \Rightarrow \quad \alpha=\frac{-b}{3a}$

and $\alpha\beta=2\alpha^2=\frac{c}{a}$

$\therefore \quad 2\alpha^2=\frac{c}{a}$



$\Rightarrow 2\times\left(\frac{-b}{3a}\right)^2=\frac{c}{a} \Rightarrow \frac{2b^2}{9a^2}=\frac{c}{a} \Rightarrow 2b^2=9ac$

35 Let the base of the triangle be x cm, then $BC=x$ cm and hypotenuse $AC=(x+2)$ cm and the perpendicular

$$AB=\frac{(x+2)-1}{2}=\frac{(x+1)}{2}$$

[Let the length of AB be k, then

$$AC=2k+1 \Rightarrow k=\frac{AC-1}{2}]$$

$\therefore$ By Pythagorus theorem

$AB^2+BC^2=AC^2$ (see the figure)

$$\left(\frac{x+1}{2}\right)^2+x^2=(x+2)^2$$

$\Rightarrow \quad \frac{x^2+1+2x}{4}+x^2=x^2+4+4x$

$\Rightarrow \quad x^2+1+2x+4x^2=4x^2+16+16x$

$\Rightarrow \quad x^2-14x-15=0\Rightarrow(x-15)(x+1)=0$

$\Rightarrow \quad x=15$ cm ($\because x=-1$ cm is inadmissible)

$\therefore \quad$ base $=15$ cm

and perpendicular $=8$ cm and hypotenuse $=17$ cm

36 Let the tens digit be x and unit digit be y. Then the two digit number $=10x+y$

but $x\times y=12 \quad \Rightarrow \quad y=\frac{12}{x}$

$\therefore$ the number is $\left(10x+\frac{12}{x}\right)$

Again $10x+\frac{12}{x}+9=10\times\left(\frac{12}{x}\right)+x$

$\Rightarrow \quad 10x^2+12+9x=120+x^2$

$\Rightarrow \quad 9x^2+9x-108=0 \Rightarrow x^2+x-12=0$

$\Rightarrow \quad (x+4)(x-3)=0$

$\Rightarrow \quad x=-4, 3$

but x cannot be negative

$\therefore \quad x=3$ only.

$\therefore \quad y=\frac{12}{x}=\frac{12}{3}=4$

$\therefore$ the number $=10x+y=10\times3+4=34$

37 Let the usual speed of plane be x km/hr

$\therefore$ Usual time taken $= \frac{1600}{x}$ hr

New speed $= (x + 400)$ km/hr

and the new time $= \frac{1600}{x} - \frac{40}{60} = \left(\frac{1600}{x} - \frac{2}{3}\right)$ hr

$\therefore$ Distance = speed $\times$ time, $1600 = (x + 400)\left(\frac{1600}{x} - \frac{2}{3}\right)$

$$1600 = 1600 - \frac{2x}{3} + \frac{640000}{x} - \frac{800}{3}$$

$\Rightarrow \quad 4800x = 4800x - 2x^2 + 1920000 - 800x$

$\Rightarrow \quad 2x^2 - 1920000 + 800x = 0 \Rightarrow x^2 - 960000 + 400x = 0$

$\Rightarrow \quad x^2 + 400x - 960000 = 0$

$\Rightarrow \quad x^2 + 1200x - 800x - 960000 = 0$

$\Rightarrow \quad x(x + 1200) - 800(x + 1200) = 0$

$$(x + 1200)(x - 800) = 0$$

$\Rightarrow \quad x = 800$ km/hr $\quad (\because x = -1200$ is inadmissible)

38 Let the two consecutive odd numbers be x and $x + 2$

$\therefore \quad x^2 + (x + 2)^2 = 290$

$\Rightarrow x^2 + x^2 + 4 + 4x = 290 \Rightarrow 2x^2 + 4x + 4 = 290$

$\Rightarrow \quad x^2 + 2x + 2 = 145$

$\Rightarrow \quad x^2 + 2x - 143 = 0$

$\Rightarrow (x + 13)(x - 11) = 0$

$\Rightarrow \quad x = 11$ or $x = -13$, but x is positive

$\therefore \quad x + 2 = 13$

$\therefore$ Sum of the numbers $= 11 + 13 = 24$

39 Let the shopkeeper buys x books

$\therefore \quad$ Rate of the book $= \frac{80}{x}$

the new number of books $= (x + 4)$

$\therefore \quad$ the new price $= \frac{80}{(x + 4)}$

$\therefore \quad \frac{80}{(x + 4)} + 1 = \frac{80}{x} \Rightarrow \left(\frac{1}{x} - \frac{1}{(x + 4)}\right) = \frac{1}{80}$

$\Rightarrow \quad \frac{4}{x^2 + 4x} = \frac{1}{80} \Rightarrow x^2 + 4x - 320 = 0$

$\Rightarrow \quad (x + 20)(x - 16) = 0$

$\Rightarrow \quad x = 16, \quad (x = -20$, is inadmissible)

$\therefore$ He bought 16 books.

40 $x^2 + (x + 4)^2 = 656$

$\Rightarrow \quad x^2 + x^2 + 16 + 8x = 656$

$\Rightarrow \quad x^2 + 4x - 320 = 0$

$\Rightarrow \quad (x + 20)(x - 16) = 0$

$\Rightarrow \quad x = 16, \quad (x = -20$ is inadmissible)

$\therefore$ Sides of the square are $x = 16$ cm

and $\quad (x + 4) = 20$ cm.

☑ Level 01 *Basic Level Exercise*

1 $\quad y_{\min} = \frac{-b^2 + 4ac}{4a}$ at $x = -\frac{b}{2a}$

$\therefore \quad y_{\min} = \frac{-p^2 + 4 \times 1 \times q}{4 \times 1} = \frac{4q - p^2}{4}$

Now, since p and q are the roots of the equation $x^2 + px + q = 0$.

$\therefore \quad p + q = -p$

$\Rightarrow \quad q = -2p$

and $\quad pq = q \quad \Rightarrow \quad p = 1 \quad (\because q \neq 0)$

$\therefore \quad q = -2$

$\therefore \quad y_{\min} = \frac{4q - p^2}{4} = \frac{4 \times (-2) - (1)^2}{4} = -\frac{9}{4}.$

2 Let α, β be the roots of the given equation, then, $\alpha + \beta = p - 2$ and $\alpha\beta = -(p + 1)$.

Now, $\quad \alpha^2 + \beta^2 = (\alpha + \beta)^2 - 2\alpha\beta = (p - 2)^2 + 2(p + 1)$

$$= p^2 - 2p + 6 = (p - 1)^2 + 5$$

Clearly $\alpha^2 + \beta^2 \geq 5$. So minimum value of $\alpha^2 + \beta^2$ is 5, which is attained at $p = 1$.

3 Let $f(x) = x^2 + 2(p + 1)x + 9p - 5$. Let α, β be the roots of $f(x) = 0$. The equation $f(x) = 0$ will have both negative roots, if

(i) $D \geq 0$ $\quad$ (ii) $a < 0, \beta < 0$, *i.e.,* $(\alpha + \beta) < 0$

(iii) $f(0) > 0$

Now, $\quad D \geq 0 \quad \Rightarrow \quad 4(p + 1)^2 - 36p + 20 \geq 0$

$\Rightarrow \quad p^2 - 7p + 6 \geq 0$

$\Rightarrow \quad (p - 6)(p - 1) \geq 0$

$\Rightarrow \quad p \leq 1$ or $p \geq 6$ $\quad \ldots$(i)

$\alpha + \beta < 0 \quad \Rightarrow \quad -2(p + 1) < 0$

$\Rightarrow \quad p + 1 > 0 \quad \Rightarrow \quad p > -1$ $\quad \ldots$(ii)

and $\quad f(0) > 0 \quad \Rightarrow \quad 9p - 5 > 0$

$\Rightarrow \quad p > \frac{5}{9}$ $\quad \ldots$(iii)

from eqs. (i), (ii) and (iii), we get $p \geq 6$.

4 Let α_1, β_1 be the roots of $ax^2 + bx + c = 0$ and α_2, β_2 be the roots of $px^2 + qx + r = 0$, then,

$$\frac{\alpha_1}{\beta_1} = \frac{\alpha_2}{\beta_2}$$

$$\Rightarrow \quad \frac{\alpha_1+\beta_1}{\alpha_1-\beta_1}=\frac{\alpha_2+\beta_2}{\alpha_2-\beta_2}$$

$$\Rightarrow \quad \frac{(\alpha_1+\beta_1)^2}{(\alpha_1-\beta_1)^2}=\frac{(\alpha_2+\beta_2)^2}{(\alpha_2-\beta_2)^2}$$

$$\Rightarrow \frac{(\alpha_1+\beta_1)^2}{(\alpha_1+\beta_1)^2-4\alpha_1\beta_1}=\frac{(\alpha_2+\beta_2)^2}{(\alpha_2+\beta_2)^2-4\alpha_2\beta_2}=\frac{b^2/a^2}{\frac{b^2-4ac}{a^2}}$$

$$=\frac{q^2/p^2}{\frac{q^2-4rp}{p^2}}=\frac{b^2}{D_1}=\frac{q^2}{D_2}\Rightarrow\frac{D_1}{D_2}=\frac{b^2}{q^2}$$

Alternatively Let 2, 3 be the roots of the equation $ax^2+bx+c=0$

$\therefore$ the equation is $x^2-5x+6=0$

$\therefore \quad a=1, \quad b=-5 \quad \text{and} \quad c=6$

$\therefore \quad D_1=b^2-4ac=25-4\times1\times6=1$

Again, if 4, 6 be the roots of the equation $px^2+qx+r=0$, then the equation will be $x^2-10x+24=0$

$\Rightarrow \quad p=1, \quad q=-10 \quad \text{and} \quad r=24$

$\therefore \quad D_2=q^2-4pr=100-4\times1\times24=4$

$\therefore \quad \frac{D_1}{D}=\frac{1}{4}.$

Now, check through option, only option (c) is correct, as

$$\frac{b^2}{q^2}=\frac{(-5)^2}{(-10)^2}=\frac{1}{4}=\frac{D_1}{D_2}.$$

Caution : $\frac{\alpha_1}{\beta_1}\neq\frac{\alpha_1}{\alpha_2}$, when solving through numerical values.

5 The given equations are :

$$x^2+px+qr=0 \quad \ldots(i)$$

$$x^2+qx+rp=0 \quad \ldots(ii)$$

and $$x^2+rx+pq=0 \quad \ldots(iii)$$

Let α, β be the roots of (i), β, γ be roots of (ii) and γ, α be the roots of (iii). Since β is a common root of (i) and (ii)

$\therefore \quad \beta^2+p\beta+qr=0$

and $\quad \beta^2+q\beta+rp=0$

$\Rightarrow \quad (p-q)\beta+r(q-p)=0 \quad \Rightarrow \quad \beta=r$

Now, $\quad \alpha\beta=qr \quad \Rightarrow \quad \alpha r=qr \quad \Rightarrow \quad \alpha=q$

Since β and γ are roots of (ii). Therefore

$$\beta r=rp \quad \Rightarrow \quad \gamma r=rp \quad \Rightarrow \quad \gamma=p$$

$\therefore \quad \alpha+\beta+\gamma=q+r+p=p+q+r$

NOTE $\alpha+\beta+\gamma$ can also be equal to 0 and $-\frac{1}{2}(p+q+r)$.

6 By hypothesis,

$$\frac{\alpha}{\alpha-1}+\frac{\alpha+1}{\alpha}=-\frac{b}{a} \quad \text{and} \quad \frac{\alpha}{\alpha-1}\cdot\frac{\alpha+1}{\alpha}=\frac{c}{a}$$

$$\Rightarrow \quad \frac{2\alpha^2-1}{\alpha^2-\alpha}=-\frac{b}{a} \text{ and } \alpha=\frac{c+a}{c-a}$$

$$\Rightarrow \quad (c+a)^2+4ac=-2b(c+a)$$

$$\Rightarrow \quad (c+a)^2+2b(a+c)+b^2=b^2-4ac$$

$$\Rightarrow \quad (a+b+c)^2=b^2-4ac$$

7 One double root means a single root appears two times *i.e.*, two roots are equal.

$\therefore \quad D=0 \quad \Rightarrow \quad (2)^2-4a\cdot1=0$

$\Rightarrow \quad a=1.$

8 Let α, β be the roots of a quadratic equation and α^2, β^2 be the roots of another quadratic, Since the quadratic remains the same, we have

$$\alpha+\beta=\alpha^2+\beta^2 \quad \ldots(i)$$

and $$\alpha\beta=\alpha^2\beta^2 \quad \ldots(ii)$$

Now, $\quad \alpha\beta=\alpha^2\beta^2 \quad \Rightarrow \alpha\beta(\alpha\beta-1)=0$

$\Rightarrow \quad \alpha=0 \quad \text{or} \quad \beta=0 \quad \text{or} \quad \alpha\beta=1.$

If $\alpha=0$, then $\beta=\beta^2$ [putting $\alpha=0$ in Eq. (i)]

$\Rightarrow \quad \beta(1-\beta)=0 \quad \Rightarrow \quad \beta=0, \quad \beta=1.$

Thus, we get two sets of values of α and β viz. $\alpha=0, \beta=0$ and $\alpha=0, \beta=1$. Now, if $\alpha\beta=1$,

then $\quad \alpha+\frac{1}{\alpha}=\alpha^2+\frac{1}{\alpha^2}$ [putting $\beta=\frac{1}{\alpha}$ in Eq. (i)]

$$\Rightarrow \quad \alpha+\frac{1}{\alpha}=\left(\alpha+\frac{1}{\alpha}\right)^2-2$$

$$\Rightarrow \quad \left(\alpha+\frac{1}{\alpha}\right)^2-\left(\alpha+\frac{1}{\alpha}\right)-2=0$$

$$\Rightarrow \quad \alpha+\frac{1}{\alpha}=2 \quad \text{or} \quad \alpha+\frac{1}{\alpha}=-1$$

$\Rightarrow \quad \alpha=1 \quad \text{or} \quad \alpha=\omega, \omega^2$

Putting $\alpha=1$, in $\alpha\beta=1$, we get $\beta=1$, and putting $\alpha=\omega$ in $\alpha\beta=1$, we get $\beta=\omega^2$

Putting $\alpha=\omega^2$ in $\alpha\beta=1$, we get $\beta=\omega$. Thus, we get four sets of values of α, β *viz.*, $\alpha=0, \beta=0; \alpha=0, \beta=1; \alpha=\omega, \beta=\omega^2; \alpha=1, \beta=1$.

Thus, there are four quadratics which remain unchanged by squaring their roots.

9 Let $x=\sqrt{6+\sqrt{6+\ \ldots\infty}}\Rightarrow x^2=x+6$

$\Rightarrow \quad x^2-x-6=0$

$\Rightarrow \quad x=3,-2.$

$\because \quad x>0, \quad \therefore x=3.$

10 The best way is to consider some values of the roots α, β and γ.

Let $\alpha = 2, \quad \beta = 3$ and $\gamma = 4$, then

$(x-\alpha)(x-\beta)(x-\gamma) = 0$

$\Rightarrow \quad (x-2)(x-3)(x-4) = 0$

$\Rightarrow \quad x^3 - 9x^2 + 26x - 24 = 0$

$\Rightarrow \quad a_0 = -9$

$a_1 = 26$

$a_2 = -24$

Now, $(1-\alpha^2)(1-\beta^2)(1-\gamma^2) = (1-4)(1-9)(1-16)$

$= -3 \times -8 \times -15 = -360$

Now, go through options and verify.

Consider option (b)

$(1+a_1)^2 - (a_0 + a_2)^2 = (1+26)^2 - (-9-24)^2$

$= (27)^2 - (33)^2$

$= (27+33)(27-33)$

$= 60 \times (-6) = -360$

Hence option (b) is correct.

11 $k = \dfrac{x^2 - x + 1}{x^2 + x + 1}$

$\Rightarrow \quad kx^2 + kx + k = x^2 - x + 1$

$\Rightarrow \quad (k-1)x^2 + (k+1)x + k - 1 = 0$

Since x is real, the discriminant

$D = (k+1)^2 - 4(k-1)^2 \geq 0$

$\Rightarrow \quad (3k-1)(-k+3) \geq 0$

$\Rightarrow \quad \left(k - \dfrac{1}{3}\right)(k-3) \leq 0$

$\Rightarrow \quad \dfrac{1}{3} \leq k \leq 3$

12 Let $x = \sqrt{2 + \sqrt{2 + \sqrt{2 + \sqrt{2 + \ldots \infty}}}}$

$\therefore \quad x = \sqrt{2+x}$

$\Rightarrow \quad x^2 = 2 + x$

$\Rightarrow \quad x^2 - x - 2 = 0$

$\Rightarrow \quad x = \dfrac{1 \pm \sqrt{9}}{2} = \dfrac{1 \pm 3}{2} = 2, -1$

$\because \quad x > 0, \quad \therefore x = 2$

13 We have, $\alpha + \beta + \gamma = 0$

$\therefore \quad \beta + \gamma = -\alpha, \quad \gamma + \alpha = -\beta$ and $\alpha + \beta = -\gamma$.

$\therefore$ The equation whose roots are $-\alpha, -\beta, -\gamma$ can be obtained by replacing x by $-x$ in the given equation.

Therefore the required equation is :

$(-x)^3 - 3(-x) + 11 = 0$

or $\quad x^3 - 3x - 11 = 0$

14 Let α be a common root of the two given equations, then $\alpha^2 - 3a\alpha + 35 = 0$ and $\alpha^2 - a\alpha - 21 = 0$. On subtracting we get $-2a\alpha + 56 = 0$ or $\alpha = \dfrac{28}{a}$.

As α is a root of $x^2 - ax - 21 = 0$,

$\therefore \quad \left(\dfrac{28}{a}\right)^2 - a\left(\dfrac{28}{a}\right) - 21 = 0$

or $\quad a^2 = 4^2$ or $a = \pm 4$

$\because a > 0$, we get $a = 4$

15 $(\alpha + \beta + \gamma)^2 = \alpha^2 + \beta^2 + \gamma^2 + 2(\alpha\beta + \beta\gamma + \gamma\alpha)$

$4 = 6 + 2(\alpha\beta + \beta\gamma + \gamma\alpha)$

$\Rightarrow \quad \alpha\beta + \beta\gamma + \gamma\alpha = -1$

Also, $\alpha^3 + \beta^3 + \gamma^3 - 3\alpha\beta\gamma$

$= (\alpha + \beta + \gamma)(\alpha^2 + \beta^2 + \gamma^2 - \alpha\beta - \beta\gamma - \gamma\alpha)$

$8 - (3\alpha\beta\gamma) = 2(6+1)$

$\Rightarrow \quad \alpha\beta\gamma = -2$

Now, $(\alpha^2 + \beta^2 + \gamma^2)^2 = \Sigma\alpha^4 + 2\,\Sigma\beta^2\gamma^2$

$= \Sigma\alpha^4 + 2[(\Sigma\beta\gamma)^2 - 2\alpha\beta\gamma(\Sigma\gamma)]$

$\Rightarrow \quad \Sigma\alpha^4 = 36 - 2[(-1)^2 - 2(-2)(2)] = 18$

16 The roots of the given equation will be of opposite signs if they are real and their product is negative, *i.e.,*

$D \geq 0$ and product of roots < 0

$\Rightarrow \quad (a^3 + 8a - 1)^2 - 8(a^2 - 4a) \geq 0$

and $\quad \dfrac{a^2 - 4a}{2} < 0$

$\Rightarrow a^2 - 4a < 0$

$[\because a^2 - 4a < 0 \Rightarrow (a^3 + 8a - 1)^2 - 8(a^2 - 4a) \geq 0]$

$\Rightarrow \quad 0 < a < 4.$

17 We have $\quad \alpha + \beta = -\dfrac{b}{a}, \quad \alpha\beta = \dfrac{c}{a}$

and $\quad \alpha + k + \beta + k = -\dfrac{q}{p}$

and $\quad (\alpha + k)(\beta + k) = \dfrac{r}{p}$

$\Rightarrow \quad \alpha + \beta + 2k = -\dfrac{q}{p}$

$\Rightarrow \quad -\dfrac{b}{a} + 2k = -\dfrac{q}{p} \qquad \left(\because \alpha + \beta = -\dfrac{b}{a}\right)$

$\therefore \quad k = \dfrac{1}{2}\left(\dfrac{b}{a} - \dfrac{q}{p}\right)$

NOTE The problem can also be solved by assuming some appropriate values.

18 Let $f(x) = ax^2 + bx + c$. It is given that α, β are real roots of $f(x) = 0$. So, k lies between α and β, if

$$af(k) < 0 \quad \Rightarrow \quad a(ak^2 + bk + c) < 0$$

$$\Rightarrow \quad a^2k^2 + abk + ac < 0$$

19 The given equation will have equal roots iff $D = 0$

$$\Rightarrow \quad (27 \times 3^{1/k} - 15)^2 - 144 = 0$$

$$\Rightarrow \quad 27 \times 3^{1/k} - 15 = \pm 12$$

$$\Rightarrow \quad 27 \times 3^{1/k} = 27 \text{ or } 3$$

$$\Rightarrow \quad 3^{1/k} = 1 \quad \text{or} \quad 3^{1/k} = \frac{1}{9}$$

$$\Rightarrow \quad \frac{1}{k} = 0 \text{ or } -2$$

But $\frac{1}{k}$ cannot be zero. So $k = -\frac{1}{2}$.

20 Let $f(x) = x^2 - 2(a-1)x + (2a+1) = 0$.

Then, $f(x) = 0$ will have both roots positive, if

(i) $D > 0$ (ii) Sum of the roots > 0 and (iii) $f(0) > 0$

Now, $\quad D \geq 0 \quad \Rightarrow \quad 4(a-1)^2 - 4(2a+1) \geq 0$

$$\Rightarrow \quad a^2 - 4a \geq 0 \quad \Rightarrow \quad a \leq 0 \quad \text{or} \quad a \geq 4 \qquad \ldots(\text{i})$$

Sum of the roots > 0

$$\Rightarrow \quad 2(a-1) > 0 \quad \Rightarrow \quad a > 1 \qquad \ldots(\text{ii})$$

and $f(0) > 0$

$$\Rightarrow \quad (2a+1) \quad \Rightarrow \quad a > -\frac{1}{2} \qquad \ldots(\text{iii})$$

From eqs. (i), (ii) and (iii) we get $a \geq 4$.

Hence, the least integral value of a is 4.

21

$$2^{3x^2 - 7x + 4} = 1 = 2^0$$

$$\Rightarrow \quad 3x^2 - 7x + 4 = 0$$

$$\Rightarrow \quad 3x^2 - 3x - 4x + 4 = 0$$

$$\Rightarrow \quad 3x(x-1) - 4(x-1) = 0$$

$$\Rightarrow \quad x = 1 \quad \text{or} \quad x = \frac{4}{3}$$

$$\therefore \quad x = 1, \frac{4}{3}$$

22 $2|x|^2 - 5|x| + 2 = 0$

$$\Rightarrow (2|x| - 1)(|x| - 2) = 0$$

$$\therefore \quad |x| = \frac{1}{2}, 2$$

$$\therefore \quad x = \pm\frac{1}{2}, \pm 2$$

23

$$(x-1)^2 + (x-2)^2 + (x-3)^2 = 0 \qquad \ldots(\text{i})$$

It is possible only when $x - 1 = 0,\ x - 2 = 0,\ x - 3 = 0$

$$x = 1, \quad x = 2, \quad x = 3.$$

but $x = 1, 2, 3$ do not satisfy eq. (i).

24 $\sqrt{x+1} - \sqrt{x-1} = \sqrt{4x-1}$

$\therefore\ x + 1 \geq 0, \quad x - 1 \geq 0, \quad 4x - 1 \geq 0$

All these inequalities are satisfied when $x \geq 1$. Squaring both the sides of the equation we get

$$(x+1) + (x-1) - 2\sqrt{x^2 - 1} = 4x - 1$$

$$\Rightarrow \quad 2\sqrt{x^2 - 1} = 1 - 2x$$

Squaring again, we get

$$4(x^2 - 1) = 1 - 4x + 4x^2 \Rightarrow x = \frac{5}{4}$$

For $x = \frac{5}{4}$, $\quad \text{LHS} = \sqrt{\frac{5}{4} + 1} - \sqrt{\frac{5}{4} - 1} = 1$

and $\quad \text{RHS} = \sqrt{4\left(\frac{5}{4}\right) - 1} = \sqrt{4} = 2$

but $\quad \text{LHS} \neq \text{RHS}$

$\therefore\ x = \frac{5}{4}$ is not a root of the equation.

25 $\alpha + \beta = \frac{3}{8}, \quad \alpha\beta = \frac{27}{8}$

$$\therefore \left(\frac{\alpha^2}{\beta}\right)^{1/3} + \left(\frac{\beta^2}{\alpha}\right)^{1/3} = \left(\frac{\alpha^3}{\alpha\beta}\right)^{1/3} + \left(\frac{\beta^3}{\alpha\beta}\right)^{1/3}$$

$$= \frac{\alpha + \beta}{(\alpha\beta)^{1/3}} = \frac{3/8}{(27/8)^{1/3}} = \frac{3/8}{3/2} = \frac{1}{4}$$

26 The quadratic equation $3x^2 + 2(a^2+1)x + (a^2 - 3a + 2) = 0$ will have two roots of opposite sign if it has real roots and the product of the roots is negative, *i.e.,* if

$$D \geq 0 \quad \text{and} \quad \alpha \cdot \beta < 0$$

$$\Rightarrow \quad 4(a^2+1)^2 - 12(a^2 - 3a + 2) \geq 0$$

and $\quad \frac{a^2 - 3a + 2}{3} < 0$

$$\therefore \quad a^2 - 3a + 2 < 0,$$

i.e., if $\quad (a-1)(a-2) < 0 \quad \text{or} \quad 1 < a < 2$

27 Let $y = \frac{(x-a)(x-b)}{(x-c)} \Rightarrow x^2 - (a+b+y)x + ab + cy = 0$

Since x is real, then $D \geq 0$

$$\Rightarrow \quad (a+b+y)^2 - 4(ab + cy) \geq 0$$

$$\Rightarrow \quad y^2 + 2(a+b-2c)y + (a+b)^2 - 4ab \geq 0$$

$$\Rightarrow \quad y^2 + 2(a+b-2c)y + (a-b)^2 \geq 0 \qquad \ldots(\text{i})$$

Since y takes all real values, (i) is possible iff

$$4(a+b-2c)^2 - 4(a-b)^2 < 0$$

$$\Rightarrow \quad (a+b-2c+a-b)(a+b-2c-a+b) < 0$$

$$\Rightarrow \quad 4(a-c)(b-c) < 0 \quad \Rightarrow (a-c)(b-c) < 0$$

This is possible if c lies between a and b, that is if $a < c < b$ or $a > c > b$.

28 $\because D = b^2 - 4ac$

and, if $D \geq 0$, then the roots of the equation are given by

$$x = \frac{-b \pm \sqrt{D}}{2a}$$

As $D = b^2 - 4ac < b^2$ $(\because a > 0 \text{ and } c > 0)$

It follows that the roots of the quadratic equation are negative.

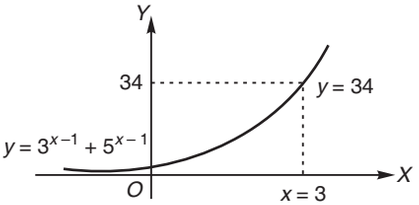
In case $D < 0$, then the roots of the equation are given by

$$x = \frac{-b \pm i\sqrt{-D}}{2a}$$

which have negative real parts.

29 It is very obvious that at $x = 3$ the given expression satisfies.

Now, $y = 3^{x-1}$ and $y = 5^{x-1}$ are both increasing functions of x (exponential functions with base greater than 1). Therefore their sum $y = 3^{x-1} + 5^{x-1}$ is also an increasing function of x. It means for $x < 3$, $y = 3^{x-1} + 5^{x-1} < 34$ and for $x > 3$, $y = 3^{x-1} + 5^{x-1} > 34$.



Thus, the equation has no other solution.

30 $\because$ $2 - \sqrt{3} = \dfrac{1}{2+\sqrt{3}}$

$\therefore$ the given equation can be expressed as

$$(2+\sqrt{3})^{x^2-2x+1} + \frac{1}{(2+\sqrt{3})^{x^2-2x-1}} = 2(2+\sqrt{3}) \qquad \ldots(i)$$

Let us put $y = (2+\sqrt{3})^{x^2-2x+1}$, then the eq. (i) can be expressed as

$$y + \frac{(2+\sqrt{3})^2}{y} = 2(2+\sqrt{3})$$

$$\Rightarrow \quad y^2 - 2(2+\sqrt{3})y + (2+\sqrt{3})^2 = 0$$

$$\Rightarrow \quad [y - (2+\sqrt{3})]^2 = 0 \Rightarrow y = 2+\sqrt{3}$$

$$\therefore \quad (2+\sqrt{3})^{x^2-2x+1} = (2+\sqrt{3})$$

$$\Rightarrow \quad x^2 - 2x + 1 = 1 \quad \Rightarrow \quad x(x-2) = 0$$

$$\Rightarrow \quad x = 0 \text{ or } 2.$$

31 For $a = 0$ or $a = \dfrac{1}{2}$ one of the quadratic equations becomes linear, so $a \neq 0$, $a \neq \dfrac{1}{2}$.

Hence the only answer is $a = \dfrac{2}{9}$

32 Let $f(x) = x^2 - 2(4k-1)x + 15k^2 - 2k - 7$. Then $f(x) > 0$

$$\Rightarrow \quad D < 0 \ [\because \text{coefficient of } x^2 > 0]$$

$$\Rightarrow \quad 4(4k-1)^2 - 4(15k^2 - 2k - 7) < 0$$

$$\Rightarrow \quad k^2 - 6k + 8 < 0 \quad \Rightarrow \quad 2 < k < 4$$

33 According to the given condition a lies between the roots.

Let $f(x) = 2x^2 - 2(2a+1)x + a(a+1)$.

For a to lie between the roots, we must have $D \geq 0$ and $f(a) < 0$

Now, $D \geq 0 \quad \Rightarrow \quad 4(2a+1)^2 - 8a(a+1) \geq 0$

$$\Rightarrow \quad 8\left[a^2 + a + \frac{1}{2}\right] \geq 0, \qquad \text{which is always true}$$

$$\therefore \quad f(a) < 0 \quad \Rightarrow \quad 2a^2 - 2a(2a+1) + a(a+1) < 0$$

$$\Rightarrow \quad -a^2 - a < 0 \quad \Rightarrow \quad a^2 + a > 0$$

$$\Rightarrow \quad a > 0 \quad \text{or} \quad a < -1$$

34 Let α, β and γ be the roots of the given equation such that $\alpha = -\beta$. Then,

$$\alpha + \beta + \gamma = a \quad \Rightarrow \gamma = a$$

Since γ is a root of the given equation, so it satisfies the equation, *i.e.,*

$$\gamma^3 - a\gamma^2 + b\gamma - c = 0$$

$$\Rightarrow \quad a^3 - a^3 + ab - c = 0 \quad \Rightarrow \quad ab = c$$

35 Let $f(x) = ax^2 + bx + c$. Since 1 lies outside the roots of $f(x) = 0$. So,

$$af(1) > 0 \quad \Rightarrow \quad f(1) > 0 \qquad (\because \ a > 0)$$

$$\Rightarrow \quad a + b + c > 0$$

36 $x - \dfrac{1}{x^2-4} = 2 - \dfrac{1}{x^2-4}$

Here $x^2 - 4 \neq 0$

$$\Rightarrow \quad x \neq \pm 2 \quad \Rightarrow \quad (x-2) = 0$$

$\Rightarrow x = 2$, which is inadmissible.

37 $2^{x/2} + (\sqrt{2}+1)^x = (5 + 2\sqrt{2})^{x/2}$

$$\Rightarrow \left(\frac{\sqrt{2}}{\sqrt{5+2\sqrt{2}}}\right)^x + \left(\frac{\sqrt{2}+1}{\sqrt{5+2\sqrt{2}}}\right)^x = 1$$

which is of the form

$$\cos^x \alpha + \sin^x \alpha = 1$$

$$\therefore \quad x = 2.$$

38 $xy = 2(x+y) \quad \Rightarrow \quad y(x-2) = 2x$

$\therefore \ y = \dfrac{2x}{x-2}$ but $x, y \in N$ by trial, we get $x = 3, 4, 6$

$\therefore \ y = 6, 4, 3$ But $x \leq y$

$\therefore \ x = 3, 4$ and $y = 6, 4$

Thus two solutions are possible.

39 Let the roots be α and $\frac{1}{\alpha}$

$\therefore \quad \alpha \cdot \frac{1}{\alpha} = \frac{c}{a} \Rightarrow c = a$

$\because \quad (|a| - |b|)^2 \geq 0$ or $|a| \geq |b|$

but $\quad c = a \quad \therefore |c| \geq |b|$

40 $\quad |x+1||x-1| = a^2 - 2a - 3$

$\Rightarrow \quad |x^2 - 1| = a^2 - 2a - 3$

$\Rightarrow \quad x^2 - 1 = \pm (a^2 - 2a - 3)$

but $\quad a^2 - 2a - 3 \geq 0$

$\therefore \quad x^2 - 1 = a^2 - 2a - 3$

$\Rightarrow \quad x^2 = a^2 - 2a - 2, \quad -a^2 + 2a + 4 \geq 0$

For real solutions,

$$a^2 - 2a - 2 \geq 0 \quad \text{and} \quad -a^2 + 2a + 4 \geq 0$$

Thus we have $a \in (-\infty, -1] \cup [3, \infty)$

41 Since k is a prime number

$\therefore \quad k \neq 0$

Again $p = 0, \ qk^{1/3} = 0$ and $rk^{2/3} = 0$

$\Rightarrow \quad p = 0$ and $q = 0$ and $r = 0$

$\therefore \quad p = q = r = 0$

42 The equation $x^4 + 2px^3 + x^2 + 2px + 1 = 0$ cannot have 0 as a root. Dividing by x^2, we can write as

$$x^2 + \frac{1}{x^2} + 2p\left(x + \frac{1}{x}\right) + 1 = 0$$

$$\Rightarrow \quad \left(x + \frac{1}{x}\right)^2 + 2p\left(x + \frac{1}{x}\right) - 1 = 0 \qquad \ldots(i)$$

Put $x + \frac{1}{x} = y$. Then we can write eq. (i) as

$$y^2 - 2py - 1 = 0 \qquad \ldots(ii)$$

Since $D > 0$, *i.e.,* $4p^2 + 4 > 0$, hence eq. (ii) has two distinct real roots. These roots are

$$y = \frac{-2p \pm \sqrt{4p^2 + 4}}{2} = -p \pm \sqrt{p^2 + 1}$$

Since $-p + \sqrt{p^2 + 1} > 0$, the equation

$$x + \frac{1}{x} = -p + \sqrt{p^2 + 1} \qquad \ldots(iii)$$

has either positive roots or non-real complex roots.

Since $-p - \sqrt{p^2 + 1} < 0$, both the roots of the equation $x + \frac{1}{x} = -p - \sqrt{p^2 + 1}$ are negative.

We can write Eq. (iii) as

$$\left(\sqrt{-x} - \frac{1}{\sqrt{-x}}\right)^2 = p - 2 + \sqrt{p^2 + 1}$$

As $\left(\sqrt{-x} - \frac{1}{\sqrt{-x}}\right)^2 > 0$, we must have,

$$p - 2 + \sqrt{p^2 + 1} > 0, \quad \textit{i.e.,} \ \sqrt{p^2 + 1} > |2 - p|.$$

Since $\quad p^2 + 1 = (p-2)^2 + 4p - 3,$

$$\sqrt{p^2 + 1} > |2 - p| \quad \text{iff } 4p - 3 > 0.$$

i.e., iff $\quad p > \frac{3}{4}$.

43 **Case 1.** Suppose $x \geq a$. Thus the given equation becomes

$$x^2 - 2a(x - a) - 3a^2 = 0$$

$\Rightarrow \quad x^2 - 2ax - a^2 = 0$

$\Rightarrow \quad x = \frac{2a \pm 2\sqrt{2}a}{2} = (1 \pm \sqrt{2})a$

As $a < 0$ and $1 + \sqrt{2} > 1$, $(1 + \sqrt{2})a < a$.

Therefore, $x \neq 1(1 + \sqrt{2})a$.

Again as $1 - \sqrt{2} < 1$, $(1 - \sqrt{2})a > a$.

$\therefore \quad x = (1 - \sqrt{2})a$.

Case 2. Suppose $x < a$, then the given equation becomes

$$x^2 - 2a(a - x) - 3a^2 = 0$$

$\Rightarrow \quad x^2 + 2ax - 5a^2 = 0$

$\Rightarrow \quad x = \frac{-2a \pm \sqrt{24}a}{2} = (-1 \pm \sqrt{6})a$

As $a < 0$, $-1 - \sqrt{6} < 0 < 1$, so $(-1 - \sqrt{6})a > a$,

$\therefore \quad x \neq (-1 - \sqrt{6})a \qquad (\because \ x < a)$

Again, as $a < 0$, $-1 + \sqrt{6} > 1$ and $(-1 + \sqrt{6})a < a$

$\therefore \quad x = (-1 + \sqrt{6})a = (\sqrt{6} - 1)a$.

44 **Case 1.** Let $x + 2 \geq 0$.

$\therefore |x + 2| = x + 2$ and the equation becomes

$$2^{x+2} - 2^{x+1} - 1 - |2^{x+1} - 1| = 0$$

$\Rightarrow \quad 2^{x+1}(2 - 1) - 1 - |2^{x+1} - 1| = 0$

$\Rightarrow \quad 2^{x+1} - 1 = |2^{x+1} - 1|$

$\Rightarrow \quad 2^{x+1} - 1 \geq 0$ or $x + 1 \geq 0$ or $x \geq -1$

Case 2. Let $x + 2 < 0$.

$\therefore \quad |x + 2| = -(x + 2)$ and the equation becomes

$$2^{-(x+2)} - |2^{x+1} - 1| = 2^{x+1} + 1 \qquad \ldots(i)$$

Put $2^{x+1} = y$. Then eq. (i) becomes $\frac{1}{2y} - |y - 1| = y + 1$

or $\quad 2y^2 + 2y + |y - 1|\, 2y = 1 \qquad \ldots(ii)$

If $y \geq 1$, then LHS of eq. (ii) becomes

$$2y^2 + 2y - 2y(y - 1) - 1 = 0$$

$\Rightarrow \quad 4y = 1$ or $y = \frac{1}{4}$

Also $\quad 2^{x+1} = 2^{-2}$ or $x = -3$

45 Let $y = 5 + 2\sqrt{6}$, then $\frac{1}{y} = 5 - 2\sqrt{6}$. Thus the given equation becomes $y^{x^2-3} + \left(\frac{1}{y}\right)^{x^2-3} = 10$ …(i)

Again let $y^{x^2-3} = t$. Then eq. (i) becomes

$$t + \frac{1}{t} = 10 \Rightarrow t^2 - 10t + 1 = 0$$

Thus, $t = 5 \pm 2\sqrt{6}$

$\therefore$ $(5 + 2\sqrt{6})^{x^2-3} = 5 \pm 2\sqrt{6} = (5 + 2\sqrt{6})^{\pm 1}$

$\Rightarrow x^2 - 3 = 1$ or $x^2 - 3 = -1 \Rightarrow x^2 = 4$ or $x^2 = 2$

$\Rightarrow$ $x = \pm 2$ or $x = \pm\sqrt{2}$

46 For the real roots we must have $D \geq 0$. *i.e.,* $b^2 - 4ac \geq 0 \Rightarrow b^2 \geq 4a (\because\ c = 1)$

b	b^2	a	$4a$	
1	1	×	×	
2	4	1	4	→ 1
3	9	1, 2	4, 8	→ 2 } 7
4	16	1, 2, 3, 4	4, 8, 12, 16	→ 4

Thus, there are 7 possible equations of the given form.

47 Let $y = a + \frac{1}{a}$ …(i)

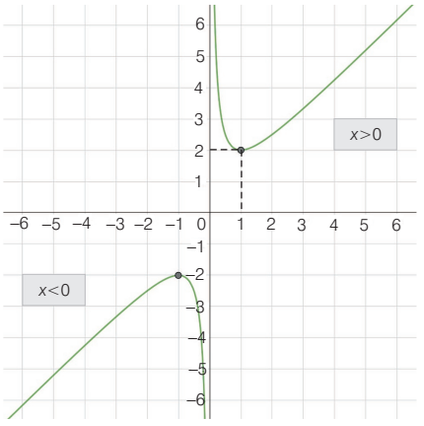
Differentiating above eq. (i), we get

$$1 - \frac{1}{a^2} = 0 \Rightarrow a^2 = 1 \Rightarrow a = \pm 1$$

But, since $a > 0$, therefore, only $a = 1$ is acceptable. Now substituting $a = 1$ in the original Eq. (i), we get the required minimum value of the expression.

Hence, minimum of $y = 1 + \frac{1}{1} = 2$

Alternatively See the following graph of $y = x + \frac{1}{x}$.



Here, $x = a$

$\therefore$ $y = x + \frac{1}{x} = a + \frac{1}{a}$

a	$\frac{1}{a}$	$a + \frac{1}{a}$
1	1	2
2	1/2	2.5
3	1/3	3.33
4	1/4	4.25
5	1/5	5.20
1/2	2	2.5
1/3	3	3.33
1/4	4	4.25

Alternatively Let us consider $y = a + \frac{1}{a}$; $(a > 0)$

$\Rightarrow$ $y = \frac{a^2 + 1}{a} \Rightarrow a^2 - ya + 1 = 0$

For a to be a real number, $(-y)^2 - (4 \times 1 \times 1) \geq 0$

$\Rightarrow$ $y^2 \geq 4 \Rightarrow y \leq -2$ or $y \geq 2$

Given that $a > 0$, so $y > 0$.

$\Rightarrow$ $y \geq 2$

It implies that the minimum value of $y = 2$.

Thus the minimum value of $a = \frac{1}{a} = 2$.

48 $(a + b + c)^2 \geq 0$

$\therefore$ $(a + b + c)^2$

$= a^2 + b^2 + c^2 + 2(ab + bc + ca) \geq 0$ …(i)

$\therefore$ $1 + 2(ab + bc + ca) \geq 0$ $(\because\ a^2 + b^2 + c^2 = 1)$

$\Rightarrow$ $(ab + bc + ca) \geq -\frac{1}{2}$ …(ii)

Also, $a^2 + b^2 \geq 2ab$, $b^2 + c^2 \geq 2bc$, $c^2 + a^2 \geq 2ac$

$(a^2 + b^2 + b^2 + c^2 + c^2 + a^2) \geq 2ab + 2bc + 2ac$

$\Rightarrow$ $a^2 + b^2 + c^2 \geq ab + bc + ac$ $(\because\ a^2 + b^2 + c^2 = 1)$

$\Rightarrow$ $ab + bc + ac \leq 1$

$\therefore$ $-\frac{1}{2} \leq ab + bc + ac \leq 1.$

49 Best way is to go through options. It satisfies for every even integer.

50 Let $(15 + 4\sqrt{14})^t = k$

$\therefore$ $(15 - 4\sqrt{14})^t = \frac{1}{k}$

$\therefore$ The given equation can be written as

$$k + \frac{1}{k} = 30$$

$\Rightarrow$ $k^2 - 30k + 1 = 0 \Rightarrow k = 15 \pm 4\sqrt{14}$

Now, the equation will hold only at $t = \pm 1$.

$\therefore$ $x^2 - 2|x| = \pm 1$

Again if $x^2 - 2|x| = 1 \Rightarrow x = \pm(1 + \sqrt{2})$

and if $x^2 - 2|x| = -1 \Rightarrow x = \pm 1$

Hence $x = \pm 1, \pm(1 + \sqrt{2})$

51 We have $|2x-3|<1 \Leftrightarrow -1<2x-3<1$

$\Leftrightarrow \quad 1<x<2 \Leftrightarrow x\in(1,2)$

52 The roots of the equation are ω and ω^2.

Let $\alpha=\omega$ and $\beta=\omega^2$. Then

$\alpha^{19}=\omega^{19}=\omega$ and $\beta^7=\omega^{14}=\omega^2$

Hence α^{19} and β^7 are roots of the same equation.

53 Let α, β be the roots of the equation $x^2+px+8=0$.

Then $\alpha+\beta=-p$ and $\alpha\beta=8$

But $\alpha-\beta=2 \Rightarrow (\alpha+\beta)^2-4\alpha\beta=(2)^2$

$\Rightarrow \quad p^2-32=4 \Rightarrow p=\pm 6.$

54 $(x+y)^2=x^2+y^2+2xy$

$\Rightarrow \quad (x+y)^2=x^2+y^2+2 \quad (\because xy=1)$

For the minimum value of the expression, $x=y$

$\therefore \quad x=1$ and $y=1$

Hence, $(x+y)_{\min}=\sqrt{x^2+y^2+2}=\sqrt{4}=2$

$(x+y)_{min}=2 \quad (\because x>0 \text{ and } xy>0 \therefore y>0)$

Alternatively

xy	x	y	$\sqrt{x^2+y^2+2}=(x+y)$
1	1/10	10	101/10
1	1/5	5	26/5
1	1/2	2	5/2
1	1	1	2
1	2	1/2	5/2
1	5	1/5	26/5
1	10	1/10	101/10

Alternatively

We know that for any real number, $AM \geq GM$.

$\therefore \quad \frac{x+y}{2} \geq \sqrt{xy} \Rightarrow (x+y) \geq 2\sqrt{xy} \Rightarrow (x+y) \geq 2 \ (\because xy=1)$

55 $x=7+4\sqrt{3}$

$\therefore \quad y=\frac{1}{7+4\sqrt{3}}=7-4\sqrt{3}$

$\therefore \quad \frac{1}{x^2}+\frac{1}{y^2}=\frac{x^2+y^2}{(xy)^2}=\frac{(7+4\sqrt{3})^2+(7-4\sqrt{3})^2}{[(7+4\sqrt{3})(7-4\sqrt{3})]^2}$

$=\frac{2(49+48)}{1}=194$

56 For real x, the ever power of x is always a non-negative number.

Therefore, we have $x^2/(1+x^4) \geq 0$

Also $1+x^4-2x^2=(1-x^2)^2 \geq 0 \Rightarrow 1+x^4 \geq 2x^2$

$\therefore \quad \left(\frac{x^2}{1+x^4}\right) \leq \frac{1}{2}, \quad$ So $0 \leq \frac{x^2}{1+x^4} \leq \frac{1}{2}$

Alternatively For real values of x, $x^2+\frac{1}{x^2} \geq 2$

$\Rightarrow \quad \frac{x^4+1}{x^2} \geq 2 \quad \Rightarrow \frac{x^2}{x^4+1} \leq \frac{1}{2}$

And, for real values of x, $\frac{x^2}{x^4+1} \geq 0$

Therefore, we have $0 \leq \frac{x^2}{1+x^4} \leq \frac{1}{2}$

57 $x^3+1 \geq x^2+x \Rightarrow x^3-x^2-x+1 \geq 0$

$\Rightarrow (x-1)^2(x+1) \geq 0 \quad \Rightarrow x \geq -1$

58 Since $a^2=5a-3$ and $b^2=5b-3$, $(a \neq b)$. It implies that a and b are the roots of $x^2=5x-3$ or $x^2-5x+3=0$.

Therefore $a+b=5$ and $ab=3$.

Now $\frac{a}{b}+\frac{b}{a}=\frac{19}{3}$ and $\frac{a}{b}\times\frac{b}{a}=1$.

So the required equation is $x^2-\frac{19}{3}x+1=0$

$\Rightarrow \quad 3x^2-19x+3=0$

Hence, choice (c) is the answer.

59 Let D_1 and D_2 be the discriminants of $f(x)$ and $g(x)$ respectively.

Then $D_1=b^2-4ac$ and $D_2=b^2+4ac$

Since $ac \neq 0 \Rightarrow ac>0$ or $ac<0$.

If $ac>0$, D_2 must be positive; D_1 may or may not be.

And if $ac<0$, D_1 must be positive; D_2 may or may not be.

It implies that when $ac \neq 0$, at least one of D_1 and D_2 must be positive. That means at least one of the two equations $f(x)$ and $g(x)$ must have real roots.

Hence choice (c) is the answer.

NOTE In any quadratic equation either both the roots are real or both the roots are non-real.

Alternatively The four roots of $f(x)\cdot g(x)=0$ are the two roots of $f(x)$ and two roots of $g(x)$. It implies that the number of real roots of $f(x)\cdot g(x)=0$ will be either 4 or 2 or 0.

Now we have to find the minimum number of real roots of $f(x)\cdot g(x)=0$

So let us consider that none of the equations have real roots. That means, both the discriminants D_1 and D_2 are negative. That is $D_1<0$ and $D_2<0$

It implies that $b^2-4ac<0$ and $b^2+4ac<0$

But, we observe that, whether $ac>0$ or $ac<0$, at least one of the above discriminants is certainly invalid. That means one of the two discriminants has to be positive.

Thus, it is certain that one equation must have real roots. This, in turn, implies that at least 2 roots have to be real.

Alternatively Let D_1 and D_2 be the discriminants of $f(x)$ and $g(x)$ respectively.

Now, $D_1 + D_2 = (b^2 - 4ac) + (b^2 + 4ac)$

$\Rightarrow \quad D_1 + D_2 = 2b^2 \Rightarrow D_1 + D_2 > 0$

It implies that at least one of D_1 and D_2 must be positive. So, at least one of the two equations $f(x)$ and $g(x)$ must have real roots.

Therefore, the equation $f(x)\cdot(g(x) = 0$ has at least two real roots.

60 Let D_1 and D_2 be the discriminants of $f(x)$ and $g(x)$ respectively.

Therefore $D_1 + D_2 = (u^2 - 4v) + (j^2 - 4k)$

$\Rightarrow \quad D_1 + D_2 = u^2 + j^2 - 4(v + k)$

$\Rightarrow \quad D_1 + D_2 = u^2 + j^2 - 2uj \Rightarrow D_1 + D_2 = (u - j)^2$

$\Rightarrow \quad D_1 + D_2 \geq 0$

So at least one of D_1 and D_2 must be positive. Therefore it can be inferred that at least one of $f(x)$ and $g(x)$ must have real roots.

Hence choice (d) is the answer.

61 Let α and α^n be the roots of the given equation, then

$$\alpha + \alpha^n = \frac{-b}{a} \qquad \ldots(i)$$

$$\alpha \cdot \alpha^n = \frac{c}{a} \Rightarrow \alpha^{n+1} = \frac{c}{a}$$

$$\Rightarrow \quad \alpha = \left(\frac{c}{a}\right)^{\frac{1}{n+1}} \qquad \ldots(ii)$$

From the eq. (i) we have, $a\alpha + a\alpha^n + b = 0$

$$\Rightarrow \quad a\left(\frac{c}{a}\right)^{\frac{1}{n+1}} + a\left(\frac{c}{a}\right)^{\frac{n}{n+1}} + b = 0$$

$$\Rightarrow \quad a\left(\frac{c}{a}\right)^{\frac{1}{n+1}} + a\left(\frac{c^n}{a^b}\right)^{\frac{1}{n+1}} + b = 0$$

$$\Rightarrow \quad (ca^n)^{\frac{1}{n+1}} + (ac^n)^{\frac{1}{n+1}} + b = 0$$

Hence choice (c) is the answer.

62 Let α and β be the roots of this equation, then

$$\alpha + \beta = \frac{-b}{a} \qquad \ldots(i)$$

and $$\alpha\beta = \frac{c}{a} \qquad \ldots(ii)$$

Also, $$\frac{\alpha}{\beta} = r \qquad \ldots(iii)$$

Now go through the given choices and check their validity.

Let's consider choice (b), then

$ac(1 + r)^2 = rb^2$

$$\Rightarrow \quad ac\left(1 + \frac{\alpha}{\beta}\right)^2 = \frac{\alpha}{\beta} \times b^2 \Rightarrow \quad ac\left(\frac{\alpha + \beta}{\beta}\right)^2 = \frac{\alpha}{\beta} \times b^2$$

$$\Rightarrow ac(\alpha + \beta)^2 \frac{1}{\beta^2} = \frac{\alpha}{\beta} \times b^2 \Rightarrow \quad ac\left(-\frac{b}{a}\right)^2 = \alpha\beta \times b^2$$

$$\Rightarrow \quad \frac{c}{a} \times b^2 = \frac{c}{a} \times b^2$$

Since both the sides are equal. Therefore the chosen relationship is true. Hence choice (b) is the answer.

63 Let's assume that $a = -2$, $b = 2$, and $k = 5$, then

$(x + 2)(x - 2) - 5 = 0 \Rightarrow (x + 3)(x - 3) = 0$

$\Rightarrow \quad c = -3, d = 3$

Now substituting the values of c and d in the given choices, we try to find out the correct choice whose roots are a, b. That is $-2, 2$.

(a) $x^2 - 14$, which is not true.

(b) $x^2 - 14$, which is not true.

(c) $x^2 - 4$, which is true, since it gives the required roots $-2, 2$.

(d) $x^2 + 1$, which is not true.

Hence choice (c) is the answer.

Alternatively $(x - a)(x - b) - k = 0$

$$\Rightarrow \quad x^2 - (a + b)x + ab - k = 0 \qquad \ldots(i)$$

$$\Rightarrow \quad c + d = a + b$$

$$\Rightarrow \quad cd = ab - k \qquad \ldots(ii)$$

The new quadratic equation whose roots are a, b is

$$x^2 - (a + b)x + ab = 0$$

Now from eqs. (i) and (ii), we get

$$x^2 - (a + b)x + ab = 0$$

$$\Rightarrow \quad x^2 - (c + d)x + cd + k = 0 \Rightarrow (x - c)(x - d) + k = 0$$

Hence choice (c) is the answer.

64 The best way to solve it is by considering arbitray values of roots then framing a cublic equation as follows.

Let's assume that $r_1 = 1, r_2 = 2$, then we will have a corresponding equation to these roots as

$$(x - 1)(x - 2) = x^2 - 3x - 2$$

Then $S_1 = r_1 + r_2 + r_2 = 3, P = r_1 r_2 = 2$, and $S_3 = r_1^3 + r_2^3 = 9$

$\therefore \quad S_1^3 = S_3 + 3PS_1 \Rightarrow 27 = 9 + 3(2 \times 3)$, which is valid.

Similarly $S_3 = S_1(S_1^2 - 3P) \Rightarrow 9 = 3(9 - 6)$, which is valid

Therefore (i) and (ii) both are true

Hence choice (c) is the answer

Alternatively Use the following formulae

$a^3 + b^3 = (a + b)(a^2 + b^2 - ab) = (a + b)[(a + b)^2 - 3ab]$

and $$(a + b)^3 = a^3 + b^3 + 3ab(a + b)$$

65 If the two roots are α and β, then

$$x^2 + bx + c = 0$$

$$\Rightarrow \quad x^2 - (\alpha + \beta)x + \alpha\beta = 0$$

It implies that $\alpha + \beta = -17$ and $\alpha\beta = 30$

Thus the wrong equation is $x^2 + 17x + 30 = 0$

And the correct equation is $x^2 + 13x + 30 = 0$

Therefore the roots of correct equation can be computed by using any of the known methods as -10 and -3.

Hence choice (c) is the answer.

NOTE Since, only the coefficient of x is wrong, it means the constant term c (or $\alpha\beta$) is correct.

66 The two roots of $6x^2 - 17x + 12 = 0$ are $\frac{3}{2}$ and $\frac{4}{3}$.

Now if $\frac{3}{2}$ is a common root in both the equations then it will satisfy $3x^2 - 2x + p = 0$ also.

Therefore, $3x^2 - 2x + p = 0$

$$\Rightarrow \quad 3\left(\frac{9}{4}\right) - 2\left(\frac{3}{2}\right) + p = 0$$

$$\Rightarrow \quad p = -\frac{15}{4}$$

Again, if $\frac{4}{3}$ is a common factor in both the equations then it will satisfy $3x^2 - 2x + p = 0$ also.

Therefore, $3x^2 - 2x + p = 0$

$$\Rightarrow \quad 3\left(\frac{16}{9}\right) - 2\left(\frac{4}{3}\right) + p = 0$$

$$\Rightarrow \quad p = -\frac{8}{3}.$$

Hence choice (b) is the answer.

Alternatively Consider two quadratic equations,

$$ax^2 + bx + c = 0; \text{ (where } a \neq 0) \qquad \ldots(i)$$

And $\quad a'x^2 + b'x + c' = 0; \text{ (where } a' \neq 0) \qquad \ldots(ii)$

If one root is common, then the following condition must be satisfied.

$$(ab' - a'b)(bc' - b'c) = (ca' - c'a)^2$$

Therefore $[(3\times -17) - (6\times -2)]\,[(-2\times 12) - (-17\times p)]$

$$= [(p\times 6) - (12\times 3)]^2$$

$$\Rightarrow 12p^2 + 77p + 120 = 0$$

$$\Rightarrow \quad p = -\frac{8}{3}, -\frac{15}{4}$$

67 The roots of the equation $x^2 + 2x + 9 = 0$ are imaginary as the discriminant $D = -32$, which is negative. That means there is a pair of conjugate roots.

So, one root alone cannot be common, as the conjugate root of the common root be same for both the equations. It implies that both the roots of the equations will be common.

$$\therefore \quad \frac{a}{1} = \frac{b}{2} = \frac{c}{9} \Rightarrow a : b : c = 1 : 2 : 9$$

Hence choice (a) is the answer.

68 Choices (b) and (c) can't be the required answer as they contain the minus sign while it is given that $a > 0$.

Now try the following approach and see if it works. Consider

$a = 4$, from the last choice.

$$x^2 - 4x - 45 = 0 \Rightarrow (x - 9)(x + 5)$$

$$x^2 - 12x + 17 = 0 \Rightarrow (x - 9)(x - 3)$$

It shows that when $a = 4$, there is one common root (9) between the two given equations.

Hence choice (d) is the answer.

69. Comparing the given equations you will get,

$$x^2 - px + q = x^2 + qx - p \Rightarrow (p + q) = x(p + q) \Rightarrow (p + q)$$

$$\Rightarrow x = 1$$

It implies that 1 is the common root, then substituting $x = 1$ in any of the given equations you will get, $p - q = 1$.

Hence choice (d) is the answer.

70. Since in each equation product of roots is clearly known, but the sum of roots is unknown. However, it is obvious that the roots will be odd as sum of roots is an even number.

With this little known information, we can assume, with some confidence, that (1, 5), (1, 7) and (5, 7) are the roots of respective equations. Then $x^2 - 6x + 5 = 0$, $x^2 - 8x + 7 = 0$ and $x^2 - 12x + 15 = 0$ be the possible equations.

Now comparing these equations with the given ones, we find that $m = 3$, $n = 4$ and $p = 6$. Therefore $m + n + p = 13$.

Hence choice (a) is the correct one.

Alternatively Let (a, b), (b, c) and (c, a) be the roots of the given equations, respectively. Then $a \times b = 5$, $b \times c = 7$ and $c \times a = 35 \quad \Rightarrow a \times b \times c = 35$

But since, a, b, c are positive real numbers, therefore $a = 5$, $b = 1$, $c = 7$.

Now, $2m = a + b = 6$, $2n = b + c = 8$, $2p = c + a = 12$.

Therefore, $2m + 2n + 2p = 26 \Rightarrow m + n + p = 13$.

71 As it's an identity, so it must be satisfied by any value of x. So the coefficients and the constant term must be zero.

Therefore, $a^2 - 1 = 0 \Rightarrow a = -1, 1$

And $a - 1 = 0 \Rightarrow a = 1$ and $a^2 - 4a + 3 = 0 \Rightarrow a = 1, 3$

Thus you can see that when $a=1$, the constant term and the coefficients of x and x^2 are zero. So, for $a=1$, the given relation will be an identity.

Hence choice (c) is the answer.

Hint Identity equations are the equations which are always true no matter what value is plugged in for the variable. If you simplify an identity equation, you'll always get a true statement.

When an equation becomes an identity in x, then the equation gets satisfied by every real number. And, this can happen only when all the 3 terms of the given equation become equal to zero. So, you can see when $a=1$, each of the three terms given in the equation becomes zero. And, then whatever value you substitute for x, you'll always get LHS = RHS.

72 The given equation is satisfied for three distinct values of x; $x=-a,\ x=-b,\ x=-c$.

The highest power of x in the given equation is 2 but this equation is satisfied by three distinct values of x. So it is an identity.

Hence choice (c) is the answer.

Hint Actually, when you simplify the given equation you will find that it's a quadratic equation, which should not have more than 2 roots. However, this equation has more than 2 roots (a, b and c). So, it is obvious that the given equation is an identity.

73 The best way is to consider any quadratic equation whose roots are not real. So, I'm assuming such an equation: $x^2-x+2=0$

Now, comparing this equation ($x^2-x+2=0$) with the given equation ($ax^2+bx+c=0$), we get $a=1$, $b=-1$ and $c=2$

Now, if you plug in the values of a, b and c in the given options, you will see that options (b), (c) and (d) do not satisfy.

Hence, choice (a) is the valid one.

Hint How can you find a quadratic equation whose roots are non-real?

(i) Have $b^2<4ac$

(ii) Directly consider any two non-real roots, say $\alpha=(1+i)$ and $\beta=1-i$ and then form the equation $x^2-(\alpha+\beta)x+(\alpha\beta)=0$

Alternatively Let $f(x)=ax^2+bx+c$. Since, the equation has no real roots, the graph of $f(x)$ will lie either above the X-axis or below the X-axis. It clearly suggests that for all the arbitrary values of x, the value of $f(x)$ will have the same sign. So, you can claim that $f(1)$ and $f(0)$ will have the same sign.

Therefore $f(1)\cdot f(0)>0 \Rightarrow (a+b+c)c>0$

Hence choice (a) is the answer.

Hint Please recall that the product of two numbers is always positive if both of them have the same sign. So, if $f(0)$ and $f(1)$ have the same sign, then their product will certainly be positive.

Here, $f(0)=c$ and $f(1)=a+b+c$

74 Let us consider any three arbitrary roots for a cubic equation, which are in HP.

As 1, 1, 1 are in HP, so we can consider them the valid roots. Then we will have the cubic equation as following

$$(x-1)(x-1)(x-1)=0 \text{ or } (x-1)^3=0$$

Or $$x^3-3x^2+3x-1=0 \quad \ldots(i)$$

Now, comparing the above eq. (i) with given equation $x^3-px^2+px-r=0$, we get $p=3$, $q=3$, $r=1$

Now, if we substitute these values of p, q and r in the given choices, then only choice (b) will be satisfied.

Hence choice (b) is the answer.

NOTE Even if you consider the three roots as 2, 3, 6 (or any three roots which are in HP), the answer will always be choice (b).

Alternatively The equation whose roots are reciprocals of the roots of the given equation is given by

$$\frac{1}{x^3}-\frac{p}{x^2}+\frac{q}{x}-r=0$$

$$\Rightarrow \quad rx^3-qx^2+px-1=0 \quad \ldots(i)$$

Since the roots of the given equation are in HP, the roots of the eq. (i) are in AP. Let the roots of eq. (i) be $(b-d)$, b, $(b+d)$.

Then, sum of the roots $=(b-d)+b+(b+d)=-\dfrac{(-q)}{r}$

$$\Rightarrow \quad b=\frac{q}{3r}$$

Since b is the root of eq. (i), so

$$rb^3-qb^2+pb-1=0$$

$$\Rightarrow \quad r\left(\frac{q}{3r}\right)^3-q\left(\frac{q}{3r}\right)^2+p\left(\frac{q}{3r}\right)-1=0$$

$$\Rightarrow \quad 27r^2-9pqr+2q^3=0$$

Hence choice (b) is the answer.

75 Replacing x by $-x$, we can get the desired equation.

$$(-x)^3-3(-x)^2+(-x)+1=0$$

$$\Rightarrow \quad -x^3-3x^2-x+1=0$$

$$\Rightarrow \quad x^3+3x^2+x-1=0$$

Hence choice (a) is the answer.

76 Replacing x by $\sqrt{x}$, we can get the desired equation.

$$(\sqrt{x})^3-2(\sqrt{x})^2+3(\sqrt{x})+1=0$$

$$\Rightarrow \quad x\sqrt{x}-2x+3\sqrt{x}+1=0$$

$\Rightarrow \quad \sqrt{x}(x+3) = (2x-1)$

Squaring both sides and simplifying, we get

$$x^3 + 2x^2 + 13x - 1 = 0$$

Hence choice (a) is the answer.

77 Replacing x by $(x)^{1/3}$, we can get the desired equation.

$$a\left[(x)^{\frac{1}{3}}\right]^3 + b\left[(x)^{\frac{1}{3}}\right]^2 + c\left[(x)^{\frac{1}{3}}\right] + d = 0$$

$$\Rightarrow \quad ax + d = -\left[b(x)^{\frac{2}{3}} + c(x)^{\frac{1}{3}}\right]$$

Cubing both the sides of the above equation and simplifying it we get,

$$a^3x^3 + x^2(3a^2d - 3abc + b^3) + x(3ad^2 - 3bcd + c^3) + d^3 = 0$$

Hence choice (d) is the answer.

Alternatively Since the equation given in the problem and the equations given in the choices are purely in variables, so you have the flexibility to solve this problem by assuming any convenient numbers.

Now, let us assume that three roots of the given equation be 1, 2, 3. Then the original equation would be

$$(x-1)(x-2)(x-3) = 0$$

$$\Rightarrow \quad x^3 - 6x^2 + 11x - 6 = 0 \qquad \ldots(i)$$

Now, form another equation whose roots are 1, 8, 27 (*i.e.,* cube of 1, 2, 3).

Then the required equation would be

$$(x-1)(x-8)(x-27) = 0$$

$$\Rightarrow \quad x^3 - 36x^2 + 251 - 216 = 0 \qquad \ldots(ii)$$

Now, if we put in the values of a, b, c, d in the given choices, only choice (d) will give the Eq. (ii).

Hence choice (d) is the answer.

78 The best way is to go through the given choices. Since 3 is there in each of the choices so it's a sure shot value for x. And you can easily notice that whether you have $x = 3$ or $x = -3$ in both the case $x^2 - 8 = 1$

So, for $x = 3$ or -3, $(7 + 4\sqrt{3}) + (7 - 4\sqrt{3}) = 14$.

That is valid.

Now there are basically two values to choose from the given choices: ± 4 and $\pm\sqrt{7}$. If we consider $x = 4$, it does not lead to any potential possibility. So let's consider $x = \sqrt{7}$

So, for $x = \pm\sqrt{7}$, $x^2 - 8 = -1$. Therefore,

$$(7 + 4\sqrt{3})^{-1} + (7 - 4\sqrt{3})^{-1}$$

$$= \frac{1}{7 + 4\sqrt{3}} + \frac{1}{7 - 4\sqrt{3}} = 14 \text{ that is valid}$$

Hence choice (c) is the answer.

79 The best way is to assume some relevant numerical values for a, b, c such that $a + b + c = 0$. So, for the sake of simplicity, we can assume

$$a = 1,\ b = 0,\ c = -1$$

Now, substituting the values of a, b and c in the given equation, $3ax^2 + 2bx + c = 0$, it becomes as $3x^2 - 1 = 0$, and its roots are $\pm\frac{1}{\sqrt{3}}$

Thus you can see that the roots are real and distinct.

Hence choice (a) is the answer.

Alternatively If you assume $a = 1,\ b = 2,\ c = -3$, you will have $3x^2 + 4x - 3 = 0$, and then its discriminant will be a positive value, which ensures that the roots are real and distinct.

NOTE For any quadratic equation, the coefficient of x^2 cannot be zero, so you can assume any real value for x, but not zero.

Remember that roots can be rational only when the discriminant is a perfect square. It means whether roots are rational or not, but they must be real and distinct (unequal) when discriminant is a positive value. That's why choice (a) is always correct but choice (c) may or may not be true.

Please try to understand that choice (c) represents the subset (or a special case) of choice (a). So as per the given condition you can tell the general answer, but not the very specific one.

Alternatively The discriminant of this equation is

$$D = 4b^2 - 12ac = 4(b^2 - 3ac)$$

$$\Rightarrow \quad D = 4[\{-(a+c)\}^2 - 3ac]$$

$$\Rightarrow \quad D = 4[(a^2 + c^2 + 2ac) - 3ac]$$

$$\Rightarrow \quad D = 4(a^2 + c^2 - ac)$$

$$\Rightarrow \quad D > 0$$

It implies that the roots are real and distinct.

But, as we can see that D is a not a perfect square so the roots are irrational.

Hint We know that for any two real numbers, $AM \geq GM$. that is $\frac{x+y}{2} \geq \sqrt{xy}$

$$\Rightarrow \quad x + y \geq 2\sqrt{xy} \quad \Rightarrow a^2 + c^2 \geq 2\sqrt{a^2c^2}$$

$$\Rightarrow \quad a^2 + c^2 \geq 2ac \quad \Rightarrow a^2 + c^2 > ac$$

$$\Rightarrow \quad a^2 + c^2 - ac > 0$$

NOTE

Since, $a^2 + c^2 - ac > 0$, therefore $D > 0$.

Otherwise, the square of any real number is always non-negative. So, we have $(a-c)^2 \geq 0$

$$\Rightarrow \quad a^2 + c^2 - 2ac \geq 0 \Rightarrow a^2 + c^2 \geq 2ac$$

$$\Rightarrow \quad a^2 + c^2 \geq 2ac > ac \Rightarrow a^2 + c^2 > ac \quad \Rightarrow a^2 + c^2 - ac > 0$$

80 Since $x = 0$ is not a solution of given equation. Dividing by x^2, we get

$$2\left(x^2 + \frac{1}{x^2}\right) + \left(x + \frac{1}{x}\right) - 11 = 0$$

$$\Rightarrow 2\left[\left(x + \frac{1}{x}\right)^2 - 2 \times x \times \frac{1}{x}\right] + \left(x + \frac{1}{x}\right) - 11 = 0 \quad \ldots(i)$$

Putting $x + \frac{1}{x} = y$ in eq. (i), we get

$$2(y^2 - 2) + y - 11 = 0 \Rightarrow 2y^2 + y - 15 = 0$$

$$\Rightarrow \quad y = -\frac{5}{3}, 2 \Rightarrow x + \frac{1}{x} = -\frac{5}{3} \text{ or } x + \frac{1}{x} = 2$$

$$\Rightarrow \quad x = \frac{-3 - \sqrt{5}}{2}, \frac{-3 + \sqrt{5}}{2}, \frac{1}{2}, 2$$

Hence choice (d) is the answer.

81 **Case 1:** If $x \in I$, then $(x) = [x]$

Therefore, $(x)^2 = [x]^2 + 2x \Rightarrow x = 0$

Case 2 : $x \notin I$, then $(x) = [x] - 1$

Therefore, $(x)^2 = [x]^2 + 2x$

$$\Rightarrow \quad [x]^2 + 1 + 2[x] = [x]^2 + 2x$$

$$\Rightarrow \quad x = [x] + \frac{1}{2}$$

$$\Rightarrow \quad x = n + \frac{1}{2}; n \in I$$

Hence choice (a) is the answer.

82 Since the roots of the equation $ax^2 + 2bx + c = 0$ are real.

Therefore,

$$4b^2 - 4ac \geq 0$$

$$\Rightarrow \quad b^2 \geq ac \quad \ldots(i)$$

And given that $m^2 > n \quad \ldots(ii)$

Now the discriminant of the equation $ax^2 + 2mbx + nc = 0$ is $4m^2b^2 - 4anc$

From the eqs. (i) and (ii), we get $m^2b^2 > anc$

$\therefore\ 4m^2b^2 > 4anc$

Hence choice (a) is the answer.

83 $16x^2 + 8(a + 5)x - 7a - 5 = 0$

Since the whole graph is strictly above the X-axis, so it implies that the roots of the graph are non-real. That means the discriminant of this equation D is negative.

Therefore,

$$[8(a + 5)]^2 - 4[16 \times (-7a - 5)] < 0$$

$$\Rightarrow \quad a^2 + 17a + 30 < 0$$

$$\Rightarrow \quad (a + 15)(a + 2) < 0$$

$$\Rightarrow \quad -15 < a < -2$$

Hence choice (b) is the answer.

84 $x = 1 + \cfrac{1}{3 + \cfrac{1}{2 + \cfrac{1}{3 + \cfrac{1}{2 + \ldots. \infty}}}}$

$$\Rightarrow x + 1 = 2 + \cfrac{1}{3 + \cfrac{1}{2 + \cfrac{1}{3 + \cfrac{1}{2 + \ldots. \infty}}}}$$

$$\Rightarrow x + 1 = 2 + \cfrac{1}{3 + \cfrac{1}{(x + 1)}}$$

$$\Rightarrow x + 1 = 2 + \frac{x + 1}{3x + 4} \Rightarrow x = 1 + \frac{x + 1}{3x + 4}$$

$$\Rightarrow \quad x = \frac{4x + 5}{3x + 4} \quad \Rightarrow x(3x + 4) = 4x + 5$$

$$\Rightarrow \quad 3x^2 = 5 \quad \Rightarrow \quad x = \pm\sqrt{\frac{5}{3}}$$

But, x cannot be a negative value.

Hence choice (c) is the answer.

85 Let us assume that $x^2 = a$ and $y^2 = b$. Then,

$$y^4 = 2x^4 + 1402$$

$$\Rightarrow \quad b^2 = 2a^2 + 1402 \quad \ldots(i)$$

As the problem asks for integral solutions, then we can assume that x and y are integers, so a and b are also integers. Since perfect squares can never be negative, so $a^2 \geq 0$ and $b^2 \geq 0$. As we can see that a^2 and b^2 are perfect square integers, so the minimum possible value of b^2 must be a perfect square number just greater than 1402 in order to satisfy the eq. (i).

Therefore the minimum possible value of $b^2 = 1444$ and the minimum possible value of $b = 38$.

From eq. (i) we know that b is an even number, so b can be expressed as following. $b = 38 + 2k$; Where k is any whole number.

$$\therefore \quad b^2 = 2a^2 + 1402$$

$$\Rightarrow \quad (38 + 2k)^2 = 2a^2 + 1402$$

$$\Rightarrow \quad a^2 = 2k^2 + 76k + 21$$

Since $2k^2 + 76k + 21$ is a perfect square, so its discriminant D should be zero.

That is $\quad D = 76^2 - 4 \times 2 \times 21 \Rightarrow D > 0$

It shows that $2k^2 + 76k + 21$ is not a perfect square.

Therefore a, b cannot be positive integers.

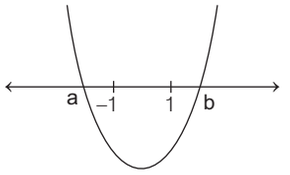
So, x, y cannot have integral solutions.

Hence choice (d) is the answer.

86 $ax^2 + bx + c = 0$

$$\Rightarrow \quad x^2 + \frac{b}{a}x + \frac{c}{a} = 0 \qquad \ldots(i)$$

Let's draw a quadratic graph such that $\alpha < -1$ and $\beta > 1$



From the graph, we observe that $f(-1) < 0$

$$\Rightarrow \quad 1 + \frac{b}{a} + \frac{c}{a} < 0 \qquad \ldots(ii)$$

Similarly from the graph, we observe that $f(1) < 0$

$$\Rightarrow \quad 1 - \frac{b}{a} + \frac{c}{a} < 0 \qquad \ldots(iii)$$

From eqs. (ii) and (iii), we can conclude that

$$1 + \left|\frac{b}{a}\right| + \frac{c}{a} < 0$$

Hence choice (a) is the answer.

87 $3x^3 = [(x^2 + \sqrt{18}x + \sqrt{32})(x^2 - \sqrt{18}x - \sqrt{32})] - 4x^2$

$\Rightarrow \quad 3x^3 = x^4 - (\sqrt{18}x + \sqrt{32})^2 - 4x^2$

$\Rightarrow \quad 3x^3 = x^4 - 2(3x + 4)^2 - 4x^2$

$\Rightarrow x^4 - 2(3x + 4)^2 - x^2(3x + 4) = 0$

Now putting $3x + 4 = y$, the above equation becomes

$$x^4 - yx^2 - 2y^2 = 0$$

$\Rightarrow (x^2 - 2y)(x^2 + y) = 0 \quad \Rightarrow (x^2 - 2y) = 0$

or $\qquad (x^2 + y) = 0 \quad \Rightarrow x^2 - (3x + 4) = 0$

$$\Rightarrow \quad x = 3 \pm \sqrt{17} \text{ or } x = \frac{-3 \pm \sqrt{7i}}{2}$$

Hence choice (a) is the answer.

88 For $x = a, b, c$ the given equation is an identity. Actually the given equation is a quadratic equation of degree two. But, since this equation has more than two solutions, therefore it is an identity.

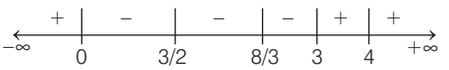
Hence choice (d) is the answer.

89 Since at $x = a, b, c$ both the sides are equal. It means there are 3 solutions.

Hence choice (c) is the answer.

NOTE Please bear in mind that the given equation is a quadratic equation which should have only two roots, but this equation has more than two roots, so it's an identity.

90 The critical points of this rational function are 0, 3/2 , 8/3, 3 and 4.



Now testing each of the 6 intervals we get the results as shown on the above number line.

Here we need non-positive intervals so we exclude all the positive intervals and combine the others keeping in mind the restriction on limits of the intervals.

Therefore the valid values of x are

$$\left[0, \frac{8}{3}\right) \cup \left(\frac{8}{3}, 3\right) \cup \{4\}.$$

The critical points 8/3, 3 are not included in the domain since the function is not defined there and 3/2, 4 are included since they satisfy the given relation. Since the problem asks only integral solutions so we have to look back in the domain of this function. Now looking in the domain we find that 1, 2, 4 are the three integral solutions to this problem.

Hence choice (b) is the answer.

Alternatively The least critical number is 0 and the greatest critical number is 4. So first of all by putting 1, 2, 3 and 4 in the above rational function you can check whether a particular integer gives the value of function $f(x) \le 0$.

Now test the same by selecting any random and convenient integer number before 1 and after 4.

The result is that only 1, 2 and 4 make the function $f(x) \le 0$.

91 $\dfrac{x^2 + 6x - 7}{|x + 3|} < 0 \quad \Rightarrow \dfrac{(x + 7)(x - 1)}{|x + 3|} < 0$

There are three critical points -7, -3 and 1. So there will be four different regions on the number line. That means there will be four intervals as following.

$$(-\infty, -7) \cup (-7, -3) \cup (-3, 1) \cup (1, \infty)$$

Now you can test each interval and then you see that only two intervals $(-7, -3)$ and $(-3, 1)$ give negative regions, which is the requirement of the problem.

Hence choice (d) is the answer.

Hint While testing for the signs in each of the intervals you can test the intervals by testing the numerator only. You need not consider the denominator as for every real number denominator will give positive results only. Also keep in mind that at $x = -3$, domain is broken (or undefined).

92 In each of the numerator and denominator, the discriminant $D < 0$; and the coefficient of x^2 is positive. So both the numerator and denominator are positive. It implies that the ratio of numerator and denominator is also positive. Therefore choices (b), (c) and (d) are eliminated.

Hence choice (a) is the answer.

93 The best way is to go through the given choices.

(a) Putting $\dfrac{-3}{2}$ in place of x does not satisfy the equation, so it's not a root of this equation at all.

(b) Putting $x = \frac{3}{2}$, the equation gets satisfied, so $\frac{3}{2}$ is one of the roots. Now put double of $\frac{3}{2}$ that is 3 in the equation, but this time it is not satisfied. So what you can do is put half of $\frac{3}{2}$ that is $\frac{3}{4}$ in the equation. This time it is satisfied, so $\frac{3}{4}$ is also the root of this equation.

So $\frac{3}{2}$ and $\frac{3}{4}$ are the roots of this equation and one root is double the other one. But we have to find the third root.

(c) Putting $\frac{-5}{3}$ in place of x, we see that the equation is satisfied. So clearly $\frac{-5}{3}$ is the third root.

Hence choice (c) is the answer.

94 Let α, β, γ be the roots of the given equation $4x^3 + 16x^2 - 9x - 36 = 0$, then sum of the roots

$$= \alpha + \beta + \gamma = -\frac{16}{4} = -4$$

$$\Rightarrow \quad \gamma = -4 \text{ since } \alpha + \beta = 0$$

Hence choice (d) is the answer.

Hint Zero is the first whole number. And $\alpha + \beta + \gamma = -\frac{b}{a}$

95 Let p be one of the roots of the required equation, then $p = x + 1 \quad \Rightarrow x = p - 1$

Now substituting $p - 1$ in the given equation, we get

$$(p-1)^3 - 5(p-1)^2 + 6(p-1) - 3 = 0$$

$$\Rightarrow \quad p^3 - 8p^2 + 19p - 15 = 0$$

Hence choice (a) is the answer.

Alternatively Let α, β, γ be the roots of the given equation

$x^3 - 5x^2 + 6x - 3 = 0$, then $\alpha + \beta + \gamma = -\frac{-5}{1} = 5$

$$\alpha\beta + \beta\gamma + \gamma\alpha = \frac{6}{1} = 6, \alpha\beta\gamma = -\frac{-3}{1} = 3$$

Now the roots of required equation are $(\alpha + 1), (\beta + 1), (\gamma + 1)$, then

$$S_1 = \Sigma\alpha = (\alpha + 1) + (\beta + 1) + (\gamma + 1)$$
$$= (\alpha + \beta + \gamma) + 3 = 8$$
$$S_2 = \Sigma\alpha\beta = (\alpha + 1)(\beta + 1) + (\beta + 1)(\gamma + 1) + (\gamma + 1)(\alpha + 1)$$
$$= (\alpha\beta + \beta\gamma + \gamma\alpha) + 2(\alpha + \beta + \gamma) + 3$$
$$= 6 + 2(5) + 3 = 19$$
$$S_3 = \Sigma\alpha\beta\gamma = (\alpha + 1)(\beta + 1)(\gamma + 1)$$
$$= \alpha\beta\gamma + (\alpha\beta + \beta\gamma + \gamma\alpha) + (\alpha + \beta + \gamma) + 3$$
$$= 3 + 6 + 3 + 3 = 15$$

Therefore the required equation is

$$p^3 - S_1 p^2 + S_2 p - S_3 = 0$$

$$\Rightarrow \quad p^3 - 8p^2 + 19p - 15 = 0$$

96 Let p be one of the roots of the required equation, then $p = x^3$

$$\Rightarrow \quad x = p^{\frac{1}{3}}.$$

Now substituting $p^{\frac{1}{3}}$ in the given equation, we get

$$(p^{1/3})^3 + 3(p^{1/3})^2 + 2 = 0$$

$$\Rightarrow \quad p + 3p^{2/3} + 2 = 0 \Rightarrow (p+2)^3 = (-3p^{2/3})^3$$

$$\Rightarrow \quad p^3 + 8 + 6p(p+2) = -27p^2$$

$$\Rightarrow \quad p^3 + 33p^2 + 12p + 8 = 0$$

Hence choice (a) is the answer.

Alternatively let α, β, γ be the roots of the given equation $x^3 + 3x^2 + 2 = 0$, then

$$\alpha + \beta + \gamma = -\frac{3}{1} = -3$$

$$\alpha\beta + \beta\gamma + \gamma\alpha = \frac{0}{1} = 0$$

$$\alpha\beta\gamma = -\frac{2}{1} = -2$$

Now the roots of required equation are $\alpha^3, \beta^3, \gamma^3$ then

$$S_1 = \Sigma\alpha = \alpha^3 + \beta^3 + \gamma^3 = -33$$
$$S_2 = \Sigma\alpha\beta = \alpha^3\beta^3 + \beta^3\gamma^3 + \gamma^3\alpha^3 = 12$$
$$S_3 = \Sigma\alpha\beta\gamma = \alpha^3\beta^3\gamma^3 = (\alpha\beta\gamma)^3 = -8$$

Therefore the required equation is

$$p^3 - S_1 p^2 + S_2 p - S_3 = 0$$

$$\Rightarrow \quad p^3 + 33p^2 + 12p + 8 = 0$$

Hint $(\alpha^3 + \beta^3 + \gamma^3) - 3(\alpha\beta\gamma)$

$$= (\alpha + \beta + \gamma)[(\alpha^2 + \beta^2 + \gamma^2) - (\alpha\beta + \beta\gamma + \gamma\alpha)]$$

$$\Rightarrow (\alpha^3 + \beta^3 + \gamma^3) - 3(-2)$$
$$= (-3)[(\alpha^2 + \beta^2 + \gamma^2) - (0)]$$

But $(\alpha + \beta + \gamma)^2 = (\alpha^2 + \beta^2 + \gamma^2) + 2(\alpha\beta + \beta\gamma + \gamma\alpha)$

$$\Rightarrow \quad (-3)^2 = (\alpha^2 + \beta^2 + \gamma^2) + 2(0) \Rightarrow (\alpha^2 + \beta^2 + \gamma^2) = 9$$

$$\therefore (\alpha^3 + \beta^3 + \gamma^3) = -3(9) - 6 = -33$$

Similarly, $(\alpha^3\beta^3 + \beta^3\gamma^3 + \gamma^3\alpha^3)$

$$= (\alpha\beta)^3 + (\beta\gamma)^3 + (\gamma\alpha)^3$$

$$\therefore (\alpha\beta)^3 + (\beta\gamma)^3 + (\gamma\alpha)^3 - 3[(\alpha\beta)(\beta\gamma)(\gamma\alpha)]$$
$$= [(\alpha\beta) + (\beta\gamma) + (\gamma\alpha)]$$
$$[(\alpha\beta)^2 + (\beta\gamma)^2 + (\gamma\alpha)^2 - (\alpha\beta\beta\gamma) + (\beta\gamma\gamma\alpha) + (\gamma\alpha\alpha\beta)]$$
$$= [0][(\alpha\beta)^2 + (\beta\gamma)^2 + (\gamma\alpha)^2 - (\alpha\beta\beta\gamma) + (\beta\gamma\gamma\alpha) + (\gamma\alpha\alpha\beta)] = 0$$

$\Rightarrow (\alpha\beta)^3 + (\beta\gamma)^3 + (\gamma\alpha)^3 = 3[(\alpha\beta)(\beta\gamma)(\gamma\alpha)]$

$\Rightarrow (\alpha\beta)^3 + (\beta\gamma)^3 + (\gamma\alpha)^3 = 3(\alpha\beta\gamma)^2$

$\Rightarrow (\alpha\beta)^3 + (\beta\gamma)^3 + (\gamma\alpha)^3 = 3(-2)^2 \Rightarrow \alpha^3\beta^3 + \beta^3\gamma^3 + \gamma^3\alpha^3 = 12$

97 $\alpha_1 + \alpha_2 + \alpha_3 = -1, \alpha_1\alpha_2 + \alpha_2\alpha_3 + \alpha_3\alpha_1 = 3, \alpha_1\alpha_2\alpha_3 = -1$

$\therefore \alpha_1 + \alpha_2 + \alpha_3 + \alpha_1\alpha_2 + \alpha_2\alpha_3 + \alpha_3\alpha_1 + \alpha_1\alpha_2\alpha_3 = 1$

Hence choice (d) is the answer.

98. The best way to solve it is by considering arbitrary values of roots then framing a cubic equation as follows.

Let's assume that $r_1 = 1$, $r_2 = 2$, $r_3 = 3$, then we will have a corresponding equation to these roots as

$(x-1)(x-2)(x-3) = x^3 - 6x^2 + 11x - 6$

It implies that $a_3 = 1$, $a_2 = -6$,

$a_1 = 11$, $a_0 = -6$

Then $S_1 = r_1 + r_2 + r_3 = 6$

And $S_2 = r_1^2 + r_2^2 + r_3^2 = 14$

$\therefore a_3S_1 + a_2 = 1 \times 6 + (-6) = 0$

Similarly $a_3S_2 + a_2S_1 + 2a_1 = 1 \times 14 + (-6) \times 6 + 2 \times 11 = 0$

Therefore (i) and (ii) both are true.

Hence choice (c) is the answer.

99. Comparing the given equation with $x^3 - S_1x^2 + S_2x - S_3 = 0$, you will find that a is positive.

Let α, β and γ be the roots of the given equation, then $\alpha + \beta + \gamma = 3$ and $\alpha\beta + \beta\gamma + \gamma\alpha = a$ and $\alpha\beta\gamma = 1$

From A.M. – G.M. inequality,

$$\frac{(\alpha + \beta + \gamma)}{3} \geq (\alpha\beta\gamma)^{\frac{1}{3}}$$

Substituting the value of $\alpha + \beta + \gamma$ and $\alpha\beta\gamma$, you will find that $\frac{(\alpha + \beta + \gamma)}{3} = (\alpha\beta\gamma)^{\frac{1}{3}}$

$\Rightarrow$ A.M. = G.M., when A.M = G.M then $\alpha = \beta = \gamma$

Therefore $\alpha\beta + \beta\gamma + \gamma\alpha = 3$

Hence, choice (d) is the answer.

Alternatively

Since $\alpha + \beta + \gamma = 3$, $\alpha\beta\gamma = 1$ and $\alpha > 0$, $\beta > 0$, $\gamma > 0$

It is possible only when $\alpha = \beta = \gamma = 1$.

Therefore $\alpha\beta + \beta\gamma + \gamma\alpha = 3$

100. Let $f(x) = x^4 + ax^3 + bx^2 - 4x + 1$.

Since there are four positive roots, it implies that there will be four changes in the sign among the various terms of the function, when the terms are written in increasing/decreasing order of degree. So a must be negative and b must be positive.

100 Let $f(x) = x^4 + ax^3 + bx^2 - 4x + 1$.

Since there are four positive roots, it implies that there will be four changes in the sign among the various terms of the function, when the terms are written in increasing/decreasing order of degree. So a must be negative and b must be positive.

Hence choice (c) is the answer.

101 If you can find the real values of p so that $f(x) \geq 0$ for all x, then for the remaining real values of p the function $f(x) < 0$ for at least one x.

Now, since $f(x) \geq 0$ for all x and $a > 0$, then $D \leq 0$.

Therefore $p^2 - 4 \times 4(p-3) \leq 0$

$\Rightarrow \quad p^2 - 16p + 48 \leq 0 \Rightarrow (p-4)(p-12) \leq 0$

$\Rightarrow \quad p \in [4, 12]$

It implies that when $p \in [4, 12]$, the given function $f(x)$ is not negative for any value of x.

It means when $p \in (-\infty, 4) \cup (12, \infty)$, the given function $f(x)$ is negative for at least one x.

Hence choice (d) is the answer.

Alternatively

Since $f(x) < 0$ for at least one value of x, and $a > 0$, then $D > 0$. Therefore $p^2 - 16p + 48 > 0$

$\Rightarrow \quad (p-4)(p-12) > 0$

$\Rightarrow \quad p \in (-\infty, 4) \cup (12, \infty)$

102 $f(x) = (p^2 + 3)x^2 + (p+2)x - 5 < 0$ ...(i)

Since $f(x) < 0$ for at least one value of x, and $a > 0$, then $D > 0$.

Therefore $(p+2)^2 - 4(p^2 + 3) \times (-5) > 0$

$\Rightarrow \quad 21p^2 + 4p + 64 > 0$ ...(ii)

Now you have to find out the values of p for which the above expression (ii) is positive. For this you would have to again find out the discriminant of expression (ii) which is negative. Since in quadratic expression (ii), the coefficient of x^2 is positive and discriminant is negative, the quadratic expression (ii) will be positive for all real numbers. That is for all real values of p, the discriminant, $D > 0$.

Thus the given function $f(x) < 0$ for at least one x, if

$p \in (-\infty, \infty)$

Hence choice (b) is the answer.

Hint $p^2 + 3 > 0$.

Alternatively If you can find the real values of p so that $f(x) \geq 0$ for all x, then for the remaining real values of p the function $f(x) < 0$ for at least one x.

$f(x) = (p^2 + 3)x^2 + (p+2)x - 5 \geq 0$ ...(i)

Now, since $f(x) \geq 0$ for all x and $a > 0$, then $D \leq 0$.

Therefore $(p+2)^2 - 4(p^2+3)\times(-5) \le 0$.

$\Rightarrow \quad 21p^2 + 4p + 64 \le 0$ ...(ii)

Since the coefficient of p^2 is positive and the discriminant of quadratic expression (ii) is negative, then the above quadratic inequality (ii) is not valid for any real value of p

It implies that when $p \in (-\infty, \infty)$, the given function $f(x)$ is not positive for any value of x.

It means when $p \in (-\infty, \infty)$, the given function $f(x)$ is negative for at least one x. Hence choice (b) is the answer.

103 let $f(x) = ax^2 + bx + c$.

$\Rightarrow f(x) = x^2 + \frac{b}{a}x + \frac{c}{a}$

Since $\alpha < -p$ and $\beta > p$. Therefore $f(-p) < 0$ and $f(p) < 0$.

When $f(-p) < 0$

$\Rightarrow \quad p^2 - \frac{b}{a}p + \frac{c}{a} < 0$ ...(i)

And when $f(p) < 0$

$\Rightarrow \quad p^2 + \frac{b}{a}p + \frac{c}{a} < 0$ ...(ii)

From eqs. (i) and (ii), we can conclude that

$$f(x) = p^2 + \left|\frac{b}{a}\right|p + \frac{c}{a} < 0$$

$$f(x) = 1 + \left|\frac{b}{a}\right|\frac{1}{p} + \frac{c}{ap^2} < 0$$

Hence choice (a) is the answer.

104 Since α is a root of $ax^2 + bx + c = 0$, therefore α will satisfy it as $a\alpha^2 + b\alpha + c = 0$ ...(i)

Similarly since β is a root of $-ax^2 + bx + c = 0$, therefore β will satisfy it as $-a\beta^2 + b\beta + c = 0$ ...(ii)

Let $f(x) = \frac{a}{2}x^2 + bx + c = 0 \Rightarrow f(\alpha) = \frac{a}{2}\alpha^2 + b\alpha + c = 0$

$\Rightarrow \quad f(\alpha) = \frac{a}{2}\alpha^2 - a\alpha^2$ [from eq. (ii)]

$\Rightarrow \quad f(\alpha) = -\frac{a}{2}a^2$ ...(iii)

$\Rightarrow \quad f(\beta) = \frac{a}{2}\beta^2 + b\beta + c = 0$ [from eq. (ii)]

$\Rightarrow \quad f(\beta) = \frac{a}{2}\beta^2 + a\beta^2$ ...(iv)

$\Rightarrow \quad f(\beta) = \frac{3a}{2}\beta^2$

Now $f(\alpha)\cdot f(\beta) = -\frac{3}{4}a^2\alpha^2\beta^2$

$\Rightarrow \quad f(\alpha)\cdot f(\beta) < 0 \quad (\because \alpha, \beta \neq 0)$

It implies that $f(\alpha)$ and $f(\beta)$, have opposite signs.

Therefore equation $f(x) = 0$ has exactly one root between α and β. Hence choice (a) is the answer.

105 **Case (i)** When $x > 0$, the given equation will be $x^2 - 3x + 2 = 0$ and then the roots will be 1, 2.

Case (ii) When $x < 0$, the given equation will be $x^2 + 3x + 2 = 0$ and then the roots will be $-1, -2$

Thus there are total four roots, *viz.* $-2, -1, 1, 2$.

Hence choice (c) is the answer.

106 The given equation is $3|x^2 + 4x + 2| = 5x + 16$ ...(i)

Case (i) When $(x^2 + 4x + 2)$ is positive, the given equation will be $3x^2 + 12x + 6 = 5x + 16 \Rightarrow 3x^2 + 7x - 10 = 0$

The roots are 1 and $\frac{-10}{3}$.

Case (ii) When $(x^2 + 4x + 2)$ is negative, the given equation will be

$-3x^2 - 12x - 6 = 5x + 16 \Rightarrow 3x^2 + 17x + 22 = 0$

The roots are -2 and $\frac{-11}{3}$.

Since $\frac{-10}{3}$ and $\frac{-11}{3}$ do not satisfy the given Eq. (i), so you have to discard them. Thus the valid values of x are 1 and -2. Hence choice (d) is the answer.

107 The best way is to go through the given choices.

All the values of choice (d) satisfy the equation, so it's the answer. Hence choice (d) is the answer.

108 Let $f(x) = (|x-1| - 3)$

Now if $f(x) = 0$

$\Rightarrow \quad (|x-1| - 3) = 0$

Case (i) When $x - 1 > 0$, then $(x-1) - 3 = 0$

$\Rightarrow \quad x = 4$

Case (ii) When $x - 1 < 0$, then

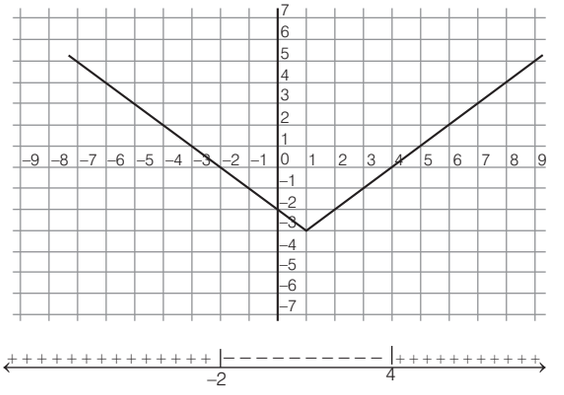
$-(x-1) - 3 = 0$

$\Rightarrow \quad x = -2$

After testing for the signs you will get

$f(x) < 0$, if $x \in (-2, 4)$ and $f(x) > 0$, if

$x \in (-\infty, -2) \cup (4, \infty)$ ...(i)



Let $g(x) = (|x + 2| - 5)$

Now if $g(x) = 0$

$\Rightarrow (|x + 2| - 5) = 0$

Case (i) When $x + 2 > 0$, then

$f(x) = (x + 2) - 5 = 0$

$\Rightarrow x = 3$

Case (ii) When $x + 2 < 0$, then

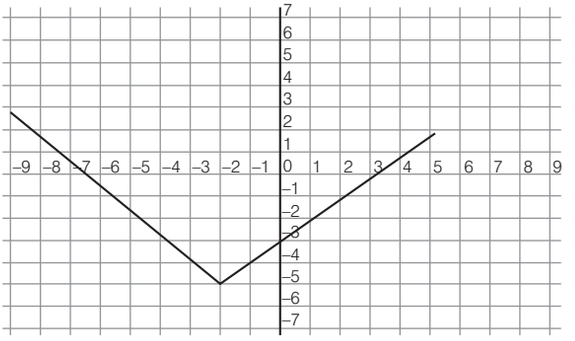
$f(x) = -(x + 2) - 5 = 0$

$\Rightarrow x = -7$

After testing for the signs you will get

$g(x) < 0$, if $x \in (-7, 3)$ and $g(x) > 0$

if $x \in (-\infty, -7) \cup (3, \infty)$ ...(ii)

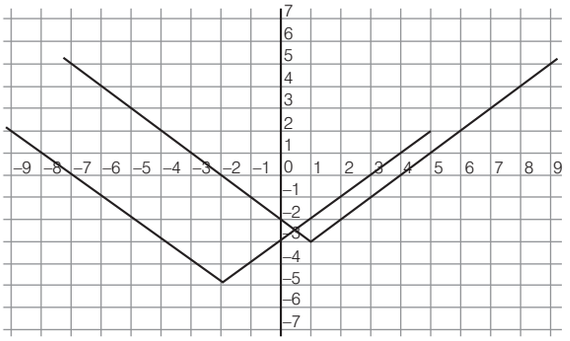


Now since you know that $f(x)g(x) < 0$, only when $f(x)$ and $g(x)$ are of opposite signs.

That means $f(x)g(x) < 0$, if $f(x) > 0$ but $g(x) < 0$ or $f(x) < 0$ but $g(x) > 0$.

So combining the results of (i) and (ii), we can conclude that $f(x)g(x) < 0$, if $x \in (-7, -2) \cup (3, 4)$.

The same result can be easily seen by the following graph.



Hence choice (d) is the answer.

Alternatively The best way is to go through the given choices. All the values of x that lie between $(-7, -2)$ and $(3, 4)$ satisfy the given equation.

Hence choice (d) is the answer.

109 **Case (i)** When both the numerator and denominator have the same sign. That is

$$\frac{x^2 - 5x + 4}{x^2 - 4} \text{ or } \frac{-(x^2 - 5x + 4)}{-(x^2 - 4)}$$

Therefore the given inequation is $\frac{x^2 - 5x + 4}{x^2 - 4} \le 1$

$$\Rightarrow \frac{x^2 - 5x + 4}{x^2 - 4} - 1 \le 0 \Rightarrow \frac{-5x + 8}{(x + 2)(x - 2)} \le 0$$

The critical points are -2, 2 and $\frac{8}{5}$. So there are four intervals $(-\infty, -2)$, $\left(-2, \frac{8}{5}\right)$, $\left(\frac{8}{5}, 2\right)(2, \infty)$

Since the rational function is non positive, therefore you have to consider only two intervals: $\left(-2, \frac{8}{5}\right]$, and $(2, \infty)$

Case (ii) when the signs of numerator and denominator are different. That is

$$\frac{-(x^2 - 5x + 4)}{(x^2 - 4)} \text{ or } \frac{(x^2 - 5x + 4)}{-(x^2 - 4)}$$

Therefore the given inequation is

$$\frac{-(x^2 - 5x + 4)}{x^2 - 4} \le 1$$

$$\Rightarrow \frac{-(x^2 - 5x + 4)}{x^2 - 4} - 1 \le 0$$

$$\Rightarrow \frac{-x(2x - 5)}{(x + `2)(x - 2)} \le 0$$

The critical points are -2, 2, 0 and $\frac{5}{2}$. So there are five intervals $(-\infty, -2)$, $(-2, 0)$, $(0, 2)$, $\left(2, \frac{5}{2}\right]$, $\left(\frac{5}{2}, \infty\right)$

Since the rational function is non-positive, therefore you have to consider only three intervals: $(-\infty, -2)$, $(0, 2)$ and $\left(\frac{5}{2}, \infty\right]$

Therefore the intersection of both the cases will be your desired result.

That is $[0, 8/5] \cup [5/2, \infty]$.

Hence choice (b) is the answer.

NOTE Since the given inequality is not a strict inequality, so the boundary values of the chosen intervals will have to be included. The best way is to cross check by the substitution of boundary values in the given (original) expression, in case of any uncertainty.

110 **Case (i)** when both the numerator and denominator have the same sign. That is

$$\frac{x^2-3x-1}{x^2+x+1} \text{ or } \frac{-(x^2-3x-1)}{-(x^2+x+1)}$$

Therefore the given inequation is

$$\frac{x^2-3x-1}{x^2+x+1}<3 \Rightarrow \frac{x^2-3x-1}{x^2+x+1}-3<0$$

$$\Rightarrow \quad \frac{-2(x+2)(x+1)}{x^2+x+1}<0$$

The critical points are -2, and -1, since denominator does not yield any real root. So, there are three intervals $(-\infty,-2)$, $(-2,-1)$, $(-1,\infty)$

Since the rational function is negative, therefore you have to consider only negative values. That is $x \in (-\infty,-2)\cup(-1,\infty)$.

Case (ii) when the signs of numerator and denominator are different. That is

$$\frac{-(x^2-3x-1)}{x^2+x+1} \text{ or } \frac{x^2-3x-1}{-(x^2+x+1)}$$

Therefore the given inequation is

$$\frac{-(x^2-3x-1)}{x^2+x+1}<3$$

$$\Rightarrow \quad \frac{-(x^2-3x-1)}{x^2+x+1}-3<0 \Rightarrow \frac{-2(2x^2+1)}{x^2+x+1}<0$$

Since both the numerator and denominator are unable to give any real root, so there is no critical point for this rational function. Further since the coefficient of x^2 of the numerator is negative so the whole graph will be negative as roots are non-real.

Since the rational function is negative, therefore all the real values satisfy the inequality. That is $(-\infty,\infty)$

Therefore the intersection of both the cases will be your desired result. That is $(-\infty,-2)\cup(-1,\infty)$.

Hence choice (b) is the answer.

111 Since the sign of $f(p)$ and $f(q)$ are opposite, it means there must be a real root between p and q through which graph intercepts the X-axis and so it changes the sign of the graph from positive to negative or negative to positive.

As you know that a real root (with odd multiplicity) changes the sign of graph – that is the two points, one lying in the left side and the other one lying in the right side of the real root, have different signs.

Hence choice (a) is the answer.

112 The best way to solve this problem is to sketch a rough graph of the given polynomial or determine the sign of each interval on the number line (or X-axis).

The real roots of the given polynomial are $2, -3, \frac{1}{2}$ and $\frac{10}{3}$.

Now there are two methods to determine the sign of the interval. First, either test each interval individually by substituting any suitable numerical value from that interval in the given polynomial or follow the ensuing technique.

After simplification, the highest power (or degree) of this equation is 9, that is odd. The coefficient of the highest power of x is a positive integral.

So the first interval (that is the left most) will be negative. After that -3 is a root of odd multiplicity so after -3, the sign of that interval will change to positive. But after that $-\frac{1}{2}$ is a root of even multiplicity so there won't be any change in sign after $-\frac{1}{2}$. Further 2 is a root of odd multiplicity so the sign will change after 2 from positive to negative. Finally, $\frac{10}{3}$ is again a root of odd multiplicity so after $\frac{10}{3}$ sign will change from negative to positive. Now since $x=-10^{10}$ lies in first interval which is negative and $x=10^{10}$ lies in the last interval which is positive, so the product of negative and positive is negative, that is $f(-10^{10})f(10^{10})<0$. Therefore (i) is correct.

Similarly, $f(-2)>0$ but $f(3)<0$, so $f(-2)f(3)<0$. Therefore (ii) is also correct.

It means choices (a), (b) and (c) are wrong, as they say that (i) and (ii) are incorrect, which is not.

Hence choice (d) is the answer.

113 Since α and β are the roots of $x^2-6x-2=0$. therefore

$$\alpha^2-6\alpha-2=0 \Rightarrow \alpha^2-2=6\alpha \quad \ldots(i)$$

$$\beta^2-6\beta-2=0 \Rightarrow \beta^2-2=6\beta \quad \ldots(ii)$$

Now we have, $\frac{a_{10}-2a_8}{2a_9}=\frac{\alpha^{10}-\beta^{10}-2(\alpha^8-\beta^8)}{2(\alpha^9-\beta^9)}$

$$=\frac{(\alpha^{10}-2\alpha^8)-(\beta^{10}-2\beta^8)}{2(\alpha^9-\beta^9)}=\frac{\alpha^8(\alpha^2-2)-\beta^8(\beta^2-2)}{2(\alpha^9-\beta^9)}$$

$$=\frac{\alpha^8(6\alpha)-\beta^8(6\beta)}{2(\alpha^9-\beta^9)}=\frac{6(\alpha^9-\beta^9)}{2(\alpha^9-\beta^9)}=3$$

Hence choice (c) is the answer

114 $\dfrac{3f_9 - 14f_6}{f_7} = \dfrac{3(a^9 - b^9) - 14(a^6 - b^6)}{a^7 - b^7}$

$$= \frac{a^6(3a^3 - 14) - b^6(3b^3 - 14)}{a^7 - b^7}$$

Since a and b are the roots of $3x^3 - 8x - 14 = 0$, therefore you will have $3a^3 - 8a - 14 = 0 \Rightarrow 3a^3 - 14 = 8a$

And, $3b^3 - 8b - 14 = 0 \Rightarrow 3b^3 - 14 = 8b$

Therefore, $\dfrac{3f_9 - 14f_6}{f_7} = \dfrac{a^6(8a) - b^6(8b)}{a^7 - b^7}$

$$= \frac{8a^7 - 8b^7}{a^7 - b^7} = \frac{8(a^7 - b^7)}{a^7 - b^7} = 8$$

Hence choice (a) is the correct one.

115 The best way is to solve through the given choices.

Choice (a)

$$f\left(-\frac{1}{4}\right) = 4\left(-\frac{1}{4}\right)^3 + 3\left(-\frac{1}{4}\right)^2 + 2\left(-\frac{1}{4}\right) + 1 = \frac{10}{16}$$

$$\Rightarrow f\left(-\frac{1}{4}\right) > 0$$

Similarly $f(0) > 0$

Since $f\left(-\dfrac{1}{4}\right) \cdot f(0) > 0$ therefore it implies that between $-\dfrac{1}{4}$ and 0 either there are two real roots or there is no real root at all.

Choice (b) $f(-11) < 0$ and $f\left(\dfrac{-3}{4}\right) < 0$

Since $f(-11) \cdot f(-3/4) > 0$, therefore it implies that between –11 amd –3/4 either there are two real roots or there is not real root at all.

Cloice (C) $f(-3/4) < 0$ and $f(-1/2) > 0$

Since $f\left(\dfrac{-3}{4}\right) . f\left(\dfrac{-1}{2}\right) < 0$, therefore it implies that between $\dfrac{-3}{4}$ and $\dfrac{-1}{2}$ either there are three real roots or there is one real root. In essence, there is certainly at least one real root. Hence choice (c) is the answer.

Hint When $f(p) . f(q) < 0$, then there is at least one real root between p and q.

Choice	$f(p)$	$f(q)$	$f(p) . f(q)$	Possible number of roots	Conclusion
(a)	>0	>0	>0	0 or 2	May or may not be
(b)	<0	<0	>0	0 or 2	May or may not be
(c)	>0	<0	<0	1 ro 3	At least one root is there
(d)	>0	>0	>0	0 or 2	May or may not be

116 The maximum number of positive real roots of a polynomial equation $f(x) = 0$ is the number of changes of signs – from positive to negative and / or negative to positive – in the coefficients of $f(x)$.

Equation	$4x^3 + 3x^2 + 2x + 1$
Coefficient /constants	+ 4 + 3 +2 + 1
Sign	+ + + +

Since there is no change in sign of coefficients/constant values, so there won't be any positive real root.

Hence choice (c) is the answer.

117 Product of roots $= \dfrac{\alpha}{\beta} \times \dfrac{\beta}{\alpha} = 1$

Now since $\alpha^3 + \beta^3 = (\alpha + \beta)(\alpha^2 + \beta^2 - \alpha\beta)$

$$\Rightarrow \quad q = (-p)[(\alpha + \beta)^2 - 3\alpha\beta] \Rightarrow q = (-p)[(-p)^2 - 3\alpha\beta]$$

$$\Rightarrow \quad \alpha\beta = \frac{1}{3}\left(p^2 + \frac{q}{p}\right)$$

Therefore sum of roots $= \dfrac{\alpha}{\beta} + \dfrac{\beta}{\alpha} = \dfrac{\alpha^2 + \beta^2}{\alpha\beta}$

$$= \frac{(\alpha + \beta)^2 - 2\alpha\beta}{\alpha\beta} = \frac{p^2 - \dfrac{2}{3}\left(p^2 + \dfrac{q}{p}\right)}{\dfrac{1}{3}\left(p^2 + \dfrac{q}{p}\right)} = \frac{p^3 - 2q}{p^3 + q}$$

So the required equation is $x^2 - \left(\dfrac{p^3 - 2q}{p^3 + q}\right)x + 1 = 0$

$$\Rightarrow \quad (p^3 + q)x^2 - (p^3 - 2q)x + (p^3 + q) = 0$$

Hence choice (b) is the answer.

118 $x^2 + 20 \le 9x$

$$\Rightarrow x^2 - 9x + 20 \le 0 \Rightarrow (x - 4)(x - 5) \le 0 \Rightarrow 4 \le x \le 5$$

$$f(4) = -4 \Rightarrow f(4) < 0 \text{ and } f(5) = 7 \Rightarrow f(5) > 0$$

It implies that there will be either only one real root or all the three roots between 4 and 5.

Using rule of signs you get to know that there is no negative root so all the roots are positive. If all the three roots lie between 4 and 5, then their sum will lie between 12 and 15. But since the sum of three roots is 15/2 (or 7.5), it means only one root lies between 4 and 5.

Since $f(4) < f(5)$, it means the highest value of $f(x)$ will be given by $f(5)$, which is 7.

Hence choice (a) is the answer.

119 $y = -\dfrac{x^2}{2} + x + 1 \Rightarrow y - \dfrac{3}{2} = -\dfrac{1}{2}(x - 1)^2$

It implies that the curve is symmetric about $x = 1$.

Hence choice (a) is the answer.

120 $f(x)=\dfrac{x^2-6x+5}{x^2-5x+6}\Rightarrow\dfrac{(x-1)(x-5)}{(x-2)(x-3)}$

The critical points are 1, 2, 3 and 5.

The vertical asymptotes are $x=2,\ x=3$

Horizontal asymptote is $y=1$.

Partial graph of the given function is shown below. Otherwise, test the nature of the function in various intervals.

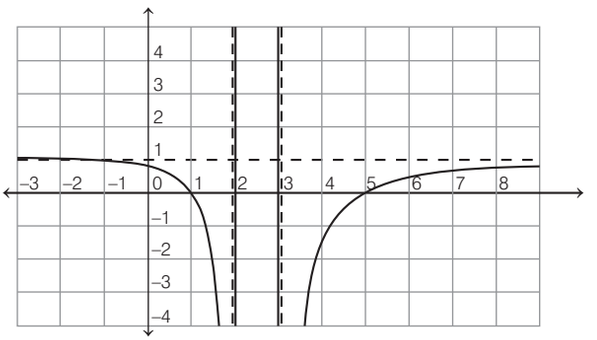
(P) When $-1<x<1\Rightarrow 0<f(x)<1$

(Q) When $1<x<2\Rightarrow f(x)<0$

(R) When $3<x<5\Rightarrow f(x)<0$

(S) When $x>5\Rightarrow 0<f(x)<1$

Therefore (P)$\rightarrow p, r, s$; (Q) $\rightarrow q, s$; (R)$\rightarrow q, s$; (S) $\rightarrow p, r, s$



Hence choice (a) is the answer.

121 $x^2-10cx-11d=0$ ...(i)

$a+b=10c$ and $ab=-11d$

$x^2-10ax-11b=0$ ...(ii)

$c+d=10a$ and $cd=-11b$

So $(a+b)+(c+d)=10(a+c)\Rightarrow b+d=9(a+c)$ ...(iii)

And $(ab)(cd)=121bd$

$\Rightarrow\quad ac=121$ ...(iv)

Now $a^2-10ac-11d=0$ and $c^2-10ac-11b=0$

So $a^2+c^2-20ac-11(b+d)=0$

$\Rightarrow (a+c)^2-22(121)-99(a+c)=0$ ...(v)

$\Rightarrow\quad (a+c)=121$ or $(a+c)=-22$

$\Rightarrow\quad a+b+c+d=10(a+c)=1210$

Hence choice (c) is the answer.

NOTE Equation (v) is a quadratic Equation. The value of $(a+c)=-22$ has to be discarded otherwise $a=-11$ and $c=-11$, which is not possible as a and c have to be distinct.

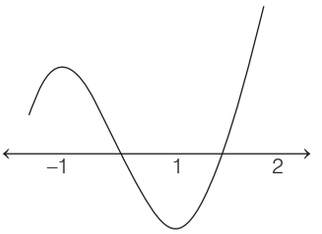
122 Since $f(1)f(2)<0$, it implies that at least one real root of $f(x)$ lies between 1 and 2.

Also $f(-1)>0$ and $f(1)<0\Rightarrow f(-1)f(1)<0$, it implies at least one real root lies between –1 and 1.

Since $f(x)$ is a cubic polynomial which either have 1 real root or 3 real roots. It means all 3 roots are real.

Therefore statement (ii) is true.

Using the given information you can sketch the graph of $f(x)$ similar to the one as shown below.



$f'(x)=3ax^2+2bx+c$ is a quadratic function. It gives minimum / maximum when $x=\dfrac{-b}{2a}$. But it is given that $f'(x)$ has local minimum at $x=0$. It implies that $b=0$

Therefore $f'(x)=3ax^2+c$

Since at $x=-1$, $f(x)$ has local maxima, it means at $x=-1,\ f'(x)=0$

That is $3a(-1)^2+c=0\ \Rightarrow c=-3a$

Therefore $f'(x)=3ax^2-3a=3a(x^2-1)$

Since $a\neq 0,\ x^2-1=0\Rightarrow\ \ x=\pm 1$.

Since at $x=\pm 1$, $f'(x)=0$, therefore at $x=\pm 1$, $f(x)$ will have its local maxima / minima.

As, $f(-1)$ already has local maxima, so $f(1)$ will have local minima.

It means $f(1)=-1$ is the local minima. So $f(x)$ is increasing for $[1,\infty)$. Therefore statement (i) and (iii) are true.

As you have just found that $b=0$, it means $\dfrac{-b}{a}=0\Rightarrow$ Sum of roots is zero.

Therefore statement (iv) is true.

Hence choice (c) is the answer.

Hint As you have determined $b=0$ and $c=-3a$, now you can easily find out the relevant polynomial as following

$f(x)=ax^3+bx^2+cx+d\ \Rightarrow f(x)=ax^3-3ax+d$

$\therefore\quad f(2)=18\ \Rightarrow 8a-6a+d=18$

$\Rightarrow\quad 2a+d=18$ and $f(1)=-1\Rightarrow a-3a+d=-1$

$\Rightarrow\quad -2a+d=-1\quad\Rightarrow\ a=\dfrac{19}{4},\ d=\dfrac{17}{2},\ c=-\dfrac{57}{4}$

Thus $f(x)=\dfrac{1}{4}(19x^3-57x+34)$

123 $f(x)=ax^3+bx^2+cx+d$ ...(i)

$f(-1)=-a+b-c+d=10$ ...(ii)

$f(1)=a+b+c+d=-6$ ...(iii)

From eqs. (ii) and (iii), $b+d=2$ and $a+c=-8$ ...(iv)

Now, $f'(x) = 3ax^2 + 2bx + c$ is a quadratic function. The quadratic function has max / min at

$$x = \frac{-(\text{coefficient of } x)}{2(\text{coefficient of } x^2)}.$$

But it is given that $f'(x)$ has local minimum at $x = 1$.

That is $1 = \frac{-(2b)}{2(3a)} \Rightarrow b = -3a$ ...(v)

Therefore $f'(x) = 3ax^2 - 6ax + c$

Now, since $f(x)$ has local maxima at $x = -1$, it implies that at $x = -1$, $f'(x) = 0$. That is $f'(-1) = 0$

$\Rightarrow$ $3a + 6a + c = 0 \Rightarrow c = -9a$ ...(vi)

From eqs. (vi), (iv) and (v), we have

$a = 1, b = -3, c = -9, d = 5$

Therefore $f(x) = x^3 - 3x^2 - 9x + 5$ and

$f'(x) = 3x^2 - 6x - 9.$

Since $f'(x) = 0 \Rightarrow 3x^2 - 6x - 9 = 0 \Rightarrow 3(x+1)(x-3) = 0$

As $f'(x) = 0$ at $x = -1$. It means at $x = -1$, $f(x)$ is maximum, as already given.

Similarly, $f'(x) = 0$ at $x = 3$. It means at $x = 3$, $f(x)$ is minimum, as required.

$f(-1) = 10$ and $f(3) = -22$. Therefore distance between $(-1, 10)$ and $(3, -22)$ is $4\sqrt{65}$.

Hence choice (a) is the answer.

Hint The distance between two points (x_1, y_1) and (x_2, y_2) is given by

$$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

124 What if a root, say β, is zero! Then

$\alpha + \beta, \alpha^2 + \beta^2, \alpha^3 + \beta^3 \Rightarrow \alpha, \alpha^2, \alpha^3$, which are naturally in GP. So, $\alpha + \beta, \alpha^2 + \beta^2, \alpha^3 + \beta^3$ will also be in GP.

And when one root is zero, product of roots will be zero. That is $c = 0$.

So $\Delta = b^2 \Rightarrow c\Delta = 0(b^2) = 0$

Hence choice (c) is the answer.

Alternatively If x, y, z are in GP, then $y^2 = xz$.

Therefore,

$$(\alpha^2 + \beta^2)^2 = (\alpha + \beta)[\alpha^3 + \beta^3]$$

$\Rightarrow$ $\alpha^4 + \beta^4 + 2\alpha^2\beta^2 = \alpha^4 + \beta^4 + \alpha\beta(\alpha^2 + \beta^2)$

$\Rightarrow$ $2(\alpha\beta)^2 = \alpha\beta(\alpha^2 + \beta^2) \Rightarrow \alpha\beta(\alpha^2 + \beta^2 - 2\alpha\beta) = 0$

$\Rightarrow \alpha\beta[(\alpha + \beta)^2 - 4\alpha\beta] = 0 \Rightarrow \frac{c}{a}\left[\left(\frac{-b}{a}\right)^2 - \frac{4c}{a}\right] = 0$

$\Rightarrow \frac{c}{a}\left[\frac{b^2 - 4ac}{a^2}\right] = 0 \Rightarrow c(b^2 - 4ac) = 0 \Rightarrow c\Delta = 0$

125 $\because f(x) = x^3 + bx^2 + cx + d$ ...(i)

$\therefore f'(x) = 3x^2 + 2bx + c$ ...(ii)

Now the discriminant of $f'(x)$ is

$D = 4b^2 - 12c$

$\Rightarrow$ $D = 4(b^2 - c) - 8c < 0$

$\Rightarrow$ $D < 0$

Since the quadratic function $f'(x)$ has no real root, so the cubic function $f(x)$ will have no local maxima/minima. It implies that either $f(x)$ is strictly increasing or strictly decreasing.

But since the coefficient of x^3 in $f(x)$ is positive so the function $f(x)$ is strictly increasing in $(-\infty, \infty)$.

Hence choice (a) is the answer.

126 min $f(x) = 2c^2 - b^2$ and max $g(x) = b^2 + c^2$

Therefore, $2c^2 - b^2 > b^2 + c^2 \Rightarrow c^2 > 2b^2 \Rightarrow |c| > \sqrt{2}|b|$

Hence choice (d) is the answer.

Hint The quadratic function has max/min at

$$x = \frac{-(\text{coefficient of } x)}{2(\text{coefficient of } x^2)}.$$

Otherwise,

$$f(x) = x^2 + 2bx + 2c^2 = (x + b)^2 + 2c^2 - b^2$$

$f(x)$ is minimum when $(x + b)^2 = 0$ at $x = -b$

and $g(x) = -x^2 - 2cx + b^2$

$$b^2 + c^2 - (x + c)^2$$

$g(x)$ is maximum when $(x + c)^2 = 0$ at $x = -c$.

127 Since both the roots are less than the arbitrary point k then you must have to satisfy the following three conditions.

(i) $D \geq 0 \Rightarrow 4a^2 - 4(a^2 + a - 3) \geq a \leq 3$

(ii) $af(k) > 0 \Rightarrow 1.\ f(3) > 0$

$\Rightarrow 9 - 6a + a^2 + a - 3 \Rightarrow a \in (-\infty, 2) \cup (3, \infty)$

(iii) $k > -\frac{b}{2a} \Rightarrow 3 > -\frac{-2a}{2} \Rightarrow a < 3$

The intersection of (i), (ii) and (iii) is $a \in (-\infty, -2)$

Hence choice (a) is the answer.

128 $(x - 9)(x - 16) = x^2 - 25x + 144$

Since the coefficient of x^2 is positive, it means the graph will open upwards. So the values between roots will be included only when, $x^2 - 25x + 144 \leq 0$

Hence choice (a) is the answer.

129 Let the common root be r, then

$f = (x - r)(x - 2) = 0 \Rightarrow f = m[(x - r)(x - 2)] = 0$

and $g = (x - r)(x - 7) = 0 \Rightarrow g = n[(x - r)(x - 7)] = 0$

When, m and n are non-zero real numbers.

Since, $f(4) \times g(9) = 24$

$\Rightarrow m(4 - r)(4 - 2) \times n\ [(9 - r)(9 - 7)] = 24$

$\Rightarrow mn(4 - r) \times (9 - r) = 6 \Rightarrow mn(r^2 - 13r + 36) = 6$

$$\Rightarrow \quad (r^2 - 13r + 36) = \frac{6}{mn} \Rightarrow r^2 - 13r + \left(36 - \frac{6}{mn}\right) = 0$$

As you can see that r depends on m and n, so there is no unique solution.

But since one root in each of the equations $f(x) = 0$ and $g(x) = 0$ is real and rational, so the other root, in each equation, must be real and rational.

A root is real only when discriminant,

$D \geq 0$. That is $b^2 - 4ac \geq 0$

$$\therefore \quad 169 - 4\left(36 - \frac{6}{mn}\right) \geq 0$$

$$\Rightarrow \quad \left(25 + \frac{24}{mn}\right) \geq 0$$

A root is rational only when discriminant D is a perfect square.

That is $D = 0, 1, 4, 9, \ldots$

$$\because \quad D = 25 + \left(\frac{24}{mn}\right) \Rightarrow mn = -\frac{24}{(25 - D)}$$

It implies that $D \neq 25$.

$$\because \quad r = \frac{-13 \pm \sqrt{D}}{2} \Rightarrow r \neq -4, -9$$

It means, (i), (ii) and (iii) are invalid.

Further, since D is a perfect square, so $\sqrt{D}$ will be a non-negative integer. Therefore the values of r would be rational numbers not the irrational ones. Therefore (iv) is also invalid. Hence choice (c) is the correct one.

☑ Level 02 *Higher Level Exercise*

1 The best way is to go through options.

Consider option (b)

$$|3^4 - 1|^{\log_3 (3^4)^2 - 2\log_{81} 9} = (3^4 - 1)^7$$

$$|80|^{\log_3 3^8 - \log_{81} 81} = (80)^7 \Rightarrow \log_3 3^8 - \log_{81} 81 = 7$$

$$\Rightarrow \quad 8 - 1 = 7 \text{ and } 7 = 7$$

Hence option (b) is correct.

2 Putting $x = \frac{1}{y}$, we get $27y^3 + 54y^2 + cy - 10 = 0$ …(i)

This above eq. (i) must be in AP.

Let the roots of equation in y be

$$\alpha - \beta, \quad \alpha, \quad \alpha + \beta \qquad (\because \text{roots are in AP})$$

$$\therefore \quad \Sigma\alpha = \alpha - \beta + \alpha + \alpha + \beta = 3\alpha$$

$$\Rightarrow \quad 3\alpha = \frac{-54}{27} \Rightarrow \alpha = \frac{-2}{3}$$

Now $\alpha = \frac{-2}{3}$ will satisfy the Eq. (i) and we get

$$27 \times \frac{-8}{27} + 54 \times \frac{4}{9} - \frac{2c}{3} - 10 = 0 \Rightarrow c = 9$$

3 $$\log_{100} |x + y| = \frac{1}{2} \Rightarrow (100)^{1/2} = |x + y|$$

$$\Rightarrow \quad |x + y| = 10 \qquad \ldots(i)$$

Again, $\log_{10} y - \log_{10} |x| = \log_{100} 4$

$$\log_{10} y - \log_{10} |x| = \log_{10} 2 \Rightarrow \log_{10} \frac{y}{|x|} = \log_{10} 2$$

$$\Rightarrow \quad y = 2|x| \qquad \ldots(ii)$$

From eq. (ii) we can conclude that y is always positive.

Now, when $x > 0$ and $y > 0$ (always)

$$|x + y| = 10 \Rightarrow |x + 2|x|| = 10$$

$$\Rightarrow \quad x + 2|x| = 10 \qquad (\because x > 0)$$

$$\Rightarrow \quad x + 2x = 10 \Rightarrow x = \frac{10}{3}$$

$$\therefore \quad y = \frac{20}{3}$$

Again, $x < 0$ and $y > 0$ (always positive)

$$|-x + 2| - x|| = 10 \Rightarrow |-x + 2x| = 10$$

$$\Rightarrow \quad |x| = 10 \Rightarrow x = -10 \qquad (\because x < 0)$$

$$\therefore \quad y = 20$$

Hence, $x = -10, \quad y = 20$ and $x = \frac{10}{3}$ and $y = \frac{20}{3}$.

4 $$2\log_2 \log_2 x + \log_{1/2} \log_2 (2\sqrt{2}x) = 1$$

$$\Rightarrow \quad 2\log_2 \log_2 x - \log_2 \log_2 (2\sqrt{2}x) = \log_2 2$$

$$\Rightarrow \quad \log_2 (\log_2 x)^2 - \log_2 [\log_2 2\sqrt{2}x] = \log_2 2$$

$$\Rightarrow \quad \log_2 \frac{(\log_2 x)^2}{[\log_2 2\sqrt{2}x]} = \log_2 2 \Rightarrow \frac{(\log_2 x)^2}{\log_2 (2\sqrt{2}x)} = 2$$

$$\Rightarrow (\log_2 x)^2 = 2\log_2 (2\sqrt{2}x) = 2\log_2 (2^{3/2}x)$$

$$\Rightarrow (\log_2 x)^2 = 2[3/2 \log_2 x + \log_2 x] = 3 + 2\log_2 x$$

$$\Rightarrow (\log_2 x)^2 - 2\log_2 x - 3 = 0 \text{ or } \log_2 x = -1$$

$$\Rightarrow \quad \log_2 x = 3 \Rightarrow x = \frac{1}{2} \text{ or } x = 8$$

But for $x = \frac{1}{2}$, $\log_2 \log_2 (1/2)$ is undefined

$\therefore$ Only possible value of $x = 8$.

5 Consider $x^2 + 4x + 3 \geq 0$ …(i)

then $(x^2 + 4x + 3) + 2x + 5 = 0$

$$\Rightarrow \quad x = -2 \quad \text{and} \quad x = -4$$

but $x = -2$ does not satisfy eq. (i)

Now, if $x^2 + 4x + 3 < 0$ …(ii)

then $-(x^2 + 4x + 3) + 2x + 5 = 0$

$$\Rightarrow \quad x = -1 - \sqrt{3}$$

or $x = -1 + \sqrt{3}$

but only $x = -1 - \sqrt{3}$ satisfies the eq. (ii).
Hence the solution set of x is $(-4, -1 - \sqrt{3})$.

Alternatively, check the options by substituting the values from the options given in the question.

6 $\because x_1, x_2, x_3$ are in AP.

$\Rightarrow \quad x_1 = a - d, \quad x_2 = a, \quad x_3 = a + d$

Where d is the common difference.
Now, since x_1, x_2, x_3 are the roots of the given equation

$$x^3 - x^2 + \beta x + \gamma = c$$

So, $\quad \Sigma\alpha = x_1 + x_2 + x_3 = 1$

$\Rightarrow \quad (a - d) + (a) + (a + d) = 1 \quad \ldots(i)$

$$\Sigma\alpha\beta = x_1x_2 + x_2x_3 + x_1x_3$$

$\Rightarrow \quad \beta = (a - d)a + a(a + d) + (a - d)(a + d) \quad \ldots(ii)$

and $\quad \Sigma = \alpha\beta\gamma = x_1x_2x_3 = -\gamma = (a - d)(a)(a + d) \quad \ldots(iii)$

hence from eq. (i) we get $a = \dfrac{1}{3}$

and from eq. (ii) we get

$$\beta = 3a^2 - d^2 \Rightarrow \beta = \frac{1}{3} - d^2 \qquad \left(\because a = \frac{1}{3}\right)$$

Thus $\quad \beta = \dfrac{1}{3} - d^2 \le \dfrac{1}{3} \qquad [\because \ d^2 \ge 0]$

$\Rightarrow \quad \beta \le \dfrac{1}{3}$ or $\beta \in \left(-\infty, \dfrac{1}{3}\right]$

Again from eq. (iii), we get

$$a(a^2 - d^2) = -\gamma \Rightarrow \left(\frac{1}{27}\right) + \left(-\frac{d^2}{3}\right) = -\gamma$$

$\Rightarrow \quad \gamma = \dfrac{d^3}{3} - \dfrac{1}{27} \Rightarrow \gamma \ge \dfrac{-1}{27} \qquad (\because \ d^2 \ge 0)$

Hence option (a) is correct.

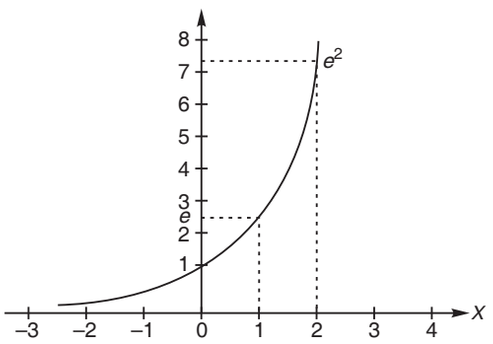
7 (a) $\rightarrow e^x < 1 + x$

(b) $\rightarrow e^x > (1 + x) \Leftrightarrow \log_e (1 + x) < x$

(c) $\rightarrow \sin x > x$

(d) $\rightarrow e^x < x \Leftrightarrow \log_e x > x$

NOTE $e \approx 2.714$ and $e^2 \approx 7.366$



From the graph it is clear that when $0 < x < 1, e^x > (1 + x)$

Option (b) is clearly wrong.

8 Let us consider some value of $p = 3$ (say), then

$$x^2 - 4x + 1$$

and $\quad (\alpha, \beta) = 2 \pm \sqrt{3} \qquad (\alpha, \beta$ are the roots)

Now, $\quad \alpha^n + \beta^n = (2 + \sqrt{3})^n + (2 - \sqrt{3})^n \quad \ldots(i) \ (n \in N)$

Then, $\alpha^n + \beta^n$ will always be an integer, for the validity of statement you can put $n = 1, 2, 3, \ldots$ etc. in Eq. (i).

Similarly for $p = 4, 5, 6, \ldots$ etc. we can conclude the same results.

NOTE In this question, the discriminant D is always positive, *i.e.*, $b^2 - 4ac > 0$. So the roots will always be real, unequal and irrational.
But the fact is that $\alpha^n + \beta^n$, for $n \in N$, always yields integral value. This can be easily proved by mathematical induction method. So if the answer is an integer, then it must be a rational number, hence option (d) is correct.

9 Just assume some values of α, β conforming the basic constraints of the problem.

e.g., $\alpha = -2, \beta = 8$, then the equation becomes

$x^2 - 6x - 16 \Rightarrow b = -6$ and $c = -16$

$\therefore \quad 1 + \dfrac{c}{a} + \left|\dfrac{b}{a}\right| = 1 - 16 + 6 = -9$

$\therefore$ The value of the expression is negative, hence choice (a) is correct.

NOTE Since $\alpha < 1$ and $\beta > 1$

$\therefore \quad \alpha\beta < 1 \Rightarrow \dfrac{c}{a} < 1$

Further the product of any two numbers $(n_1, n_2 \ne 0)$ is less than the sum of the number if any one of them is negative.

So, $\quad \alpha\beta < \alpha + \beta \qquad (\because$ Here $\alpha\beta$ is negative)

$\therefore \ \dfrac{c}{a} < \left|\dfrac{b}{a}\right|$; but $\dfrac{c}{a}$ is numerically greater than $\left|\dfrac{b}{a}\right|$.

$\Rightarrow \quad 1 + \dfrac{c}{a} + \left|\dfrac{b}{a}\right| < 0.$

10 Since p and q are the roots of given equation $x^2 + px + q = 0$ then $p + q = -p \Rightarrow q = -2p$

and $\quad pq = q \Rightarrow p = 1$

So, when $p = 1$, then $q = -2$.

Again, when $q = 0$, then $p = 0$ hence,

$$p = 1, 0 \quad \text{and} \quad q = -2, 0$$

Thus, option (b) is most appropriate.

11 $\because p, q, r$ are in AP.

$\therefore \quad q = \dfrac{p + r}{2} \qquad [\because \ p + r = 2q]$

For the real roots $q^2 - 4pr \ge 0$

$\Rightarrow \quad \left(\dfrac{p + r}{2}\right)^2 - 4pr \ge 0 \Rightarrow p^2 + r^2 - 14pr \ge 0$

$$\Rightarrow \quad \left(\frac{p}{r}\right)^2 - 14\left(\frac{p}{r}\right) + 1 \geq 0$$

$$\Rightarrow \quad \left(\frac{p}{r} - 7\right)^2 \geq 48$$

$$\Rightarrow \quad \left|\frac{p}{r} - 7\right| \geq 4\sqrt{3}$$

12 The given equation is $|x-2|^2 + |x-2| - 2 = 0$.

Let us assume $|x-2| = m$

Then, $m^2 + m - 2 = 0$ or $(m-1)(m+2) = 0$

Only admissible value is

$m = 1 \quad (\because \ m \neq -2 \text{ as } m \geq 0]$

$\therefore \quad |x-2| = 1$

$\Rightarrow x - 2 = 1 \quad \Rightarrow \quad x = 3 \text{ or } -(x-2) = 1 \quad \Rightarrow \quad x = 1$

Hence $x = 1, 3$

$\therefore$ Sum of the roots of equation $= 1 + 3 = 4$.

13 Just consider an option, and then substitute the values of A and B from assumed option, if the roots p, q, r, s are in AP, then the assumed option is correct, else not.

Thus we find that options a, b and c are incorrect.

Hence (d) is the right choice.

Alternatively Let us consider $p = a - 3d$, $q = a - d$, $r = a + d$. and $s = a + 3d$

$\therefore \quad 2a - 4d = 2 \quad \ldots(i)$

and $\quad 2a + 4d = 18 \quad \ldots(ii)$

Solving equations (i) and (ii), we get

$a = 5, d = 2$

$\therefore \quad p = -1, \quad q = 3, \quad r = 7, \quad s = 11$

Hence $\quad A = pq = -3$ and $B = rs = 77$

Thus (d) is the right choice

14 Let $\quad f(x) = x^2 - 2ax + a^2 + a - 3$

Since $f(x)$ has real roots, both less than 3.

Therefore, $D > 0$ and $f(3) > 0$

$\Rightarrow \quad a^2 - (a^2 + a - 3) > 0$ and $a^2 - 5a + 6 > 0$

$\Rightarrow a < 3 \quad$ and $\quad (a-2)(a-3) > 0$

$\Rightarrow a < 3 \quad$ and $\quad a < 2 \text{ or } a > 3 \Rightarrow a < 2$

15 Considering the given constraints in the problem.

Let us consider $\alpha, \beta = (-3, 2)$

Then the given equation becomes

$x^2 + x - 6 = 0 \Rightarrow b = 1$

and $\quad c = -6$

Now, we check for the given choices, which satisfy the aforesaid conditions

(a) It is clearly wrong (b) It is correct

(c) It is also wrong (d) It is also wrong

Hence option (b) is appropriate.

NOTE You should not worry about this technique. It must be clear to you that while assuming the values of α, β, you have to strictly follow the basic given constraints, *i.e.,* α must be less than β and after forming the similar equation you should have $c < 0 < b$. So I think it is even very intelligent method to solve the problems rather than conventional methods.

16 Let us assume $a = 3$, $b = 4$, given that $a < b$ then the given equation becomes

$(x-3)(x-4) - 1 = 0$ or $x^2 - 7x + 11 = 0$

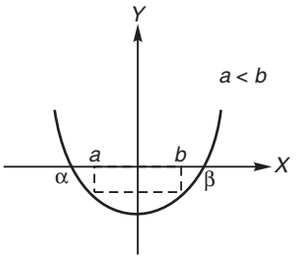
$\therefore \quad x = \dfrac{7 \pm \sqrt{49 - 44}}{2} \quad \Rightarrow \quad x = \dfrac{7 \pm \sqrt{5}}{2}$

$\Rightarrow \quad x = \dfrac{7 + \sqrt{5}}{2} > 4 \quad$ and $\quad \dfrac{7 - \sqrt{5}}{3} < 3$

Hence only option (d) is satisfied, hence correct.

Alternatively Since $f(x) = (x-a)(x-b) - 1 = 0$

$\Rightarrow \quad (x-a)(x-b) = 1$



$\alpha < a \quad$ and $\quad \beta > b$

It means X-axis is shifted to -1 unit below the original position. So it is clear from the graph that $\alpha < a$ and $\beta > b$.

17 $\quad \alpha\beta = p \quad$ and $\quad \gamma\delta = q$

Now since, $\alpha, \beta, \gamma, \delta$ are in GP and integral values. So the options (b) and (c) are ruled out, as they have no required proper integral factors. Now let us look for option (a). We see that $\quad \alpha\beta = -2 = -1 \times 2$

$\gamma\delta = -32 = -4 \times 8$

So, $-1, 2, -4, 8$ are in GP satisfying the above conditions.

Again in option (d) the two values don't have the factors with common ratio, hence it is wrong. Finally option (a) is correct.

Alternatively The sum of roots and product of roots is as follows :

$\alpha + \beta = 1, \quad \alpha\beta = p$

$\gamma + \delta = 4, \quad \gamma\delta = q$

Let r be the common ratio of the GP $\alpha, \beta, \gamma, \delta$.

Then, $\quad \alpha + \beta = 1 \quad$ and $\quad \gamma + \delta = 4$

$\alpha + \alpha r = 1 \quad$ and $\quad \alpha r^2 + \alpha r^3 = 4$

$\Rightarrow \quad \alpha(1 + r) = 1 \quad$ and $\quad \alpha r^2(1 + r) = 4$

So $\ 1 + r = \dfrac{1}{2} \quad$ and $\quad \alpha r^2\left(\dfrac{1}{\alpha}\right) = 4 \Rightarrow r = \pm 2$

When $r = 2$, then $\alpha = \frac{1}{3}$ which is inadmissible.

Hence, $r = -2$ is to be considered, then $\alpha = -1$

Thus $\alpha\beta = p = -2$ and $r\delta = q = -32$.

18 When this problem will be solved by algebraic methods, it will take too much time to solve beyond the normal required time. So, the best way to get the correct and quick answer is to assume some simple roots (*i.e.,* α and β) then go through options.

Let us take two arbitrary values $\alpha = -1, \beta = 2$, then the equation will be $x^2 - x - 2 = 0$

Comparing with the equation $x^2 - px + q = 0$

$\Rightarrow \quad p = 1, \quad q = -2$

Now, the sum of the roots of the required equation

$$= [(\alpha^2 - \beta^2)(\alpha^3 - \beta^3)] + [\alpha^3\beta^2 + \alpha^2\beta^3]$$

$$= 27 + 4 = 31$$

and product of roots $[(\alpha^2 - \beta^2)(\alpha^3 - \beta^3)[\alpha^3\beta^2 + \alpha^2\beta^3]$

$$= 27 \times 4 = 108$$

Hence equation is $x^2 - 31x + 108 = 0$

Now putting the values of p and q in the equation options *a, b,* and *c* we get option (b) is correct. as :

$$x^2 - [1 - \{5 \times 1 (-2)\} + 5 \times 1 \times 4] + [1 \times 4 - \{5 \times 1 \times (-8)\} + 4 \times 1 \times 16] = 0$$

$$= x^2 - 31x + 108 = 0$$

19 Let us consider choice (a). When we put the values of A and B respectively, we get the values of α, β, γ and δ as –1, 1/3, 1/5, 1/3, which are not in HP. So this option is not correct.

Now for our convenience we consider choice (c), then by substituting the values of A and B, we get the values of α, β, γ and δ as 1, 1/2, 1/3 and 1/4 which are in HP. Hence this could be the correct choice.

Alternatively $Ax^2 - 4x + 1 = 0$ …(i)

$$\alpha + \gamma = \frac{4}{A} \text{ or } \alpha\gamma = \frac{1}{A}$$

and $Bx^2 - 6x + 1 = 0$ …(ii)

$$\beta + \delta = \frac{6}{B} \text{ or } \beta\delta = \frac{1}{B}$$

Since it is given that α, β, γ, δ are in HP.

$$\therefore \quad \beta = \frac{2\alpha\gamma}{\alpha + \gamma} = \frac{1}{2} \text{ and } \gamma = \frac{2\beta\delta}{\beta + \delta} = \frac{1}{3}$$

Again since β and γ are the roots of the given equation hence they must satisfy the equation. So

$B\beta^2 - 6\beta + 1 = 0$ and $A\gamma^2 - 4\gamma + 1 = 0 \Rightarrow B = 8$ and $A = 3$

Hence option (c) is correct.

20 Assume some convenient and appropriate values of *a, b, c* as

$$a = 3, \quad b = 4, \quad c = 6.$$

Then, $(x - 3)(x - 4) - 6 = 0$

$[\because (x - a)(x - b) = c, c \neq 0]$

$\Rightarrow \quad x^2 - 7x + 6 = 0 \Rightarrow \alpha = 6, \quad \beta = 1$

Again $(x - 6)(x - 1) + 6$ $(\because (x - \alpha)(x - \beta) + c = 0)$

$$x^2 - 7x + 6 + 6 = 0 \text{ or } x^2 - 7x + 12 = 0$$

$\therefore$ The roots $k_1 = 3$ and $k_2 = 4$

which are same as a and b.

Hence, option (c) is correct.

Alternatively $x^2 - (a + b)x + (ab - c) = 0$

$\therefore \quad \alpha + \beta = a + b$ and $\alpha\beta = ab - c$

Again if k_1 and k_2 be the roots of the other equation, then

$$(x - \alpha)(x - \beta) + c = 0$$

i.e., $x^2 - (\alpha + \beta)x + (\alpha\beta + c) = 0$

$\therefore \quad k_1 + k_2 = \alpha + \beta = a + b$ …(i)

and $k_1 \cdot k_2 = \alpha\beta + c = (ab - c) + c = ab$ …(ii)

Thus, from eqs. (i) and (ii) it is clear that the roots are a and b. Hence correct choice is *c.*

21 The best way is to assume any convenient arbitrary numerical values. And then verify the options.

Let us assume $a = 1, b = 2, c = -3$, as $a + b = c = 0$. Then we will see that only choice (c) has a valid relation as both the sides have same value.

Hence, choice (c) is the answer.

22 Given that $px^2 - qx + q = 0 \Rightarrow px^2 + q = qx$

As p and q are prime, so they are positive. It implies $x > 0$.

Let us consider now $x = \frac{a}{b}$ such that a and b are co-prime.

$$\therefore \quad px^2 - qx + q = 0 \Rightarrow p\frac{a^2}{b^2} - q\frac{a}{b} + q = 0$$

and $pa^2 - qab + qb^2 = 0$ …(i)

Now dividing eq. (i) by a we get $pa - qb + \frac{qb^2}{a} = 0$; as $pa - qb$ is integer, so $\frac{qb^2}{a}$ too must be an integer. But, since a and b are co-prime, so a cannot divide b. It implies that $a = 1$ or q.

Similarly by dividing eqn. (i) we get to know that $b = 1$ or p.

Therefore $x = \frac{a}{b} = \frac{1}{1}, \frac{1}{p}, \frac{q}{1}, \frac{q}{p}$

Case 1: If $x = 1$, $px^2 - qx + q = 0 \Rightarrow p = 0$.

That's impossible as p being a prime number cannot be zero.

Case 2: If $x = \frac{1}{p}$, $px^2 - qx + q = 0 \Rightarrow \frac{1}{p} - \frac{q}{p} + q = 0 \Rightarrow$

$pq + 1 = q$.

That's impossible as $pq > q$.

Case 3: If $x = q$, $px^2 - qx + q = 0 \Rightarrow pq^2 + q = q^2$.

That's impossible as $pq^2 > q^2$.

Case 4: If $x = \frac{q}{p}$, $px^2 - qx + q = 0 \Rightarrow q = 0$.

That's impossible as q being a prime number cannot be zero.

Therefore no rational solutions to the quadratic equation $px^2 - qx + q = 0$ exists.

Hence, choice (a) is the correct answer.

23. Let r be an integral root of the given equation, then

$r^4 - pr^3 + q = 0 \Rightarrow r^3(r - p) + q = 0 \Rightarrow q = r^3(p - r)$

Since q itself is a prime (which cannot be the product of two distinct primes), so either $p - r = \pm 1$ or $r^3 = \pm 1$,

If $p - r = \pm 1$, then $q = \pm r^3$ which is not possible as a prime number cannot be a perfect cube. So $r^3 = \pm 1$.

If $r = -1$, then $q = -1(p + 1)$

$\Rightarrow q + p = -1$, which is impossible as prime numbers are always positive.

Further, if $r = 1$, then $q = 1(p - 1) \Rightarrow p - q = 1$.

So we can infer that $p = 3$ and $q = 2$ when the root $r = 1$.

Therefore the required integral root is 1.

Hence choice (d) is the answer.

24. $x^2 + 4y^2 + 9z^2 - 2xy - 6yz - 3zx$

$= \frac{1}{2}[2x^2 + 8y^2 + 18z^2 - 4xy - 12yz - 6zx]$

$= \frac{1}{2}[(x^2 + 4y^2 - 4xy) + (x^2 + 9z^2 - 6zx)$

$+ (4y^2 + 9z^2 - 12yz)$

$= \frac{1}{2}[(x - 2y)^2 + (x - 3z)^2 + (2y - 3z)^2] \geq 0$

That means the given expression is always non-negative.

Hence choice (b) is the correct one.

Hint Since a perfect square number is always a non-negative number.

$\therefore (x - 2y)^2 \geq 0, (x - 3z)^2 \geq 0, (2y - 3z)^2 \geq 0$.

25 Let $p = e^{\sin x}$, then the given equation becomes as shown below.

$p + \frac{1}{p} = 4 \qquad \Rightarrow p^2 + p - 4 = 0$

$\Rightarrow \qquad p = 2 - \sqrt{5}$ or $p = 2 + \sqrt{5} \Rightarrow e^{\sin x} = 2 - \sqrt{5}$

or $\quad e^{\sin x} = 2 + \sqrt{5}$.

Now taking log on both the sides, we get

$\sin x = \log(2 - \sqrt{5})$ or $\sin x = \log(2 + \sqrt{5})$

Here, $2 - \sqrt{5}$ is a negative number. Since log of negative number is not defined, so $\sin x = \log(2 - \sqrt{5})$ does not give the solution.

Again, $\sin x = \log(2 + \sqrt{5}) > \log e$

$\Rightarrow \sin x > 1$, which is not possible.

Hence choice (a) is the answer.

Hint $\log e = 1$ and $e = 2.714$. Also, $-1 \leq \sin x \leq 1$.

26 Since α and β are the roots of $x^2 + ux + v = 0$.

Therefore

$\alpha + \beta = -u$ ...(i)

And $\alpha\beta = v$ ...(ii)

Again since α and β are the roots of $x^{2n} + u^n x^n + v^n = 0$.

Therefore α and β will satisfy this equation too, which is shown below.

$(\alpha^n)^2 + u^n\alpha^n + v^n = 0$ ...(iii)

$(\beta^n)^2 + u^n\beta^n + v^n = 0$ ...(iv)

From eqs. (iii) and (iv) we can infer that α^n and β^n are the roots of $p^2 + u^n p + v^n = 0$.

So $\alpha^n + \beta^n = -p^n$ ...(v)

And $\alpha^n\beta^n = q^n$ ...(vi)

From the eq. (i), we have

$(\alpha + \beta)^n = (-p)^n = p^n$, as n is even.

Now, from the eq. (v) , we have

$(\alpha + \beta)^n = -(-p^n) = -(\alpha^n + \beta^n)$

$\Rightarrow \qquad (\alpha^n + \beta^n) + (\alpha + \beta)^n = 0$ ...(vii)

Now dividing eq. (vii) by β^n, we get

$\left(\frac{\alpha}{\beta}\right)^n + 1 + \left(\frac{\alpha + \beta}{\beta}\right)^n = 0$

$\Rightarrow \qquad \left(\frac{\alpha}{\beta}\right)^n + 1 + \left(\frac{\alpha}{\beta} + 1\right)^n = 0$ ...(viii)

Again dividing eq. (vii) by α^n, we get

$\left(\frac{\beta}{\alpha}\right)^n + 1 + \left(\frac{\alpha + \beta}{\beta}\right)^n = 0$

$\Rightarrow \qquad \left(\frac{\beta}{\alpha}\right)^n + 1 + \left(\frac{\beta}{\alpha} + 1\right)^n = 0$ ...(ix)

From eqs. (viii) and (ix), we can infer that $\frac{\alpha}{\beta}$ and $\frac{\beta}{\alpha}$ are the roots of $x^n + 1 + (x + 1)^n = 0$

Hence choice (d) is the answer.

27 Let α and β be the two roots, such that $\alpha+\beta=\left(\frac{1}{\alpha}\right)^2+\left(\frac{1}{\beta}\right)^2$

That is $\alpha+\beta=\frac{1}{(\alpha)^2}+\frac{1}{(\beta)^2}$

$\Rightarrow \quad \alpha+\beta=\frac{\alpha^2+\beta^2}{(\alpha\beta)^2}=\frac{(\alpha+\beta)^2-2\alpha\beta}{(\alpha\beta)^2}$ ...(i)

Now since, $\alpha+\beta=\frac{-b}{a}$ ...(ii)

And $\alpha\beta=\frac{c}{a}$ ...(iii)

Therefore using eqs. (ii) and (iii), the Eq. (i) becomes as following.

$$\frac{-b}{a}=\frac{\left(\frac{-b}{a}\right)^2-2\left(\frac{c}{a}\right)}{\left(\frac{c}{a}\right)^2}$$

$\Rightarrow \quad -\frac{b}{a}=\frac{b^2-2ac}{c^2} \Rightarrow bc^2+ab^2=2ca^2$

Therefore bc^2, ca^2, ab^2 are in A.P.

Hence choice (c) is the answer.

Alternatively Let us consider the two roots 1 and 1, as they satisfy the given condition $1+1=\left(\frac{1}{1}\right)^2+\left(\frac{1}{1}\right)^2$

Therefore, you will have the following quadratic equation,

$(x-1)(x-1)=0$

$\Rightarrow \quad x^2-2x+1=0$

$\Rightarrow \quad a=1,\ b=-2,\ c=1$

Then, $bc^2=-2,\ ca^2=1,\ ab^2=2$

As, $-2, 1, 2$ are in AP, therefore choice (c) is the valid one.

28 Since $f(x)$ is positive for all real values of x, it means the graph of $f(x)$ is strictly above the X-axis. That means roots are not real.

So, the best way is to consider any quadratic equation whose roots are not real. So,

I'm assuming a desired equation: $x^2-x+2=0$

Now, comparing this equation $(x^2-x+2=0)$ with the given equation $(ax^2+bx+c=0)$, we get

$a=1,\ b=-1$ and $c=2$

But, $g(x)=ax^2+(2a+b)x+(2a+b+c)$

Now, if you plug in the values of a, b and c in $g(x)$, you will get $g(x)=x^2+x-3$. And, you see, as the discriminant of $g(x)$ is strictly negative and coefficient of x^2 is positive, so the roots of $g(x)$ will be non-real and the graph will be strictly above the X-axis. That is $g(x)>0$.

Hence, choice (a) is the valid one.

Alternatively Since $f(x)$ is positive for all real x.

Then, $b^2-4ac<0$

and $a>0$ ...(i)

Now $g(x)=ax^2+(2a+b)x+(2a+b+c)$

The discriminant of $g(x)$ is

$D=(2a+b)^2-4a(2a+b+c) \Rightarrow D=(b^2-4ac)-4a^2$

But using eq. (i) we can conclude that $(b^2-4ac)-4a^2<0$

$\therefore D<0$

And from eq. (i), we already know that $a>0$. Therefore $g(x)>0$, for all real x.

Hence choice (a) is the answer.

29 Since AM of $(x-1)$ and $(x-5)$ = AM of $(x-2)$ and $(x-4)=(x-3)$. So, for our convenience, we can substitute y in place of $x-3$. Therefore

$(x-1)^3+(x-2)^3+(x-3)^3+(x-4)^3+(x-5)^3=0$

$\Rightarrow (y+2)^3+(y+1)^3+y^3+(y-1)^3+(y-2)^3=0$

$\Rightarrow [(y+2)^3+(y-2)^3]+y^3+[(y+1)^3+(y-1)^3]=0$

$\Rightarrow 2(y^3+12y)+2(y^3+3y)+y^3=0$

$\Rightarrow 5y^3+30y=0 \Rightarrow 5y(y^2+6)=0$

$\Rightarrow y=0,\pm\sqrt{-6} \Rightarrow y=0,\pm\sqrt{6}i$

$\therefore x=3,\ 3\pm\sqrt{6}i$

Hence choice (b) is the answer.

30 The AM of $(x+3)$ and $(x-1)$ is $(x+1)$.

So, now putting $x+1=y$, we get the given equation in the following form.

$(y+2)^5-(y-2)^5\geq 244$

$\Rightarrow 2(10y^4+80y^2+32)\geq 244 \Rightarrow (y^2+9)(y^2-1)\geq 0$

$\Rightarrow (y^2-1)\geq 0$, since $y^2+9>0$ for every real value of y.

The corresponding roots for $y^2-1=0$ are -1 and 1.

So the inequation $y^2-1\geq 0$ is valid only when $y\leq -1$ or $y\geq 1$.

Now if $y\leq -1 \Rightarrow x\leq -2$ And if $y\geq 1 \Rightarrow x\geq 0$

It implies that the real solutions of the given equation is

$x\leq -2$ or $x\geq 0$

Therefore the solution set is $(-\infty,-2]\cup[0,\infty)$

Hence choice (b) is the answer.

Hint $(y+2)^5=y^5+{}^5C_1y^4\times(2)+{}^5C_2y^3\times(2^2)+{}^5C_3y^2\times(2^3)+{}^5C_4y\times(2^4)+{}^5C_5y\times(2^5)$

and $(y-2)^5=y^5-{}^5C_1y^4\times(2)+{}^5C_2y^3\times(2^2)-{}^5C_3y^2\times(2^3)+{}^5C_4y\times(2^4)-{}^5C_5\times(2^5)$

Therefore $(y+2)^5-(y-2)^5$

$$=2[{}^5C_1y^4\times(2)+{}^5C_3y^2\times(2^3)+{}^5C_5\times(2)^5]$$

$$\Rightarrow (y+2)^5-(y-2)^5$$

$$=2[5y^4\times(2)+10y^2\times(8)+1\times(32)]$$

31 From the given information we will have the following results.

If $\alpha+\beta=-p$ and $\alpha\beta=q$ ...(i)

And $\alpha^n+\beta^n=-p^n$ and $\alpha^n\beta^n=q^n$ ...(ii)

Now since $\frac{\alpha}{\beta}$ is root of $x^n+1+(x+1)^n=0$, so it must satisfy this equation.

$$\therefore \quad \left(\frac{\alpha}{\beta}\right)^n+1+\left(\frac{\alpha}{\beta}+1\right)^n=0$$

$$\Rightarrow \quad \frac{\alpha^n}{\beta^n}+1+\left(\frac{\alpha+\beta}{\beta}\right)^n=0$$

$$\Rightarrow \quad \frac{\alpha^n+\beta^n}{\beta^n}+\frac{(\alpha+\beta)^n}{\beta^n}=0$$

$$\Rightarrow \quad \frac{-p^n}{\beta^n}+\frac{(-p)^n}{\beta^n}=0 \Rightarrow \frac{-p^n+(-p)^n}{\beta^n}=0$$

$$\Rightarrow \quad -p^n+(-p)^n=0$$

It is valid only when n is an even integer.

Hence choice (c) is the answer.

32 Let's assume that $a+ib$ is an imaginary root of the given equation, then the conjugate of this root $a-ib$ is also a root of this equation. Putting $x=a+ib$ and $x=a-ib$ in the given equation we get

$$\frac{P_1^2}{(a+ib-p_1)}+\frac{P_2^2}{(a+ib-p_2)}+\ldots+\frac{P_k^2}{(a+ib-p_k)}$$

$$=a+ib+1 \qquad ...(i)$$

$$\frac{P_1^2}{(a-ib-p_1)}+\frac{P_2^2}{(a-ib-p_2)}+\ldots+\frac{P_k^2}{(a-ib-p_k)}$$

$$=a-ib+1 \qquad ...(ii)$$

Subtracting eq. (i) from eq. (ii), we get

$$2ib\left[\frac{P_1^2}{(a-p_1)^2+b^2}+\frac{p_2^2}{(a-p_2)^2+b^2}+\ldots+\frac{P_k^2}{(a-p_k)^2+b^2}\right]=-2ib$$

$$\Rightarrow 2ib\left[\frac{P_1^2}{(a-p_1)^2+b^2}+\frac{P_2^2}{(a-p_2)^2+b^2}+\ldots+\frac{P_k^2}{(a-p_k)^2+b^2}\right]+2ib=0$$

$$2ib\left[1+\left\{\frac{P_1^2}{(a-p_1)^2+b^2}+\frac{P_2^2}{(a-p_2)^2+b^2}+\ldots+\frac{P_k^2}{(a-p_k)^2+b^2}\right\}\right]=0$$

Since all the values inside the bracket are positive, so the expression in the bracket cannot be zero. Therefore

$2ib=0 \quad \Rightarrow b=0$ since $i\neq 0$

$a+ib=a$ and $a-ib=a$

Therefore all the roots are real.

Hence choice (c) is the answer.

33 $(x-a)(x-c)+k(x-b)(x-d)=0$

$$\Rightarrow x^2-(a+c)x+ac+k[x^2-(b+d)x+bd]=0$$

$$\Rightarrow (1+k)x^2-[(a+c)+k(b+d)]x+(ac+kbd)=0 \qquad ...(i)$$

Let's assume that the eq. (i) will have real root, then the discriminant $D\geq 0$.

That is $[(a+c)+k(b+d)]^2-4[(1+k)(ac+kbd)]\geq 0$

$$\Rightarrow [(b+d)^2-4bd]k^2+[2(a+c)(b+d)-4ac-4bd]k+[(a+c)^2-4ac]\geq 0$$

$$\Rightarrow (b-d)^2k^2+2(ab+ad+bc+cd-2ac-2bd)k+(a-c)^2\geq 0 \qquad ...(ii)$$

Now, the expression (ii) looks like a quadratic inequality. In the above inequation (ii) the coefficient of k^2 [*i.e.*, $(b-d)^2$] is positive.

Let's assume that the discriminant of the expression (ii) is J. Now,

(a) If $J>0$, for certain values of k, expression will be positive and for certain values of k, expression will be negative. So it won't be valid for all the real values of k.

(b) If $J=$`0, for all the values of k, expression will be non-negative, so it will be valid.

(c) If $J<0$, for all the values of k, expression will be positive, so it will be valid.

Therefore the need arises to determine the discriminant J. Then,

$$J=4(ab+ad+bc+cd-2ac-2bd)^2-4(b-d)^2(a-c)^2$$

$$\Rightarrow J=4(ab+ad+bc+cd-2ac-2bd)^2-4[(b-d)(a-c)]^2$$

$$\Rightarrow J=4[(ab+ad+bc+cd-2ac-2bd)^2-\{(b-d)(a-c)\}^2]$$

$$\Rightarrow J=4[\{(ab+ad+bc+cd-2ac-2bd+(b-d)(a-c)\}\times\{ab+ad+bc+cd-2ac-2bd+(b-d)(a-c)\}]$$

$$\Rightarrow J=16(b-c)(a-d)(a-b)(d-c)$$

$\Rightarrow J = 16(-ve)(-ve)(-ve)(+ve)$; since $a < b < c < d$. $\Rightarrow J < 0$

Since the discriminant is negative and the coefficient of k^2 is positive, it means the given inequation is valid for all the real values of k. This in turn implies that the roots of the given equation are real. Hence choice (a) is the answer.

Hint Since $b < d$, so $(b-d)^2$ is positive; as the square of any negative number is always positive.

Alternatively

Let $f(x) = (x-a)(x-c) + k(x-b)(x-d) = 0$

Also it is given that $a < b < c < d$.

Now, $f(b) = (b-a)(b-c) \Rightarrow f(b) < 0$

$(\because b - a > 0$ and $b - c < 0)$

And $f(d) = (d-a)(d-c)$

$\Rightarrow f(d) > 0$ $(\because d - a > 0$ and $d - c > 0)$

Since $f(b)$ and $f(d)$ have opposite signs therefore the given equation has one real root between b and d.

Since one root is real and a, b, c, d, k are also real, therefore the other root of the given equation will also be real.

Thus the given quadratic equation

$(x-a)(x-c) + k(x-b)(x-d) = 0$ has both the real roots.

34 Since the discriminant of the quadratic equation $x^2 - bx - c = 0$ is $b^2 + 4c$, which is positive, so there will be two real roots, say α and β.

The product of the roots $= \alpha\beta = -c$, so one root will be negative and one root will be positive.

Then the three coordinates will be

$A(\alpha, 0)$, $B(\beta, 0)$ and $C(0, c)$.

Therefore the line segment $AO = -\alpha$

(as the root is negative), $BO = \beta$ and $CO = c$.

As we know that in a circle, with two intersecting chords the product of the segments is

equal. That is $AO \times BO = CO \times DO$.

$\therefore \quad -\alpha \times \beta = c \times DO$

$\Rightarrow \quad c = c \times DO$

$\Rightarrow \quad DO = 1$

Since D lies on the Y-axis, so the coordinates of D are $(0, 1)$, which is coincidently independent of both b and c.

Hint When you put $x = 0$ in $y = x^2 - bx - c$, you will get $y = OC$

CHAPTER 15

Set Theory

It is one of the easiest and most interesting chapters. Almost every year 2-3 questions appear in CAT from this chapter, either in QA or in DI/DS section. The important feature of this chapter is Venn diagrams which play a vital role in the logical reasoning. That's why this chapter is interesting, logical and important in CAT, XLRI, FMS, CET etc. Since we have to solve most of the problems through Venn diagrams, therefore the whole emphasis is given on the theory and concepts of Venn diagrams. Formulae and algebraic theory is not important particularly in CAT, still we have to know some fundamentals of sets and their applications.

15.1 Set

A well defined collection of objects is called a set. The objects in a set are called its members or elements. If a is an element of a set A, then we write $a \in A$ (and say a belongs to A) i.e., 'a' is a member of 'A'. If a does not belong to A, then we write $a \notin A$ By convention the sets are denoted by capital alphabets e.g., $A, B, C, \ldots X, Y, Z$ etc and elements of a set are denoted by $a, b, c, \ldots, x, y, z$ etc.

Important Notations of Standard Sets

N :	the set of natural numbers	Z :	the set of integers
Z^+ :	the set of positive integers	Q :	the set of all rational numbers
Q^+ :	the set of all positive rational numbers	R :	the set of real numbers
R^+ :	the set of all positive real numbers	C :	the set of all complex numbers.

15.2 Methods of Representation of Sets

1. *Roster Method*

In this method a set is described by listing all the elements, separated by commas, within braces { } , *e.g.*

(i) The set of perfect squares upto 100 may be described as {0, 1, 4, 9, 16, 25, 36, 49, 64, 81,100}

(ii) The set of all the days of a week may be described as {Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday}.

NOTE The order of elements (*i.e.,* position of elements) is not important. Hence any element can be written anywhere within braces { }.

2. *Set Builder Method*

In this method, a set is described by listing its property in the given manner.

The set $P(x)$ is described as $P = \{ x : P(x) \text{ holds} \}$ or $\{ x \mid P(x) \text{ holds} \}$

Chapter Checklist

- *Set*
- *Methods of Representation of Sets*
- *Types of Sets*
- *Venn Diagrams*
- *Operations on Sets*
- *Algebraic Laws of Sets*
- *Important Results on Number of Elements in Sets*
- *Problems Based on Venn Diagrams*
- *Concept of Maximum or Minimum*
- ***CAT Test***

or $P = \{ x : x \text{ has the property } abc \ldots \}$

which is read as 'the set of all x such that $P(x)$ holds'. The symbol '|' or ':' is read as 'such that', *e.g.,*

1. The set of perfect squares upto 100 can be written as
   $P = \{x : x \text{ is a perfect square and } 0 \le x \le 100, x \in N\}$
   or $P = \{ x : x \in N,\ x = n^2,\ 0 \le x < 100, n \in Z \}$
   or $P = \{ x^2 : x \in Z\}$
2. The set of all the odd natural numbers can be expressed as $A = \{ x : x \in N,\ x = 2n - 1,\ n \in N \}$

15.3 Types of Sets

Singleton Set : A set consisting of a single element is called a singleton set.

e.g. 1. {cat}, {7} etc. 2. $\{ x : x + 5 = 7 \} = \{2\}$

3. {0} is a singleton set.

Empty Set : A set containing no element at all is called an empty set or a null set or a void set and is denoted by ϕ. In set builder form it is expressed as $\phi = \{\}$

e.g. 1. $\{ x : x \in N,\ 9 < x < 10 \} = \phi$ 2. $\{ x : x \in R,\ x^2 = -8 \} = \phi$

NOTE A set containing atleast one element is called a non-empty or non-void set.

Finite Set : If a set has finite number of elements that can be counted or listed *i.e.,* the counting of elements surely comes to an end, is called a finite set, *e.g.,*

1. Set of all the management institutes in the world.
2. Set of all the recognised countries in the world.

Cardinal Number : The number of distinct elements in a finite set is called the 'cardinal number' of the set *e.g.,* $n(A) \to n$ is the number of distinct elements in the set A.

Infinite Set : If the number of elements of a set is infinite *i.e.,* which cann't be counted by natural numbers, is called infinite set in other words if a set is not finite then it must be an infinite set, *e.g.*

1. Set of all points on the arc of a circle
2. Set of all concentric circles with a given centre
3. Number of all lines in a particular plane.
4. $\{ x : x \in R,\ 1 < x < 2 \}$ and $\{x : x \in I,\ x < 10 \}$

Equivalent Sets : Two finite sets A and B are equivalent if their cardinal numbers are same *i.e.* $n(A) = n(B)$

e.g. $A = \{ a, e, i, o, u \}$ and $B = \{1, 3, 5, 7, 9\} \Rightarrow n(A) = n(B)$

Equal Sets : Two sets A and B are said to be equal, if every element of A is in B and every element of B is in A and it is denoted as $A = B$. When the elements of A and B are distinct, then $A \neq B$ *i.e.,* A and B are not equal *e.g.,*

1. $A = \{a, e, i, o, u\}$ and $B = \{e, o, i, a, u\} \Rightarrow A = B$
2. $A = \{p, q, r\}, B = \{q, p, r\}$ and $C = \{r, q, p\}$
   $\Rightarrow$ $A = B = C$
3. $A = \{C, A, T\}, B = \{C, A, T, A\}$
   $C = \{A, C, A, A, T\} \Rightarrow A = B = C$

Remark

1. Order of elements in the list of elements is not important *i.e.,* meaningless.
2. The repetition of elements in a set is meaningless.
3. $\phi \neq \{0\} \neq 0$, since ϕ is a set containing no element at all, {0} is a singleton set and 0 is not a set.
   Remember that equivalent sets are not always equal but equal sets are always equivalent. Thus {1, 2, 3,4} and {*W, X, Y, Z*} are equivalent but not equal.

Subsets : Let A and B be two sets such that every element of A is the element of B (*i.e.,* every element of A is in B), then A is called a subset of B and is denoted as-$A \subseteq B$ (Read it as-A is a subset of B)

Superset : If $A \subseteq B$, we say that B is a superset of A and we write $B \supseteq A$. Read it as-B is the superset of A.

e.g. $B = \{2, 4, 6, 8, 10\}$, $A = \{4, 8\} \Rightarrow B \supseteq A$

Proper Subset : If $A \subseteq B$ and $A \neq B$, then A is called a proper subset of B and denoted as $A \subset B$ *e.g.,*

1. $\{5, 15, 25\} \subset \{5, 10, 15, 20, 25\}$
2. $N \subset W \subset I \subset Q \subset R$

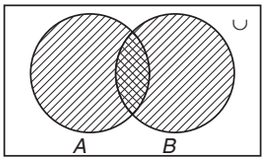
Comparable Sets : Two sets A and B are said to be comparable if either $A \subseteq B$ or $B \subseteq A$.

Results on Subsets

1. The empty set ϕ is a subset of every set.
2. Every set is a subset of itself.
3. The number of all possible subsets of a set containing n elements is 2^n.
4. The number of all proper subsets of a set containing n elements is $(2^n - 1)$.
5. The set of all subsets of a given set A is called the power set of A, denoted by $P(A)$. Thus, if A has n elements $P(A)$ has 2^n elements.

Universal Set : A set that contains all sets in a given context is called the universal set *e.g.,*

1. In a two dimensional coordinate geometry, the set of all points in x-y plane is the universal set.
2. Sets containing natural numbers have a universal set N.
3. If $A = \{1, 2, 4\}$, $B = \{2, 2, 4, 6\}$,
   $C = \{1, 2, 5, 6, 7\}$, then $U = \{1, 2, 3, 4, 5, 6, 7\}$



Power Set : The collection or family of all the subsets of a set A is called the power set of A and is denoted by $P(A)$.

NOTE The power set is always non-empty, because the empty set and the given set itself are the members or elements of the power set.

$A = \{1, 2, 3\}$, then the number of subsets of the $P(A)$ will be $2^3 = 8$

$P(A) = \{\ \}, \{1\}, \{2\}, \{3\}, \{1, 2\}, \{2, 3\}, \{1, 3\}, \{1, 2, 3\}$

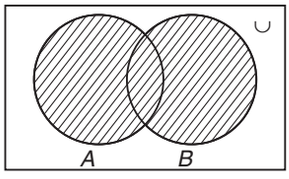
15.4 Venn Diagrams

First of all Swiss mathematician Euler elucidated the idea of representing the sets by points in a closed curve. Later on British mathematician Venn brought this into practice.That's why this whole concept is known as Euler-Venn diagram or simply Venn diagrams. In Venn diagrams the universal set U is represented by points within a rectangle and its subsets are represented by points in closed curves (usually circles) within a rectangle.

15.5 Operations On Sets

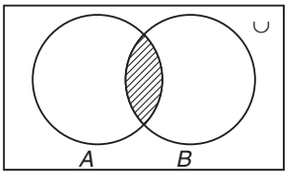
1. **Union of Sets :** If A and B be two sets, then the union of A and B is the set of the all those elements which belong either to A or to B or to both A and B. It is denoted as $A \cup B$ (read as 'A union B') e.g.

$A = \{2, 3, 5\}, \quad B = \{1, 2, 4, 5\}, \quad A \cup B = \{1, 2, 3, 4, 5\}$



[The shaded region is representing the union of sets]

2. **Intersection of Sets :** If A and B be two sets then the intersection of A and B is the set of all those elements that belong to both A and B. It is denoted by $A \cap B$ (read as ''A intersection B'')



[The shaded region is representing the intersection of sets]

e.g. $A = \{3, 6, 9, 12, 15, 18\}, B = \{4, 6, 8, 10, 12, 14, 16, 18\}$

$\therefore \quad A \cap B = \{6, 12, 18\}$

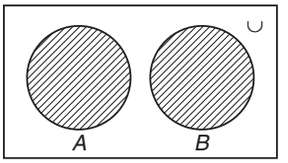
Disjoint Sets : Two sets A and B are said to be disjoint, if $A \cap B = \phi$. If $A \cap B \neq \phi$ then A and B are said to be intersecting or overlapping sets.

e.g. $A = \{1, 3, 5, 7, 9\} \quad B = \{2, 4, 6, 8, 10\}, C = \{4, 8, 12\}$

Here $A \cap B = \phi$ and $B \cap C \neq \phi$

$\therefore$ A and B are disjoint sets

$\therefore$ B and C are intersecting sets.



Sets A and B have no elements common.

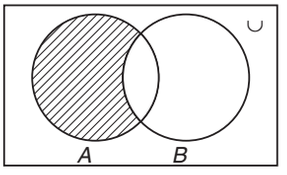
Difference of Sets : The difference of set A and set B (written as $A - B$) is the set of all those elements of A which do not belong to B. Thus, $A - B = \{x : x \in A \text{ and } x \notin B\}$

or $A - B = \{x \in A : x \notin B\}$

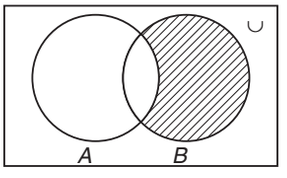
Clearly $x \in A - B \Leftrightarrow x \in A \text{ and } x \notin B$

e.g. If $A = \{1, 2, 3, 4, 5, 6\}, \quad B = \{2, 4, 6, 8, 10\}$

$A - B = \{1, 3, 5\}$ and $B - A = \{8, 10\}$

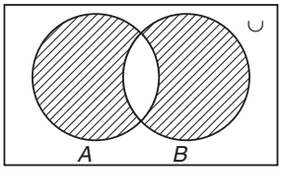


(A – B) is represented by the shaded region



(B – A) is represented by the shaded region

Symmetric difference of two Sets : The symmetric difference of sets A and B is the set $(A - B) \cup (B - A)$ and is denoted by $A \Delta B$

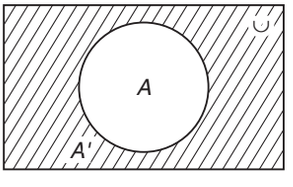


Thus $A \Delta B = (A - B) \cup (B - A) = \{x : x \notin A \cap B\}$

Complement of a Set : If U be the universal set and a set A is such that $A \subset U$ then, the complement of A with respect to U is denoted by A' or A^c or $U - A$ and is defined by the set of all those elements of U which are not in A.

Thus $A' = \{x \in U : x \notin A\}$

Clearly $x \in A' \Leftrightarrow x \notin A$



[A' is shown by the shaded region]

e.g. $U = \{2, 3, 5, 7, 11, 13 \ldots\}$, $A = \{2\}$

$A' = U - A = \{3, 5, 7, 11, 13, \ldots\}$

15.6 Algebraic Laws of Sets

1. **Idempotent Laws :** For any set A, we have
   (i) $A \cup A = A$ (ii) $A \cap A = A$
2. **Identity Laws :** For any set A, we have
   (i) $A \cup \phi = A$ (ii) $A \cap U = A$
3. **Commutative Laws :** For any two sets A and B, we have
   (i) $A \cup B = B \cup A$ (ii) $A \cap B = B \cap A$
4. **Associative Laws :** If A, B and C are any three sets, then
   (i) $(A \cup B) \cup C = A \cup (B \cup C)$
   (ii) $A \cap (B \cap C) = (A \cap B) \cap C$
5. **Distributive Laws :** If A, B and C are any three sets, then
   (i) $A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$
   (ii) $A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$
6. **De-Morgan's Laws :** If A and B are any two sets, then
   (i) $(A \cup B)' = A' \cap B'$ (ii) $(A \cap B)' = A' \cup B'$

15.7 Important Results on Operations on Numbers

1. $A - B = A \cap B'$
2. $B - A = B \cap A'$
3. $A - B = A \Leftrightarrow A \cap B = \phi$
4. $(A - B) \cup B = A \cup B$
5. $(A - B) \cap B = \phi$
6. $A \subseteq B \Leftrightarrow B' \subseteq A'$
7. $(A - B) \cup (B - A) = (A \cup B) - (A \cap B)$

15.8 Important Results on Number of Elements in Sets

If A, B and C are finite sets, and U be the finite universal set then

(i) $n(A \cup B) = n(A) + n(B) - n(A \cap B)$

(ii) $n(A \cup B) = n(A) + n(B) \Leftrightarrow A, B$ are disjoint non-void sets.

(iii) $n(A - B) = n(A) - n(A \cap B)$ *i.e.,* $n(A - B) + n(A \cap B) = n(A)$

(iv) $n(A \Delta B) =$ Number of elements which belong to exactly one of A or $B = n(A) + n(B) - 2n(A \cap B)$

(v) $n(A \cup B \cup C) = n(A) + n(B) + n(C) - n(A \cap B) - n(B \cap C) - n(A \cap C) + n(A \cap B \cap C)$

(vi) number of elements in exactly two of the sets A, B, C $= n(A \cap B) + n(B \cap C) + n(C \cap A) - 3n(A \cap B \cap C)$

(vii) number of elements in exactly one of the sets A, B, C
$= n(A) + n(B) + n(C) - 2n(A \cap B) - 2n(B \cap C) - 2n(A \cap C) + 3n(A \cap B \cap C)$

(viii) $n(A' \cup B') = n[(A \cap B)'] = n(U) - n(A \cap B)$

(ix) $n(A' \cap B') = n[(A \cup B)'] = n(U) - n(A \cup B)$

Introductory Exercise 15.1

1. If $A = \{S\}$, which of the following is a correct statement ?
(a) $S \in A$ (b) $S \subset A$ (c) $\{S\} \in A$ (d) $A = S$

2. Consider the following statements :
1. Any set A is comparable with itself
2. {0} is a singleton set
3. $\{\phi\}$ is an empty set.
Of these statements, the correct ones are :
(a) 1 and 2 (b) 2 and 3
(c) 1 and 3 (d) 1, 2 and 3

3. The total number of elements in the power set of a set A containing n elements is :
(a) n^2 (b) 2^n
(c) $2^n - 1$ (d) none of these

4. Let $A = \{3, \pi, \sqrt{2}, -5, 3 + \sqrt{7}, 2/7\}$. The subset of A containing all the elements from it which are irrational numbers is :
(a) $\{\pi, \sqrt{2}, 3 + \sqrt{7}\}$ (b) $\{3, \pi, 2/7, -5, 3 + \sqrt{7}\}$
(c) $\{3, 2/7, -5\}$ (d) $\{3, -5\}$

5. The set $\{x : (x - 3)(x - 5) > 0\}$ is equal to :
(a) $\{x : 3 < x < 5\}$ (b) $\{x : x < 3\} \cup \{x : x < 5\}$
(c) $\{x : x < 3\} \cup (x : x > 5\}$ (d) none of these

6. If A is the set of all integral multiples of 3 and B is the set of all integral multiples of 5, then $A \cap B$ is the set of all integral multiples of :
(a) 3 + 5 (b) 5 – 3
(c) GCD (3, 5) (d) LCM (3, 5)

7. If $X = \{4^n - 3n - 1 : n \in N\}$ and $Y = \{9(n - 1) : n \in N$, then precisely :
(a) $X \subset Y$ (b) $X \subseteq Y$
(c) $X = Y$ (d) $X \supseteq Y$

8. The number of elements of the set $\{x : x \in N, x^2 = 1\}$, where N is the set of all natural numbers is :
(a) 2 (b) 1 (c) 0 (d) 3

9. If $A = \{1, 2, 3, 4\}$ and $B = \{5, 6, 7\}$, then $A \cap B$ is :
(a) {1, 2, 3} (b) {5, 6, 7}
(c) {4} (d) ϕ

10. If $A = \{1, 2, 3, ... 9\}$, $B = \{2, 4, 6, 7, 8\}$ and $C = \{3, 4, 5, 8, 9, 10\}$, then $(A - B) \cup C$ is :
(a) $\{1, 3, 4, 5, 8, 9, 10\}$ (b) $\{1, 2, 3, 4, 5, 6, 7, 8, 9\}$
(c) $\{2, 4, 6, 7, 8\}$ (d) $\{1, 3, 4, 5, 8, 9\}$

11. $A \cup B = A$, then :
(a) $A \subset B$ (b) $B \subset A$
(c) $A \not\subset B$ and $B \not\subset A$ (d) none of these

12. If A has 3 elements and B has 6 elements, then the minimum number of elements in $A \cup B$ is :
(a) 3 (b) 6
(c) 9 (d) 18

13. Let $X = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$ be the universal set and $A = \{2, 4, 6\}$, $B = \{1, 3, 7\}$, then $A^c \cap B^c$ is equal to :
(a) $\{2, 4, 5, 6, 8, 9, 10\}$ (b) $\{1, 3, 5, 7, 8, 9, 10\}$
(c) X (d) $\{5, 8, 9, 10\}$

14. If A, B, C are any three sets, then :
(a) $A - (B \cup C) = (A - B) \cup (A - C)$
(b) $A - (B \cup C) = (A - B) \cap (A - C)$
(c) $A - (B \cap C) = (A - B) \cup (A - C)$
(d) $A - (B \cup C) = (A \cup B) - (A \cup C)$

15. Consider the following statements :
For any two sets A and B
(1) $(A - B) \cup B = A$ (2) $(A - B) \cup A = A$
(3) $(A - B) \cap B = \phi$ (4) $A \subseteq B \Rightarrow A \cup B = B$
Of these statements :
(a) 1, 2, 3 are correct (b) 2, 3, 4 are correct
(c) 1, 3, 4 are correct (d) 1, 2, 4 are correct

16. If X and Y are two sets and X' denotes the complement of X, then $X \cap (X \cup Y)'$ equals :
(a) X (b) Y (c) ϕ (d) none

17. If $B \subseteq A$, which of the following statements is correct?
(a) $A \cup B = B \Rightarrow A = B$ (b) $A \cap B = B \Rightarrow A \supseteq B$
(c) $A - B = A \Rightarrow A = B$ (d) $B - A = B \Rightarrow A = B$

18. If A, B and C be any three sets, then $A \cup (B \cap C)$ is the same as :
(a) $(A \cap C) \cup (B \cap C)$ (b) $(A \cup B) \cap (A \cup C)$
(c) $(A \cup B) \cap (B \cup C)$ (d) $(A \cup C) \cap (B \cup C)$

19. $A - (B \cup C)$ equals :
(a) $(A - B) \cup (A - C)$ (b) $(A - B) \cap (A \cap C)$
(c) $(A - B) \cup C$ (d) $(A - C) \cup B$

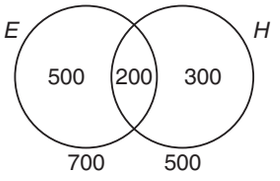
15.9 Problems Based on Venn Diagrams

Venn Diagram Containing Two Circles

Exp. 1) In a group of 1000 people 700 can speak English and 500 can speak Hindi. If all the people speak atleast one of the two languages, find :
(a) how many can speak both the languages?
(b) how many can speak exactly one language?

Solution

(a) $n(E \cup H) = n(E) + n(H) - n(E \cap H)$
$1000 = 700 + 500 - n(E \cap H)$



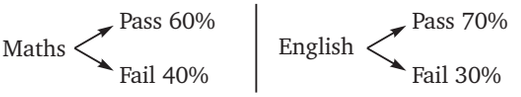
$\Rightarrow \quad n(E \cap H) = 200$

(b) People speaking exactly one language
$n(E \cup H) - n(E \cap H) = 1000 - 200 = 800$

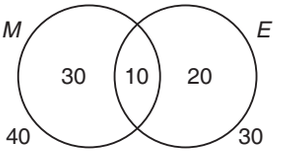
Alternatively People speaking exactly one language
$= 500 + 300 = 800$

Exp. 2) In an exam 60% of the candidates passed in Maths and 70% candidates passed in English and 10% candidates failed in both the subjects. If 300 candidates passed in both the subjects. The total number of candidates appeared in the exam, if they took test in only two subjects viz-Maths and English.

Solution



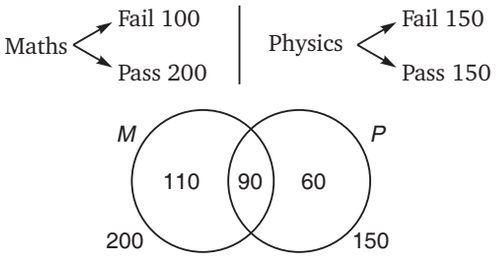
Fail in both subjects = 10%



Failed number of candidates
$\therefore$ Total number of candidates failed in atleast one subject
$= 30 + 10 + 20 = 60\%$
$\therefore$ Total number of candidates passed in both the subjects
$= 100 - 60 = 40\%$
Let total number of candidates appeared in exam $= x$
$\therefore \quad \frac{40x}{100} = 300$
$\Rightarrow \quad x = 750$
Hence, total 750 candidates appeared in exam.

Exp. 3) A class took two tests, one in Physics and other in Maths. $\left(\frac{1}{3}\right)^{rd}$ class failed in Maths and $\frac{1}{2}$ class failed in Physics. 60% of those passed in Physics also passed in Maths. If 300 students took both the tests then how many students failed in both?

Solution



Total number of students passed in atleast one subject

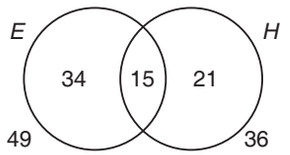
$$= 110 + 90 + 60 = 260$$

Therefore number of students failed in both the subjects

$$= 300 - 260 = 40$$

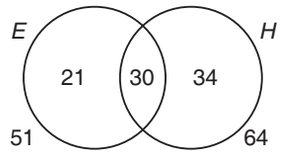
Exp. 4) In an exam 49% candidates failed in English and 36% failed in Hindi and 15% failed in both subjects. If the total number of candidates who passed in English alone is 630. What is the total number of candidates appeared in exam?

Solution



Number of candidates failed in atleast one subject

$$= 34 + 15 + 21 = 70\%$$



$\therefore$ Number of candidates passed in both the subjects

$$= 100 - 70 = 30\%$$

Number of candidates passed in English only

$$= 51 - 30 = 21\%$$

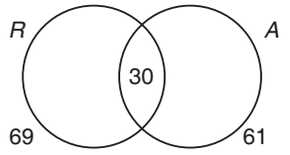
Let the total number of candidates be x, then $\frac{21x}{100} = 630$

$\Rightarrow$ $x = 3000$

Alternatively Since 21% candidates failed in Hindi only it means they are pass in only English. Hence, number of candidates who are passed only in English = 21%

Exp. 5) In a survey it was found that 69% of Indians like romantic movies and 61% like action movies. What percentage of Indians like both type of movies?

Solution $n(R \cap A) = (69 + 61) - 100$

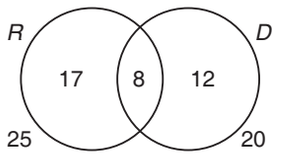


NOTE In general we cannot determine the solution but this can be done if we assume that all the Indians like atleast one of these two types of movies.

Exp. 6) In a certain city only two cellular (mobile) phone services are available. One is Radiance and other is DSML. It is known that 25% of the city population uses the services of Radiance and 20% uses the services of DSML, while 8% uses both Radiance and DSML. It is also known that 30% of those who uses Radiance services but not services of DSML have prepaid cards and 40% of those who uses DSML but not Radiance have prepaid cards while 50% of those who uses the services of both Radiance and DSML have prepaid cards. What percentage of the population have prepaid cards?

(a) 12·5% (b) 10% (c) 13·9% (d) 20%

Solution

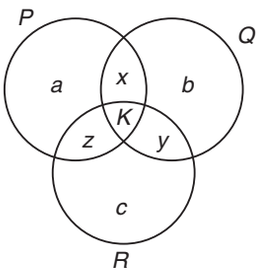


$\therefore$ Percentage of people have prepaid cards

$$= (30\% \text{ of } 17) + (40\% \text{ of } 12) + (50\% \text{ of } 8) = 13.9\%$$

Ven Diagrams Containing Three Circles

Explanation of the concept using an example



Let P, Q, R be three books, then

$a \rightarrow$ number of people reading only P

$b \rightarrow$ number of people reading only Q

$c \rightarrow$ number of people reading only R

$x \rightarrow$ number of people reading P and Q both but not R

$y \rightarrow$ number of people reading Q and R both but not P

$z \rightarrow$ number of people reading P and R both but not Q

$k \rightarrow$ number of people reading all the three books

$x + k \rightarrow$ number of people reading P and Q both

$y + k \rightarrow$ number of people reading Q and R both

$z + k \rightarrow$ number of people reading P and R both

$a + x + k + z \rightarrow$ number of people reading P

$b + x + k + y \rightarrow$ number of people reading Q

$c + y + k + z \rightarrow$ number of people reading R

$a + x + b \rightarrow$ number of people reading P or Q but not R

$b + y + c \rightarrow$ number of people reading Q or R but not P

$c + z + a \rightarrow$ number of people reading P or R but not Q.

$a + b + c \rightarrow$ number of people reading only one book

$x + y + z \rightarrow$ number of people reading only two books

$k \rightarrow$ number of people reading all of three books

$(a + b + c) + (x + y + z) + (k) \rightarrow$ number of people reading atleast one book $(x + y + z) + (k) \rightarrow$ number of people reading atleast two books $(a + b + c) + (x + y + z) + (k) \rightarrow$ total number of readers.

Finding the Values of Components

$P + Q + R = (a + x + k + z) + (b + x + k + y) + (c + y + k + z)$

$P + Q + R = (a + b + c) + 2(x + y + z) + 3k$

$P + Q + R = \alpha + 2\beta + 3\gamma$

where $\alpha = a + b + c, \quad \beta = x + y + z, \quad \gamma = k$

Again $(x + k) + (y + k) + (z + k) = (x + y + z) + 3k = \beta + 3\gamma$

$\therefore \quad (\alpha + 2\beta + 3\gamma) - (\beta + 3\gamma) = \alpha + \beta$

and $\quad (\alpha + \beta + \gamma) - (\alpha + \beta) = \gamma$

NOTE 'And' means intersection, 'or' means union

Exp. 1) In a group of 100 children, 32% play hockey, 64% play football and 40% play cricket. 14% play hockey and football, 15% play football and cricket, 13% play hockey and cricket. Only 6% play all the three games.

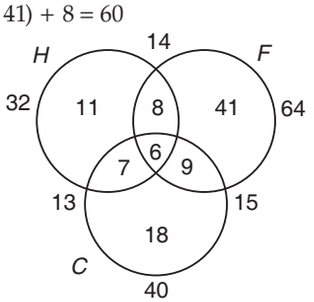
(a) How many children play only one game?

(b) How many children play atleast two game?

(c) How many children play hockey or football but not circket?

Solution (a) $11 + 41 + 18 = 70$ (b) $(8 + 7 + 9) + 6 = 30$

(c) $(11 + 41) + 8 = 60$



Exp. 2) In a hostel of 100 students capacity, 42 are science graduate, 34 are law graduate and 58 are commerce graduate. 8 students are science and law graduate, 13 students are law and commerce graduate, 18 students are commerce and science graduate. How many students are only science graduate?

Solution $\alpha + \beta + \gamma = 100; \alpha + 2\beta + 3\gamma = 42 + 34 + 58 = 134$

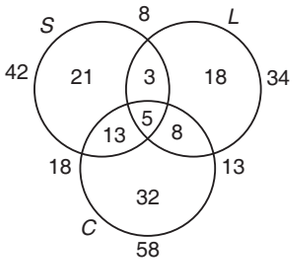
$\beta + 3\gamma = 8 + 13 + 18 = 39$

$\alpha + \beta = (\alpha + 2\beta + 3\gamma) - (\beta + 3\gamma) = 134 - 39 = 95$

$\therefore \quad \gamma = (\alpha + \beta + \gamma) - (\alpha + \beta) \Rightarrow \gamma = 100 - 95 = 5$

$\therefore$ Number of students who are only science graduate

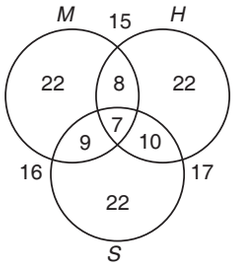
$= 42 - [(18 + 8) - 5] = 42 - (13 + 3 + 5) = 21$



Exp. 3) In a premier B-school having 100 students in the MBA final year, 15 students specializes in Marketing and HR. 17 students specializes in HR and Systems, 16 students specializes in Marketing and Systems. The number of students specializes in only one field is equal and is 22 in each field of specialization. How many students specializes in all three fields viz- Marketing, HR and Systems?

Solution $\alpha = a + b + c = 22 + 22 + 22 = 66$

$\therefore \quad \beta + \gamma = 100 - \alpha = 100 - 66 = 34$



Again $\quad \beta + 3\gamma = x + y + z + 3k = 15 + 16 + 17 = 48$

$\therefore \quad (\beta + 3\gamma) - (\beta + \gamma) = 2\gamma = 48 - 34 = 14 \quad \Rightarrow \gamma = 7$

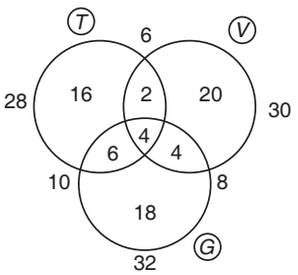
Hence, 7 students specializes in all the three fields.

Exp. 4) In a music school 28 students learn trumpet, 30 students learn violin and 32 students learn guitar. 6 students learn trumpet and violin, 8 students learn violin and guitar, 10 students learn guitar and trumpet. The number of students who learn only one instrument is 54. Also 20 students learn only violin. Every student learn atleast one instrument out of the three instruments.

(a) Find the number of students in the music school.

(b) Find the number of students who learn trumpet and guitar but not violin?

Solution



$x + b + k + y = 30$

$b = 20$

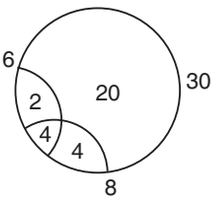
$\Rightarrow \quad x + k + y = 10$

But, $\quad (x + k) + (y + k) = 14$

$\Rightarrow \quad (x + y + k) + k = 14$

$\Rightarrow \quad 10 + k = 14$

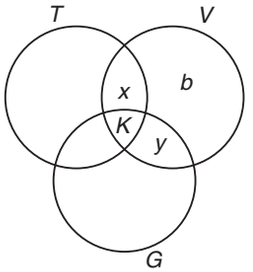
$\Rightarrow \quad k = 4$



(a) Number of students in music school

$= (16 + 20 + 18) + (2 + 4 + 6) + 4 = 70$

(b) Number of students who learn trumpet and guitar but not violin = 6



Exp. 5) Out of 180 students in a class 7 students failed in all the three subjects viz., Physics, Chemistry, Maths. Only 144 students pass in only one subject and 21 students pass in only two subjects.

(a) How many students passed in all the three subjects?

(b) How many students passed in atleast two subjects?

(c) How many students passed in at most two subjects but atleast in one subject?

Solution $\alpha = a + b + c = 144 \Rightarrow \beta = x + y + z = 21$

$\alpha + \beta + \gamma = 180 - 7 = 173 \quad \therefore \gamma = (\alpha + \beta + \gamma) - (\alpha + \beta)$

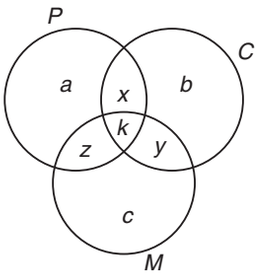
$\Rightarrow \quad \gamma = (173) - (144 + 21) \quad \Rightarrow \gamma = 8 (\gamma = k)$

(a) 8

(b) Atleast two subjects $= \beta + \gamma = 21 + 8 = 29$

(c) Atleast one subject but atmost two subjects.

$= \alpha + \beta = 144 + 21 = 165.$



Exp. 6) In a marriage party total 278 guests were present. 20 guests took Pepsi and Dew, 23 guests took Dew and Sprite and 21 guests took Pepsi and Sprite and 9 guests took all the three cold drinks viz. Pepsi, Sprite and Dew. It is also known that there were equal number of bottles of each of three kinds viz. Pepsi, Dew and Sprite

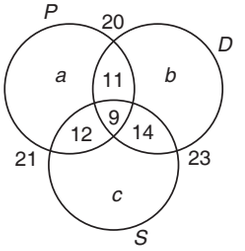
(a) How many guests took only one bottle colddrink?

(b) How many guests enjoyed Dew or Sprite but not Pepsi?

(c) How many guests enjoyed Pepsi and Dew but not Sprite?

Solution Number of guests $= (a + b + c) + (11 + 12 + 14) + (9)$

$= 278$



Number of bottles $= (a + b + c) + 2(11 + 12 + 14) + 3(9)$

$= [(a + b + c) + (11 + 12 + 14) + (9)] + (11 + 12 + 14) + 2(9)$

$= 278 + 55 = 333$

$\therefore \quad$ Each kind of bottles $= \dfrac{333}{3} = 111$

$\because \quad a = 111 - (11 + 9 + 12) = 79$

$b = 111 - (11 + 9 + 14) = 77$

$c = 111 - (12 + 9 + 14) = 76$

(a) Number of guests who took only one bottle $= a + b + c$

$= (79 + 77 + 76) = 232$

(b) Dew or Sprite but not Pepsi $= b + 14 + c$

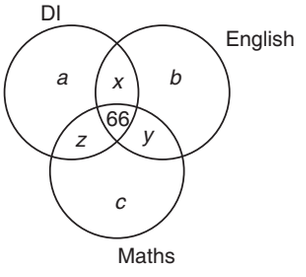
$= 77 + 14 + 76 = 167$

(c) Dew and Pepsi but not Sprite = 20 – 9 = 11

Exp. 7) 250 students appeared in MOCK CAT consisting of three sections viz. Maths, Data Interpretation (DI) and English. 20 students did not qualify any of the three sections and 66 students qualified all the three sections, 24 students did not qualify DI only. 12 did not qualify DI and Maths only.

Those who qualified Maths only exceeded those who did not qualify any of the section by 16. Those who did not qualify Maths only exceeded those who did not qualify only DI and Maths by 8. Those who did not qualify English only were twice the number of students who did not qualify Maths only. Find the number of students who has qualified atleast two sections.

Solution Total students = 250



Number of students who did not qualify any of the three sections = 20

∴Number of students who qualified atleast one section
= 250 − 20 = 230

Hint $y = 24$ (It means 24 students must have qualified English and Maths) $b = 12$ (It means they have qualified neither DI nor Maths but English only)

$c = 36 = (20 + 16) \Rightarrow x = 20 = (12 + 8) \Rightarrow z = 40 = (20 \times 2)$

$\therefore \quad (a + b + c) + (x + y + z) + 66 = 230$

$(a + 12 + 36) + (20 + 24 + 40) + 66 = 230 \Rightarrow a = 32$

but the required answer = $(x + y + z) + 66 = 84 + 66 = 150$

15.10 Concept of Maxima and Minima

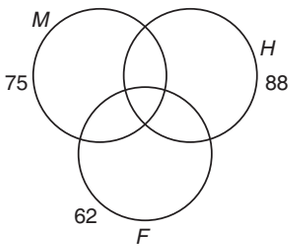
Type 1. In a Business School there are 3 electives and atleast one elective is compulsory to opt. 75% students opted for Marketing, 62% students opted for Finance and 88% students opted for HR. A student can have dual or triple specialization.

(a) What is the minimum number of students that are specialize in all three streams?

(b) What is the maximum number of students that can specialize in all three streams?

Solution

(a) 75% students opted for Marketing, it means atleast 25% students opted for HR or Finance or HR and Finance both.

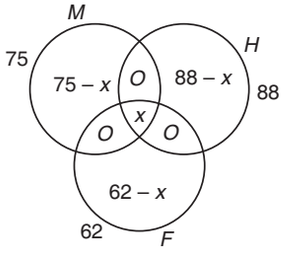


Similarly atleast 12% students opted for Marketing or Finance or Marketing and Finance both. Again atleast 38% students opted for Marketing or HR or Marketing and HR both.

$\therefore \qquad 25 + 12 + 38 = 75\%$

It means that if there is no intersection in these three courses,75% would be maximum number of students in M, H, F alone or $(M \cap H)$, $(M \cap F)$, $(H \cap F)$. Thus it gives atleast 25% = (100 − 75) students in all 3 departments.

(b) $(75 - x) + (88 - x) + (62 - x) + x = 100 \Rightarrow x = 62.5\%$

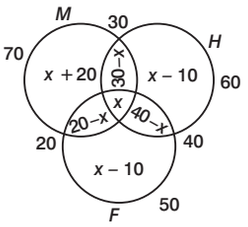


Type 2. In a Business school there are 3 electives offered to the students, where students have a choice of not choosing any electives. 70% students opted for Marketing, 60% students opted for HR and 50% students opted for Finance. 30% students opted for Marketing and HR both, 40% opted for HR and Finance both, 20% opted for Marketing and Finance both.

(a) What is the minimum number of students opted for all 3 electives?

(b) What is the maximum number of students opted for all 3 electives?

Solution Total number of students = $70 + (x - 10) + (40 - x) + (x - 10) = 90 + x$



(a) The minimum value of x so that none of the categories becomes negative = 10

(b) The maximum value of x so that none of the categories becomes negative = 20

Type 3. In a hostel there are 250 students. 120 watch news channels, 80 watch sports channels and 90 watch music channels. Each channel telecasts the content as per their nature. 50 students watch both news and sports channel 60 students watch both sports and music channel and 65 students watch both news and music channels.

(a) What is the minimum number of students who watch atleast one of the given channel?

(b) What is the maximum number of students who watch atleast one of the given channels?

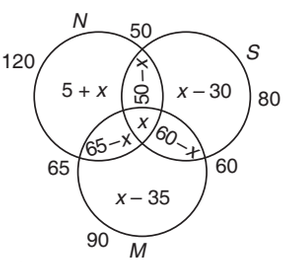
(c) What is the minimum number of students who watch all the three types of channels?

(d) What is the maximum number of students who watch all the three types of channels?

Solution Since the number of students cannot be negative

$$\therefore \quad \left.\begin{matrix} x - 30 \geq 0 \\ x - 35 \geq 0 \end{matrix}\right\}$$

$$\text{Also} \quad \left.\begin{matrix} 50 - x \geq 0 \\ 60 - x \geq 0 \\ 65 - x \geq 0 \end{matrix}\right\}$$



Total number of students playing atleast one game
$= 120 + (x - 30) + (60 - x) + (x - 35) = 115 + x$

(a) Minimum number of students watching atleast one channel = 115 + 35 = 150

(b) Maximum number of students watching atleast one channel = 115 + 50 = 165

(c) Minimum number of students watching all the 3 channels = 35

(d) Maximum number of students watching all the 3 channels = 50

CAT-Test

Questions Helping you bell the CAT

LEVEL 01 > BASIC LEVEL EXERCISE

1 In a city 45% of the people read English and Hindi newspapers. 15% read only Urdu newspaper and 75% read Hindi newspaper. If nobody reads all the three newspapers and everybody read atleast one newspaper out of English, Hindi and Urdu newspapers, how many read Urdu newspaper?

(a) Max 45% (b) Max. 55%
(c) Min 25% (d) Min 30%

Directions (for Q. Nos. 2 to 5) *In our coaching institute there are total 170 students and they use different vehicles for transportation viz. bike, car and taxi.*
The ratio of students using all 3 vehicles to students using atleast 2 vehicles is 2 : 9*. The ratio of students using only one vehicle to students using atleast 2 vehicles is 8 : 9.*
Number of students using car only exceeds number of students using bike only by 14.
Number of students using taxi only exceeds number of students using bike only by 12. Number of students using taxi, bike, car is 90, 93, 97 respectively.

2 Number of students using all three vehicles is :

(a) 18 (b) 12
(c) 20 (d) none of these

3 Number of students using no more than one vehicles is :

(a) 76 (b) 80
(c) 60 (d) can't be determined

4 Number of students using exactly two vehicles is :

(a) 38 (b) 55
(c) 70 (d) none of these

5 The number of students who are using both bike and car but not taxi is :

(a) 23 (b) 40
(c) 36 (d) data insufficient

6 In a survey among *B*-school students, 68% of those surveyed were in favour of atleast one of the three magazines- *A*, *B* and *C*. 38% of those surveyed favoured magazine *A*, 26% favoured magazine *B* and 36% favoured magazine *C*. If 11% of those surveyed favoured all three magazines. What per cent of those surveyed favoured more than one of the three magazines?

(a) 25% (b) 33% (c) 21% (d) 26%

Directions (for Q. Nos. 7 and 8) *In a class of 80 students 25 passed in QA and DI, 25 passed in DI and English, 20 passed in QA and English. 10 student passed in all the three subjects.*

7 How many students passed only in Q.A.?

(a) 20 (b) 15
(c) 12 (d) can't be determined

8 If no student failed in all three subjects, what is the total number of students who passed in QA only, DI only and English only?

(a) 50 (b) 30
(c) 25 (d) can't be determined

Directions (for Q. Nos. 9 and 10) *A survey shows that 41%, 35% and 60% of the people watch ''Maine Pyaar Kiya'' ''Maine Pyaar Kyun Kiya'' and ''Pyaar to Hona Hi Tha'' respectively. 27% people watch exactly two of the three movies and 3% watch none.*

9 What percentage of people watch all the three movies ?

(a) 40% (b) 6%
(c) 9% (d) 12%

10 If another survey indicates that 16% of the people watch Maine Pyaar Kiya and Pyaar to Hona Hi Tha, and 14% watch Maine Pyaar Kyun Kiya and Pyaar to Hona Hi Tha, then what percentage of the people watch only Maine Pyaar Kyun Kiya ? (Use the data from the previous question, if necessary)

(a) 10% (b) 8%
(c) 12% (d) 15%

11 Find the number of positive integers up to 100 which are not divisible by any 2, 3 and 5 ?

(a) 24 (b) 25
(c) 26 (d) 27

12 A survey was conducted at a coaching institution and it was found that there were 34 students who appeared in MAT. There were 37 students who appeared in CAT of which 17 students appeared in MAT. 30 students appeared in XAT of which 13 students appeared in MAT. Of the XAT applicants (*i.e.,* appeared students) 14 appeared in CAT and these 6 appeared in MAT. How many students appeared in CAT but not in MAT or XAT ?

(a) 9 (b) 10
(c) 12 (d) none of these

13 A survey among 151 persons is conduced regarding their favourite channel of radio - Radio city, Radio mirchi and Radio life. It was found that every listener of Radio mirchi also listen either Radio city or Radio life. The number of persons listening all the radio channels is the same as the number of persons who listen none of the channels. 55 persons listen exactly two channels and 70 persons listen only one channel. The number of people who listen all the three channels ?
(a) 16 (b) 13
(c) 9 (d) data insufficient

14 In a group of 132 people 50, 60, 70 people like three different sweets-Barfi, Jalebi, Rasgulla, respectively. The number of people who like all the three sweets is half the number of people who like exactly two sweets. The number of people who like exactly any two out of the three sweets is the same as those who like exactly any other two of the three sweets. The number of people who like the three sweets
(a) 12 (b) 6
(c) 8 (d) none of these

15 In the previous question (number 14) find the number of people who like Rasgulla or Jalebi but not Barfi.
(a) 82 (b) 42 (c) 48 (d) 38

16 In a group of 80 employees, the number of employees who are engineers is twice that of the employees who are MBAs. The number of employees who are not engineers is 32 and that of those who are not MBAs is 56. The number of employees who are both engineers and MBAs is twice that of the employees who are only MBAs. How many employees are neither engineer (B. Tech) nor MBAs?
(a) 24 (b) 38
(c) 36 (d) can't be determined

Directions (for Q. Nos. 17 to 19) *There are 60 workers who work for M/s. Nottan Dibbawala Pvt. Ltd. Mumbai, out of which 25 are women. Also :*
(i) 28 workers are married (ii) 26 workers are graduate
(iii) 20 married workers are graduate of which 9 are men
(iv) 15 men are graduate (v) 15 men are married.

17 How many unmarried women are graduate ?
(a) 20 (b) 8
(c) 0 (d) can't be determined

18 How many unmarried women work in the company ?
(a) 11 (b) 12
(c) 9 (d) none of these

19 How many graduate men are married ?
(a) 9 (b) 15
(c) 13 (d) none of these

Directions (for Q. Nos. 20 to 23) *In the year 222 B.C. 100 CAT aspirants appeared in CAT- (Common Admission Test for MBA in some prestigious institutions). They had to show their competency in all the following four areas viz- Maths, Data Interretation (DI), Logical Reasoning (LR) and English.*
Number of aspirants who had qualified Maths is 55.
Number of aspirants who had qualified LR is 38
Number of aspirants who had qualified Maths and English is 30.
Number of aspirants who had qualified LR and English is 15.
Number of aspirants who had qualified Maths and LR is 20.
Number of aspirants who had qualified Maths, LR and English is 5.
Number of aspirants who had qualified DI is 22.
Number of aspirants who had qualified DI and LR is 5.
Number of aspirants who had qualified DI and Maths is 5.
Number of aspirants who had qualified DI, Maths and LR is 5.
Number of aspirants who had qualified English is 50.
Number of aspirants who had qualified English could not qualify DI section.

20 Number of aspirants who had qualified only in DI section
(a) 17 (b) 22
(c) 27 (d) none of these

21 Number of aspirants who had qualified in only Maths and LR sections :
(a) 20 (b) 10 (c) 28 (d) 38

22 Find the number of aspirants who had qualified in atleast two sections out of 4 sections.
(a) 45 (b) 35
(c) 55 (d) can't be determined

23 Find the number of aspirants who had qualified none of the sections.
(a) 12 (b) 18 (c) 7 (d) 0

24 In a survey among 80 people, 50 people like arrange marriage and 70 people like love marriage. What is the minimum and maximum number of people like both the marriages respectively?
(a) 40, 45 (b) 40,50
(c) 30, 40 (d) can't be determined

25 In a car agency one day 120 cars were decorated with three different accessories *viz.,* power window, AC and music system. 80 cars were decorated with power windows, 65 cars were decorated with AC and 80 cars were decorated with music systems. What is the minimum and maximum number of cars which were decorated with all of three accessories ?
(a) 10 ,61 (b) 10, 45
(c) 25, 35 (d) none of these

26 In our coaching there were 200 students enrolled for DI, 150 for English and 150 for Maths. Of these 80 students enrolled for both DI and English. 60 students enrolled for Maths and English, while 70 students enrolled for DI and Maths. Some of these students enrolled for all the three subjects. Diwakar teaches those students who are enrolled for DI classes only. Priyanka teaches those students who are enrolled for English only and Varun teaches those students who are enrolled for Maths only. Sarvesh is a senior most faculty therefore, he can teach all the three subjects. Students always prefer a specialist for their respective subjects. If Diwakar teaches 80 students then the other three faculty can be arranged in terms of the number of students taught as
(a) Sarvesh > Varun > Priyanka
(b) Sarvesh > Pri0yanka > Varun
(c) Varun > Sarvesh > Priyanka
(d) none of the above

Directions (for Q. Nos. 27 to 29) *on the basis of the information given below*

Sanskaram Karoti (SK) is a spiritual organisation involved in performing spiritual rites. Currently it has 37 volunteers. They are involved in three jobs : Body Massage (BM), Yoga and Pooja. Each volunteer working with Sanskaram Karoti (SK) has to be involved in atleast one of the three jobs mentioned above.

- A maximum number of volunteers are involved in Yoga. Among them, the number of volunteers involved in Yoga alone is equal to the volunteers having additional involvement in the Pooja.
- The number of volunteers involved in Pooja alone is double the number of volunteers involved in all the three jobs.
- 17 volunteers are involved in Body Massage (BM).
- The number of volunteers involved in Body Massage alone is one less than the number of volunteers involved in Pooja alone.
- Ten volunteers involved in the Body Massage are also involved in atleast one more job.

27 Based on the information given above, the minimum number of volunteers involved in both Yoga and Body Massage, but not in the Pooja is :
(a) 1 (b) 3 (c) 4 (d) 5

28 Which of the following additional information would enable to find the exact number of volunteers involved in various jobs?
(a) Twenty volunteers are involved in Yoga
(b) Four volunteers are involved in all the three jobs
(c) Twenty three volunteers are involved in exactly one task
(d) No need for any additional information

29 After some time, the volunteers who were involved in all the three tasks were asked to withdraw from one task. As a result, one of the volunteers opted out of the Body Massage and one opted out of the Pooja, while the remaining ones involved in all the three tasks opted out of the Yoga. Which of the following statements, then, necessarily follows?
(a) The least number of volunteers is now performing Body Massage
(b) More volunteers are now associated with Yoga as compared to Pooja
(c) More volunteers are now performing Body Massage as compared to Pooja
(d) None of the above

Direction for (Q 30–32) *A modeling agency conducted a survey to figure out the most preferred brands of lingerie. In the survey total 969 models participated and the top three brands emerged are – Vagin Pouvoir, Victoria's Secret and Ravage. 169 models like all the three brands, 269 models like Vagin Pouvoir and Victoria's Secret, 369 models like Vagin Pouvoir. The number of models who like Ravage is 69 less than that of models who like Victoria's Secret.*

30 The number of models who like Ravage is 69 less than that of models who like Victoria's Secret. What could be the maximum number of models who don't like any of these top three brands?
(a) 369 (b) 331 (c) 300 (d) 269

31 The number of models who like Ravage is 69 less than that of models who like Victoria's Secret. If the number of models who like only Ravage is less than the number of models who like only Vagin Pouvoir then what could be the maximum number of models who like only Victoria's Secret?
(a) 68 (b) 300 (c) 136 (d) 299

32 The number of models who like Ravage is 69 more than the number of models who like Victoria's Secret.
(a) 269 (b) 300 (c) 231 (d) 369

33 Let $S = \{1,2,3,4\}$. The total number of unordered pairs of disjoint subsets of S is equal to
(a) 34 (b) 43 (c) 42 (d) 41

34 There are two sets A and B such that $A \in$ (1, 5, 9, 13, 17, …, 100th term) and $B \in \{3, 10, 17, 24, 31, \ldots,$ 100th term$\}$. If there is another set $S = A \cup B$, find the total number of elements in S.
(a) 186 (b) 165 (c) 135 (d) 172

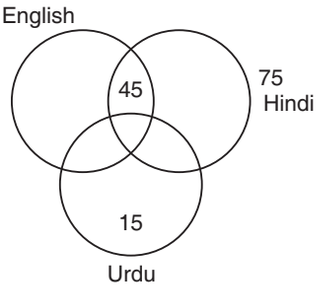
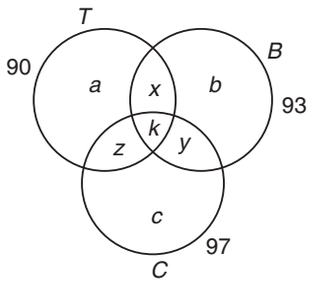
Hints & Solutions

☑ Level 01 *Basic Level Exercise*

1 It is clear that 45% people cannot read another third (*i.e.,* Urdu) newspaper. Besides them all of the rest people can read Urdu newspaper.



Hence, maximum 55% (100 – 45) people can read Urdu newspaper.



$$a + b + c = \alpha, \quad x + y + z = \beta, \quad k = \gamma$$

$$\alpha + \beta + \gamma = 170$$

$$\alpha + 2\beta + 3\gamma = 90 + 93 + 97 = 280$$

$$\gamma : (\beta + \gamma) = 2 : 9$$

$\Rightarrow$ $\gamma : \beta = 2 : 7$

and $\alpha : (\beta + \gamma) = 8 : 9$

$\Rightarrow$ $\alpha : \beta : \gamma = 8 : 7 : 2$

$\therefore$ $\alpha = 80, \beta = 70$ and $\gamma = 20$

$\Rightarrow$ $a + b + c = 80, \quad x + y + z = 70$ …(i)

and $k = 20$

Again $c - b = 14$ and $a - b = 12$ …(ii)

On solving eq. (i) and (ii) we get $a = 30,\ b = 18,\ c = 32$

Again $(a + x + k + z) - (a + k) = (x + z)$

$$= 90 - (30 + 20) = 40$$

and $(x + y + z) - (x + z) = y = 70 - 40 = 30$

similarly $x = 25$ and $z = 15$

Solutions (for Q. Nos. 2 to 5)

2 20

3 80

4 70

5 23

6 $\alpha + \beta + \gamma = 68$

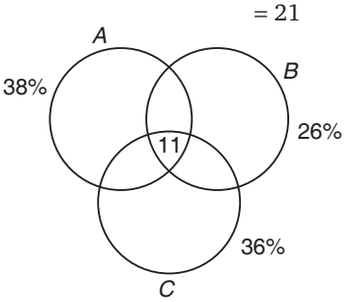
$$\alpha + 2\beta + 3\gamma = (38 + 26 + 36) = 100$$

and $\gamma = 11$

$\therefore$ $(\alpha + 2\beta + 3\gamma) - [(\alpha + \beta + \gamma) + \gamma)] = \beta + \gamma$

$$= 100 - [68 + 11]$$

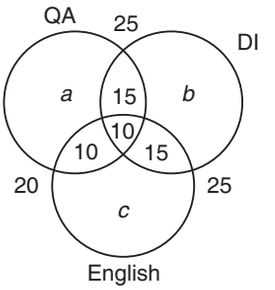
$$= 21$$



Hence, 21% favoured more than one magazine.
($\alpha \rightarrow$ favoured only one magazine, $\beta \rightarrow$ favoured only two magazines, $\gamma \rightarrow$ favoured all three magazines)

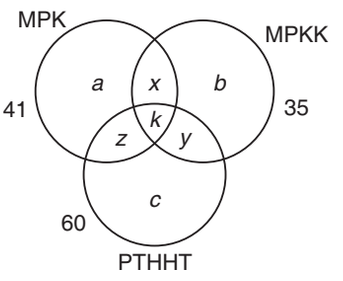
Solutions (for Q. Nos. 7 to 8)

7 Since we don't know how many students failed in all the three subjects, the questions cannot be answered. Hence (d).



8 $(a + b + c) = 80 - [(15 + 15 + 10) + (10)] = 30$

9



$$\alpha + \beta + \gamma = 97\%$$

$$\alpha + 2\beta + 3\gamma = 41 + 35 + 60 = 136\%$$

But $\beta = (x + y + z) = 27\%$

$\therefore$ $(\alpha + 2\beta + 3\gamma) - (\alpha + \beta + \gamma) = \beta + 2\gamma = 39\%$

$\therefore \quad (\beta + 2\gamma) - \beta = 2\gamma = 39 - 27 = 12\%$

$\therefore \quad \gamma = 6\% = (k)$

$\therefore$ 6% people watch all the three movies

10 $z + k = 16 \Rightarrow z = 10 \quad \{\because \gamma = k = 6\}$

$y + k = 14 \Rightarrow y = 8$

$\therefore \quad x = 9 \quad (\because x + y + z = 27)$

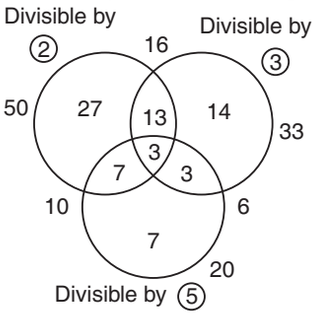
$\therefore \quad b = 35 - (x + k + y) = 35 - (9 + 6 + 8) = 12\%$

11 Total numbers divisible by 2 upto 100 = 50

Total numbers divisible by 3 upto 100 = 33

Total numbers divisible by 5 upto 100 = 20

Total numbers divisible by 2 and 3 *i.e.,* 6 upto 100 = 16



Total numbers divisible by 3 and 5 *i.e.,* 15 upto 100 = 6

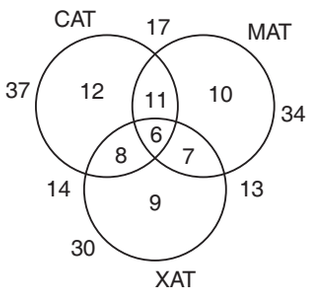
Total numbers divisible by 2 and 5 *i.e.,* 10 upto 100 = 10

Total numbers divisible by 2, 3 and 5 *i.e.,* 30 upto 100 = 3

$\therefore$Total number of numbers upto 100 which are divisible by at least one of 2, 3 and 5 = 74

$\therefore$ Total number of numbers upto 100 which are not divisible by any 2, 3 or 5 = 100 – 74 = 26

12

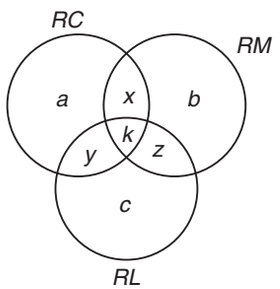


Hence, there are 12 students who appeared in CAT but not in MAT or XAT.

13 $\beta = (x + y + z) = 55$

$\alpha = (a + b + c) = 70$

$\gamma = k$



Let m people listen none of the three channels, then

$m = \gamma = k$

$(\alpha + \beta + \gamma) + m = 151$

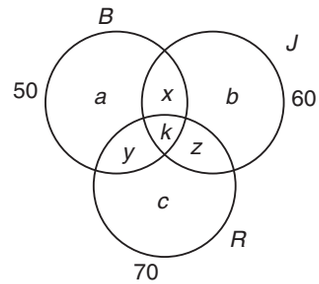
$\Rightarrow \quad \alpha + \beta + \gamma + \gamma = 151$

$\Rightarrow \quad (55 + 70) + 2\gamma = 151$

$\Rightarrow \quad \gamma = 13$

Hence, there are 13 people listen all three channels.

14 $\alpha = a + b + c, \quad \beta = x + y + z, \quad \gamma = k$



Here $\gamma = \frac{1}{2}\beta \Rightarrow 2\gamma = \beta$

Again $x = y = z = p$

$\therefore \quad \beta = 3p \Rightarrow \gamma = \frac{3}{2}p$

Now, $\alpha + 2\beta + 3\gamma = 50 + 60 + 70 = 180$

$\Rightarrow \quad \alpha + 4\gamma + 3\gamma = 180$

$\Rightarrow \quad \alpha + 7\gamma = 180 \quad \ldots(i)$

Again $\alpha + \beta + \gamma = 132$

$\alpha + 2\gamma + \gamma = 132$

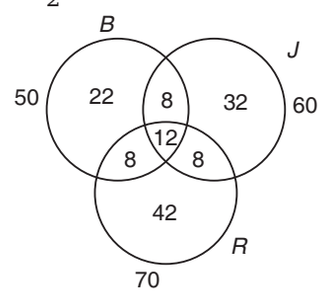
$\Rightarrow \quad \alpha + 3\gamma = 132 \quad \ldots(ii)$

From eq. (i) and (ii), we get

$\gamma = 12$

Hence, 12 people like all 3 sweets.

15 $\gamma = \frac{3}{2}p \Rightarrow 12 = \frac{3}{2}p \Rightarrow p = 8$

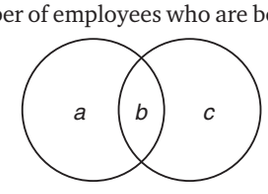


Hence, the number of persons who like Rasgulla or Jalebi but not Barfi $= 32 + 8 + 42 = 82$

16 Let a be the number of engineers only

c be the number of MBAs only

b be the number of employees who are both engineers and



MBAs and d be the number of employees who are neither engineer nor MBA

$\therefore \quad a+b+c+d=80 \quad \ldots(i)$

$(a+b)=2(b+c)$

$\Rightarrow \quad (a-b)=2c \quad \ldots(ii)$

and $\quad c+d=32 \quad \ldots(iii)$

and $\quad a+d=56 \quad \ldots(iv)$

and $\quad b=2c \quad \ldots(v)$

From eq. (ii) and (v), we get

$a=2b \quad \ldots(vi)$

From eq. (i) and (iii), we get

$a+b=48$

From eq. (vi), we get

$b=16$

$\therefore \quad a=32$ (from eq. vi)

and $\quad c=8$ (from eq. v)

and $\quad d=24$

Hence, 24 employees are neither engineer nor MBAs.

Solutions (for Q. Nos. 17 to19)

Total number of employees = 60

Women = 25

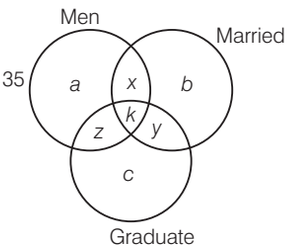
Men = 35

Married workers = 28

Graduate workers = 26

$a \rightarrow$ unmarried men who are not graduate

$b \rightarrow$ married women who are not graduate



$c \rightarrow$ unmarried women who are graduate

$x \rightarrow$ married men who are not graduate

$y \rightarrow$ married women who are graduate

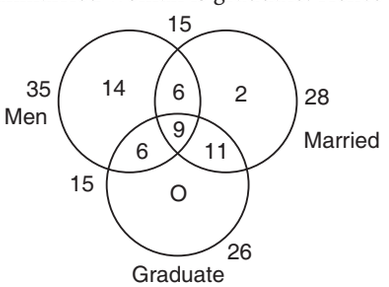
$z \rightarrow$ unmarried men who are graduate

$k \rightarrow$ married men who are graduate

$p \rightarrow$ unmarried women who are not graduate

According to the given information the Venn diagram can be completed as given below.

17 No one unmarried woman is graduate. Hence (c)

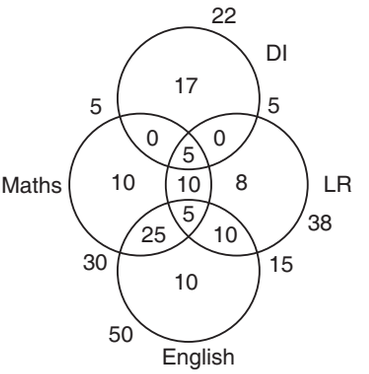


18 Number of unmarried women

$= 60 - [14 + 2 + 6 + 6 + 11 + 9] = 12$

19 There are 9 graduate men who are married.

Solutions (for Q. Nos. 20 to 23)



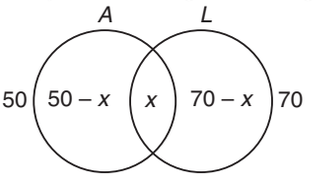
20 17

21 10

22 55

23 0

24 For the minium value of x people who like only arrange marriage and only love marriage must be greater



$\therefore \quad x = (70 + 50) - 80 = 40$

For the maximum value of x**:** $(50 - x)$ and $(70 - x)$ must not be negative, therefore max. possible value of x is 50.

25 80 cars were decorated with power windows it means at least 40 cars were decorated with AC or music system or both.

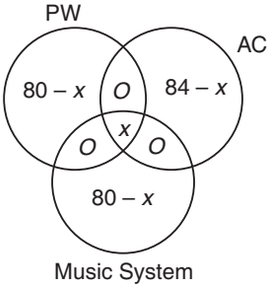
84 cars were decorated with ACs, it means atleast 36 cars were decorated with power windows or music systems.

80 cars were decorated with music system means at least 40 cars were decorated with power windows or ACs.

It means if there is no intersection in these three, then at most 40 + 36 + 40 = 116 cars had been decorated with one or two accessories.

Hence at least 4 cars would have been decorated with all three accessories.

For maximum value of x :



Total number of cars $= (80 - x) + (84 - x) + (80 - x) + x$

$120 = 244 - 2x$

$\Rightarrow \quad 2x = 124$

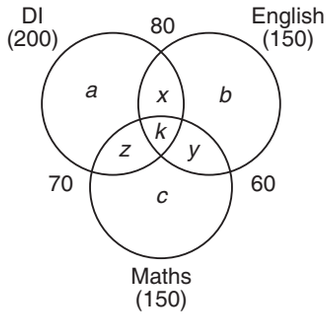
$\Rightarrow \quad x = 62$

minimum $\rightarrow$ 4 cars and maximum $\rightarrow$ 62 cars

26 $a + x + k + z = 200$ …(i)

$b + x + k + y = 150$ …(ii)

$c + y + k + z = 150$ …(iii)



But since Diwakar teaches only 80 students of DI.

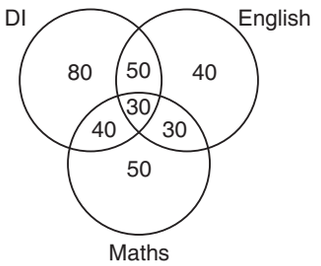
Therefore, $a = 80$

Hence, $x + k + z = 120$

but $(x + k) + (k + z) = 150$

$\therefore \quad k = 30$

Hence, $x = 50, \quad z = 40, \quad y = 30, \quad b = 40$



$\therefore$ No. of students taught by Diwakar $= a = 80$

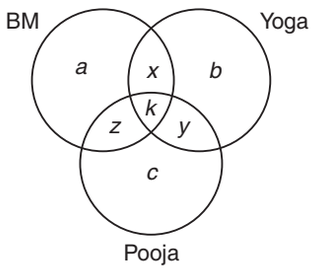
No. of students taught by Priyanka $= b = 40$

No. of students taught by Varun $= c = 50$

No. of students taught by Sarvesh $= x + y + z + k = 150$

Hence, choice (a) is correct.

Solutions (for Q. Nos. 27 to 29)



Remember Maximum number of volunteers are involved in Yoga.

Now, $b = k + y$ …(i)

$c = 2k$ …(ii)

$a + x + k + z = 17$ …(iii)

$a = c - 1$ …(iv)

$x + k + z = 10$ …(v)

From eq. (iii) and (v), we obtain

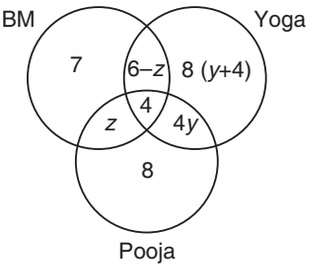
$a = 7$ …(vi)

and from eq. (iv) and (vi), we obtain

$c = 8 \quad \Rightarrow \quad k = 4$

$\therefore \quad (z + x) = 6 \quad \Rightarrow \quad x = (6 - z)$

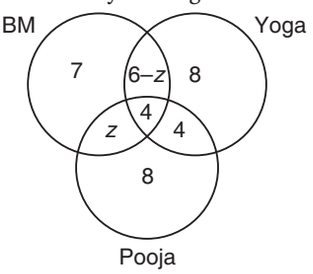
$\therefore \quad b = (y + 4)$, from eq. (i).



Again $7 + (6 - z) + 4 + z + (y + 4) + y + 8 = 37$

$\Rightarrow \quad 29 + 2y = 37 \quad \Rightarrow \quad y = 4$

27 Since no. of volunteers involved in Yoga are maximum so we can compare it from the no. of volunteers involved in Pooja and that of Body Massage.



Since,

$6 - z > z \; \forall \; z \in (0, 1, 2, 3, \ldots)$

$\therefore \quad z = 0, 1, 2 \Rightarrow (6 - z) = 4, 5, 6$

Hence, the minimum possible value of $(6 - z) = 4$.

28 See the venn diagram shown in solution no. 27,then you will notice that you are required to know the value of y.

Thus from the data provided by choice (a) enable us to calculate all the required details.

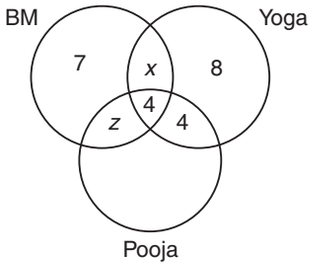
$\because \quad \{(6 - z) + 4 + 4 + 8\}_{\text{Yoga}} = 20$

$\Rightarrow \quad z = 4$

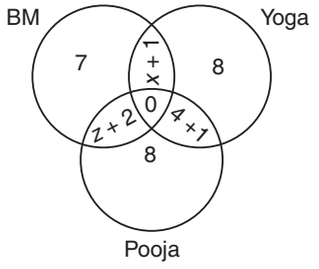
Hence, we can find the exact number of volunteers involved in various projects.

NOTE Coincidentally we obtain $z = 4$ in both the questions 27 and 28 but actually these two answers have no any relation between them.

29 **Initially**



After the withdraw of volunteers :



The volunteer who is opted out of the BM will be involved in the Yoga and Pooja.

Similarly the volunteer who is opted out of Pooja will be involved in the BM and Yoga.

and the remaining two volunteers who are opted out of Yoga will be involved in BM and Pooja.

NOTE Since initially 4 volunteers are involved in all the three jobs, but when a volunteer leave one job, he or she still continue to perform other two jobs.

Total no. of volunteers in BM

$= 7 + (x + 1) + 0 + (z + 2)$

$= 16$ $(\because\ x + z = 6)$

Since we know that $x = 4, 5, 6$

Therefore corresponding values of $z = 2, 1, 0$

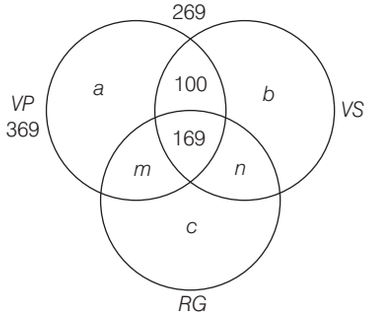
$(\because\ x + z = 6)$

$\therefore$ No. of volunteers involved in Yoga = 18, 19 or 20

and No.of volunteers involved in Pooja = 17, 16 or 15

Hence, it is clear that choice (b) is correct.

Solutions for (Q. 30-32) Consider the following diagram.



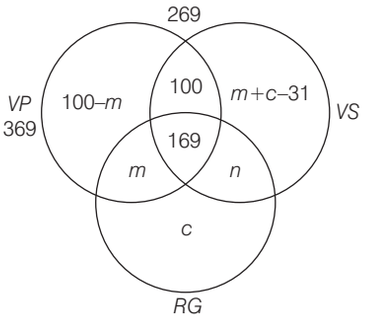
Given that, $a + m + 169 + 100 = 369$

$\Rightarrow$ $a = 100 - m$

And $(100 + b + 169 + n) - (169 + n + m + c) = 69$

$\Rightarrow$ $(100 + b) - (m + c) = 69$

$\Rightarrow$ $b = m + c - 31$



30. In order to maximize the number of models who don't like any of the top three brands, you have to minimize the total value represented by the above Venn diagram.

Therefore, minimum number of models who like at least one of these three brands

$= \min[(369) + (c) + (n) + (m + c - 31)]$ …(i)

But you know that $c \geq 0, n \geq 0, m + c - 31 \geq 0, 100 - m \geq 0$

Since, you have to minimize the value of Eq. (i), so you can take $n = 0$, as there is no other restriction on n.

Now, $100 - m \geq 0 \Rightarrow m \leq 100.$

And $m + c - 31 \geq 0 \Rightarrow c \geq 31 - m$

Therefore, maximum value of $m = 31$ and the minimum value of $c = 0$

Thus, the minimum value of Eq. (i) is 369.

So, the maximum number of models who don't like any of these top three brands = 669 – 369 = 300

Hence, choice (c) is the correct answer.

31. Given that $c < a$

$\Rightarrow$ $c < 100 - m$

$\Rightarrow$ $m + c < 100$

$\Rightarrow$ $(m + c) - 31 < 100 - 31$

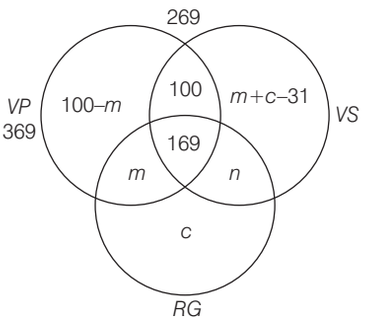
$\Rightarrow$ $(m + c) - 31 < 69$

$\therefore$ Maximum of $(m + c - 31) = 68$

Hence, choice (a) is the correct answer.

32. Given that $a + m + 169 + 100 = 369$

$\Rightarrow$ $a = 100 - m$



And $(169 + n + m + c) - (100 + b + 169 + n) = 69$

$\Rightarrow \quad (100 + b) - (m + c) = 69$

$\Rightarrow \quad b = m + c - 169$

In order to maximize the number of models who don't like any of the top three brands, you have to minimize the total value represented by the above Venn diagram.

Therefore, minimum number of models who like at least one of these three brands

$$= \text{Min}[(369) + (c) + (n) + (m + c - 169)] \quad \ldots(\text{i})$$

But, you know that $c \geq 0$, $n \geq 0$, $m + c - 169 \geq 0$ and $100 - m \geq 0$

Since, you have to minimize the value of eqn. (i), so you can take $n = 0$, as there is no other restriction on n.

Now, $100 - m \geq 0 \Rightarrow m \leq 100$.

And $m + c - 169 \geq 0$

$\Rightarrow \quad c > 169 - m$

Therefore, minimum value of $c = 69$

Thus, the minimum value of Eq. (i) is 438 (= 369 + 69).

So, the maximum number of models who don't like any of these top three brands = 669 – 438 = 231

Hence, choice (c) is the correct answer.

33. Let us assume a random pair P_i having two sets X_i and Y_i, such that X_i and Y_i are the subsets of S, but no element is common in X_i and Y_i.

Now, each element of S can be the element of either X_i or Y_i or none of them. It implies that any element of S can be placed in 3 ways. So, all the 4 elements can be placed in $3 \times 3 \times 3 \times 3$ ways. It means the total pairs = 3^4.

But, this includes a pair P_i in which both the sets X_i and Y_i are empty.

So, the total number of ordered pairs having at least one element in at least one of X_i and $Y_i = 3^4 - 1$

But the problem is asking for unordered pairs, so it would be $\frac{3^4 - 1}{2}$ pairs.

Now, we will add back one more unordered pair P_i in which both X_i and Y_i are empty.

So, the total number of unordered disjoint pairs

$$= \left(\frac{3^4 - 1}{2}\right) + 1 = \frac{3^4 + 1}{2} = 41$$

Hence, choice (d) is the answer.

34. The common difference between any two consecutive elements of $A = 4$

And the common difference between any two consecutive elements of $B = 7$

Therefore, the difference between any two consecutive common terms = LCM of (4, 7) = 28.

The first common term is 17.

The 100th term of A is 397 and the 100th term of B is 696.

Since, the largest term of A is smaller than the largest term of B, it means there can't be any common term beyond 397.

Now, since all the common terms are in Arithmetic Progression, so you can use the formula $a + (n - 1)d = l$.

Therefore, $17 + (n - 1)28 \leq 397$

$\Rightarrow \quad (n - 1)28 \leq 380$

$\Rightarrow \quad (n - 1) \leq 13$

$\Rightarrow \quad n \leq 14$

It implies that there are 14 common terms between A and B.

Therefore total number of elements in

$$S = (100 + 100) - 14 = 186$$

Hence, choice (a) is the correct one.

NOTE To know more about the arithmetic series and number of terms you may like to refer Sequence, Series and Progressions chapter in Quantum CAT.

CHAPTER 16

Logarithm

Atleast one question from this chapter is necessarily being asked in CAT. Whenever a question appears related with logarithm, it is of applied nature and the logic behind the question is the application of logarithm. One more thing I would like to mention that many a student are scared of this chapter. But In my opinion they should not bother about the word 'logarithm' instead they should look the problems of logarithm as problems of exponents and most of the problems can be easily solved by plotting the graph. Notice that this chapter is important for SNAP, MAT, IIFT, JMET and XAT etc.

16.1 Exponential Function

For every $x \in R$, $e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \ldots \frac{x^n}{n!} + \ldots$ or $e^x = \sum_{n=0}^{\infty} \frac{x^n}{n!}$

Here e^x is called as exponential function and it is a finite number for every $x \in R$.

Properties

For every $x \in R$, e^x is defined, then

(i) $e^x > 0$ for all $x \in R$ and $e^0 = 1$

(ii) $e^a > e^b$ if $a > b$ and $a, b \in R$

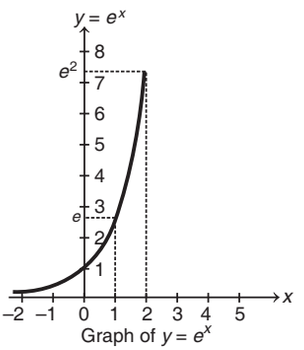
(iii) $e^a \times e^b = e^{(a+b)}$ for all $a, b \in R$

(iv) $e^a \div e^b = e^{(a-b)}$ for all $a, b \in R$

(v) $(e^a)^b = e^{ab}$ for all $a, b \in R$

(vi) For each positive real number x there exists one and only one real number y such that $e^y = x$

(vii) e^x is one-one function (viii) $e \approx 2.714$



Graph of $y = e^x$

16.2 Logarithm

Let a, b be positive real numbers then $a^x = b$ can be written as

$$\log_a b = x; \qquad a \neq 1, a > 0, b > 0$$

e.g.,

$$2^5 = 32 \Leftrightarrow \log_2 32 = 5$$

$$10^3 = 1000 \Leftrightarrow \log_{10} 1000 = 3$$

$$3^{-4} = \frac{1}{81} \Leftrightarrow \log_3 \left(\frac{1}{81}\right) = -4 \text{ etc.}$$

Chapter Checklist

- **CAT Test**

Types of Logarithm

(i) **Natural Logarithm :** $\log_e N$ is called Natural logarithm or Naperian Logarithm, denoted by $\ln N$ *i.e.,* when the base is '*e*' then it is called as Natural logarithm.

e.g., $\log_e 5, \log_e\left(\frac{1}{81}\right), \log_e 72 \ldots$ etc.

(ii) **Common Logarithm :** $\log_{10} N$ is called common logarithm or Brigg's Logarithm *i.e.,* when base of log is 10, then it is called as common logarithm.

e.g., $\log_{10}(100), \log_{10} 25, \log_{10} 248$ etc.

16.3 Properties of Logarithm

1. $\log_a 1 = 0, \quad a > 0, a \neq 1$

2. $\log_a a = 1, \quad a > 0, a \neq 1$

3. $\log_a a^x = x \; \forall \; x \in R, x > 0$

4. $a^{\log_a x} = x \; \forall \; x \in R, x > 0$

NOTE $\log_a a^x$ is the inverse function of a^x.

5. $\log_a (m \,.\, n) = \log_a m + \log_a n \; \forall \; m, n > 0, a > 0, a \neq 1$

6. $\log_a (m/n) = \log_a m - \log_a n \; \forall \; m, n > 0, a > 0, a \neq 1$

7. $\log_a (m^n) = n \log_a m \; \forall \; m > 0, a > 0, a \neq 1$

8. $\log_a\left(\frac{1}{m}\right) = -\log_a m \; \forall \; m > 0, a > 0, a \neq 1$

9. $\log_a b = \frac{1}{\log_b a} = \frac{\log_c b}{\log_c a} \; \forall a, b, c > 0$ and $a \neq 1, b \neq 1, c \neq 1$

10. If $\log_a b = x \; \forall \; a > 0, a \neq 1, b > 0$ and $x \in R$

(i) $\log_{(1/a)} b = -x$ (ii) $\log_a (1/b) = -x$

(iii) $\log_{1/a} (1/b) = x$

11. $\log_{a^m}(b) = \frac{1}{m} \log_a b$

12. $\log_a x$ is a decreasing function, if $0 < a < 1$

13. $\log_a x$ is an increasing function, if $a > 1$

NOTE The base of logarithm can never be equal to 1. *i.e.,* $\log_1 x$ is undefined $\forall$ x.

14. On the real number line the base of logarithm can assume any positive real value except 1 (*i.e.,* unity) Hence at $a = 1$, $\log_a x$ is not defined; $x > 0$

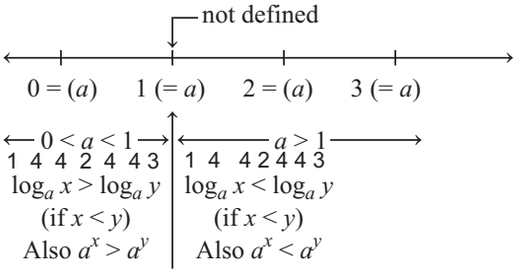
Thus at $a > 0$ except $a = 1$, $\log_a x$ is defined; $x > 0$

15. On the real number line x can assume any positive real value (number) for $\log_a x$; $a > 0, a \neq 1$

Thus the logarithm of only positive values is defined *i.e.*, $\log_a x$ is defined for every ' $x > 0, a > 0, a \neq 1$. Hence for $f(x) = \log_a x$

Domain $\rightarrow R^+$ and Range $\rightarrow R$

16.



at $a = 1$, $\log_a x$ is not defined.

17.

For $0 < a < 1$

$\log_a x > 1$ if $x < a \; \forall \; x > 0$

$\log_a x = 1$ if $x = a \; \forall \; x > 0$

$\log_a x < 1$ if $x > a \; \forall \; x = 0$

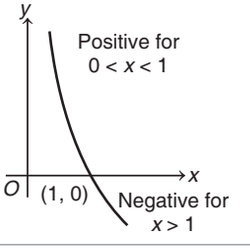
18.

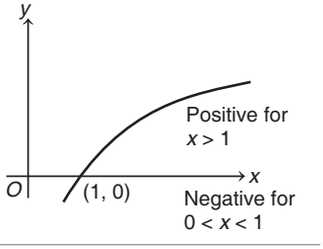
For $a > 1$

$\log_a x < 1$ if $x < a \; \forall \; x > 0$

$\log_a x = 1$ if $x = a \; \forall \; x > 0$

$\log_a x > 1$ if $x > a \; \forall \; x > 0$

19. $0 < a < 1$	$a > 1$
$\log_a x$ is a decreasing function	$\log_a x$ is an increasing function
$\log_a x > \log_a y \quad (x < y)$ *i.e.,* inequality gets reversed	$\log_a x < \log_a y \, (x < y)$ *i.e.,* the inequality remains unchanged
	Sign of $\log_a x$	Sign of $\log_a x$
	




20.	$0 < a < 1$	$a > 1$
			Domain $\to R$ Range $\to R^+$	Domain $\to R$ Range $\to R^+$
	Decreasing function	Increasing function

21. For $|x| < 1$

(i) $\log(1+x) = \left(x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \ldots\right)$

(ii) $\log(1-x) = -\left(x + \frac{x^2}{2} + \frac{x^3}{3} + \frac{x^4}{4} + \ldots\right)$

(iii) $\log\left(\frac{1+x}{1-x}\right) = 2\left[x + \frac{x^3}{3} + \frac{x^5}{5} + \ldots\right]$

(iv) $\log 2 = \left(1 - \frac{1}{2} + \frac{1}{3} - \ldots\right)$

(v) $\log_{10} 2 = 0.3010$

(vi) $\log_{10} 3 = 0.4771$

22. Logarithmic Inequalities

$0 < a < 1$	$a > 1$
$\log_a b \geq \log_a c \Leftrightarrow b \leq c$	$\log_a b \geq \log_a c \Leftrightarrow b \geq c > 0$
$\log_a b \geq c \Leftrightarrow b \leq a^c$	$\log_a b \geq c \Leftrightarrow b \geq a^c$

16.4 Characteristics and Mantissa

Characteristic : The integral part of logarithm is known as characteristic.

Mantissa : The decimal part is known as mantissa and is always positive. *e.g.,* In $\log_a x$, the integral part of x is called the characteristic and the decimal part of x is called the mantissa. For example : In log 3274 = 3.5150, the integral part is 3 *i.e.,*characteristic is 3 and the decimal part is .5150 *i.e.*, mantissa is .5150.

To find the characteristic of common logarithm $\log_{10} x$:

(a) When the number is greater than 1 *i.e.*, $x > 1$. In this case , the characteristic is one less than the number of digits in the left of the decimal point in the given number.

(b) When the number is less than 1 *i.e.*, $0 < x < 1$. In this case the characteristic is one more than the number of zeros between the decimal point and the first significant digit of the number and is negative.

NOTE The characteristic may be positive or negative. If the characteristic is negative, it is always represented by putting a bar on the number *i.e.*, $-1 \to \bar{1} \quad \Rightarrow \quad -2 \to \bar{2} \Rightarrow -3 \to \bar{3}$

Exp.

Number	Characteristic	Number	Characteristic
8.3145	0	0.457	$\bar{1}$
74.8120	1	0.0546	$\bar{2}$
568.31	2	0.001324	$\bar{3}$

Remark

(1) Students must note that $\bar{2}.784$ is not the same as -2.784

i.e., $\bar{2}.784 = (-2) + (.784) \Rightarrow -2.784 = (-2) - (.784)$

(2) If the logarithm of a number is negative, then we have to make the **mantissa** positive.
For this we subtract 1 from the integral part and add up 1 to the decimal part.

e.g., $-2.5436 = (-2) + (-.5436)$ Step 1.

$\Rightarrow \quad = (-2-1) + (-.5436+1)$ Step 2.

$\Rightarrow \quad = (-3) + (.4564)$ Step 3.

$\Rightarrow \quad = \bar{3}.4564$ Step 4.

16.5 Points to Remember About Characteristics

1. The characteristic of common logarithm of positive number less than unity $(i.e., 1)$ is negative.
2. The characteristic of common logarithm of a positive number greater than 1 is positive.
3. If the logarithm to any base a gives the characteristic 'n', then the number of possible integral values is given by $a^{n+1} - a^n$. For example $\log_{10} x = n\,.\,abcd$, then the number of integral values that x can have given by $10^{n+1} - 10^n$

e.g., $\log_{10} x = 2\,.\,abcd$ gives $10^{2+1} - 10^2 = 900$ integral values for x

i.e., $x = 100, 101, 102, 103, \ldots 998, 999$. For all these 900 integral numbers $(100 - 999)$ all the characteristic is 2.

Similarly $\log_{10} x = 3.\,abcd$ give $10^{3+1} - 10^3 = 9000$ integral values for x *i.e.*, $x = 1000, 1001, 1002, \ldots., 9999$.

For all these 9000 integral numbers $(1000 - 9999)$ the characteristic is 3.

4. If the characteristic of $\log_{10} x$ is negative (*i.e.*, $-n$), then the number of zeros between the decimal and the first significant number after the decimal is $(n-1)$

e.g., $\log_{10} x = -3\,.\,abcd$ has $a = 0$ and $b = 0$.

i.e., first two places after the decimal point are filled with zeros since characteristic is -3.

Hence $\log_{10} x = -3\,.\,abcd = -3\,.\,00cd$

16.6 Important Conversions

(i) For $a > 1,\ a \neq 1,\ c > 0,\ a^b > c \iff \log_a c < b$

(ii) For $0 < a < 1,\ a \neq 1,\ c > 0,\ a^b > c \iff \log_a c > b$

Exp. 1) The value of log 6 is equal to :

(a) $\log 1 + \log 2 + \log 3$ (b) $\log (1 + 2 + 3)$

(c) $\log (1 \times 2 \times 3)$ (d) all of the above

Solution $\log 6 = \log (1 \times 2 \times 3) = \log 1 + \log 2 + \log 3$

Also $\log 6 = \log (1 + 2 + 3)$, Hence (d)

Exp. 2) Find the value of $\log_8 128$.

Solution Let $\log_8 128 = x \Rightarrow 8^x = 128 \Rightarrow 2^{3x} = 2^7 \Rightarrow 3x = 7$

$$\Rightarrow \quad x = \frac{7}{3} \quad \therefore \quad \log_8 128 = \frac{7}{3}$$

Exp. 3) Find the value of $\log_{5\sqrt{5}}(125)$.

Solution Let $\log_{5\sqrt{5}}(125) = x \Rightarrow (5\sqrt{5})^x = 125 \Rightarrow 5^{(3/2)x} = 5^3$

$$\Rightarrow \quad \frac{3}{2}x = 3 \quad \Rightarrow \quad x = 2$$

$$\therefore \quad \log_{5\sqrt{5}}(125) = 2$$

Exp. 4) c $\log_5 \log_5 (3125)$.

Solution $\log_5 \log_5 (3125) = \log_5 \log_5 5^5 = \log_5 5 \log_5 5$

$= \log_5 5.1 \qquad (\because \log_5 5 = 1)$

$= \log_5 5 = 1$

$\therefore \quad \log_5 \log_5 (3125) = 1$

Exp. 5) If $\log_{10} x - \log_{10} \sqrt{x} = \dfrac{2}{\log_{10} x}$, find the value of x.

Solution $\log_{10} x - \log_{10} \sqrt{x} = \dfrac{2}{\log_{10} x}$

$$\Rightarrow \quad \log_{10}\left(\frac{x}{\sqrt{x}}\right) = \frac{2}{\log_{10} x} \quad \Rightarrow \quad \log_{10}(x)^{1/2} = \frac{2}{\log_{10} x}$$

$$\Rightarrow \quad \frac{1}{2}\log_{10} x = \frac{2}{\log_{10} x}$$

$$\Rightarrow \quad \frac{1}{2}(\log_{10} x)^2 = 2 \Rightarrow (\log_{10} x)^2 = 4$$

$$\Rightarrow \quad \log_{10} x = \pm 2$$

If $\log_{10} x = 2 \Rightarrow x = 10^2 \quad \Rightarrow \quad x = 100$

If $\log_{10} x = -2$

$$\Rightarrow \quad x = 10^{-2} \quad \Rightarrow \quad x = \frac{1}{100} \quad \therefore x = 100, \frac{1}{100}$$

Exp. 6) Find the value of $\log_y x \times \log_z y \times \log_x z$.

(a) 0 (b) 1 (c) $\log x$ (d) xyz

Solution $\log_y x \times \log_z y \times \log_x z = \dfrac{\log_a x}{\log_a y} \times \dfrac{\log_a y}{\log_a z} \times \dfrac{\log_a z}{\log_a x} = 1$

Exp. 7) If $\dfrac{\log a}{b-c} = \dfrac{\log b}{c-a} = \dfrac{\log c}{a-b}$, then find the value of $a^a \cdot b^b \cdot c^c$.

Solution We have, $\dfrac{\log a}{b-c} = \dfrac{\log b}{c-a} = \dfrac{\log c}{a-b} = k$ (say)

Then, $\log a = k(b-c), \log b = k(c-a), \log c = k(a-b)$

Let $A = a^a \cdot b^b \cdot c^c$

Then $\log A = a \log a + b \log b + c \log c$

$= ak(b-c) + bk(c-a) + ck(a-b)$

$= abk - ack + bck - abk + cak - bck = 0$

Thus $\log A = 0 = \log 1$

$\therefore \quad A = 1$ *i.e.*, $a^a \cdot b^b \cdot c^c = 1$

Exp. 8) Find the value of $\log_8 25$, given that $\log_{10} 2 = 0.3010$

Solution $\log_8 25 = \dfrac{\log_{10} 25}{\log_{10} 8} = \dfrac{2}{3}\dfrac{\log 5}{\log 2} = \dfrac{2\log_{10}(10/2)}{3\log_{10} 2}$

$$= \frac{2(\log_{10} 10 - \log_{10} 2)}{3 \times 0.3010} = \frac{2(1 - 0.3010)}{0.9030} = 1.5482$$

Exp. 9) Find the value of $\dfrac{\log\sqrt{27} + \log 8 + \log\sqrt{1000}}{\log 120}$.

Solution

$$\frac{\log (27)^{1/2} + \log 2^3 + \log (10^3)^{1/2}}{\log (3 \times 2^2 \times 10)}$$

$$= \frac{\frac{1}{2}\log 3^3 + 3\log 2 + \frac{1}{2}\log (10)^3}{\log 3 + \log 2^2 + \log 10}$$

$$= \frac{\frac{3}{2}\log 3 + \frac{3}{2}\cdot 2\log 2 + \frac{3}{2}\log 10}{\log 3 + 2\log 2 + \log 10}$$

$$= \frac{\frac{3}{2}(\log 3 + 2\log 2 + \log 10)}{\log 3 + 2\log 2 + \log 10} = \frac{3}{2}$$

Exp. 10) Solve for x, if $\log_x (8x - 3) - \log_x 4 = 2$

Solution $\log_x(8x-3) - \log_x 4 = 2 \Rightarrow \log_x\left(\dfrac{8x-3}{4}\right) = 2$

$$\Rightarrow \quad x^2 = \frac{8x-3}{4} \quad \Rightarrow \quad 4x^2 - 8x + 3 = 0 \quad \Rightarrow \quad x = \frac{3}{2} \text{ or } \frac{1}{2}$$

Exp. 11) Find the value of

$$x^{\log y - \log z} \times y^{\log z - \log x} \times z^{\log x - \log y}.$$

Solution Let $P = x^{\log y - \log z} \times y^{\log z - \log x} \times z^{\log x - \log y}$

Then $\log P = \log x^{\log y - \log z} + \log y^{\log z - \log x} + \log z^{\log x - \log y}$

$= (\log y - \log z)\log x + (\log z - \log x)\log y$

$+ (\log x - \log y)\log z$

$$= \log x \log y - \log z \log x + \log y \log z - \log x \log y + \log z \log x - \log y \log z = 0$$

i.e., $\log P = 0 = \log 1 \ \therefore \ P = 1$

Exp. 12) If $\frac{xy \log (xy)}{x+y} = \frac{yz \log (yz)}{y+z} = \frac{zx \log (zx)}{z+x}$, then show that $x^x = y^y = z^z$.

Solution $\frac{xy \log (xy)}{x+y} = \frac{yz \log (yz)}{y+z} = \frac{zx \log (zx)}{z+x} = k$ (say)

Then $xy \log xy = k(x+y)$

or $\log xy = k\left(\frac{1}{x} + \frac{1}{y}\right)$

or $\log x + \log y = k\left(\frac{1}{x} + \frac{1}{y}\right)$ …(i)

Similarly, $\log y + \log z = k\left(\frac{1}{y} + \frac{1}{z}\right)$ …(ii)

and $\log z + \log x = k\left(\frac{1}{z} + \frac{1}{x}\right)$ …(iii)

Adding (i), (ii) and (iii), we get

$$2(\log x + \log y + \log z) = 2k\left(\frac{1}{x} + \frac{1}{y} + \frac{1}{z}\right)$$

or $\log x + \log y + \log z = k\left(\frac{1}{x} + \frac{1}{y} + \frac{1}{z}\right)$ …(iv)

Subtracting eqs. (i), (ii) and (iii) successively from (iv), we get

$$\log z = k \cdot \frac{1}{z}, \quad \log x = k \cdot \frac{1}{x}, \quad \log y = \frac{k}{y}$$

or $z \log z = k, \quad x \log x = k$

and $y \log y = k$ or $x \log x = y \log y = z \log z$

or $\log (x^x) = \log (y^y) = \log (z^z)$

Hence $x^x = y^y = z^z$

Exp. 13) If $\log_a bc = x$, $\log_b ca = y$, $\log_c ab = z$, prove that $\frac{1}{x+1} + \frac{1}{y+1} + \frac{1}{z+1} = 1$.

Solution $\frac{1}{x+1} + \frac{1}{y+1} + \frac{1}{z+1}$

$$= \frac{1}{(\log_a bc) + 1} + \frac{1}{(\log_b ca) + 1} + \frac{1}{(\log_c ab) + 1}$$

$$= \frac{1}{\log_a bc + \log_a a} + \frac{1}{\log_b ca + \log_b b} + \frac{1}{\log_c ab + \log_c c}$$

$$= \frac{1}{\log_a abc} + \frac{1}{\log_b abc} + \frac{1}{\log_c abc}$$

$$= \log_{abc} a + \log_{abc} b + \log_{abc} c \qquad \left(\because \log_a b = \frac{1}{\log_b a}\right)$$

$$= \log_{abc} (abc) = 1$$

Exp. 14) Given $\log 2 = 0.3010$ and $\log 3 = 0.4771$, find the value of $\log 45$.

Solution $\log 45 = \log 3^2 \cdot 5 = \log 3^2 + \log 5 = 2 \log 3 + \log 5$

$$= 2 \times 0.4771 + \log \frac{10}{2} = 0.9542 + \log 10 - \log 2$$

$$= 0.9542 + 1 - 0.3010 = 1.6532$$

Exp. 15) Given $\log 2 = 0.3010$ and $\log 3 = 0.4771$. Find the value of $\log 0.0075$.

Solution $\log 0.0075 = \log \frac{75}{10000} = \log 75 - \log 10000$

$$= \log 3 \times 5^2 - \log 10^4 = \log 3 + 2 \log 5 - 4 \log 10$$

$$= \log 3 + 2[\log 10 - \log 2] - 4 \log 10$$

$$= 0.4771 + 2[1 - 0.3010] - 4 = -2.1249$$

Exp. 16) What is the number of digits in 3^{3^3}? Given that $\log 3 = 0.47712$?

Solution Let $x = 3^{3^3} = (3)^{3^3}$

Then $\log x = 3^3 \log 3 = 27 \times 0.47712 = 12.88224$

Since the characteristic in the resultant value of $\log x$ is 12

$\therefore$ The number of digits in x is $(12 + 1) = 13$

Hence the required number of digits in 3^{3^3} is 13.

Exp. 17) If $\log 3 = 0.4771$, find the number of digits in 3^{43}.

Solution Let $x = 3^{43}$

$\therefore \quad \log x = \log 3^{43} = 43 \log 3 = 43 \times 0.4771 = 20.5153$

Since the characteristic of $\log 3^{43}$ is 20, then number of digits in 3^{43} is $(20 + 1) = 21$.

Exp. 18) How many zeros are there between the decimal point and the first significant figure in $(0.5)^{100}$? Given that $\log \frac{1}{2} = \bar{1}.6990$

Solution Let $x = (0.5)^{100}$

$\therefore \quad \log x = 100 \log (0.5) = 100 \times \bar{1}.6990$

$$= 100(-1 + 0.6990) = -100 + 69.90$$

$$= -31 + 0.90 = \overline{31}.90$$

Since the characteristics of $\log (0.5)^{100}$ is $\overline{31}$, the number of zeros between the decimal point and the first significant figure is $31 - 1 = 30$.

Exp. 19) If $\frac{x(y+z-x)}{\log x} = \frac{y(z+x-y)}{\log y} = \frac{z(x+y-z)}{\log z}$, then

(a) $xy = yz = zx$ (b) $x^y y^x = z^y y^z = x^z z^x$

(c) $xyz = 1$ (d) none of these

Solution Let $\frac{x(y+z-x)}{\log x} = \frac{y(z+x-y)}{\log y}$

$$= \frac{x(x+y-z)}{\log z} = \frac{1}{k} \quad \text{(say)}$$

$\Rightarrow \quad \log x = kx(y+z-x); \ \log y = ky(z+x-y)$

$\log z = kz(x+y-z)$

Hence $y \log x + x \log y = 2kxyz, \ y \log z + z \log y = 2kxyz$

$z \log x + x \log z = 2kxyz$

Thus $y \log x + x \log y = y \log z + z \log y = z \log x + x \log z$

$\Rightarrow \quad \log (x^y y^x) = \log (z^y y^z) = \log (x^z z^x)$

$\Rightarrow \quad x^y y^x = z^y y^z = x^z z^x$

Introductory Exercise 16.1

1. If $x^y = k$, then :

(a) $\log_y k = x$ (b) $\log_x y = k$
(c) $\log_k x = y$ (d) $\log_x k = y$

2. If $\log_m n = p$, then :

(a) $m^n = p$ (b) $p^n = m$
(c) $m^p = n$ (d) $n^p = m$

3. $\log_a(mn)$ is equal to :

(a) $n \log_a(m)$ (b) $\log_a m \times \log_a n$
(c) $\log_a m + \log_a n$ (d) $\log_a m - \log_a n$

4. $\log_a\left(\frac{m}{n}\right)$ is equal to :

(a) $\log_a(m-n)$ (b) $\log_a m - \log_a n$
(c) $\frac{(\log_a m)}{n}$ (d) $\log_a m \div \log_a n$

5. The value of $\log_{81} 27$ is :

(a) 3^7 (b) $\frac{4}{3}$ (c) $\frac{3}{4}$ (d) $\frac{1}{3}$

6. The value of $\log_{36} \frac{1}{216}$ is :

(a) $\frac{2}{3}$ (b) $-\frac{3}{2}$
(c) $\frac{1}{6}$ (d) none of these

7. The value of $\log_{\sqrt{6}} 216$ is :

(a) $\frac{1}{6}$ (b) $\sqrt{6}$ (c) 3 (d) 6

8. The value of $\log_{3\sqrt{2}} 5832$ is :

(a) 12 (b) 9
(c) 6 (d) none of these

9. The value of $\log_{(-1/5)} 625$ is :

(a) $\frac{1}{4}$ (b) -5 (c) -4 (d) -3

10. The value of $\log_{10}(0.0001)$ is :

(a) $\frac{1}{1000}$ (b) -3
(c) -4 (d) none of these

11. The value of $\log_{(0.01)}(10000)$ is :

(a) 1/2 (b) -2 (c) 1/4 (d) -4

12. The value of $(\log_4 32 + \log_9 243)$:

(a) 5 (b) 4
(c) 3 (d) none of these

13. The value of $(\log_2 8 + \log_3 9 + \log_5 25)$ is :

(a) 5 (b) 6
(c) 7 (d) none of these

14. The value of $\log_2(\log_3 81)$ is :

(a) 0 (b) 1 (c) 2 (d) 6

15. The value of $\log_2 \log_2 \log_3 \log_5(125)^3$ is :

(a) 0 (b) 1 (c) 2 (d) 3

16. The value of $\log_2 \log_2 \log_2 \log_2(65536)$ is :

(a) 4 (b) 2 (c) 1 (d) 0

17. The value of
$\log_{10} 1 + \log_{10} 10 + \log_{10} 100 + \ldots \log_{10} 10000000000$
(a) 10 (b) 11
(c) 11111111111 (d) 55

18. The value of $\log_5 5 + \log_5 5^2 + \log_5 5^3 + \ldots + \log_5 5^n$:

(a) $n!$ (b) $n^2 - 1$
(c) $\frac{(n+1)\,n}{2}$ (d) none of these

19. The value of $27^{\log_3 81}$ is :

(a) 27381 (b) 531441
(c) 65631 (d) none of these

20. The value of ${}_{216}\log_6 49$ is :

(a) 117694 (b) 117649
(c) 216649 (d) none of these

21. The value of $25^{(-1/4\log_5 25)}$ is :

(a) $\frac{1}{5}$ (b) $-\frac{1}{25}$
(c) -25 (d) none of these

22. $(\log_{10} 500000 - \log_{10} 5)$ is equal to :

(a) 5 (b) 50
(c) 49995 (d) 100000

23. If $\log_5[\log_3(\log_2 x)] = 1$, then x is :

(a) 2^{234} (b) 243
(c) 2^{243} (d) none of these

24. If $\log_2 \log_{10} 4x = 1$, then the value of x is :

(a) 1/25 (b) 25
(c) 5 (d) none of these

25. If $\log_{27} x = \frac{4}{3}$, then the value of x is :

(a) 9
(b) 27
(c) 81
(d) none of the above

26. If $\log_x\left(\frac{4}{9}\right) = -\frac{1}{2}$, then the value of x is :

(a) $\frac{16}{81}$ (b) $-\frac{2}{3}$
(c) $\frac{81}{16}$ (d) none of these

27. If $\log_{100} x = -4$, then the value of x is :

(a) $\frac{1}{(10)^{-4}}$ (b) $(10)^{-4}$

(c) $\frac{1}{(10)^{8}}$ (d) none of these

28. If $\log_{100} x = -\frac{1}{2}$, then the value of x is :

(a) 0.001 (b) $\frac{1}{10}$

(c) 0.00001 (d) 10^{-2}

29. If $\log_x(0.2) = -\frac{1}{4}$, then the value of x is :

(a) 4^{-5} (b) 0.016

(c) 5^4 (d) none of these

30. The value of x satisfying $\log_{243} x = 0.8$ is :

(a) 81 (b) 1.8

(c) 2.43 (d) none of these

31. If $\log_e(x-1) + \log_e x + \log_e(x+1) = 0$, then

(a) $x^2 + e^{-1}$ (b) $x^3 - x - 1 = 0$

(c) $x^2 + e - 1 = 0$ (d) $x^3 - x - e = 0$

32. The value of $\log_3 5 \times \log_{25} 9$ is :

(a) 0 (b) 1

(c) 2 (d) 4

33. The value of $\left(\log \frac{14}{3} + \log \frac{11}{5} - \log \frac{22}{15}\right)$ is :

(a) log 77 (b) log 11

(c) log 7 (d) none of these

34. The value of $\left[3 \log\left(\frac{81}{80}\right) + 5 \log\left(\frac{25}{24}\right) + 7 \log\left(\frac{16}{15}\right)\right]$ is

(a) log 3 (b) log 5

(c) log 7 (d) log 2

35. $\left(\log \frac{a^3}{bc} + \log \frac{b^3}{ac} + \log \frac{c^3}{ab}\right)$ is equal to :

(a) 1 (b) log abc

(c) abc (d) none of these

36. $\frac{1}{(\log_a bc) + 1} + \frac{1}{(\log_b ac) + 1} + \frac{1}{(\log_c ab) + 1}$ is equal to:

(a) 1 (b) 2

(c) 0 (d) abc

37. $\frac{1}{\log_{ab} abc} + \frac{1}{\log_{bc} abc} + \frac{1}{\log_{ca} abc}$ is equal to :

(a) 0 (b) 1

(c) 2 (d) 3

38. The value of $\left(\frac{1}{\log_5 210} + \frac{1}{\log_6 210} + \frac{1}{\log_7 210}\right)$ is :

(a) 0 (b) 1

(c) 18 (d) 21

39. The value of $\left[\frac{1}{\log_{a/b} x} + \frac{1}{\log_{b/c} x} + \frac{1}{\log_{c/a} x}\right]$ is :

(a) 0 (b) 1 (c) abc (d) x^3

40. If $\log_{10} 2 = 0.3010$, then $\log_2 10$ is :

(a) 3.010 (b) 1.5050

(c) 3.3222 (d) none of these

41. If $2^x \cdot 3^{2x} = 100$, then the value of x is

(log 2 = 0.3010, log 3 = 0.4771)

(a) 2.3 (b) 1.59

(c) 1.8 (d) 1.41

42. If $\log_{10} 2 = 0.3010$ and $5^x = 400$, then the value of x is:

(a) 3.72 (b) 2.52

(c) 0 (d) none of these

43. If log 2 = 0.3010, the number of digits in 5^{20} is :

(a) 16 (b) 14

(c) 8 (d) none of these

44. If $\log(m+n) = \log m + \log n$, then :

(a) $mn = 1$ (b) $m = -n$

(c) $\frac{m}{(m-1)} = n$ (d) none of these

45. If $\log_{10} a + \log_{10} b = c$, then the value of a is :

(a) bc (b) $\frac{c}{b}$

(c) $\frac{(10)^c}{b}$ (d) $\frac{10b}{c}$

46. The mantissa of log 3274 is 0.5150. The value of log (0.3274) is :

(a) $\bar{1}.5150$ (b) 1.5150

(c) $\bar{2}.5150$ (d) none of these

47. If $\log_{10} x = 1.9675$, then the value of $\log_{10}(100x)$ is :

(a) 196.75 (b) 3.9675

(c) 2.9675 (d) none of these

48. If $5^x = (0.5)^y = 1000$, then the value of $\left(\frac{1}{x} - \frac{1}{y}\right)$ is :

(a) $\frac{1}{4}$ (b) $\frac{1}{3}$

(c) $\frac{1}{2}$ (d) 1

49. If $\frac{1}{2}\log x + \frac{1}{2}\log y + \log 2 = \log(x+y)$, then :

(a) $x + y = 0$ (b) $x = y$

(c) $x = 2, y = 0$ (d) $x = \log y$

50. If $p = \log_3 5$ and $q = \log_{17} 25$, which one of the following is correct ?

(a) $p < q$ (b) $p = q$

(c) $p > q$ (d) can't say

51. If $x^2 + 4y^2 = 12xy$, then $\log(x + 2y)$ is equal to :

(a) $\frac{1}{2}(\log x + \log y + 2\log 2)$

(b) $\frac{1}{2}(\log x + \log y + 4\log 2)$

(c) $\frac{1}{2}(\log x + \log y - \log 2)$

(d) none of the above

52. The value of $(2^{\log_3 7} - 7^{\log_3 2})$ is :

(a) 0 (b) 1

(c) $\log_7 5$ (d) $\log_7 6$

53. $\frac{1}{\log_2 a} + \frac{1}{\log_4 a} + \frac{1}{\log_8 a} + \ldots$ to n terms $= \frac{n(n+1)}{k}$, then k is equal to :

(a) $\log_2 a^2$ (b) $\log_2\left(\frac{a}{2}\right)$

(c) $\log_a 2$ (d) none of these

54. The value of $(\log \tan 1° + \log \tan 2° + \ldots + \log \tan 89°)$ is :

(a) -1 (b) 0

(c) $\frac{1}{\sqrt{2}}$ (d) 1

55. The value of x for which $\log_9 x - \log_9\left(\frac{x}{10} + \frac{1}{9}\right) = 1$ is :

(a) 2
(b) 4
(c) 9
(d) 10

56. If $(x^4 - 2x^2y^2 + y^4)^{a-1} = (x - y)^{2a}(x + y)^{-2}$, then the value of a is :

(a) $(x^2 - y^2)$ (b) $\frac{x - y}{x + y}$

(c) $\frac{\log(x + y)}{\log(x - y)}$ (d) $\frac{\log(x - y)}{\log(x + y)}$

57. $\log_2 7$ is :

(a) an integer
(b) a prime number
(c) a rational number
(d) an irrational number

58. $\log_y x = ?$

(a) $x \log_e y$ (b) $\frac{x}{\log_e y}$

(c) $\frac{\log_e x}{\log_e y}$ (d) $\frac{\log_e y}{\log_e x}$

59. The value of

$\log_{10} 2 + 16\log_{10}\left(\frac{16}{15}\right) + 12\log_{10}\left(\frac{25}{24}\right) + 7\log_{10}\left(\frac{81}{80}\right)$

is :

(a) 0 (b) 1

(c) 2 (d) 3

60. If $\log_{10} x = a$, $\log_{10} y = b$ and $\log_{10} z = c$, then antilog $(pa + qb - rc) = ?$

(a) $\frac{pxqy}{rz}$ (b) $px + qy - rz$

(c) $\frac{x^p y^q}{z^r}$ (d) $x^p y^q z^r$

61. $\log_{10} a^p \cdot b^q \cdot c^r = ?$

(a) $pqr(\log_{10} abc)$
(b) $p\log_{10} a + q\log_{10} b + r\log_{10} c$
(c) $pqr(\log_{10} a + \log_{10} b + \log_{10} c)$
(d) $(\log_{10} a)^p + (\log_{10} b)^q + (\log_{10} c)^r$

62. If a, b, c are in GP then $\log_{10} a, \log_{10} b, \log_{10} c$ are in :

(a) GP (b) HP

(c) AP (d) none of these

63. If $\log_{10} x, \log_{10} y, \log_{10} z$ are in AP then x, y, z are in :

(a) AP (b) GP

(c) HP (d) none of these

64. If a, b, c are in GP then $\frac{1}{\log_a x}, \frac{1}{\log_b x}, \frac{1}{\log_c x}$ are in :

(a) AP (b) GP

(c) HP (d) none of these

65. If $\log(x - 1) + \log(x + 1) = 3\log 2$, then x is equal to :

(a) ± 1 (b) 4

(c) ± 3 (d) none of these

66. If a, b, c are three consecutive integers, then $\log(ac + 1)$ has the value :

(a) $\log b$ (b) $(\log b)^2$

(c) $2\log b$ (d) $\log 2b$

CAT-Test

Questions Helping you bell the CAT

LEVEL 01 > BASIC LEVEL EXERCISE

1 Find the value of $\log_{10}\sqrt[7]{13}$ if $\log_{10}13 = 1.1139$:
(a) 0.15913 (b) 0.5119
(c) 1.15913 (d) none of these

2 Find the logarithm of 144 to the base $2\sqrt{3}$:
(a) 8 (b) 4
(c) $2\sqrt{3}$ (d) none of these

3 If $\log_a N = (\log_b N) \times P$, then find P in terms of a and b :
(a) b^a (b) a^b
(c) $\log_a b$ (d) none of these

4 The value of $\log (ab)^2 - \log (ac) + \log (bc^4) - 3 \log (bc)$ is :
(a) 0 (b) $\log b$
(c) $\log c$ (d) $\log a$

5 If $\log_2 x + \log_4 x + \log_{64} x = 5$, find x :
(a) 8 (b) 16 (c) 7 (d) 2

6 If $\log_q (xy) = 3$ and $\log_q (x^2y^3) = 4$, find the value of $\log_q x$
(a) 4 (b) 5 (c) 3 (d) 2

7 If $\dfrac{\log x}{l+m-2n} = \dfrac{\log y}{m+n-2l} = \dfrac{\log z}{n+l-2m}$, then xyz is equal to :
(a) 0 (b) 1 (c) lmn (d) 2

8 If a, b, c be the p^{th}, q^{th}, r^{th} terms of a GP then the value of $(q-r)\log a + (r-p)\log b + (p-q)\log c$ is :
(a) 0 (b) 1 (c) -1 (d) pqr

9 If $a^{3-x}\, b^{5x} = a^{x+5}\, b^{3x}$, then the value of $x \log\left(\dfrac{b}{a}\right)$ is :
(a) $\log a$ (b) $\log b$
(c) $\log x$ (d) 1

10 If $u = v^2 = w^3 = z^4$, then $\log_u (uvwz)$ is equal to :
(a) $1 + \dfrac{1}{2} - \dfrac{1}{3} - \dfrac{1}{4}$ (b) 24
(c) $1 + \dfrac{1}{2} + \dfrac{1}{3} + \dfrac{1}{4}$ (d) $\dfrac{1}{24}$

11 Find the value of $\dfrac{\log\sqrt{27} + \log\sqrt{8} - \log\sqrt{125}}{\log 6 - \log 5}$:
(a) $\dfrac{2}{3}$ (b) $\dfrac{1}{3}$
(c) $\dfrac{3}{2}$ (d) none of these

12 The first term and the last term of a GP are a and k respectively. If the number of terms be n, then n is equal to ($r \rightarrow$ common ratio) :
(a) $1 - \dfrac{\log k - \log a}{\log r}$ (b) $1 + \dfrac{\log a + \log k}{\log r}$
(c) $1 + \dfrac{\log k - \log a}{\log r}$ (d) $\log r = \log k - \log a$

13 If a, b, c are in GP , then $\log_a d, \log_b d, \log_c d$ are in :
(a) AP (b) HP
(c) GP (d) none of these

14 Find the value of x for $\log_x 2 . \log_{x/16} 2 = \log_{x/64} 2$:
(a) 4 (b) 4, 16 (c) 4,8 (d) 4, 8, 32

15 Find the value of x and y respectively for
$\log_{10}(x^2y^3) = 7$ and $\log_{10}(x/y) = 1$:
(a) $x = 10, y = 100$ (b) $x = 100, y = 10$
(c) $x = 10, y = 20$ (d) none of these

16 If $y = a^{\left(\frac{1}{1-\log_a x}\right)}$ and $z = a^{\left(\frac{1}{1-\log_a y}\right)}$, then x is equal to :
(a) $1 + \log yz$ (b) $\dfrac{1}{1-\log_a z}$
(c) $a^{\left(\frac{1}{1-\log_a z}\right)}$ (d) $\dfrac{y}{z}$

17 If $x = \log_c b + \log_b c$, $y = \log_a c + \log_c a$ and $z = \log_b a + \log_a b$, then $x^2 + y^2 + z^2$ is equal to :
(a) 1 (b) 2 (c) xyz (d) $xyz + 4$

18 Find the value of $\dfrac{1}{\log_3 e} + \dfrac{1}{\log_3 e^2} + \dfrac{1}{\log_3 e^4} + \ldots$ is :
(a) $\log_e 9$ (b) 0
(c) 1 (d) $\log_e 270$

19 If $\log_{10} x^2 - \log_{10}\sqrt{y} = 1$, find the value of y, when $x = 2$
(a) 2/9 (b) 4/25 (c) 25/4 (d) 4/9

20 Find the value of $(b^2)^{5\log_b x}$:
(a) 10^x (b) x^4 (c) $10x$ (d) x^{10}

21 Find the value of $(7^3)^{-2\log_7 8}$:
(a) 8^{-7} (b) 6^{-8}
(c) 8^{-6} (d) none of these

22 $\log 12900$ is equal to :
(a) $2 \log 129$ (b) $\log 129 + \log 2$
(c) $4 + \log 1.29$ (d) none of these

23 $\log 0.786$ is equal to :
(a) $\log 786 - \log 3$ (b) $\log 78.6 - \log 100$
(c) $\log 786 - 3$ (d) both (b) and (c)

24 If $\log_5 x = y$, then 5^{5y} is equal to :
(a) $\frac{x}{5}$ (b) $5x$ (c) $\log_x 5$ (d) x^5

25 If $A = \log_{13} 189$ and $B = \log_{23} 521$, then which one of the following is correct?
(a) $A < B$ (b) $A = B$
(c) $A > B$ (d) none of these

26 If $A = \frac{(\log_3 2187)}{5}$ and $B = \log_{243} 2187$, then which one of the following is correct?
(a) $A < B$ (b) $A = B$
(c) $A > B$ (d) can't be determined

27 If $(150)^x = 7$, then x is equal to :
(a) $\frac{\log 7}{(\log 3) + (\log 5) + 1}$ (b) $\frac{\log 7}{(\log 3) + (\log 6)}$
(c) $\frac{\log 7}{(\log 3) + (\log 5) + 10}$ (d) none of these

28 The value of x satisfying the following relation
$\log_{1/2} x = \log_2 (3x - 2)$
(a) $\frac{1}{3}$ (b) $-\frac{1}{3}$
(c) 3 (d) none of these

29 If $\log_2 (x + y) = 3$ and $\log_2 x + \log_2 y = 2 + \log_2 3$ then the values of x and y are
(a) $x = 1, y = 8$ (b) $x = 4, y = 4$
(c) $x = 4, y = 8$ (d) $x = 2, y = 6$

30 The set of all the solutions of the equation
$\log_5 x \log_6 x \log_7 x = \log_5 x \cdot \log_6 x + \log_6 x \cdot \log_7 x + \log_7 x \cdot \log_5 x$ is :
(a) $\{0, 1\}$ (b) $\{1, 210\}$
(c) $\{1, 5, 6, 7, 210\}$ (d) none of these

31 The value of $\frac{\log_3 54}{\log_{486} 3} - \frac{\log_3 1458}{\log_{18} 3}$ is :
(a) 0 (b) 1 (c) 2 (d) 3

32 The number of solutions of $\log_9 (2x - 5) = \log_3 (x - 4)$ is :
(a) 0 (b) 1 (c) 2 (d) 3

33 If $\log_3 2$, $\log_3 (2^x - 5)$ and $\log_3 (2^x - 7/2)$ are in AP then x is equal to :
(a) 2 (b) 3 (c) 4 (d) 5

34 If $1, \log_y x, \log_z y, -15 \log_x z$ are in AP, then
(a) $z^3 = x$ (b) $x = y^{-1}$
(c) $z^{-3} = y$ (d) $x = y^{-1} = z^3$

35 If $\log_x a$, $a^{x/2}$ and $\log_b x$ are in GP, then x is equal to :
(a) $\log_a (\log_b a)$ (b) $\log_a (\log_e a) - \log_a (\log_e b)$
(c) $-\log_a (\log_a b)$ (d) both (a) and (b)

36 If $1, \log_9 (3^{1-x} + 2)$ and $\log_3 (4 \cdot 3^x - 1)$ are in AP, then x is equal to :
(a) $\log_4 3$ (b) $\log_3 4$
(c) $1 + \log_3 4$ (d) $\log_3 (3/4)$

37 The value of $\frac{1}{\log_{100} n} + \frac{1}{\log_{99} n} + \frac{1}{\log_{98} n} + \ldots + \frac{1}{\log_2 n}$ is:
(a) 1 (b) $\frac{1}{\log_{100!} n}$ (c) $\frac{1}{\log_n 99!}$ (d) $\frac{1}{\log_n 100!}$

38 If $\log_2 (1 + 3^{x-1}) + 2 = \log_2 (3^{2x-2} + 7)$, then x is :
(a) 0 (b) 1
(c) 2 (d) both (b) and (c)

39 $x^{\log_5 x} > 5$ implies :
(a) $x \in (0, \infty)$ (b) $x \in (1, \infty)$
(c) $x \in (1, 2)$ (d) $x \in (0, 1/5) \cup (5, \infty)$

40 Find x, if $\log x^3 - \log 3x = 2 \log 2 + \log 3$:
(a) 3 (b) 6
(c) 9 (d) none of these

41 If x satisfies $\log_{5,} (2x + 3) < \log_5 7$, then x lies in :
(a) $\left(-\frac{3}{2}, 2\right)$ (b) $\left(\frac{3}{2}, 2\right)$ (c) $(0, \infty)$ (d) $(0, 2)$

42 Find x, if $\log_{2x} \sqrt{x} + \log_{2\sqrt{x}} x = 0$:
(a) $1, 2^{-5/6}$ (b) $1, 2^{-6/5}$
(c) $4, -2$ (d) none of these

43 For a positive real x $(x > 1)$, which one of the following is correct ?
(a) $\frac{x}{1+x} < x < \log (x + 1)$ (b) $x < \frac{x}{1+x} < \log (x + 1)$
(c) $\log (x + 1) < \frac{x}{1+x} < x$ (d) $\frac{x}{1+x} < \log (x + 1) < x$

44 For $x \in N$, $x > 1$, if $P = \log_x (x + 1)$ and $Q = \log_{(x+1)} (x + 2)$, then which one of the following is correct ?
(a) $P < Q$ (b) $P = Q$
(c) $P > Q$ (d) can't be determined

45 If $a = 1 + \log_x yz$, $b = 1 + \log_y zx$ and $c = 1 + \log_z xy$, then $ab + bc + ca$ is :
(a) 1 (b) 0
(c) abc (d) none of these

46 Find the values of x and y for the given equation $xy^2 = 4$ and $\log_3 (\log_2 x) + \log_{1/3} (\log_{1/2} y) = 1$:
(a) $x = \frac{1}{8}, y = 64$ (b) $x = \frac{1}{4}, y = 48$
(c) $x = 64, y = \frac{1}{4}$ (d) none of these

47 Find x if $\log_{1/\sqrt{2}} (1/\sqrt{8}) = \log_2 (4^x + 1) \cdot \log_2 (4^{x+1} + 4)$:
(a) 0 (b) 1
(c) 2 (d) none of these

48 The value of x satisfying

$$\log_3 4 - 2\log_3\sqrt{3x+1} = 1 - \log_3(5x-2)$$

(a) 1 (b) 2
(c) 3 (d) none of these

49 The solution set of $|3-4x|>2$ is :

(a) $\left(\frac{7}{4},\infty\right)$ (b) $\left(-\frac{1}{4},\frac{7}{4}\right)$
(c) $\left(-\infty,-\frac{1}{4}\right)\cup\left(\frac{7}{4},\infty\right)$ (d) $\left(-\infty,\frac{1}{4}\right)\cup\left(\frac{5}{4},\infty\right)$

50 Solve the following equations for x and y

$\log_{100}|x+y| = \frac{1}{2}$, $\log_{10} y - \log_{10}|x| = \log_{100} 4$:

(a) $\left(\frac{8}{3},\frac{16}{3}\right)(-8,-16)$

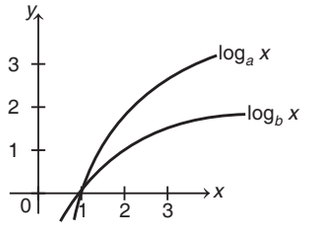
(b) $\left(\frac{10}{3},\frac{20}{3}\right),(-10,20)$

(c) $\left(-\frac{10}{3},-\frac{20}{3}\right),(70,20)$

(d) none of the above

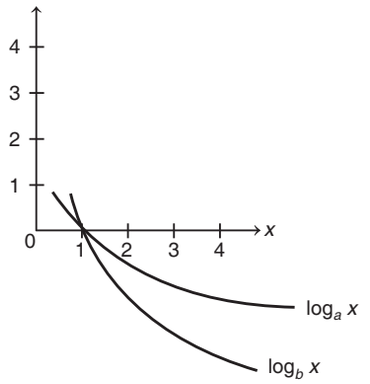
LEVEL 02 › HIGHER LEVEL EXERCISE

1 In the adjoining diagram there are two curvature graphs of $\log_a x$ and $\log_b x$ shown for $x>0$. If $(a, b)>0$ and $a\neq b\neq 1$, then :



(a) $a<b$ (b) $a>b$
(c) can't be determined (d) none of the above

2 In the adjoining diagram graphs of $\log_a x$ and $\log_b x$ are shown for $x>0$ and $0<a<1$, then :



(a) $a<b$ (b) $a>b$
(c) can't be determined (d) none of these

3 Find the sum of 'n' terms of the series.

$$\log_2\left(\frac{x}{y}\right)+\log_4\left(\frac{x}{y}\right)^2+\log_8\left(\frac{x}{y}\right)^3+\log_{16}\left(\frac{x}{y}\right)^4+\ldots :$$

(a) $\log_2\left(\frac{x}{y}\right)^{4n}$ (b) $n\left(\log_2\frac{x}{y}\right)$
(c) $\log_2\left(\frac{x^{n-1}}{y^{n-1}}\right)$ (d) $\frac{1}{2}\log_2\left(\frac{x}{y}\right)^{n(n+1)}$

4 Find the value of $\log m + \log m^2 + \log m^3 + \ldots + \log m^n$:

(a) $\frac{n(n+1)}{2}$ (b) $\frac{mn}{2}$
(c) $\frac{n(n+1)}{2}\log m$ (d) $n(n+1)\log m^2$

5 The greatest possible value of n could be if $9^n<10^8$, given that $\log 3 = 0.4771$ and $n\in N$:

(a) 7 (b) 8 (c) 9 (d) 10

6 The set of solutions for all x satisfying the equation

$$x^{\log_3 x^2+(\log_3 x)^2-10}=\frac{1}{x^2}\text{is :}$$

(a) {1, 9} (b) {1, 4, 16} (c) {1, 9, 81} (d) $\left\{9,\frac{1}{81},1\right\}$

7 The set of all the solutions of the inequality $\log_{(2-x)}(x-3)\geq 1$ is :

(a) $x<2$ (b) $x>3$
(c) $(x<2)\cup(x>3)$ (d) none of these

8 If $\log_3 30=\frac{1}{a}$ and $\log_5 30=\frac{1}{b}$ then the value of $3\log_{30}2$ is:

(a) $3(1+a+b)$ (b) $2(1-a-b)$
(c) $3(1-a-b)$ (d) $3(1+a-b)$

9 The set of all values of x satisfying $x^{\log_x|3-x|^2}=4$:

(a) $(\sqrt{3},2)$ (b) (1, 5) (c) $[1,\infty)$ (d) {1, 5}

10 The number of solutions of the expression satisfying $4^{x^2+2}-9\cdot 2^{x^2+2}+8=0$ is :

(a) 0 (b) 1
(c) 2 (d) none of these

11 The number of solutions satisfying, for $x\in R$

$$x^{\left[(\log_3 x)^2-\frac{9}{2}\log_3 x+5\right]}=3\sqrt{3}$$

(a) 0 (b) 1 (c) 2 (d) 3

12 Find the values of x satisfying

$$\log_{x^2+6x+8}\log_{2x^2+2x+3}(x^2-2x)=0\text{is :}$$

(a) 0 (b) -1 (c) 2 (d) -3

13 For every p being real number the solution set of the inequality

$$\log_{10} p + (\log_{10} 10p)^2 + (\log_{10^{100p}})^2 \le \log_{10}(10)^9$$

(a) $p \ge 10^{-4}$ (b) $p > 10^{1/2}$
(c) $10^{-4} \le p \le 10^{1/2}$ (d) none of the above

14 The number of real solutions of the equation

$$2\log_2 \log_2 x + \log_{1/2} \log_2(2\sqrt{2}x) = 1 \text{ is :}$$

(a) 1 (b) 2
(c) 3 (d) more than 3

15 The number of solutions of the equation $\log_{x/2} x^2 + 40 \log_{4x} \sqrt{x} - 14 \log_{16x} x^3 = 0$ is :

(a) 0 (b) 1 (c) 2 (d) 3

16 Find the solution set of x, for the given inequality $\log_m n > 1$, where $m = \dfrac{(5)^2 - (x)^2}{(4)^2}$ and $n = \dfrac{2(12-x) - x^2}{14}$:

(a) $(-5, 4)$ (b) $\{-3, 3\}$
(c) $(-3, 1) \cup (3, 4)$ (d) none of these

17 Find the values of x satisfying the following system of inequalities

$$\frac{\sqrt{(2-x)(x-8)}}{\log_{3/10} \frac{10}{7}\left[\log_2\left(\frac{5}{2}\right)\right]} \ge 0 \quad \text{and} \quad \frac{2^x}{8} - (2^5 - 1) > 0$$

(a) 6 (b) 8 (c) 4 (d) (2, 8)

18 The least value of expression $2\log_{10} x - \log_x(1/100)$ for $x > 1$ is :

(a) 2 (b) 3 (c) 4 (d) 5

19 The equation $x^{[(3/4)(\log_2 x)^2 + \log_2 x - (5/4)]} = \sqrt{2}$ has :

(a) at least one real solution
(b) exactly three real solutions
(c) exactly one irrational solution
(d) all of these

20 The values of x for which the given equation satisfy $\log_{(2x+3)}(6x^2 + 23x + 21) = 4 - \log_{(3x+7)}(4x^2 + 12x + 9)$ are :

(a) $(-8, 5)$ (b) $-\frac{1}{4}$ only (c) $-4, -\frac{1}{4}$ (d) $-\frac{1}{4}, -2$

21 Find all real values of x satisfying equation

$$|x-1|^{\log x^2 - 2\log_x 9} = (x-1)^7$$

(a) (2, 9) (b) (9, 81)
(c) (2, 81) (d) none of these

22 Find the value of x_0, if (x_0, y_0) be the solution of the following equations

$$(2x)^{\ln 2} = (3y)^{\ln 3};\ 3^{\ln x} = 2^{\ln y}$$

(a) 1/6 (b) 1/3 (c) 1/2 (d) 6

23 The number $\log_{20} 3$ lies in

(a) (3/4, 4/5) (b) (1/3, 1/2)
(c) (1/2, 3/4) (d) (1/4, 1/3)

24 Find the number of consecutive zeros in the non-integral part of the number $\dfrac{5}{500^{50}}$ if $\log 5 = 0.4771$.

(a) 125 (b) 124
(c) 123 (d) 100

Hints & Solutions

☑ Introductory Exercise 16.1

1 $x^y = k \quad \Leftrightarrow \quad \log_x k = y$

2 $\log_m n = p \quad \Leftrightarrow \quad m^p = n$

3 $\log_a (mn) \quad \Leftrightarrow \quad \log_a m + \log_a n$

4 $\log_a \left(\frac{m}{n}\right) = \log_a m - \log_a n$

5 $\log_{81} 27 = \frac{\log_{10} 27}{\log_{10} 81} = \frac{\log_{10} 3^3}{\log_{10} 3^4} = \frac{3 \log_{10} 3}{4 \log_{10} 3} = \frac{3}{4}$

6 $\log_{36} \left(\frac{1}{216}\right) = \log_{36} 6^{-3} = \frac{\log 6^{-3}}{\log 36}$

$= \frac{-3 \log 6}{2 \log 6} = -\frac{3}{2}$

7 $\log_{\sqrt{6}} 216 = \frac{\log 216}{\log \sqrt{6}} = \frac{\log (\sqrt{6})^6}{\log \sqrt{6}} = \frac{6 \log \sqrt{6}}{\log \sqrt{6}} = 6$

8 $\log_{3\sqrt{2}} 5832 = \log_{3\sqrt{2}} (18)^3 = \log_{3\sqrt{2}} [(3\sqrt{2})^2]^3$

$= \log_{3\sqrt{2}} (3\sqrt{2})^6 = 6 \qquad (\because \log_a a^m = m)$

9 Let $\log_{(-1/5)} 625 = x$

$\therefore \qquad \left(-\frac{1}{5}\right)^x = 625 \quad \Rightarrow \left(-\frac{1}{5}\right)^x = (5)^4$

$\Rightarrow \qquad (-5)^{-x} = (5)^4 = (-5)^4 \Rightarrow x = -4$

10 Let $\log_{10} (0.0001) = x$

$\therefore \qquad 10^x = 0.0001 = 10^{-4}$

$\Rightarrow \qquad x = -4$

11 Let $\log_{0.01} (10000) = x$

$\therefore \qquad (0.01)^x = 10000 \Rightarrow (10^{-2})^x = 10000$

$\Rightarrow \qquad 10^{-2x} = 10^4 \qquad \Rightarrow \qquad x = -2$

12 $\log_4 32 + \log_9 243 = \frac{\log 32}{\log 4} + \frac{\log 243}{\log 9}$

$= \frac{5 \log_2 2}{2 \log_2 2} + \frac{5 \log_3 3}{2 \log_3 3} = \frac{5}{2} + \frac{5}{2} = 5$

13 $\log_2 2^3 + \log_3 3^2 + \log_5 5^2 = 3 + 2 + 2 = 7$

14 $\log_2 (\log_3 81) = \log_2 (\log_3 3^4) = \log_2 (4 \log_3 3)$

$= \log_2 4 = \log_2 2^2 = 2$

15 $\log_2 \log_2 \log_3 \log_5 (125)^3 = \log_2 \log_2 \log_3 \log_5 5^9$

$= \log_2 \log_2 \log_3 9$

$= \log_2 \log_2 (2) = \log_2 1 = 0$

16 $\log_2 \log_2 \log_2 \log_2 (65536) = \log_2 \log_2 \log_2 \log_2 (2^{16})$

$= \log_2 \log_2 \log_2 16 = \log_2 \log_2 4$

$= \log_2 2 = 1$

17 $\log_{10} 1 + \log_{10} 10 + \log_{10} 100 + \ldots + \log_{10} 10000000000$

$= \log_{10} (1 \times 10 \times 100 \times \ldots \times 10000000000)$

$= \log_{10} 10^{(0+1+2+3+\ldots.10)} = \log_{10} 10^{55} = 55$

Alternatively

$\log_{10} 1 + \log_{10} 10 + \log_{10} 10^2 + \ldots + \log_{10} 10^{10}$

$= 0 + 1 + 2 + 3 + 4 + \ldots + 10 = 55$

18 $\log_5 5 + \log_5 5^2 + \log_5 5^3 + \ldots + \log_5 5^n$

$= 1 + 2 + 3 + \ldots + n = \frac{n(n+1)}{2}$

19 $27^{\log_3 81} = 3^{3 \log_3 81}$

$= 3^{\log_3 (81)^3} = (81)^3 = 531441 \qquad (\because a^{\log_a m} = m)$

20 $216^{\log_6 49} = 6^{3 \log_6 49}$

$= 6^{\log_6 (49)^3} = (49)^3 = 117649$

21 $25^{[(-1/4) \log_5 25]} = 5^{[2(-1/4) \log_5 25]}$

$= 5^{(-1/2) \log_5 25} = 5^{\log_5 (25)^{-1/2}} = 25^{-1/2} = \frac{1}{5}$

22 $\log_{10} 500000 - \log_{10} 5 = \log_{10} \left(\frac{500000}{5}\right) = \log_{10} 100000$

$= \log_{10} 10^5 = 5$

23 $\log_5 [\log_3 (\log_2 x)] = 1 = \log_5 5$

$\Rightarrow \qquad \log_3 (\log_2 x) = 5 = \log_3 3^5$

$\Rightarrow \qquad \log_2 x = 3^5 = 243 \Rightarrow 2^{243} = x$

24 $\log_2 \log_{10} 4x = 1 = \log_2 2$

$\Rightarrow \qquad \log_{10} 4x = 2 = \log_{10} 10^2 = \log_{10} 100$

$\Rightarrow \qquad 4x = 100 \quad \Rightarrow \quad x = 25$

25 If $\log_{27} x = \frac{4}{3} \Rightarrow (27)^{4/3} = x$

$\Rightarrow \quad (3^3)^{4/3} = x \quad \Rightarrow \qquad 3^4 = x \quad \Rightarrow x = 81$

26 $\log_x \left(\frac{4}{9}\right) = -\frac{1}{2}$

$\Rightarrow \qquad x^{-1/2} = \frac{4}{9} \quad \Rightarrow \quad \frac{1}{x^{1/2}} = \frac{4}{9}$

$\Rightarrow \qquad \left(\frac{1}{x}\right)^{1/2} = \frac{4}{9} \quad \Rightarrow \qquad \frac{1}{x} = \left(\frac{4}{9}\right)^2 \quad \Rightarrow x = \frac{81}{16}$

27 $\log_{100} x = -4 \Rightarrow (100)^{-4} = x$

$\Rightarrow x = (10^2)^{-4} = 10^{-8} \Rightarrow x = \frac{1}{10^8}$

28 $\log_{100} x = -\frac{1}{2} \Rightarrow (100)^{-1/2} = x$

$\Rightarrow (10^2)^{-1/2} = x \Rightarrow 10^{-1} = x$

$\Rightarrow x = \frac{1}{10}$

29 $\log_x 0.2 = -\frac{1}{4}$

$\Rightarrow x^{-1/4} = 0.2 = \frac{2}{10} \Rightarrow x^{-1} = \left(\frac{2}{10}\right)^4$

$\Rightarrow x = \left(\frac{10}{2}\right)^4 \Rightarrow x = 5^4$

30 $\log_{243} x = 0.8$

$\Rightarrow 243^{0.8} = x \Rightarrow (3^5)^{4/5} = x$

$\Rightarrow 3^4 = x \Rightarrow x = 81$

31 $\log_e(x-1) + \log_e x + \log_e(x+1) = 0$

$\Rightarrow \log_e(x-1) \times x\,(x+1) = \log_e 1$

$\Rightarrow \log_e(x^2-1)x = \log_e 1$

$\Rightarrow (x^2-1)x = 1$

$\Rightarrow x^3 - x - 1 = 0$

32 $\log_3 5 \times \log_{25} 9 = \frac{\log 5}{\log 3} \times \frac{\log 3^2}{\log 5^2} = \frac{\log 5}{\log 3} \times \frac{2\log 3}{2\log 5} = 1$

33 $\log \frac{14}{3} + \log \frac{11}{5} - \log \frac{22}{15}$

$= \log\left(\frac{14}{3} \times \frac{11}{5} \times \frac{15}{22}\right) = \log 7$

34 $3\log \frac{81}{80} + 5\log \frac{25}{24} + 7\log \frac{16}{15}$

$= \log\left[\left(\frac{81}{80}\right)^3 \times \left(\frac{25}{24}\right)^5 \times \left(\frac{16}{15}\right)^7\right]$

$= \log\left(\frac{3^{12} \times 5^{10} \times 2^{28}}{2^{12} \times 5^3 \times 2^{15} \times 3^5 \times 3^7 \times 5^7}\right)$

$= \log 2$

35 $\log \frac{a^3}{bc} + \log \frac{b^3}{ac} + \log \frac{c^3}{ab} = \log\left(\frac{a^3b^3c^3}{ab \cdot bc \cdot ac}\right) = \log abc$

36 $\frac{1}{(\log_a bc)+1} + \frac{1}{(\log_b ac)+1} + \frac{1}{(\log_c ab)+1}$

$= \frac{1}{\log_a bc + \log_a a} + \frac{1}{\log_b ac + \log_b b} + \frac{1}{\log_c ab + \log_c c}$

$= \frac{1}{\log_a abc} + \frac{1}{\log_b abc} + \frac{1}{\log_c abc}$

$= \log_{abc} a + \log_{abc} b + \log_{abc} c = \log_{abc} abc = 1$

37 $\frac{1}{\log_{ab} abc} + \frac{1}{\log_{bc} abc} + \frac{1}{\log_{ca} abc}$

$= \log_{abc}(ab) + \log_{abc}(bc) + \log_{abc}(ca)$

$= \log_{abc}(abc)^2 = 2$

38 $\frac{1}{\log_5 210} + \frac{1}{\log_6 210} + \frac{1}{\log_7 210}$

$= \log_{210} 5 + \log_{210} 6 + \log_{210} 7$

$= \log_{210}(5 \times 6 \times 7) = \log_{210} 210 = 1$

39 $\frac{1}{\log_{a/b} x} + \frac{1}{\log_{b/c} x} + \frac{1}{\log_{c/a} x}$

$= \log_x \frac{a}{b} + \log_x \frac{b}{c} + \log_x \frac{c}{a}$

$= \log_x\left(\frac{a}{b} \times \frac{b}{c} \times \frac{c}{a}\right) = \log_x 1 = 0$

40 $\log_2 10 = \frac{1}{\log_{10} 2} = \frac{1}{0.3010} = 3.3222$

41 $2^x \cdot 3^{2x} = 100$

$\Rightarrow x \log 2 + 2x \log 3 = \log 100$

$\Rightarrow x\,(0.3010 + 2 \times 0.4771) = 2$

$\Rightarrow x = \frac{2}{1.2552} = 1.59$

42 $\log_{10} 2 = 0.3010$ and $5^x = 400$

$\therefore 5^x = 400$

$\Rightarrow x \log 5 = \log 4 + \log 100$

$\Rightarrow x\,(\log 10 - \log 2) = 2\log 2 + 2$

$\Rightarrow x\,(1 - 0.3010) = 2\,(0.3010 + 1)$

$\Rightarrow x = 3.72$

43 $5^{20} = 20 \log 5$

$= 20 \log\left(\frac{10}{2}\right) = 20\,(\log 10 - \log 2)$

$= 20 \times [1 - 0.3010]$

$= 20 \times 0.6990 = 13.98$

Characteristic = 13

$\therefore$ Number of digits = (13 + 1) = 14

44 $\log(m+n) = \log m + \log n$

$\Rightarrow \log(m+n) = \log(mn)$

$\Rightarrow m + n = mn$

$m = n(m-1)$

$\Rightarrow n = \frac{m}{(m-1)}$

45 $\log_{10} a + \log_{10} b = c$

$\Rightarrow \log_{10}(ab) = c \Rightarrow 10^c = ab$

$\Rightarrow a = \frac{(10)^c}{b}$

46 Since 0.3274 gives characteristic $\bar{1}$. Therefore value of $\log(0.3274) = \bar{1}.5150$

47 $\log_{10}(100x) = \log_{10} 100 + \log_{10} x$

$= 2 + 1.9675 = 3.9675$

48 $(5)^x = 1000$

$\Rightarrow \quad 5 = 10^{3/x}$ …(i)

And $(0.5)^y = 1000 \Rightarrow \left(\frac{5}{10}\right)^y = 10^3$

$\Rightarrow \quad 5^y = 10^3 \times 10^y \Rightarrow \quad 5 = 10^{\frac{(3+y)}{y}}$ …(ii)

From eq. (i) and (ii)

$$5 = 10^{3/x} = 10^{\frac{(3+y)}{y}} \Rightarrow \frac{3}{x} = \frac{3+y}{y}$$

$\Rightarrow \quad \frac{1}{x} - \frac{1}{y} = \frac{1}{3}$

49 $\frac{1}{2}\log x + \frac{1}{2}\log y + \log 2 = \log(x+y)$

$\Rightarrow \quad \log(x^{1/2}y^{1/2} \times 2) = \log(x+y)$

$\Rightarrow \quad 2\sqrt{xy} = (x+y) \Rightarrow \; 4xy = (x+y)^2$

$\Rightarrow \quad (x+y)^2 - 4xy = 0 \Rightarrow (x-y)^2 = 0$

$\Rightarrow \quad x - y = 0 \Rightarrow \quad x = y$

50 $q = \log_{17}(5)^2 = 2\log_{17} 5$

$\Rightarrow \quad \frac{1}{q} = \frac{1}{2}\log_5 17$

And $\frac{1}{p} = \log_5 3 = \frac{1}{2} \times (2\log_5 3)$

$= \frac{1}{2}(\log_5 9)$

$\therefore \quad \frac{1}{p} < \frac{1}{q} \Rightarrow \quad p > q$

51 $x^2 + 4y^2 = 12xy$

$\Rightarrow \quad x^2 + (2y)^2 + 4xy = 12xy + 4xy$

$\Rightarrow \quad (x+2y)^2 = 16xy$

$\Rightarrow \quad (x+2y)^2 = (2^4)\,xy$

$\Rightarrow \quad 2\log(x+2y) = 4\log 2 + \log x + \log y$

$\Rightarrow \quad \log(x+2y) = \frac{1}{2}(\log x + \log y + 4\log 2)$

52 $\log_3 7 = \frac{\log_2 7}{\log_2 3} = (\log_2 7)(\log_3 2)$

$\log_3 7 = (\log_3 2)(\log_2 7) = \log_2 7^{\log_3 2}$

$\therefore \quad 2^{\log_3 7} = 2^{\log_2 7^{\log_3 2}}$

$\Rightarrow \quad 2^{\log_3 7} = 7^{\log_3 2}$

$\Rightarrow \quad 2^{\log_3 7} - 7^{\log_3 2} = 0$

53 $\frac{1}{\log_2 a} + \frac{1}{\log_4 a} + \frac{1}{\log_8 a} + \ldots + \frac{1}{\log_{2^n} a} = \frac{n(n+1)}{k}$

$= \log_a 2 + \log_a 2^2 + \log_a 2^3 + \ldots + \log_a 2^n = \frac{n(n+1)}{k}$

$\Rightarrow \quad (\log_a 2)(1 + 2 + 3 + \ldots + n) = \frac{n(n+1)}{k}$

$\Rightarrow (\log_a 2)\left[\frac{n(n+1)}{2}\right] = \frac{n(n+1)}{k} \Rightarrow \frac{1}{2}\log_a 2 = \frac{1}{k}$

$\Rightarrow \quad \log_a 2 = \frac{2}{k} \quad \Rightarrow \quad \log_2 a = \frac{k}{2}$

$\Rightarrow \quad 2\log_2 a = k \quad \Rightarrow \quad \log_2 a^2 = k$

54 $\log\tan 1° + \log\tan 2° + \ldots + \log\tan 89°$

$= (\log\tan 1° + \log\tan 89°) + (\log\tan 2° + \log\tan 88°) + \ldots + \log\tan 45°$

$= \log(\tan 1° \cdot \tan 89°) + \log(\tan 2° \cdot \tan 88°) + \ldots \log 1$

$= \log(\tan 1° \cdot \cot 1°) + \log(\tan 2° \cdot \cot 2°) + \ldots \log 1$

$= \log 1 + \log 1 + \ldots + \log 1$

$(\because \tan(90 - \theta) = \cot\theta$ and $\tan 45° = 1) = 0$

55 $\log_9 x - \log_9\left(\frac{x}{10} + \frac{1}{9}\right) = 1 = \log_9 9$

$\Rightarrow \quad \log_9 \frac{x}{\left(\frac{x}{10} + \frac{1}{9}\right)} = \log_9 9$

$\Rightarrow \quad \frac{x}{\left(\frac{x}{10} + \frac{1}{9}\right)} = 9 \Rightarrow \frac{x \times 90}{9x + 10} = 9$

$\Rightarrow \quad 10x = 9x + 10 \Rightarrow x = 10$

Alternatively Go through options.

56 $[(x^2 - y^2)^2]^{a-1} = (x-y)^{2a}(x+y)^{-2}$

$\Rightarrow \quad (x^2 - y^2)^{2(a-1)} = (x-y)^{2a}(x+y)^{-2}$

$\Rightarrow (x-y)^{2(a-1)}(x+y)^{2(a-1)} = (x-y)^{2a}(x+y)^{-2}$

$\Rightarrow \quad \frac{(x-y)^{2a-2}}{(x-y)^{2a}} \frac{(x+y)^{2a-2}}{(x+y)^{-2}} = 1$

$\Rightarrow \quad (x-y)^{-2}(x+y)^{2a} = 1$

$\Rightarrow \quad -2\log(x-y) + 2a\log(x+y) = \log 1$

$\Rightarrow \; 2a\log(x+y) = 2\log(x-y) \Rightarrow a = \frac{\log(x-y)}{\log(x+y)}$

57 Let $\log_2 7$ be a rational

$$\log_2 7 = \left(\frac{p}{q}\right) \qquad q \neq 0$$

$\Rightarrow \quad 2^{(p/q)} = 7 \quad \Rightarrow \quad 2^p = 7^q$

Here p and q being the integers cannot satisfy the above relation.

Hence, $\log_2 7$ is an irrational number.

(Clearly (a) and (b) are wrong)

58 $\log \dfrac{x}{y} = \dfrac{\log_e x}{\log_e y}$ (see the theory)

59 $\log_{10} 2 + \log_{10}\left(\dfrac{16}{15}\right)^{16} + \log_{10}\left(\dfrac{25}{24}\right)^{12} + \log_{10}\left(\dfrac{81}{80}\right)^{7}$

$= \log_{10} 2 + \log_{10}\left(\dfrac{2^{64}}{3^{16}\times 5^{16}}\right) + \log\left(\dfrac{5^{24}}{2^{36}\times 3^{12}}\right) + \log\left(\dfrac{3^{28}}{2^{28}\times 5^{7}}\right)$

$= \log_{10} \dfrac{2^{65}\times 3^{28}\times 5^{24}}{2^{64}\times 3^{28}\times 5^{23}} = \log_{10}(2\times 5) = \log_{10} 10 = 1$

60 $(pa + qb - rc) = p \log_{10} x + q \log_{10} y - r \log_{10} z$

$= \log_{10}(x^p) + \log_{10}(y^q) - \log_{10}(z^r) = \log_{10}\left(\dfrac{x^p y^q}{z^r}\right)$

$\Rightarrow$ antilog $(pa + qb - rc) = \dfrac{x^p y^q}{z^r}$.

61 $\log_{10} a^p . b^q . c^r = \log_{10} a^p + \log_{10} b^q + \log_{10} c^r$

$= p \log_{10} a + q \log_{10} b + r \log_{10} c$

62 $\because$ a, b, c are in GP

$\Rightarrow \quad b^2 = ac \Rightarrow 2 \log b = \log a + \log c$

$\Rightarrow \log_x a, \log_x b, \log_x c$ are in AP

$\Rightarrow \log_{10} a, \log_{10} b, \log_{10} c$ are in AP

63 $\log_{10} x, \log_{10} y, \log_{10} z$ are in AP

$\therefore \quad 2 \log_{10} y = \log_{10} x + \log_{10} z$

$\Rightarrow \quad \log_{10} y^2 = \log_{10}(xz)$

$\Rightarrow \quad y^2 = xz$

$\Rightarrow x, y, z$ are in GP

64 $\because$ a, b, c, are in GP

$\therefore \log_x a, \log_x b, \log_x c$ are in AP

$\Rightarrow \dfrac{1}{\log_a x}, \dfrac{1}{\log_b x}, \dfrac{1}{\log_c x}$ are in AP

65 $\log (x-1) + \log (x+1) = 3 \log 2 = \log 2^3$

$\Rightarrow \quad \log [(x-1)(x+1)] = \log 8$

$\Rightarrow \quad \log (x^2 - 1) = \log 8$

$\Rightarrow \quad x^2 - 1 = 8 \Rightarrow x^2 = 9 \Rightarrow x = \pm 3$

But at $x = -3$ logarithm equation is not defined.

Hence, $x = 3$

66 a, b, c are consecutive integers

$\therefore \quad b = a + 1$ and $c = a + 2$

$\therefore \log (ac + 1) = \log [a(a + 2) + 1]$

$= \log [(b-1)(b - 1 + 2) + 1] \quad (\because a = b - 1)$

$= \log b^2 = 2 \log b$

☑ Level 01 *Basic Level Exercise*

1 $\log_{10} \sqrt[7]{13} \Rightarrow \log_{10}(13)^{1/7}$

$\Rightarrow \quad \dfrac{1}{7} \log_{10} 13 = \dfrac{1}{7} \times 1.1139 = 0.15913$

2 $\log_{2\sqrt{3}} 144 = \log_{2\sqrt{3}} (2\sqrt{3})^4 = 4$

3 $\log_a N = \log_b N \times P$

$\Rightarrow \quad \dfrac{\log_a N}{\log_b N} = P \Rightarrow \dfrac{\frac{1}{\log_N a}}{\frac{1}{\log_N b}} = P$

$\Rightarrow \quad \dfrac{\log_N b}{\log_N a} = P \Rightarrow \log_a b = P$

4 $\log (ab)^2 - \log (ac) + \log (bc^4) - 3 \log (bc)$

$= \log \dfrac{(ab)^2}{ac} + \log \dfrac{(bc^4)}{(bc)^3} = \log \left[\dfrac{(ab)^2}{ac} \times \dfrac{(bc^4)}{(bc)^3}\right] = \log a$

5 $\log_2 x + \log_4 x + \log_{64} x = 5$

$\Rightarrow \quad \dfrac{1}{\log_x (2)} + \dfrac{1}{2 \log_x (2)} + \dfrac{1}{6 \log_x (2)} = 5$

$\Rightarrow \quad \dfrac{10}{6 \log_x (2)} = 5 \Rightarrow \log_x (2) = \dfrac{1}{3}$

$\Rightarrow \quad \log_2 x = 3 \Rightarrow 2^3 = x \therefore x = 8$

Alternatively Go through options.

6 $\log_q (xy) = 3$ and $\log_q (x^2 y^3) = 4$

$\therefore \quad \log_q (x^2 y^3) = 4 \Rightarrow \log_q [(xy)^2 \cdot y]$

$\Rightarrow \quad \log_q (xy)^2 + \log_q y = 4$

$\Rightarrow \quad 2 \log_q (xy) + \log_q y = 4$

$\Rightarrow \quad 2 \times 3 + \log_q y = 4$

$\Rightarrow \quad \log_q y = -2$

Again $\log_q (xy) = \log_q x + \log_q y = 3$

$\Rightarrow \quad \log_q x + (-2) = 3$

$\Rightarrow \quad \log_q x = 5$

7 $\dfrac{\log x}{l + m - 2n} = \dfrac{\log y}{m + n - 2l} = \dfrac{\log z}{n + l - 2m} = k$ (say)

$\Rightarrow \quad \log x = k (l + m - 2n) \quad \ldots(i)$

$\log y = k (m + n - 2l) \quad \ldots(ii)$

$\log z = k (n + l - 2m) \quad \ldots(iii)$

$\therefore \log x + \log y + \log z$

$= k (l + m - 2n) + k (m + n - 2l) + k (n + l - 2m)$

$\log (xyz) = 0$

$\Rightarrow \quad \log xyz = \log 1$

$\Rightarrow \quad xyz = 1$

8 Let m be the first term and k be the common ratio of GP, then

$$a = mk^{p-1},\ b = mk^{q-1},\ c = mk^{r-1}$$

$\therefore\ (q-r)\log a + (r-p)\log b + (p-q)\log c$

$= \log[mk^{(p-1)}]^{q-r} + \log b[mk^{(q-1)}]^{r-p} + \log[mk^{(r-1)}]^{p-q}$

$= \log\,(m^{q-r+r-p+p-q})\,(k^{p-1})^{q-r}\,(k^{q-1})^{r-p}\,(k^{r-1})^{p-q}$

$= \log m^0\ k^0 = \log 1 = 0$

9 $a^{3-x}\cdot b^{5x} = a^{x+5}\cdot b^{3x}$

$$\Rightarrow \quad \frac{a^{3-x}}{a^{x+5}} = \frac{b^{3x}}{b^{5x}} \quad \Rightarrow\ a^{-2(x+1)} = b^{-2x}$$

$$\Rightarrow\ a^{-2x}\cdot a^{-2} = b^{-2x} \ \Rightarrow\ \left(\frac{b}{a}\right)^{-2x} = a^{-2}$$

$$\Rightarrow \quad \left(\frac{b}{a}\right)^{x} = a \quad \Rightarrow\ \log\left(\frac{b}{a}\right)^{x} = \log a$$

$$\Rightarrow \quad x\log\left(\frac{b}{a}\right) = \log a$$

10 $v = u^{1/2},\quad w = u^{1/3},\quad z = u^{1/4}$

$\therefore\ uvwz = u^{\left(1+\frac{1}{2}+\frac{1}{3}+\frac{1}{4}\right)}$

$\therefore\ \log_u uvwz = \log_u u^{\left(1+\frac{1}{2}+\frac{1}{3}+\frac{1}{4}\right)} = \left(1+\frac{1}{2}+\frac{1}{3}+\frac{1}{4}\right)\log_u u$

$$= \left(1+\frac{1}{2}+\frac{1}{3}+\frac{1}{4}\right)$$

11 $\dfrac{\log\sqrt{27} + \log\sqrt{8} - \log\sqrt{125}}{\log 6 - \log 5}$

$$= \frac{\log\,(3^{3/2}\times 2^{3/2}) - \log\,(5)^{3/2}}{\log 6 - \log 5}$$

$$= \frac{\log 6^{3/2} - \log 5^{3/2}}{\log 6 - \log 5} = \frac{\frac{3}{2}\log\left(\frac{6}{5}\right)}{\log\left(\frac{6}{5}\right)} = \frac{3}{2}$$

12 Last term $k = a\cdot r^{n-1}$, $r \rightarrow$ common ratio

$$\therefore \quad \log k = \log\,(a\,.\,r^{n-1})$$

$$\Rightarrow \quad \log k = \log a + (n-1)\log r$$

$$\Rightarrow \quad \frac{\log k - \log a}{\log r} = n - 1$$

$$\Rightarrow \quad n = 1 + \left(\frac{\log k - \log a}{\log r}\right)$$

13 $\because$ a, b, c are in GP

$$\therefore \quad b^2 = ac$$

$$\Rightarrow \quad 2\log b = \log a + \log c$$

$\therefore \log a, \log b, \log c$ are in AP

i. e., $\log_d a, \log_d b, \log_d c$ are in AP

$\therefore \log_a d, \log_b d, \log_c d$ are in HP

14 Best way is to go through options

15 Best way is to go through options

Alternatively $\log_{10} x^2y^3 = 7$

$$\Rightarrow \quad x^2y^3 = 10^7 \qquad \ldots(i)$$

and $\log_{10}\left(\dfrac{x}{y}\right) = 1$

$$\Rightarrow \quad \frac{x}{y} = 10 \qquad \ldots(ii)$$

$$\therefore \quad \frac{x^2y^3}{(x/y)^2} = \frac{10^7}{(10)^2} \ \Rightarrow\ y^5 = 10^5$$

$$\Rightarrow \quad y = 10 \qquad \therefore \quad x = 100$$

16 $y = a^{\left(\frac{1}{1-\log_a x}\right)}$

$$\Rightarrow \quad \log_a y = \frac{1}{1-\log_a x} \qquad \text{(taking log of both sides)}$$

$$\Rightarrow \quad \log_a x = 1 - \frac{1}{\log_a y} \qquad \ldots(i)$$

Again $z = a^{\left(\frac{1}{1-\log_a y}\right)} \Rightarrow \log_a z = \dfrac{1}{1-\log_a y}$

$$\Rightarrow \quad \log_a y = 1 - \frac{1}{\log_a z} \qquad \ldots(ii)$$

$\therefore$From eq. (i) and (ii), we get

$$\log_a x = 1 - \frac{1}{\left(1 - \frac{1}{\log_a z}\right)}$$

$$\Rightarrow \quad \log_a x = \frac{1}{(1-\log_a z)} \ \Rightarrow\ x = a^{\frac{1}{1-\log_a z}}$$

Alternatively Consider some numerical values suppose $a = 10$ and $x = \sqrt{10}$

$$\therefore \quad y = a^{\left(\frac{1}{1-\log_a x}\right)}$$

$$y = 10^{\left(\frac{1}{1-\log_{10}\sqrt{10}}\right)} \Rightarrow\ y = 100$$

and $z = a^{\left(\frac{1}{1-\log_a y}\right)}$

$$\therefore \quad z = 10^{\left(\frac{1}{1-\log_{10}100}\right)} \Rightarrow z = \frac{1}{10}$$

Now, go through options. Consider option (c)

$$x = a^{\frac{1}{1-\log_a z}} = 10^{\left(\frac{1}{1-\log_{10}(1/10)}\right)}$$

$$x = 10^{1/2} = \sqrt{10}$$

Hence, option (c) is correct.

NOTE You can check other options but they do not satisfy.

17 Let $a = 10$, $b = 100$ and $c = 1000$, then

$$x = \log_{1000}(100) + \log_{100}(1000) = \frac{13}{6}$$

$$y = \log_{10} 1000 + \log_{1000} 10 = \frac{10}{3}$$

$$z = \log_{100} 10 + \log_{10} 100 = \frac{5}{2}$$

$$\therefore \quad x^2 + y^2 + z^2 = \left(\frac{13}{6}\right)^2 + \left(\frac{10}{3}\right)^2 + \left(\frac{5}{2}\right)^2 = \frac{794}{36}$$

and $$xyz = \frac{13}{6} \times \frac{10}{3} \times \frac{5}{2} = \frac{650}{36}$$

$$\therefore \quad xyz + 4 = \left(\frac{650}{36}\right) + 4 = \frac{794}{36}$$

Hence, option (d) is correct.

18 $$\frac{1}{\log_3 e} + \frac{1}{\log_3 e^2} + \frac{1}{\log_3 e^4} + \ldots$$

$$= \frac{1}{\log_3 e} + \frac{1}{2\log_3 e} + \frac{1}{4\log_3 e} + \ldots$$

$$= \frac{1}{\log_3 e}\left(1 + \frac{1}{2} + \frac{1}{4} + \ldots\right) = \log_e 3\left(\frac{1}{1 - 1/2}\right)$$

(using sum of infinite GP) $\left(s_\infty = \frac{a}{1-r}; |r| < 1\right)$

$$= 2\log_e 3 = \log_e 3^2 = \log_e 9$$

19 $$\log_{10} x^2 - \log_{10} \sqrt{y} = 1$$

$$\Rightarrow \quad \log_{10}\left(\frac{x^2}{\sqrt{y}}\right) = \log_{10} 10$$

$$\Rightarrow \quad \frac{x^2}{\sqrt{y}} = 10 \quad \Rightarrow \quad \frac{4}{\sqrt{y}} = 10$$

$$\Rightarrow \quad \sqrt{y} = \frac{4}{10} = \frac{2}{5} \quad \Rightarrow \quad y = \frac{4}{25}$$

20 $(b^2)^{5\log_b x} = b^{10\log_b x} = b^{\log_b (x)^{10} = x^{10}}$

21 $(7^3)^{-2\log_7 8} = 7^{-6\log_7 8} = 7^{(\log_7 8^{-6})} = 8^{-6} = \frac{1}{8^6}$

22 $\log 12900 = \log(1.29 \times 10000)$

$$= \log 1.29 + \log 10000 = \log 1.29 + 4$$

23 $\log 0.786 = \log\left(\frac{786}{1000}\right) = \log 786 - \log 1000$

$$= \log 786 - 3$$

Also $$\log 0.786 = \log \frac{78.6}{100} = \log 78.6 - \log 100$$

24 $$\log_5 x = y \quad \Rightarrow \quad 5^y = x$$

$$\therefore \quad (5^y)^5 = x^5 \quad \Rightarrow \quad 5^{5y} = x^5$$

25 $A = \log_{13} 189 = \log_{13}(13^2 + 20)$

and $B = \log_{23} 521 = \log_{23}(23^2 - 8)$

$\therefore \quad A > B \qquad (\because A > 2 \text{ and } B < 2)$

26 $$A = \frac{\log_3 2187}{5} = \frac{1}{5}\log_3 2187$$

$$= \frac{1}{5}\log_3(3^7) = \frac{7}{5}\log_3 3 = \frac{7}{5}$$

and $$B = \log_{243} 2187 = \frac{\log_3 2187}{\log_3 243} = \frac{\log_3 3^7}{\log_3 3^5} = \frac{7}{5}$$

$$\therefore \quad A = B$$

27 $$(150)^x = 7$$

$$\Rightarrow \quad \log_{150} 7 = x \Rightarrow \frac{\log 7}{\log 150} = x$$

$$\Rightarrow \quad x = \frac{\log 7}{\log(3 \times 5 \times 10)} = \frac{\log 7}{\log 3 + \log 5 + \log 10}$$

$$= \frac{\log 7}{\log 3 + \log 5 + 1}$$

28 $$\log_{1/2} x = \log_2(3x - 2)$$

$$\Rightarrow \quad -\log_2 x = \log_2(3x - 2)$$

$$\Rightarrow \quad \log_2(x^{-1}) = \log_2(3x - 2)$$

$$\Rightarrow \quad x^{-1} = (3x - 2) \Rightarrow 3x^2 - 2x - 1 = 0$$

$$\Rightarrow \quad 3x^2 - 3x + x - 1 = 0$$

$$\Rightarrow \quad 3x(x - 1) + 1(x - 1) = 0$$

$$\Rightarrow \quad x = 1, . -1/3$$

but at $x = -1/3$, $\log x$ is not defined

The only admissible value of x is 1.

Alternatively Go through options.

29 $$\log_2(x + y) = 3$$

and $$\log_2 x + \log_2 y = 2 + \log_2 3$$

$\because \quad \log_2(x + y) = 3 = \log_2 2^3 = \log_2 8$

$$\Rightarrow \quad x + y = 8,$$

Hence option (c) is wrong.

Again, $\log_2 x + \log_2 y = 2 + \log_2 3 = \log_2 4 + \log_2 3$

$$\Rightarrow \quad \log_2(xy) = \log_2 12 \Rightarrow xy = 12$$

Hence, option (d) is correct.

30 Go through option.

at $x = 0$, $\log x$ is not defined.

at $x = 1$, both sides are equal.

Again at $x \neq 1$

$$\log_5 x \log_6 x \log_7 x = \log_5 x \log_6 x + \log_6 x \cdot \log_7 x + \log_7 x \cdot \log_5 x$$

$$\Rightarrow \quad 1 = \frac{1}{\log_7 x} + \frac{1}{\log_5 x} + \frac{1}{\log_6 x}$$

(By dividing both sides by $\log_5 x \log_6 x \log_7 x$)

$$\therefore \quad 1 = \log_x 7 + \log_x 5 + \log_x 6$$

$$1 = \log_x(7 \cdot 5 \cdot 6) = \log_x 210$$

$$\Rightarrow \quad \log_x 210 = 1$$

$$\Rightarrow \quad x = 210$$

Hence, $x = \{1, 210\}$

31 Let $\log_3 18 = a$

$$\therefore \frac{\log_3 54}{\log_{486} 3} - \frac{\log_3 1458}{\log_{18} 3}$$

$$= \log_3(18\times 3)\log_3(18\times 27) - \log_3(18\times 81)\log_3 18$$

$$= (\log_3 18 + \log_3 3)(\log_3 18 + 3\log_3 3) - (\log_3 18 + 4\log_3 3)\log_3 18$$

$$= (a+1)(a+3) - (a+4)a$$

$$= a^2 + 3 + 4a - a^2 - 4a = 3$$

32 $$\log_9(2x-5) = \log_3(x-4)$$

$$\Rightarrow \frac{1}{2}\log_3(2x-5) = \log_3(x-4)$$

$$\Rightarrow \log_3(2x-5) = \log_3(x-4)^2$$

$$\Rightarrow (2x-5) = (x-4)^2 \Rightarrow (2x-5) = x^2 + 16 - 8x$$

$$\Rightarrow x^2 - 10x + 21 = 0 \Rightarrow (x-3)(x-7) = 0$$

$$\Rightarrow x = 3 \text{ or } x = 7$$

but at $x = 3$, $\log_3(x-4)$ is not defined since $(x-4)$ becomes negative

Hence, $x = 7$ is the only possible solution.

33 Since we know that when a, b, c are in GP, then $\log a$, $\log b$ and $\log c$ are in AP.

Therefore $2, (2^x - 5)$ and $(2^x - 7/2)$ must be in GP

Now, going through options, we get

at $x = 3$ the three terms $2, (2^x - 5)$ and $(2^x - 7/2)$ are in GP

Hence $\log 2$, $\log(2^x - 5)$ and $\log(2^x - 7/2)$ are in AP.

Alternatively

We have $2\log_3(2^x - 5) = \log_3 2 + \log_3(2^x - 7/2)$

$$\Rightarrow \log_3(2^x - 5)^2 = \log_3 2(2^x - 7/2)$$

$$\Rightarrow (2^x - 5)^2 = 2(2^x - 7/2)$$

$$\Rightarrow (2^x)^2 - 10\cdot 2^x + 25 = 2\cdot 2^x - 7$$

$[10\cdot 2^x + 2\cdot 2^x = 12\cdot 2^x]$ $[\because (a-b)^2 = a^2 - 2ab + b^2]$

$$\Rightarrow (2^x)^2 - 12\cdot 2^x + 32 = 0$$

$$\Rightarrow (2^x - 8)(2^x - 4) = 0$$

$$\Rightarrow x = 3, \quad x = 2$$

but at $x = 2$, $\log(2^x - 5)$ is undefined

Hence $x = 3$

34 Go through options.

35 As $\log_x a$, $a^{x/2}$, $\log_b x$ are in GP.

$$\therefore (a^{x/2})^2 = \log_x a \cdot \log_b x$$

$$\Rightarrow a^x = \frac{\log a}{\log x}\cdot\frac{\log x}{\log b} = \frac{\log a}{\log b} = \log_b a$$

$$\Rightarrow a^x = \log_b a$$

$$\Rightarrow x = \log_a(\log_b a) = \log_a\left(\frac{\log_e a}{\log_e b}\right)$$

$$= \log_a(\log_e a) - \log_a(\log_e b)$$

36 $1, \log_9(3^{1-x} + 2), \log_3(4\cdot 3^x - 1)$ are in AP

$1, \log_3(3^{1-x} + 2)^{1/2}, \log_3(4\cdot 3^x - 1)$ are in AP

$\therefore \log_3 3, \log_3(3^{1-x} + 2)^{1/2}, \log_3(4.3^x - 1)$, are in AP

$\therefore 3, (3^{1-x} + 2)^{1/2}, (4\cdot 3^x - 1)$ are in GP

$$\therefore [(3^{1-x} + 2)^{1/2}]^2 = 3\cdot(4\cdot 3^x - 1)$$

$$\Rightarrow 3^{1-x} + 2 = 4\cdot 3^{x+1} - 3$$

$$\Rightarrow 4\cdot 3^{x+1} - 3^{1-x} = 5$$

Solving we get $x = \log_3\left(\frac{3}{4}\right)$

Alternatively Go through options. Consider option (d)

$$x = \log_3\frac{3}{4} \Rightarrow 3^x = \frac{3}{4}$$

$$\Rightarrow 1, \log_9\left(\frac{3}{3/4} + 2\right), \log_3\left(4\cdot\frac{3}{4} - 1\right)$$

$\Rightarrow 1, \log_9 6, \log_3 2 \Rightarrow \log_9 9, \log_9 6, \log_9 4$ are in AP

Since 9, 6, 4 are in GP.

37 $$\frac{1}{\log_{100} n} + \frac{1}{\log_{99} n} + \ldots + \frac{1}{\log_2 n}$$

$$= \log_n 100 + \log_n 99 + \ldots + \log_n 2$$

$$= \log_n(100\times 99\times 98\times\ldots\times 2) = \log_n 100! = \frac{1}{\log_{100!} n}$$

38 Best way is to go through options.

At $x = 1$, $\log_2(1 + 3^0) + 2 = \log_2(3^0 + 7)$

$$\Rightarrow \log_2 2 + 2 = \log_2 8 \quad (\because x^0 = 1)$$

$$\Rightarrow 1 + 2 = \log_2 2^3 \Rightarrow 3 = 3$$

Similarly, at $x = 2$

$$\log_2(1+3) + 2 = \log_2(9+7)$$

$$\Rightarrow (\log_2 4) + 2 = \log_2(16) \Rightarrow 4 = 4$$

Hence, (d) is the correct answer.

39 $$x^{\log_5 x} > 5$$

Taking logarithm with base 5 we have

$$(\log_5 x)(\log_5 x) > 1$$

$$\Rightarrow (\log_5 x)^2 > 1 \Rightarrow (\log_5 x)^2 - 1 > 0$$

$$\Rightarrow (\log_5 x - 1)(\log_5 x + 1) > 0$$

$$\Rightarrow \log_5 x > 1 \text{ or } \log_5 x < -1$$

$$\Rightarrow x > 5 \text{ or } x < \frac{1}{5}$$

Also, x must be greater than zero

$$\therefore x \in (0, 1/5)\cup(5, \infty)$$

Alternatively Go through options

Let us assume $x = 25$

then $25^{\log_5 25} = 625 > 5$, which is true

Hence option (d) is correct.

Again consider $x = 5$, then

$5^{\log_5 5} = 5$, which is not greater than 5.

Hence choices (a) and (b) are wrong.

Thus option (d) is correct.

40 $\log x^3 - \log 3x = 2\log 2 + \log 3$

$\log \frac{x^2}{3} = \log 12 \quad \Rightarrow \frac{x^2}{3} = 12 \Rightarrow x = \pm 6$

But at $x = -6$, $\log 3x$ and $\log x^3$ are not defined.

Hence $x = 6$ is the only correct answer.

41 $\log_5(2x+3) < \log_5 7$

$\Rightarrow \quad (2x+3) < 7 \Rightarrow 2x < 4 \Rightarrow x < 2$

But $(2x+3) > 0 \Rightarrow x > -\frac{3}{2}$

$\therefore \quad x \in \left(-\frac{3}{2}, 2\right)$

42 Best way is to go through options.

Alternatively Suppose $\log_2 x = t$, then

$\log_{2\sqrt{x}} x = \frac{\log_2 x}{\log_2 2\sqrt{x}} = \frac{t}{1+\frac{t}{2}}$ and $\log_{2x}\sqrt{x} = \frac{\log_2\sqrt{x}}{\log_2 2x}$

$= \frac{\frac{1}{2}\log_2 x}{1+\log_2 x} = \frac{t/2}{1+t}$ $\log_{2\sqrt{x}} x + \log_{2x}\sqrt{x} = \frac{2t}{2+t} + \frac{t}{2+2t} = 0$

$2t\,(2+2t) + t\,(2+t) = 0$

$\Rightarrow 4t + 4t^2 + 2t + t^2 = 0 \Rightarrow 5t^2 + 6t = 0$

$\Rightarrow \quad t\,(5t+6) = 0 \Rightarrow t = 0 \quad \text{or} \quad t = -\frac{6}{5}$

$\Rightarrow \quad \log_2 x = 0 \quad \Rightarrow x = 2^0 = 1$

and $\log_2 x = -\frac{6}{5} \quad \Rightarrow x = 2^{-6/5}$

$\therefore \quad x = 1 \quad \text{and} \quad x = 2^{-6/5}$

43 Clearly option (b) is wrong

$\therefore \quad \frac{x}{1+x} < x$ for every $x > 1$

Again $\frac{x}{1+x} < \log(x+1);\ x > 1$

Hence option (c) is also wrong and $\log(x+1) < x$

$\therefore$ Option (d) is correct.

44 $\frac{k}{l} > \frac{k+1}{l+1}$ for $(k, l) > 0$ and $k > l$

Let $k = x+1$ and $l = x$

$\therefore \quad \frac{x+1}{x} > \frac{(x+1)+1}{(x)+1} \quad \because (x+1) > x$

$\therefore \frac{\log(x+1)}{\log x} > \frac{\log(x+2)}{\log(x+1)} \Rightarrow \log_x(x+1) > \log_{x+1}(x+2)$

45 $a = 1 + \log_x yz = \log_x x + \log_x yz = \log_x xyz$

Similarly $b = \log_y xyz$ and $c = \log_z xyz$

Now, $ab + bc + ca = abc\left[\frac{1}{c} + \frac{1}{a} + \frac{1}{b}\right]$

$= abc\left[\frac{1}{\log_x xyz} + \frac{1}{\log_y xyz} + \frac{1}{\log_z xyz}\right]$

$= abc\,[\log_{xyz} x + \log_{xyz} y + \log_{xyz} z] = abc\,[\log_{xyz} xyz] = abc$

46 $\log_3(\log_2 x) + \log_{1/3}(\log_{1/2} y) = 1$

$\Rightarrow \quad \log_3(\log_2 x) - \log_3(\log_{1/2} y) = 1$

$\Rightarrow \quad \log_3\left(\frac{\log_2 x}{\log_{1/2} y}\right) = 1 = \log_3 3$

$\Rightarrow \quad \frac{\log_2 x}{\log_{1/2} y} = 3 \quad \Rightarrow \log_2 x = 3\log_{1/2} y = -3\log_2 y$

$\Rightarrow \quad x = y^{-3} \quad \Rightarrow \quad xy^3 = 1 \qquad \ldots(i)$

Again dividing eq. (i) by $xy^2 = 4$,' we get $y = \frac{1}{4}$

$\therefore \quad x = 64$ [From eq. (i)]

Alternatively Go through options.

47 Best way is to check the options.

Alternatively

$\log_{(1/\sqrt{2})}(1/\sqrt{8}) = \log_2(4^x+1)\cdot\log_2(4^{x+1}+4)$

$\Rightarrow \quad \frac{\log_2(1/\sqrt{8})}{\log_2(1/\sqrt{2})} = \log_2(4^x+1)\cdot\log_2(4^{x+1}+4)$

$\Rightarrow \quad 3 = [\log_2 4 + \log_2(4^x+1)]\,[\log_2(4^x+1)]$

$\Rightarrow \quad (2+t)\,t = 3, \text{ where } t = \log_2(4^x+1)$

$\Rightarrow \quad t = -3, 1$

If $\log_2(4^x+1) = -3$, then $4^x = -7/8$ which is not possible

If $\log_2(4^x+1) = 1$, then $4^x + 1 \Rightarrow 2 \Rightarrow 4^x = 1 \Rightarrow x = 0$

48 $\log_3 4 - \log_3(3x+1) = \log_3\frac{3}{(5x-2)}$

$\log_3\frac{4}{3x+1} = \log_3\frac{3}{(5x-2)}$

$\Rightarrow \quad \frac{4}{(3x+1)} = \frac{3}{(5x-2)} \Rightarrow 20x - 8 = 9x + 3$

$\Rightarrow \quad 11x = 11 \quad \Rightarrow x = 1$

Alternatively Go through options.

49 $|3-4x| > 2 \Rightarrow (3-4x) > 2 \quad \text{or} \quad -(3-4x) > 2$

$\Rightarrow \quad x < \frac{1}{4} \quad \text{or} \quad x > \frac{5}{4}$

$\therefore \quad x \in \left(-\infty, \frac{1}{4}\right) \cup \left(\frac{5}{4}, \infty\right)$

50 $\log_{100}|x+y| = \frac{1}{2}$

$\Rightarrow \quad |x+y| = 10 \qquad (-10 \text{ is inadmissible})$

and $\log_{10} y - \log_{10}|x| = \log_{100} 4$

$\Rightarrow \log_{10}\left(\frac{y}{|x|}\right) = \log_{10} 2 \Rightarrow \frac{y}{|x|} = 2 \Rightarrow y = 2|x|$

Hence we have $|x+2|x||| = 10$

Now, if $x > 0$, then we have, $3x = 10 \Rightarrow x = \frac{10}{3}$

and if $x < 0$, then $|-x| = 10 \Rightarrow x = -10$

Thus, $x = \frac{10}{3}, \quad y = \frac{20}{3}$

and $x = -10, \quad y = 20$

☑ Level 02 *Higher Level Exercise*

1 See the theory of this chapter

3 $\log_2\left(\frac{x}{y}\right)+\log_4\left(\frac{x}{y}\right)^2+\log_8\left(\frac{x}{y}\right)^3+\ldots$

$=\log_2\left(\frac{x}{y}\right)+\log_2\left(\frac{x}{y}\right)+\log_2\left(\frac{x}{y}\right)+\ldots$

$=\log_2\left(\frac{x}{y}\times\frac{x}{y}\times\frac{x}{y}\times\ldots\ n\text{ times}\right)$

$=\log_2\left(\frac{x}{y}\right)^n=n\log_2\left(\frac{x}{y}\right)$

4 $\log m+\log m^2+\log m^3+\ldots+\log m^n$

$=\log(m\cdot m^2\cdot m^3\ \ldots m^n)=\log m^{(1+2+3+\ldots n)}$

$=\log(m)^{\frac{n(n+1)}{2}}=\frac{n(n+1)}{2}\log m$

5 Given that $9^n<10^8$

Taking log to both sides

$\log 9^n<\log 10^8$

$\Rightarrow\quad 2n\log 3<8\log 10$

$\Rightarrow\quad 2n\times 0.4771<8$

$\Rightarrow\quad n\times 0.9542<8$

$\Rightarrow\quad n<\frac{8}{0.9542}$

$n<8.3839$

$\therefore\quad n=8\qquad(\because n\in N)$

6 Taking log of both sides with base 3 we have,

$[\log_3 x^2+(\log_3 x)^2-10]\log_3 x=-2\log_3 x$

$\Rightarrow\quad \log_3 x=0$

or $\quad(\log_3 x)^2+2\log_3 x-8=0$

$\Rightarrow x=1,\quad(\log_3 x+4)(\log_3 x-2)=0$

$\Rightarrow x=1,\quad \log_3 x=-4\quad\text{and}\quad\log_3 x=2$

$\Rightarrow x=1,\quad x=\frac{1}{81}\quad\text{and}\quad x=9$

$\therefore\quad x=\left\{1,\frac{1}{81},9\right\}$

7 $(x-3)>0\ \Rightarrow\ x>3$

and $\quad(2-x)>0\quad\text{and}\quad 2-x\neq 1$

$\therefore\quad x<2\quad\text{and}\quad x\neq 1$

Clearly there is no single value for which these inequalities are satisfied. Thus the set of its solutions is empty.

8 $\log_3 30=\frac{1}{a}\ \Rightarrow\ a=\log_{30}3\quad\text{and}\quad\log_5 30=\frac{1}{b}$

$\Rightarrow\quad b=\log_{30}5$

$3\log_{30}2=3[\log_{30}(30/15)]$

$=3[\log_{30}30-\log_{30}15]$

$=3[\log_{30}30-(\log_{30}3+\log_{30}5)]$

$=3[1-a-b]$

9 $x^{\log_x|3-x|^2}=4$

$\Rightarrow\quad|3-x|^2=4$

$\Rightarrow\quad|3-x|=2\qquad(-2\text{ is inadmissible})$

$\Rightarrow\quad(3-x)=2\quad\text{or}\quad-(3-x)=2$

$\Rightarrow\quad x=1\quad\text{or}\quad x=5$

10 Let $2^{x^2+2}=t$, then

$4^{x^2+2}-9\cdot 2^{x^2+2}+8=0$ becomes

$t^2-9t+8=0$

$\Rightarrow\quad t=1,8$

$\Rightarrow\quad 2^{x^2+2}=1$

$\Rightarrow\quad x^2+2=0$ but this has no solution

If $\quad 2^{x^2+2}=8\ \Rightarrow\ x^2+2=3$

$\Rightarrow\quad x^2=1\ \Rightarrow\ x=\pm 1$

11 Taking log of both sides, we get

$\left[(\log_3 x)^2-\frac{9}{2}\log_3 x+5\right]\log_3 x=\frac{3}{2}$

$\Rightarrow\quad 2(\log_3 x)^3-9(\log_3 x)^2+10(\log_3 x)-3=0$

$\Rightarrow\quad(\log_3 x-1)(\log_3 x-3)(2\log_3 x-1)=0$

$\Rightarrow\quad\log_3 x=1,\ \log_3 x=3,\ 2\log_3 x=1$

$\Rightarrow\quad x=3,\ x=27,\ x=\sqrt{3}$

i.e., $\quad x=(\sqrt{3},3,27)$

12 $x^2+6x+8>0\quad\text{and}\quad 2x^2+2x+3>0$

$\Rightarrow\quad(x+4)(x+2)>0\quad\text{and}\quad\left(x+\frac{1}{2}\right)^2+\frac{5}{4}>0$

$\Rightarrow\quad x\in(-\infty,-4)\cup(-2,\infty)\qquad\ldots(i)$

The given equation can be written as

$\log_{(2x^2+2x+3)}(x^2-2x)=1$

$\Rightarrow\quad x^2-2x=2x^2+2x+3$

$\Rightarrow\quad x^2+4x+3=0$

$\Rightarrow\quad x=-1,-3$

but at $x=-3$, $\log_{(x^2+6x+8)}$ is not defined

Hence, $\quad x=-1$

13 Let $u=\log_{10}p$, then the given inequality reduces to

$(2+u)^2+(1+u)^2+u\le 9$

$2u^2+7u+5\le 9$

$2u^2+7u-4\le 0$

$\Rightarrow\quad 2u^2+8u-u-4\le 0$

$\Rightarrow\quad 2u(u+4)-1(u+4)\le 0$

$\Rightarrow\quad(u+4)(2u-1)\le 0$

$\Rightarrow \quad -4 \le u \le \frac{1}{2}$

$\Rightarrow \quad -4 \le \log_{10} p \le \frac{1}{2}$

$\Rightarrow \quad 10^{-4} \le p \le 10^{1/2}$

14 Let $u = \log_2 x$, then

$$2\log_2 \log_2 x + \log_{1/2} \log_2 (2\sqrt{2}x) = 1$$

$\Rightarrow \quad 2\log_2 u + \log_{1/2}(\log_2 2^{3/2} + u) = 1$

$\Rightarrow \quad \log_2 u^2 - \log_2 (3/2 + u) = 1$

$\Rightarrow \quad \log_2\left(\frac{u^2}{3/2+u}\right) = 1$

$\Rightarrow \quad u^2 = 2\left(\frac{3}{2} + u\right)$

$\Rightarrow \quad u^2 - 2u - 3 = 0$

$\Rightarrow \quad u = -1, 3$

$\Rightarrow \quad x = \frac{1}{2}, 8$

but at $x = \frac{1}{2}$, $2\log_2 \log_2 x$ is undefined

Hence, $x = 8$

15 By changing the base to 2 the given equation becomes

$$\frac{\log_2 x^2}{\log_2 x/2} + \frac{40\log_2 \sqrt{x}}{\log_2 4x} - 14\frac{\log_2 x^3}{\log_2 16x} = 0$$

$\Rightarrow \quad \frac{2\log_2 x}{\log_2 x - 1} + 20\frac{\log_2 x}{2 + \log_2 x} - 42\frac{\log_2 x}{4 + \log_2 x} = 0$

Let $t = \log_2 x$, then we have

$$2t\,(4+t)(2+t) - 42t\,(t-1)(t+2) + 20t\,(t-1)(t+4) = 0$$

$\Rightarrow \quad 2t[t^2 + 6t + 8 - 21t^2 - 21t + 42 + 10t^2 + 30t - 40] = 0$

$\Rightarrow \quad t[2t^2 - 3t - 2] = 0$

$\Rightarrow \quad t = 0, \quad t = 2, \quad t = -\frac{1}{2}$

$\Rightarrow \quad x = 1, \quad x = 4, \quad x = \frac{1}{\sqrt{2}}$

16 $m > 0$ and $n > 0$ and $m \ne 1$

i.e., $25 - x^2 > 0$ and $x \ne \pm 3$

and $24 - 2x - x^2 > 0$

$\Rightarrow \quad -5 < x < 5, \; x \ne \pm 3$

and $x^2 + 2x - 24 < 0$

$-5 < x < 5, \quad x \ne \pm 3$

and $-6 < x < 4$

$x \in (-5, 4) - \{-3, 3\}$ …(i)

Case 1. $0 < m < 1 \;\Rightarrow\; 9 < x^2 < 25$

$\Rightarrow \quad x \in (-5, -3) \cup (3, 5)$ …(ii)

$\therefore$ The given inequality can be written as

$$\frac{24 - 2x - x^2}{14} < \frac{25 - x^2}{16}$$

$\Rightarrow \quad x^2 + 16x - 17 > 0$

$\Rightarrow \quad (x + 17)(x - 1) > 0$

$\Rightarrow \quad x < -17 \quad \text{or} \quad x > 1$

From eqs. (i) and (ii), we have

$x \in (3, 4)$

Case 2. If $m > 1$, *i.e.*, $\frac{25 - x^2}{16} > 1$

$\Rightarrow \quad x \in (-3, 3)$ …(iii)

The given inequality reduces to

$$\frac{24 - 2x - x^2}{14} > \frac{25 - x^2}{16}$$

$\Rightarrow \quad x^2 + 16x - 17 < 0$

$\Rightarrow \quad -17 < x < 1$

Thus combining with (iii), we get

$x \in (-3, 1)$

but $x \in \{-5, 4) \sim \{-3, 3\}$ by (1)

thus $x \in (-3, 1)$

Hence, the required value of x should lie in $(-3, 1) \cup (3, 4)$.

17 $\log_2\left(\frac{5}{2}\right) = (\log_2 5) - 1$

but $\because \quad (\log_2 5) - 1 > (\log_2 4) - 1$

$\therefore \quad \log_{3/10}\left[\frac{10}{7}(\log_2 5 - 1)\right] < \log_{3/10}\frac{10}{7} < \log_{3/10} 1 \; (= 0)$

$(\because \log_a x < \log_a y \text{ if } x > y \text{ for } 0 < a < 1)$

Since $\log_{3/10}\frac{10}{7}(\log_2 5 - 1) < 0$

Hence, the first inequality is true only if

$$\sqrt{(x-8)(2-x)} = 0$$

$\Rightarrow \quad x = 8 \quad \text{or} \quad x = 2$

If $x = 8$, then $\frac{2^x}{8} - (2^5 - 1) = 1 > 0$

If $x = 2$ then $\frac{2^x}{8} - (2^5 - 1) = \frac{1}{2} - (2^5 - 1) < 0$

Hence, $x = 8$ is the required value.

18 $2\log_{10} x - \log_x \frac{1}{100} = 2\log_{10} x - \frac{\log_{10} 10^{-2}}{\log_{10} x}$

$= 2\log_{10} x + \frac{2}{\log_{10} x}$

$= 2\left(\log_{10} x + \frac{1}{\log_{10} x}\right)$

Since $x > 1 \;\Rightarrow\; \log_{10} x > 0$

But since AM $\ge$ GM

$\therefore \quad \frac{\left(\log_{10} x + \frac{1}{\log_{10} x}\right)}{2} \ge \sqrt{\log_{10} x \times \frac{1}{\log_{10} x}}$

$$\Rightarrow \quad \log_{10} x + \frac{1}{\log_{10} x} \geq 2$$

$$\Rightarrow \quad 2\left(\log_{10} x + \frac{1}{\log_{10} x}\right) \geq 4$$

For $x = 10$, $\quad 2\left(\log_{10} x + \frac{1}{\log_{10} x}\right) \geq 4$

Hence the least value of $\left(\log_{10} x - \log_x \frac{1}{100}\right)$ is 4.

19 We have , $x^{[(3/4)(\log_2 x)^2 + \log_2 x - (5/4)]} = \sqrt{2}$

$$\Rightarrow \quad \log_x \sqrt{2} = \frac{3}{4}(\log_2 x)^2 + \log_2 x - \left(\frac{5}{4}\right)$$

$$\Rightarrow \quad \frac{\log \sqrt{2}}{\log x} = \frac{3}{4}(\log_2 x)^2 + \log_2 x - \left(\frac{5}{4}\right)$$

$$\Rightarrow \quad \log \sqrt{2} = \log x \left[\frac{3}{4}(\log_2 x)^2 + \log_2 x - \left(\frac{5}{4}\right)\right]$$

$$\Rightarrow \quad \log_2 \sqrt{2} = \log_2 x \left[\frac{3}{4}(\log_2 x)^2 + \log_2 x - \left(\frac{5}{4}\right)\right]$$

$$\Rightarrow \quad \frac{1}{2} = \alpha\left[\frac{3}{4}\alpha^2 + \alpha - \frac{5}{4}\right] \qquad (\text{say } \alpha = \log_2 x)$$

$$\Rightarrow \quad 2 = 3\alpha^3 + 4\alpha^2 - 5\alpha$$

$$\Rightarrow \quad 3\alpha^3 + 4\alpha^2 - 5\alpha - 2 = 0$$

$$\Rightarrow \quad (\alpha - 1)(3\alpha^2 + 7\alpha + 2) = 0$$

$$\Rightarrow \quad \alpha = 1 \Rightarrow \log_2 x = 1 \Rightarrow x = 2$$

Again $\quad 3\alpha^2 + 7\alpha + 2 = 0$

$$\Rightarrow \quad \alpha = -2, -\frac{1}{3}$$

$$\Rightarrow \quad \log_2 x = -2 \quad \text{and} \quad \log_2 x = \frac{-1}{3}$$

$$\Rightarrow \quad x = \frac{1}{4} \Rightarrow x = 2^{-1/3}$$

Hence $\quad x = 2, \frac{1}{4}, 2^{-1/3}$

Thus option (d) is most appropriate.

20 $\quad 2x + 3 > 0 \quad \text{and} \quad 2x + 3 \neq 1$

$$\Rightarrow \quad x > -\frac{3}{2} \quad \text{and} \quad x \neq -1$$

And $\quad 3x + 7 > 0 \quad \text{and} \quad 3x + 7 \neq 1$

$$\Rightarrow \quad x > \frac{-7}{3} \Rightarrow x \neq -2$$

Now, $\log_{(2x+3)}(6x^2 + 23x + 21)$

$$= 4 - \log_{(3x+7)}(4x^2 + 12x + 9)$$

$$\Rightarrow \log_{(2x+3)}(2x + 3)(3x + 7) = 4 - \log_{(3x+7)}(2x + 3)^2$$

$$\Rightarrow \log_{(2x+3)}(2x + 3) + \log_{(2x+3)}(3x + 7) = 4 - 2\log_{(3x+7)}(2x + 3)$$

$$\Rightarrow 1 + \log_{(2x+3)}(3x + 7) + 2\log_{(3x+7)}(2x + 3) - 4 = 0$$

$$\Rightarrow \quad \frac{2\log(2x + 3)}{\log(3x + 7)} + \frac{\log(3x + 7)}{\log(2x + 3)} - 3 = 0 \qquad \ldots(\text{i})$$

Putting $\frac{\log(2x + 3)}{\log(3x + 7)} = y$ in eq. (i), we get

$$2y + \frac{1}{y} - 3 = 0 \Rightarrow 2y^2 - 3y + 1 = 0$$

$$(2y - 1)(y - 1) = 0$$

$$\Rightarrow \quad y = \frac{1}{2} \quad \text{and} \quad y = 1$$

Now, when $y = \frac{1}{2}$

$$\therefore \quad \frac{\log(2x + 3)}{\log(3x + 7)} = \frac{1}{2}$$

$$\Rightarrow \quad (2x + 3)^2 = (3x + 7)$$

$$4x^2 + 9x + 2 = 0$$

$$(4x + 1)(x + 2) = 0$$

$$x = -\frac{1}{4}, -2$$

Again if $y = 1$, then

$$\frac{\log(2x + 3)}{\log(3x + 1)} = 1$$

$$\Rightarrow \quad 2x + 3 = 3x + 7$$

$$x = -4$$

Since we know that $x > -\frac{3}{2}$ and $x > -\frac{7}{3}$

therefore $x = -2$ and $x = -4$ are not admissible values

Again since $x \neq -1$ and $x \neq -2$

Hence $x = -2$ is also inadmissible value

Thus, $x = -\frac{1}{4}$ is only possible value.

$\therefore$ Option (b) is correct.

Alternatively Go through options

21 $x > 0, x \neq 1$

Since exponential function assumes positive value, so we must have $(x - 1)^7 > 0$ *i.e.*, $x > 1$.

Taking logarithm on both sides, we get

$$(\log_3 x^2 - 2\log_x 9)\log(x - 1) = 7\log(x - 1)$$

Either $\log(x - 1) = 0$ *i.e.*, $x = 2$

or $\quad \log_3 x^2 - 2\log_x 9 = 7$

$$\Rightarrow \quad 2(\log_3 x) - 4\log_x 3 = 7$$

$$\Rightarrow \quad 2t - \frac{4}{t} = 7, \qquad (\because t = \log_3 x)$$

$$\Rightarrow \quad 2t^2 - 7t - 4 = 0$$

$$\Rightarrow \quad t = 4, -\frac{1}{2}$$

$$\log_3 x = 4 \Rightarrow x = 81$$

If $\log_3 x = -\frac{1}{2}$, then $x = 3^{-1/2} < 1$, which is not the case

Hence, $\quad x = 2, 81$

22 $(2x)^{\ln 2} = (3y)^{\ln 3}$ …(i)

$3^{\ln x} = 2^{\ln y}$ …(ii)

Now, taking log of both the sides in Eq. (ii), you get

$$\log x \log 3 = \log y \log 2$$

$$\Rightarrow \quad \log y = \frac{\log x \log 3}{\log 2} \quad \text{…(iii)}$$

Similarly, taking log of both the sides in (i), you get

$$\log 2(\log 2 + \log x) = \log 3(\log 3 + \log y)$$

$$\Rightarrow (\log 2)^2 + \log 2 \log x = (\log 3)^2 + \frac{(\log 3)^2 \log x}{\log 2} \quad \text{[from eq. (iii)]}$$

$$\Rightarrow (\log 2)^2 - (\log 3)^2 = \frac{(\log 3)^2 - (\log 2)^2}{\log 2}(\log x)$$

$$\Rightarrow \quad -\log 2 = \log x$$

$$\Rightarrow \quad x = \frac{1}{2} \Rightarrow x_0 = \frac{1}{2}$$

Hence, choice (c) is the answer.

23 $3 < 20^{1/2}$

$$\Rightarrow \quad \log_{20} 3 < \log_{20}(20)^{1/2})$$

$$\Rightarrow \quad \log_{20} 3 < \frac{1}{2}$$

and $3 > 20^{1/3}$

$$\Rightarrow \quad \log_{20} 3 > \log_{20}(20)^{1/3})$$

$$\Rightarrow \quad \log_{20} 3 < \frac{1}{3}$$

$$\therefore \quad \frac{1}{3} < \log_{20} 3 > \frac{1}{2}$$

Hence, choice (b) is the answer.

24 Let $m = \frac{5}{500^{50}} \Rightarrow m = 5 \times 500^{-50}$

Taking log on both the sides, we get

$\log m = \log(5 \times 500^{-50})$

$\log m = \log 5 + \log 500^{-50}$

$\log m = \log 5 - 50 \log 500$

$\log m = \log 5 - 50 \log(5 \times 10^2)$

$\log m = \log 5 - 50(\log 5 + 2 \log 10)$

$\log m = -49 \log 5 - 100 \log 10$

$\log m = -49 \log 5 - 100$

$\log m = -49(0.4771) - 100$

$\log m = -123.3779$

$\log m = -123 - 0.3779$

$\log m = -124 + 0.6221$

$\log m = \overline{124}.6221$

Since, the characteristic of $\log m$ is $\overline{124}$, therefore the number of consecutive zeros immediately after the decimal point will be $124 - 1 = 123$.

Hence choice (c) is the correct one.

CHAPTER 17

Functions and Graphs

In the introduction of this chapter, I would like to mention that in the recent past this chapter contributed 3-12 questions in some years. Basically on an average 4-5 questions are being asked from this chapter. Besides most of the questions are based on the user defined (or self defined) functions which are rather easier in comparison to the problems based on the algebraic functions of pure mathematics. Still you are required to know some basic characteristic and applications of standard algebraic functions, since they are not uncommon in CAT. Remember that a little bit of practice on this chapter will give you an edge over your competitor, since the problems related to this chapter are very easy provided that these problems are being solved patiently. Moreover, you need not to remember any formula at all.

The structure of the chapter is as follows :

1. Function (An introduction)
2. Domain, range and graphs of different types of functions and operations on real valued functions.
3. Transformation of graphs.
4. Composite functions
5. Even and odd functions
6. Surjective and injective functions
7. Inverse functions
8. Binary operations
9. User defined (or self defined) operations (Also important for XAT)
10. Maxima and minima.

17.1 Functions

Suppose we have to produce some required products from the raw materials, then the raw material is known as input and the desired products are known as output. For this we have to look into two points.

1. Every input must give some output (to avoid wastage of inputs)
2. No input should give more than one output. (To avoid ambiguity or variation from the desired output). Thus, if the above conditions are satisfied by any input output relation, then this relation is called function,

Chapter Checklist

- *Functions*

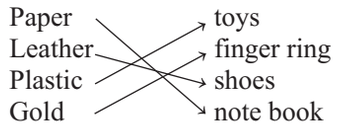
- *Surjective and Injective Functions*
- *Inverse Function*
- *Binary Operations*
- *User Defined Functions*
- *Maxima and Minima*
- ***CAT Test***

e.g.,



Here you can see that each input gives an output necessarily and no input give more than one output. The collection of raw materials (*i.e.,* input) is called the ''Domain'' and the collection of products (or output) is called the ''Range''.

Definitions

1. **Domain :** Set of inputs (also called pre-images) is called domain.
2. **Codomain :** Set of possible outputs is called codomain.
3. **Range :** Set of actual outputs (also called images) is known as range. Here, Range $\subseteq$ Codomain.

Mathematical Definition of Function

Let A and B be two non-empty sets, then a function from 'A' to 'B' is a rule that assigns to each element in a set A, one and only one element of a set B. In general, the sets A and B need not be sets of real numbers. However, we consider only those functions for which A and B are both subsets of the real numbers. If the number of elements in A be n and the number of elements in B be m, then the total number of functions that can be defined from A to B is n^m.

$$A \xrightarrow{f} B \quad \text{or} \quad f : A \longrightarrow B$$

If a pre-image is denoted by x and an image is denoted by y then we can write $y = f(x)$.

Here, $f(x)$ is called the value of the function f at the point x.

Remember

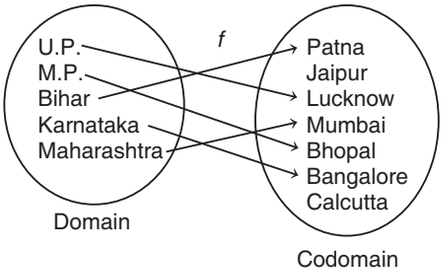
A function cannot be multiple-valued. For example, the expression $\pm\sqrt{x}$ does not define a function of x, since it assigns two values to each positive x. *i.e.*, $y = f(x)$

or $y = \pm\sqrt{x}$ is not a function since y assumes two values

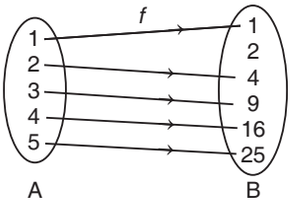
i.e., $y = +\sqrt{x}$ and $y = -\sqrt{x}$, which is impossible.

Methods of Representation of a Function

1. **Verbal description :** For example, if f is a function which assigns to each state in the country its capital city.



2. **Arrow diagram :**



Domain = {1, 2, 3, 4, 5}
Codomain = {1, 2, 4, 9,16, 25}
Range = {1, 4, 9, 16, 25}

3. **Tabular form :**

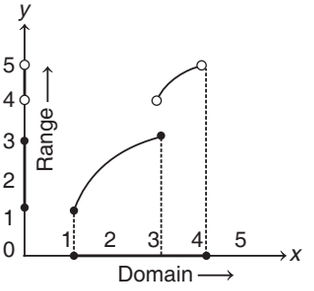
e.g.,

x	-1	-2	-3	0	1	2
y	-1	-8	-27	0	1	8

$D = \{-1, -2, -3, 0, 1, 2\}, R = \{-1, -8, -27, 0, 1, 8\}$

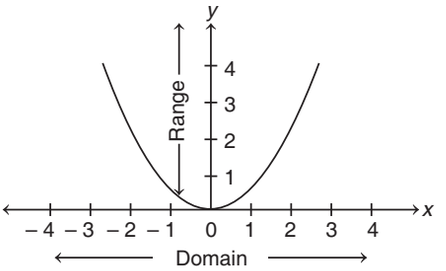
$f(2) = 8, \quad f(-2) = -8$ etc.

4. **Graph :**



$D = [1, 4], R = [1, 3] \cup (4, 5)$

5. **Equation** (or formula) : $f : R \to R \quad f(x) = x^2 \ \forall\, x \in R$



$D = R$ (all real numbers),
Codomain = R (All real numbers)
(Range) $R = R^+ \cup \{0\}$
($R^+ \to$ set of positive real numbers)

17.2 Domain & Graphs of Different Types of Functions

A function $f : A \to B$ is called a real valued if the image of every element of A, under f is a real number *i.e.,* if $f(x) \in R \ \forall\, x \in A$; $y = f(x)$

$x \to$ independent variable
$y \to$ dependent variable

Domain : The values of x must be such that for every x, y must be real is called the domain. In other words the value of x for which the values of $f(x)$ is not a real number cannot be included in the domain of the function $y = f(x)$. There are five different common situations where the domain of $f(x)$ for some particular value(s) is not defined.

(a) *When base of* $(1/2n)^{th}$ *power is negative for any*

$$n \in I: \text{If } x^{1/2} = k \Rightarrow x = k^2$$

since k^2 is always positive even when x is negative, therefore this equality is not satisfied. Hence the domain of definition of $y = \sqrt{x}$ is defined for only $x \geq 0$ *i.e.,* not defined for $x < 0$

Example

Function	Domain defined for	Domain not defined for
$(x-3)^{1/2}$	$(x-3) \geq 0 \Rightarrow x \geq 3$	$(x-3) < 0 \Rightarrow x < 3$
$(x+4)^{1/6}$	$(x+4) \geq 0 \Rightarrow x \geq -4$	$(x+4) < 0 \Rightarrow x < -4$
$(\lvert x \rvert - 3)^{1/10}$	$\lvert x \rvert - 3 \geq 0 \Rightarrow \lvert x \rvert \geq 3$ $\Rightarrow x \leq -3$ and $x \geq 3$	$\lvert x \rvert - 3 < 0 \Rightarrow \lvert x \rvert < 3$ $\Rightarrow -3 < x < 3$

(b) *When denominator of a function is zero*

If $\frac{x^2+1}{2x}$ is such that $x = 0$, then $\frac{x^2+1}{2x}$ is not defined *i.e.,* the function $y = \frac{1}{x}$ is defined only for $x \neq 0$ (*i.e.,* non zero real numbers) therefore the domain of function

$$f(x) = \frac{1}{x} \text{ is } (-\infty, 0) \cup (0, \infty) \text{ or } (-\infty, \infty) - \{0\}$$

or $\quad -\infty < x < 0 \cup 0 < x < \infty.$

Examples

Function	Domain defined for	Domain not defined for
$\frac{1}{(x-3)}$	$x \in (-\infty, \infty) - \{3\}$	$x = 3$
$\frac{19}{(x^2-16)}$	$x \in (-\infty, \infty) - \{\pm 4\}$	$x = \pm 4$
$\frac{(x^2+4)}{\lvert x \rvert - 5}$	$x \in (-\infty, \infty) - \{\pm 5\}$	$x = \pm 5$
$\frac{1}{(l_n x) - 1}$	$x \in (0, \infty) - \{e\}$	$x = e$

(c) *When function becomes 0°*

Example $y = (\lvert x \rvert - 3)^{(x-3)}$ is undefined for $x = 3$

(d) **When the value of x in $\log_a x$ becomes non- positive** (*i.e,* negative or zero)

$\therefore \quad \log_{10}(-3)$ is not defined.

(e) **When the value of a in $\log_a x$ becomes 1 or 0 or negative.**

$\therefore \log_1 5$ is not defined. Similarly, $\log_{(-3)} 10$ is not defined.

Example

Function	Domain defined for	Domain not defined for
$\log_{10}(x-5)$	$(x-5) > 0 \Rightarrow x > 5$	$x - 5 \leq 0 \Rightarrow x \leq 5$
$\log_{15}(7-x)$	$(7-x) > 0 \Rightarrow x < 7$	$(7-x) \leq 0 \Rightarrow x \geq 7$
$\log_{(x^2-4)} 12$	$(x^2-4) > 0$ and $x^2 - 4 \neq 1$ $\Rightarrow x < -2$ and $x^2 \neq 5$ and $x > 2$ and $x \neq \pm\sqrt{5}$ $\therefore x \in (-\infty, -2) \cup (2, \infty)$ excluding $\pm\sqrt{5}$	$x^2 - 4 \leq 0$ and $x^2 - 4 = 1$ $\Rightarrow -2 \leq x \leq 2$ and $x^2 = 5$ and $x = \pm\sqrt{5}$ $\therefore x \in [-2, 2] \cup \{\pm\sqrt{5}\}$

17.3 Range

The set of all images of all the elements of domain. It can be obtained by one of the following ways.

(i) Obtaining x in terms of y and then finding the values of y for which we get real x. *e.g.,* $f(x) = \frac{x+2}{x+3} = y$

$$\Rightarrow yx + 3y = x + 2 \Rightarrow x(y-1) = (2-3y) \Rightarrow x = \frac{2-3y}{y-1}$$

for $y = 1$, there is no real value of x for the above equation is satisfied hence.
Range $= R - \{1\}$ $R \rightarrow$ Set of real numbers

(ii) If the given function is continuous, then Range $= [l, m]$, where l is the least value of the function in its domain and m is the maximum value in its domain.

(iii) By sketching the graphs of the function.

17.4 Equal Function

Two functions f and g are said to be equal iff (*i.e.,* if and only if)

(i) the domain of f = domain of g

(ii) the co-domain of f = co-domain of g, and

(iii) $f(x) = g(x)$ for every x belong to their common domain.

If two functions f and g are equal then we write $f = g$, e.g.,

1. Let $A = \{1, 2\}$, $B = \{3, 6\}$ and $f : A \rightarrow B$ given by $f(x) = x^2 + 2$ and $g : A \rightarrow B$ given by $g(x) = 3x$. Then we observe that f and g have the same domain and co-domain also $f(1) = 3 = g(1)$; $f(2) = 6 = g(2)$

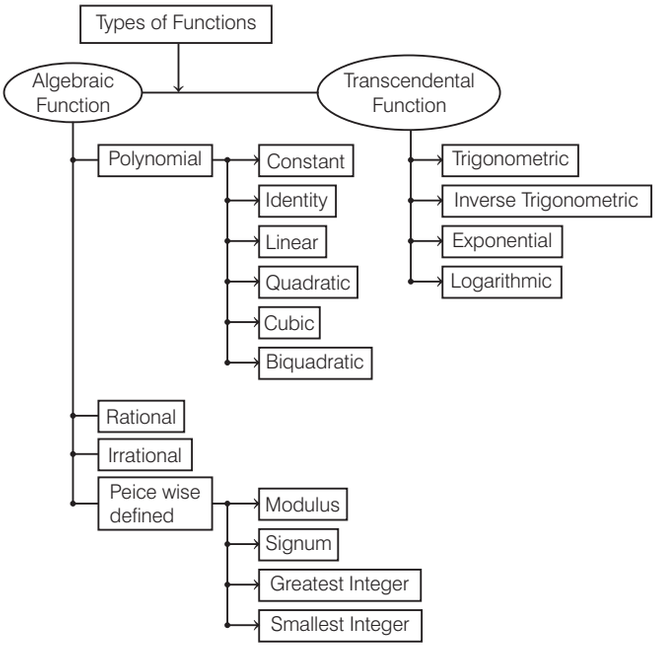
   Hence, $\quad f = g$

2. Let $f(x) = \sqrt{\frac{x-3}{x-5}}$ and $g(x) = \frac{\sqrt{x-3}}{\sqrt{x-5}}$ $f(x)$ is defined when $x - 3$ and $x - 5$ both are negative, since $\frac{x-3}{x-5} > 0$

But when $x-3$ and $x-5$ are negative then both $\sqrt{x-3}$ and $\sqrt{x-5}$ are undefined. Hence $g(x)$ is undefined

$\therefore$ Domain of $f \neq$ Domain of g. Hence, $f(x)$ and $g(x)$ are different.

17.5 Types of Functions



Algebraic Functions

A function which contains finite number of terms having different powers of independent variable (x) and the operations $+, -, \times, \div$ is called algebraic function

e.g., $4x^2 - 3x^{1/2} + 7, \quad 5x^2 + 13x + 8, \quad \dfrac{x^2+1}{x^2-2}$ etc.

A–1) Polynomial Functions A function $f(x)$ of the following form is known as polynomial function.

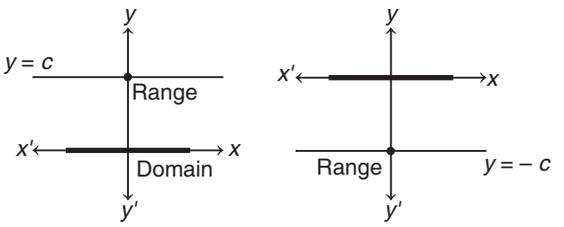
$$f(x) = a_0 + a_1x + a_2x^2 + \ldots + a_nx^n$$

where $n \in N$ and $a_1, a_2, a_3 \ldots a_n \in R$

Domain : It is the set of real numbers

Range : It is the set of real numbers

(A–1.1) **Constant function :** $f(x) = c, c \in R$, c is constant.

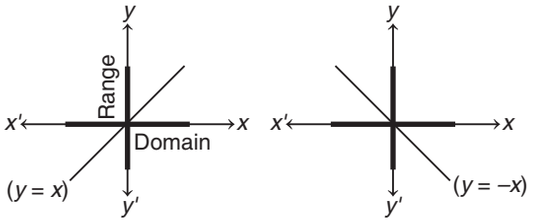


Domain : It is the set of real numbers

Range : It is a particular real number $\{c\}$

(A–1.2) **Identity function**

$$y = x \quad i.e., \quad f(x) = x$$

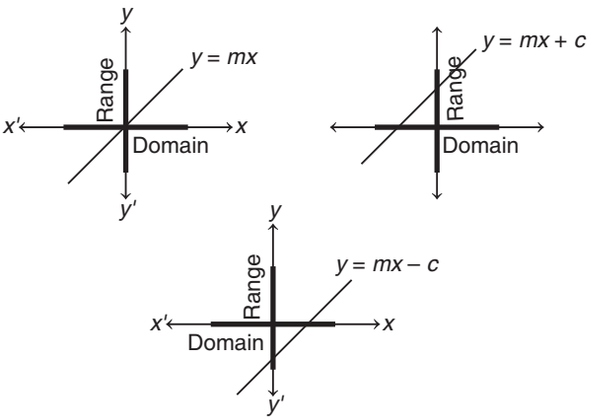


(*i.e,* input equals to output or pre image equals to image)

Domain $\rightarrow$ It is the set of real numbers.

Range $\rightarrow$ It is also the set of real numbers.

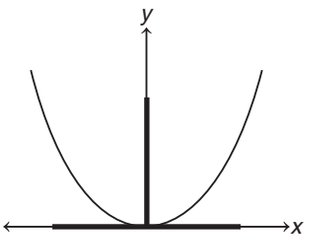
(A–1.3) **Linear function** $y = mx + c (m, c \in R, m$ is positive)



Domain $\rightarrow$ It is the set of real numbers.

Range $\rightarrow$ It is also the set of real numbers.

(A–1.4.) **Quadratic function** $y = f(x) = x^2$



$\because \quad f(x) = f(-x)$

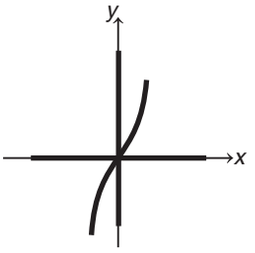
$\therefore$ Graph of $f(x)$ is symmetric about y-axis.

Domain $\rightarrow$ It is the set of real values.

Range $\rightarrow R^+ \cup \{0\}$ *i.e.,* non-negative real numbers

(A–1.5) **Cubic function** $y = f(x) = x^3$

$\because$ $f(-x) = -f(x)$



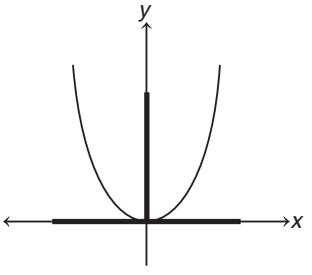
$\therefore$ Graph of $f(x)$ is symmetric about origin

Domain $\rightarrow R$ (set of real numbers)

Range $\rightarrow R$ (set of real numbers)

(A–1.6) Biquadratic function $y = f(x) = x^4$

$\because$ $f(x) = f(-x)$



$\therefore$ Graph of $f(x)$ is symmetric about y-axis.

Domain $\rightarrow R$ (set of real numbers)

Range $\rightarrow R^+ \cup \{0\}$ *i.e.,* set of non-negative real numbers.

NOTE Graph of $f(x) = x^n$ is symmetric about

(a) y-axis if n is even (b) origin if n is odd

Relation between the values of x, x^2, x^3 ...etc.

For	Order of the values
$x \in (0, 1)$	$x > x^2 > x^3 > x^4 \ldots$
$x \in (1, \infty)$	$x < x^2 < x^3 < x^4 \ldots$
$x \in (-1, 0)$	$x < x^3 < x^5 \ldots$ (–ve values)
	$x^2 > x^4 > x^6 \ldots$ (+ve values)
$x \in (-\infty, -1)$	$x > x^3 > x^5 \ldots$ (–ve values)
	$x^2 < x^4 < x^6 \ldots$ (+ve values)

(A–2) **Rational Function** $f : A \rightarrow R;\ f(x) = \dfrac{P(x)}{Q(x)}$

Here, $P(x)$ and $Q(x)$ are polynomial functions and

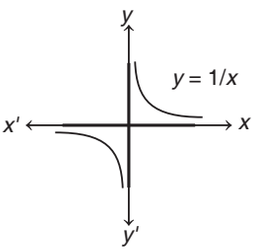
$A = \{x : x \in R$ such that $Q(x) \neq 0\}$

Examples

	Function	Domain
1.	$\dfrac{a_0 + a_1x + a_2x^2 + \ldots + a_nx^n}{P_0 + P_1x + P_2x^2 + \ldots + P_nx^n}$	Set of all the real numbers except the real roots of the equation $P_0 + P_1x + P_2x^2 + \ldots + P_nx^n$
2.	$\dfrac{x^2 + 5x + 8}{x^2 - 5x + 6}$	$R - \{2, 3\}$
3.	$\dfrac{1}{x^n}; n \in N$	$R - \{0\}$

Graphs of Important Rational Functions

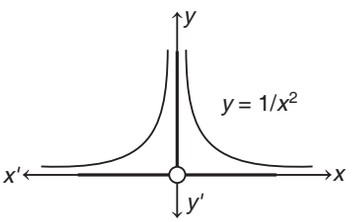
1. $y = f(x) = \dfrac{1}{x} \Rightarrow f(x) = -f(-x)$



Domain $\rightarrow R - \{0\}$; set of non-zero rational numbers

Range $\rightarrow R - \{0\}$; set of non-zero rational numbers

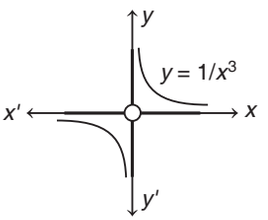
2. $y = f(x) = \dfrac{1}{x^2} \Rightarrow f(x) = f(-x)$



Domain $\rightarrow R - \{0\}$ *i.e.,* set of non-zero rational numbers

Range $\rightarrow R^+$ *i.e.,* set of positive rational numbers

3. $y = f(x) = \dfrac{1}{x^3} \Rightarrow f(-x) = -f(x)$



Domain $\to R - \{0\}$ *i.e.,* set of non-zero rational numbers

Range $\to R - \{0\}$ *i.e.,* set of non-zero rational numbers.

NOTE Graph of $f(x) = \frac{1}{x^n} (n \in N)$ is symmetric about

(a) y axis if n is even (b) origin if n is odd.

Relation between the values of $\frac{1}{x}, \frac{1}{x^2}, \frac{1}{x^3}, \frac{1}{x^4} \ldots$

For	The order of the values
$x \in (1, \infty)$	$\frac{1}{x} > \frac{1}{x^2} > \frac{1}{x^3} > \frac{1}{x^4} \ldots$
$x \in (0, 1)$	$\frac{1}{x} < \frac{1}{x^2} < \frac{1}{x^3} < \frac{1}{x^4} \ldots$
$x \in (-1, 0)$	$\frac{1}{x^2} < \frac{1}{x^4} < \frac{1}{x^6} \ldots$ (positive values) $\frac{1}{x} > \frac{1}{x^3} > \frac{1}{x^5} \ldots$ (negative values)
$x \in (-\infty, -1)$	$\frac{1}{x^2} > \frac{1}{x^4} > \frac{1}{x^6} \ldots$ (positive values) $\frac{1}{x} < \frac{1}{x^3} < \frac{1}{x^5} \ldots$ (negative values)

(A–3) **Irrational Functions** : The algebraic functions containing one or more terms having non-integral rational powers of x are called irrational functions.

e.g., $y = 4x^2 + \sqrt{2x}$, then y is undefined if $x < 0$

$y = \sqrt{x}$ then y is undefined if $x < 0$

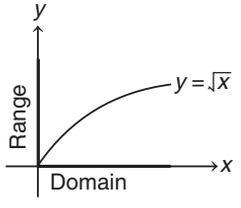
$y = \frac{5x^3 + 7x^2 + 3\sqrt{x}}{\sqrt{x+4}}$, then y is undefined if $x < 0$

and $\sqrt{x+4} \le 0$

These functions are not defined for $f(x) < 0$. They are also not-defined if the denominator is zero.

Graphs of Important Irrational Functions

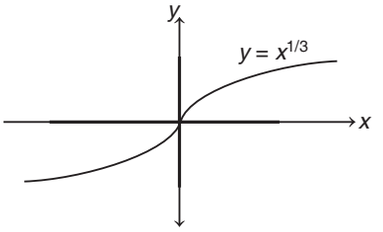
1. $y = f(x) = x^{1/2}$ (*i.e.,* $\sqrt{x}$)



Domain $\to R^+ \cup \{0\}$ *i.e.,* set of non-negative real numbers.

Range $\to R^+ \cup \{0\}$ *i.e.,* set of non-negative real numbers

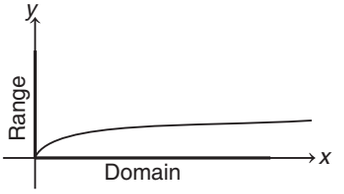
2. $y = f(x) = x^{1/3}$



Domain $\to$ (*i.e.,* set of real numbers)

Range $\to R$ (*i.e.,* set of real numbers)

3. $y = f(x) = x^{1/4}$



Domain $\to R^+ \cup \{0\}$ *i.e.,* set of non-negative real numbers

Range $\to R^+ \cup \{0\}$ *i.e.,* set of non-negative real numbers

Relation between the values of $x^{1/2}, x^{1/3}, x^{1/4} \ldots$

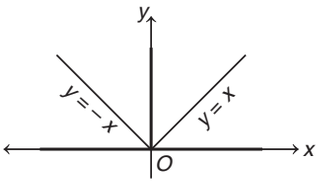
For	Order of the values
$x \in (1, \infty)$	$x^{1/2} > x^{1/3} > x^{1/4} > x^{1/5} > \ldots.$
$x \in (0, 1)$	$x^{1/2} < x^{1/3} < x^{1/4} < x^{1/5} < \ldots.$
$x \in (-1, 0)$	$x^{1/3} > x^{1/5} > x^{1/7} \ldots.$
$x \in (-\infty, -1)$	$x^{1/3} < x^{1/5} < x^{1/7} \ldots.$

(A– 4) Piecewise Defined Functions

(A– 4.1) Modulus function (or absolute-value function)

$$y = f(x) = |x| = \begin{cases} x \text{ if } x \ge 0 \\ -x \text{ if } x < 0 \end{cases}$$

$\because$ $f(-x) = f(x)$



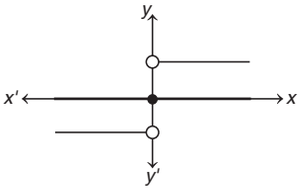
$\therefore$ $f(x)$ is symmetric about y-axis.

Domain $\to R$ (*i.e.,* set of real numbers)

Range $\to R \cup \{0\}$ (*i.e.,* set of non-negative real numbers)

(A– 4.2) Signum function [Sgn (x)]

$$y = f(x) = \text{Sgn}(x) = \begin{cases} 1 \text{ if } x > 0 \\ 0 \text{ if } x = 0 \\ -1 \text{ if } x < 0 \end{cases}$$



Domain $\to R$ Range $\to \{-1, 0, 1\}$

- Indicates that the points (0, 1) and (0, – 1) are not included in the graphs.
- Indicates that the point (0, 0) is included in the graphs

(a) $\text{Sgn}(x) = \begin{cases} \dfrac{x}{|x|} \text{ if } x \neq 0 \\ 0 \text{ if } x = 0 \end{cases}$ (b) $\text{Sgn}(x) = \begin{cases} \dfrac{|x|}{x} \text{ if } x \neq 0 \\ 0 \text{ if } x = 0 \end{cases}$

(A–4.3) Greatest integer function

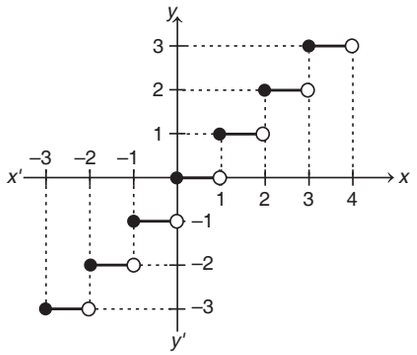
$y = [x]$ denotes the greatest integer less than or equal to x.

e.g., $[2.3] = 2$

$[4.7] = 4$; $[5.2] = 5$

$[-8.3] = -9$; $[-13.2] = -14$

i.e., $[n] = n$, if n is an integer and $[x] = n$, if $n \le x < n+1$ Any real number x can be expressed as. Integral part + Fractional part *i.e.,* $I + f$ *where* $0 \le f < 1$ then $[x]$ gives the integral part of x.



Domain $\to R$ (Set of real numbers)

Range $\to$ (Integral values) $\{\ldots -3, -2, -1, 0, 1, 2, 3, \ldots \text{etc.}\}$
(It is also called the step functions)

(A–4.4) Smallest (or least) **integer function**

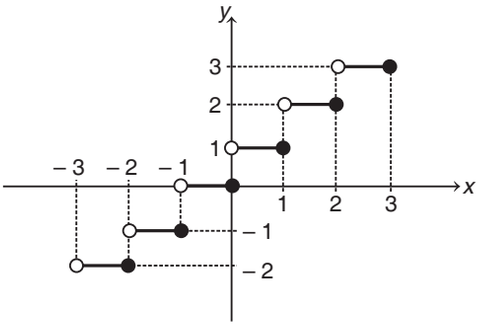
The function whose value at any number x is the smallest integer greater than or equal to x is called the least integer function

e.g., if $y = f(x) = \{x\} =$ Smallest integer, greater than or equal to x.

Then, $\{2.8\} = 3$

$\{7.5\} = 8 \Rightarrow \{-3.6\} = -3 \Rightarrow \{-7.4\} = -7$

i..e, $\{n\} = n$, if n is an integer and $\{x\} = n$, if $n < x \le n+1$



Domain $\to R$ (Set of real numbers)

Range $\to I$ (Integral values)

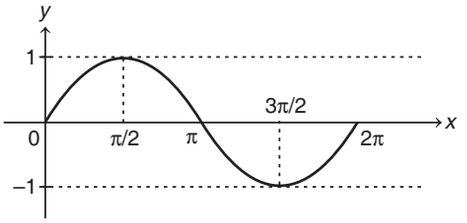
e.g., $\{-3, -2, -1, 0, 1, 2, 3 \text{ etc.}\}$

Transcendental Function

A function which is not an algebraic function is called a transcendental function. *e.g.,* trigonometry, logarithmic and exponential function.

(T–1) Trigonometric Function :

(T–1.1) $y = f(x) = \sin x$

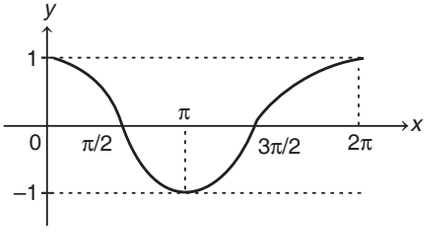


It is a periodic function with period 2π

Domain $\to R$ (Set of real numbers)

Range $\to [-1, 1]$ *i.e.,* $\{x \in R : -1 \le x \le 1\}$

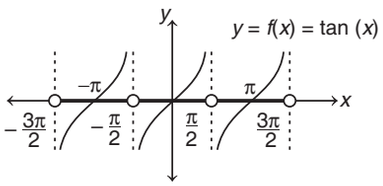
(T–1.2) $y = f(x) = \cos x$



Period $= 2\pi$

Domain $\to R$ Range $\to [-1, 1]$

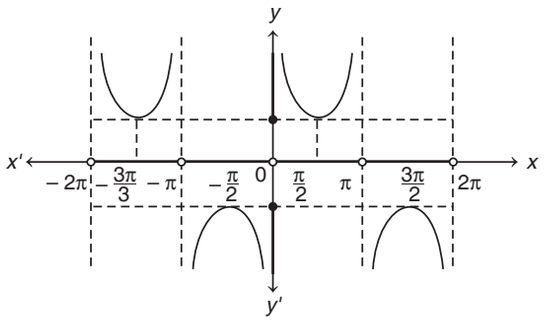
(T–1.3)



Period $= \pi$ Domain $\to R - \left\{(2n+1)\frac{\pi}{2},\ n \in I\right\}$

Range $\to R$ (Set of real numbers)

(T–1.4) $y = f(x) = \text{cosec } x$

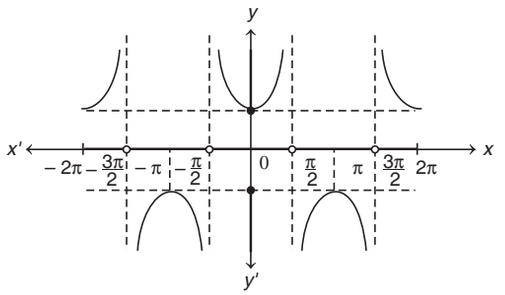


Period $= 2\pi$

Domain $\to R - \{n\pi\ :\ n \in I\}$

Range $(-\infty, -1] \cup [1, \infty)$

(T–1.5) $y = f(x) = \sec x$

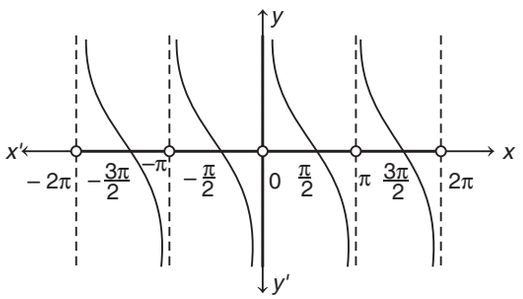


Period $= 2\pi$

Domain $\to R - \left\{(2n+1)\frac{\pi}{2}\ :\ n \in I\right\}$

Range $\to (-\infty, -1] \cup [1, \infty)$

(T–1.6) $y = f(x) = \cot x$



Period $= \pi$

Domain $\to \{n\pi\ :\ n \in I\}$

Range $\to R$ (set of real numbers)

(T–2.1) $y = \sin^{-1} x \Rightarrow x = \sin\ y \in [-1, 1]$

$\therefore$ Domain $= [-1, 1]$

(T–2.2) $y = \cos^{-1} x \Rightarrow x = \cos\ y \in [-1, 1]$

$\therefore$ Domain $= [-1, 1]$

(T–2.3) $y = \tan^{-1} x \Rightarrow x = \tan\ y \in R$

$\therefore$ Domain $= R$

(T–2.4) $y = \cot^{-1} x \Rightarrow x = \cot\ y \in R$

$\therefore$ Domain $= R$

(T–2.5) $y = \sec^{-1} x$

$\Rightarrow \quad x = \sec\ y \in (-\infty, -1] \cup [1, \infty)$

$\therefore$ Domain $= (-\infty, -1] \cup [1, \infty)$

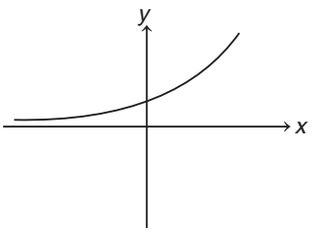
(T–2.6) $y = \text{cosec}^{-1} x \Rightarrow x = \text{cosec}\ y \in (-\infty, -1] \cup [1, \infty)$

$\therefore$ Domain $= (-\infty, -1] \cup [1, \infty)$

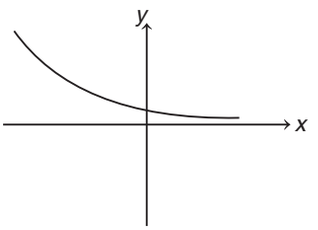
(T–3) Exponential Function $y = a^x$

(i) $y = a^x; a > 1$

Domain $\to R$ Range $\to R^+$



(ii) $y = a^x; 0 < a < 1$



Domain $\to R$ Range $\to R^+$

NOTE

$0 < a < 1$	function is decreasing	i.e., $a^x > a^y$ if $x < y$
$a > 1$	function is increasing	i.e., $a^x < a^y$ if $x < y$

(iii) (a) $y = e^x$ and (b) $y = e^{|x|}$

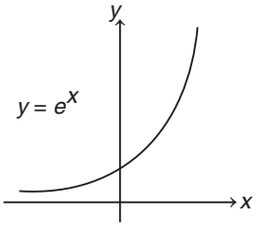


Fig. (a)

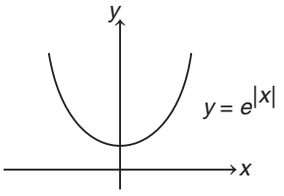

Fig. (b)

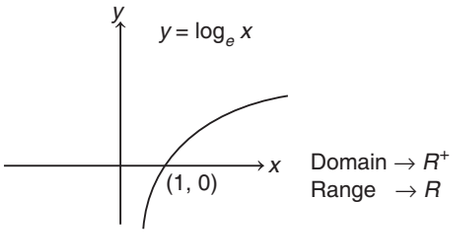
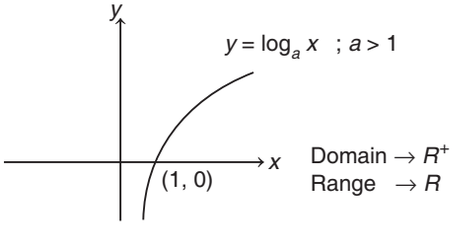
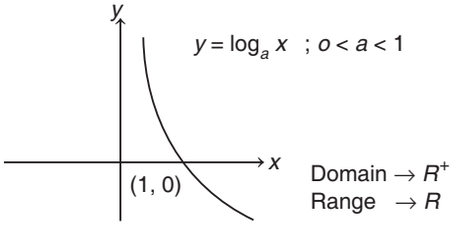
(a) Domain $\to R$
Range $\to R^+$

(b) Domain $\to R$
Range $\to R^+$

(T–4) **Logarithmic Function**







17.6 Algebraic Operations on Real Functions

Addition : If f and g are two functions, then the sum of the functions $(f+g)(x) = f(x) + g(x)$ is defined only for those values of x for which both f and g are defined *i.e.,*

$$x \in \text{Dom } f \cap \text{Dom } g$$

$$\therefore \quad \text{Dom } (f+g) = \text{Dom } f \cap \text{Dom } g$$

Subtraction : If f and g are two functions, then the difference of the functions $(f-g)x = f(x) - g(x)$

Where $x \in \text{Dom } f \cap \text{Dom } g$

$$\therefore \quad \text{Dom of } (f-g) = \text{Dom } f \cap \text{Dom } g$$

Multiplication : If k is any real number and f is a function, then kf is defined for all $x \in \text{Dom } f$ by $(kf)x = k\ f(x)$

Hence, if f and g are two functions, then the pointwise product fg is defined for all $x \in \text{Dom } f \cap \text{Dom } g$ by $(fg)x = f(x)\,g(x)$

$$\therefore \quad \text{Dom of } (fg)x = \text{Dom } f \cap \text{Dom } g$$

Division : If f and g are two functions, then f/g is defined for all $x \in \text{Dom } f \cap \text{Dom } g \cap \{x : g(x) \neq 0\}$ by $(f/g)x = \dfrac{f(x)}{g(x)}$

$$\therefore \text{ Dom } (f/g)x = \text{Dom } f \cap \text{Dom } g - \{x : x \in \text{Dom } g \text{ and } g(x) = 0\}$$

Composition : Let $f : A \to B$ and $g : B \to C$ be functions, then $gof : A \to C$ defined by $(gof)x = g(f(x))$

Alternatively

$(gof(x)) = g\,f(x)$ *i.e., gof* is defined when

(a) input of f (*i.e.,* x) $\in$ Domain of f and

(b) input of g (i.e., $f(x) \in$ Domain of g

Note that *gof* is defined, then *fog* may not be defined

Introductory Exercise 17.1

1. The domain of the function $f(x) = x$ is :
(a) R (b) R^+
(c) $R - \{0\}$ (d) $R^+ \cup \{0\}$

2. The domain of the function $f(x) = \sqrt{x}$ is :
(a) R (b) R^+
(c) $R^+ \cup \{0\}$ (d) $R - \{0\}$

3. The domain of the function $f(x) = \dfrac{1}{x}$ is :
(a) R (b) R^+
(c) $R - \{0\}$ (d) $R^+ \cup \{0\}$

4. The domain of the function $f(x) = |x|$ is :
(a) R (b) R^+
(c) $R - \{0\}$ (d) $R^+ \cup \{0\}$

5. The domain of the function $f(x) = \sqrt{|x|}$ is :
(a) $x \in (-\infty, \infty)$ (b) $x \in (0, \infty)$
(c) $x \in (-\infty, 0) \cup (0, \infty)$ (d) $x \in [0, \infty)$

6. The domain of the function $f(x) = |\sqrt{x}|$ is :
(a) $x \in (-\infty, +\infty)$ (b) $x \in (0, \infty)$
(c) $x \in (9, 16)$ (d) $x \in [0, \infty)$

7. The domain of the function $f(x) = \frac{1}{\sqrt{x}}$ is :

(a) $-\infty < x < \infty$ (b) $0 < x < \infty$
(c) $R - \{0\}$ (d) $0 \le x < \infty$

8. The domain of the function $f(x) = \sqrt{x^2}$ is :

(a) $-\infty < x < \infty$ (b) $0 < x < \infty$
(c) $R - \{0\}$ (d) $R^+ \cup \{0\}$

9. The domain of the function $f(x) = (\sqrt{x})^2$ is :

(a) $-\infty < x < \infty$ (b) $0 < x < \infty$
(c) $0 \le x < \infty$ (d) none of these

10. The domain of the function $f(x) = \log_{10} x$ is :

(a) $-\infty < x < \infty$ (b) $0 < x < \infty$
(c) $0 \le x < \infty$ (d) none of these

11. The domain of the function $f(x) = \log x^2$ is :

(a) R (b) R^+
(c) $R - \{0\}$ (d) $R^+ \cup \{0\}$

12. The domain of the function $f(x) = \frac{1}{\log_{10} x}$ is :

(a) R (b) $R^+ - \{1\}$
(c) $R^+ \cup \{0\}$ (d) $R - \{0\}$

13. The domain of the function $f(x) = \frac{1}{\sqrt{\log_{10} x}}$ is

(a) R (b) $R^+ - (0, 1]$
(c) $R - \{0\}$ (d) none of these

14. The domain of the function $f(x) = \sqrt{3x - 4}$ is :

(a) $[0, \infty)$ (b) $\left[\frac{3}{4}, \infty\right)$ (c) $\left[\frac{4}{3}, \infty\right)$ (d) $(4, \infty)$

15. The domain of the function $f(x) = \sqrt{4x - 3} + \sqrt{2x - 6}$ is :

(a) $[0, \infty)$ (b) $\left[\frac{3}{4}, \infty\right)$ (c) $\left[\frac{4}{3}, \infty\right)$ (d) $[3, \infty)$

16. The domain of $y = \frac{1}{\sqrt{|x| - x}}$ is :

(a) $[0, \infty)$ (b) $(0, \infty)$ (c) $(-\infty, 0)$ (d) $(-\infty, 0]$

17. The domain of $y = \frac{x}{\sqrt{x^2 - 3x + 2}}$

(a) $(-\infty, \infty)$ (b) $[0, \infty)$
(c) $(-\infty, 1] \cup [2, \infty)$ (d) none of these

18. The domain of $y = \log_{10}(\sqrt{6 - x} + \sqrt{x - 4})$ is :

(a) R (b) $R - \{0\}$
(c) $[6, \infty)$ (d) $(4, 6)$

19. The domain of definition of the function

$$y = \frac{1}{\log_{10}(1 - x)} + \sqrt{x + 2} \text{ is :}$$

(a) $[-2, 1)$ (b) $[-2, 0)$
(c) $[-2, 0) \cup (0, 1)$ (d) $(-2, 1]$

20. The domain of definition of $f(x) = \frac{\log_2(x + 3)}{x^2 + 3x + 2}$ is :

(a) $(-3, -2)$ (b) $(-2, -1]$
(c) $(-3, \infty) \sim \{-1, -2\}$ (d) $[0, \infty)$

21. The domain of $f(x) = 2 \sin x + 3 \cos x + 4$ is :

(a) R (b) R^+
(c) $R - \{0\}$ (d) $R - \{n\pi : n \in I^+\}$

22. The domain of the function $y = \sqrt{\log \frac{1}{|\sin x|}}$ is :

(a) R (b) $R \sim \left(\frac{n}{2}\pi; n \in I\right)$
(c) $[0, \infty)$ (d) $R \sim \{n\pi, n \in I\}$

23. The domain of $f(x) = (x^2 + x + 1)^{-3/2}$ is :

(a) $(-\infty, \infty)$ (b) $(0, \infty)$
(c) $\left(\frac{3}{2}, \infty\right)$ (d) none of these

24. The domain of $f(x) = \log(5x - 6 - x^2)$ is :

(a) $(5, 6)$ (b) $(2, 3)$
(c) $[2, \infty)$ (d) none of these

25. The domain of $y = \log_x 5$ is :

(a) $x > 5$ (b) $(0, \infty)$ (c) $(0, \infty) \sim \{1\}$ (d) $[5, \infty)$

26. The domain of $y = 9 - \sqrt{9 - x^2}$ is :

(a) $x < -3$ (b) $-3 < x < 3$
(c) $x \in [-3, 3]$ (d) none of these

27. The domain of $y = \frac{x}{\sqrt{x^2 - 5x + 6}}$ is :

(a) $R \sim \{2, 3\}$ (b) $R \sim (2, 3)$
(c) $R - [2, 3]$ (d) none of these

28. The range of the function $y = \frac{x^2}{1 + x^4}$ is :

(a) $[0, \infty)$ (b) $[0, 2]$ (c) $\left(0, \frac{1}{2}\right)$ (d) $\left[0, \frac{1}{2}\right]$

29. Find the range of $f(x) = \frac{x^2 - 2}{x^2 - 3}$:

(a) $(1, \infty)$ (b) $(-\infty, 2/3]$
(c) $(-\infty, 2/3)$ (d) $(-\infty, 2/3] \cup (1, \infty)$

30. If $f(x) = \frac{x^2 + 2x + 3}{x}$, then the range of the function is

(a) $[2\sqrt{3}, 3\sqrt{2}]$ (b) $R - (2 - 2\sqrt{3}, 2 + 2\sqrt{3})$
(c) $R - (2, 2\sqrt{3})$ (d) none of these

31. Which of the following pairs are identical :

(a) $f(x) = \sqrt{x^2}$, $g(x) = (\sqrt{x})^2$

(b) $f(x) = \frac{1}{\sqrt{x^2}}$, $g(x) = \frac{x}{x^2}$

(c) $f(x) = \log(x - 1) + \log(x - 2)$,
$g(x) = \log(x - 1)(x - 2)$

(d) none of the above

32. If $f(x)=\frac{1}{\sqrt{|x|-x}}$ and $g(x)=\frac{1}{\sqrt{x-|x|}}$, then
(a) dom $f \neq \phi$ and dom $g = \phi$
(b) dom $f = \phi$ and dom $g \neq \phi$
(c) dom $f = \phi$ and dom $g = \phi$
(d) f and g have the same domain

33. If $f(x) = x$, $g(x)=\sqrt{x^2}$ and $h(x)=\frac{x^2}{x}$, then the set of values for which the given functions $f(x)$, $g(x)$ and $h(x)$ are identical is :
(a) $R - \{0\}$ (b) R
(c) R^+ (d) $R^+ \cup \{0\}$

34. If $f(x) = \log x^4$ and $g(x) = 4\log x$, then the domain for which $f(x)$ and $g(x)$ are identical ?
(a) $(-\infty, \infty)$ (b) $[0, \infty)$
(c) $(0, \infty)$ (d) none of these

35. If $f(x) = \text{Sgn } x$ and $g(x) = 1 + x - [x]$. Then for all x, $f(g(x))$ is equal to :
(a) 0 (b) 1
(c) x (d) $f(x)$

36. If $f(x) = 64x^3 + \frac{1}{x^3}$ and α, β are the roots of $4x + \frac{1}{x} = 2$, then :
(a) $f(\alpha) = -24$ (b) $f(\alpha) = -16$
(c) $f(\beta) = -16$ (d) both (b) and (c)

37. If $f(x)=\frac{x}{\sqrt{1+x^2}}$, then $f(f(f(x)))$ is :
(a) $\frac{3x}{\sqrt{1+x^2}}$ (b) $\frac{x}{\sqrt{1+3x^2}}$
(c) $\frac{x^3}{\sqrt{1+x^2}}$ (d) $\frac{x}{\sqrt{3+3x^2}}$

38. If $f(x)=\frac{4^x}{4^x+2}$, then the value of $f(x) + f(1-x)$ is :
(a) 0 (b) -1
(c) 1 (d) can't be determined

39. If $f(x) = 1 - f(1-x)$, then the value of
$$f\left(\frac{1}{999}\right) + f\left(\frac{2}{999}\right) + \ldots + f\left(\frac{998}{999}\right) \text{ is :}$$
(a) 998 (b) 1
(c) 499 (d) none of these

40. Let $f(x) = x^2$ and $g(x) = \sqrt{x}$, then :
(a) gof (3) = 9 (b) gof (– 3) = 9
(c) gof (3) = 3 (d) gof (– 9) = 3

41. If $g(x) = x^2 - x + 7$ and $\left(\frac{1}{9}\right) gof(x) = x^2 + x + 1$, then $f(x)$ is :
(a) $2x - 3$ (b) $3x + 2$
(c) $3x - 2$ (d) none of these

42. Let $f(x)=\frac{x}{x+3}$, then $f(x+1) = ?$
(a) $\frac{3x+2}{x+2}$ (b) $\frac{x+1}{x+4}$ (c) $\frac{x+1}{x+3}$ (d) $\frac{2x+3}{x+3}$

43. Let $f(x)=\frac{x}{x+3}$, then $\frac{1}{f(x+1)} - f\left(\frac{1}{x+1}\right) = ?$
(a) $\frac{3x^2+7x+4}{3(x^2+5x+5)}$ (b) $\frac{3(x^2+5x+5)}{3x^2+7x+4}$
(c) $\frac{-x(2x+3)}{(x+3)^2}$ (d) $\frac{-(x+3)^2}{x(2x+3)}$

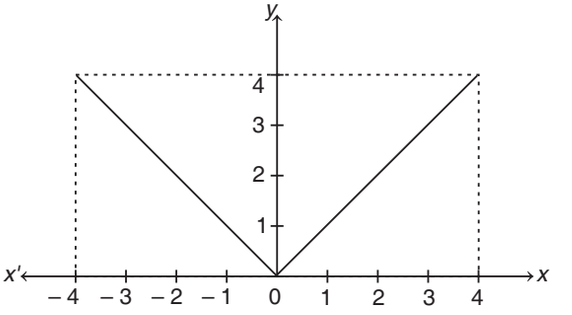
44. If $f(x)=\frac{x+1}{x-1}$, $x \neq 1$, find $f(f(f(f(f(2)))))$
(a) 2 (b) 3 (c) 4 (d) 6

17.7 Transformation of Graphs

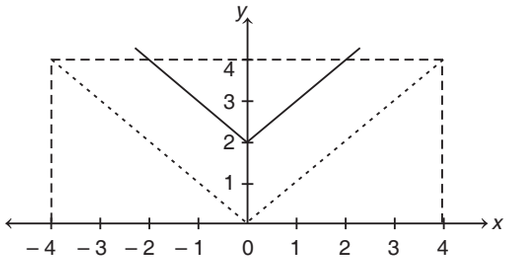
Here we study some techniques for the following transformation.

1. $f(x) \to f(x) + k$ 2. $f(x) \to f(x) - k$
3. $f(x) \to k\, f(x)$ 4. $f(x) \to \frac{1}{k} f(x)$
5. $f(x) \to -f(x)$ 6. $f(x) \to |f(x)|$
7. $f(x) \to f(x+k)$ 8. $f(x) \to f(x-k)$
9. $f(x) \to f(kx)$ 10. $f(x) \to f\left(\frac{x}{k}\right)$
11. $f(x) \to f(-x)$ 12. $f(x) \to f|x|$

1. $f(x) \to f(x) + k$, k is a positive constant. Shift the graph of $f(x)$ upwards by 'k'.

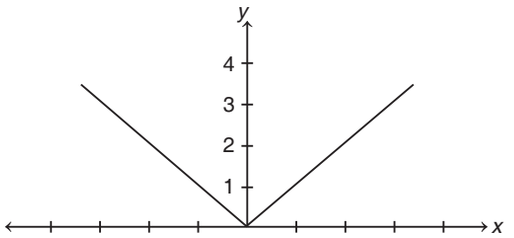


$f(x) = |x|$

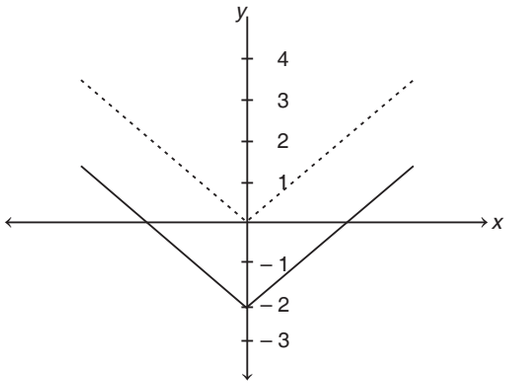


$f(x) = |x| + 2$

2. $f(x) \to f(x) - k$; k is a positive constant

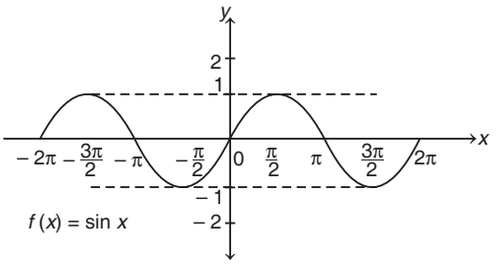


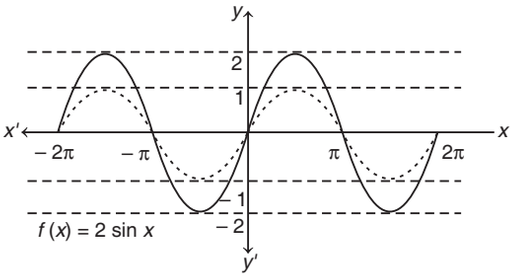
$f(x) = |x|$



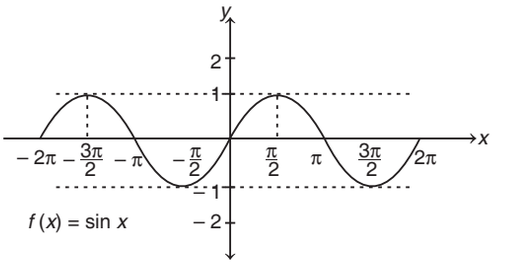
$f(x) = |x| - 2$

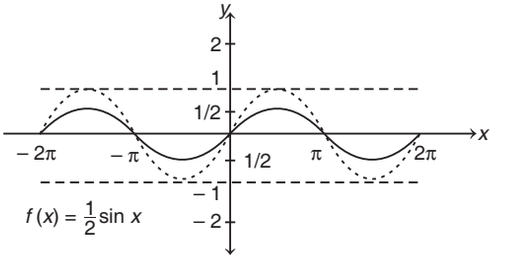
3. $f(x) \to kf(x)$; $(k > 1)$ Stretch the graph of $f(x)$, k' times along y-axis.



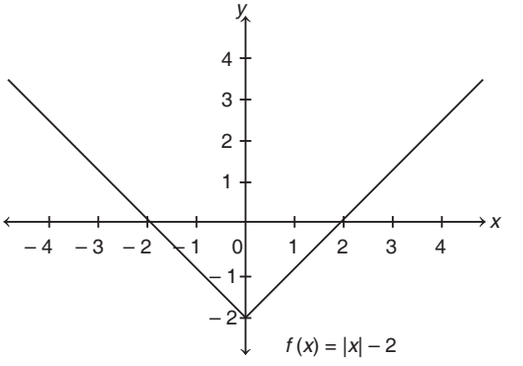


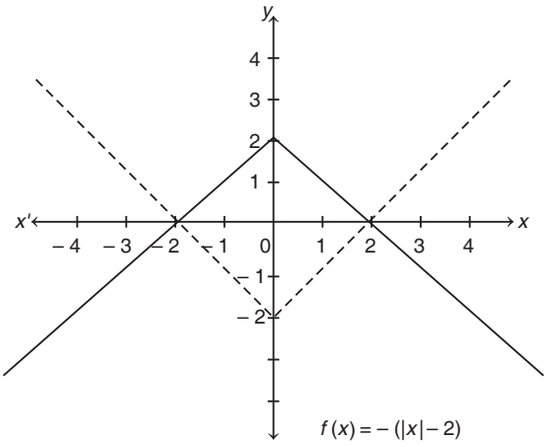
4. $f(x) \to \frac{1}{k} f(x)$; $(k > 1)$ Shrink the graph of $f(x)$ 'k' times along y-axis.



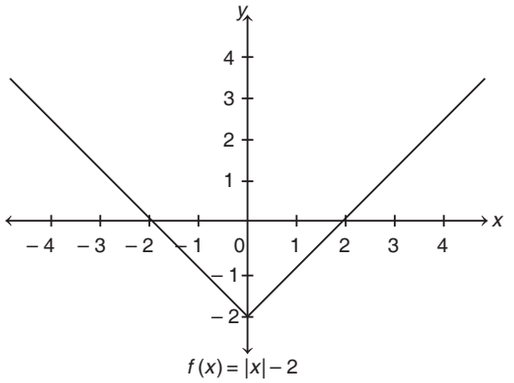


5. $f(x) \to -f(x)$ Turn the graph of $f(x)$ by 180° about x-axis. or Take the mirror image of $f(x)$ in x-axis.

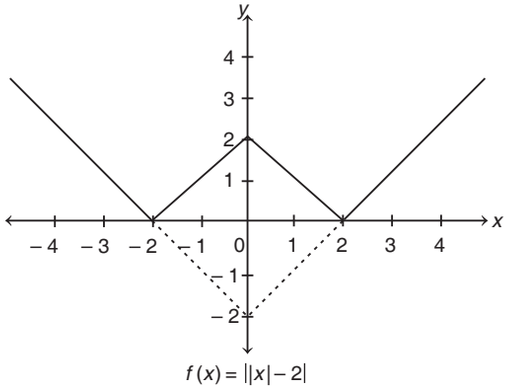




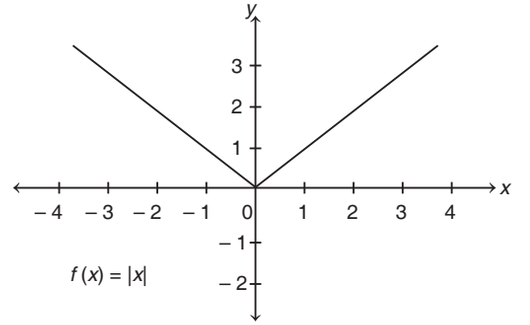
6. $\boldsymbol{f(x) = |\, f(x)\,|}$, where $|\, f(x)\,| = \begin{cases} f(x) \text{ if } f(x) \geq 0 \\ -f(x) \text{ if } f(x) < 0 \end{cases}$

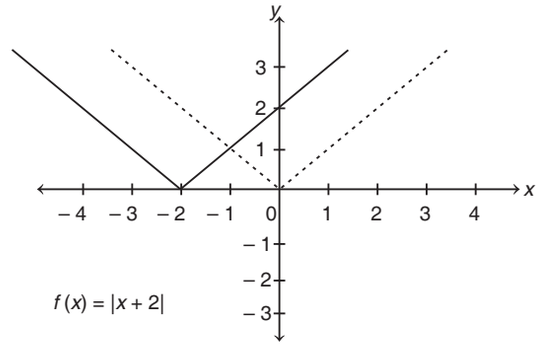


Turn the portion of the graph of $f(x)$ lying below x-axis by 180° about x-axis. Or, take the mirror image (in x-axis) of the portion of the graph of $f(x)$ which lies below x-axis.

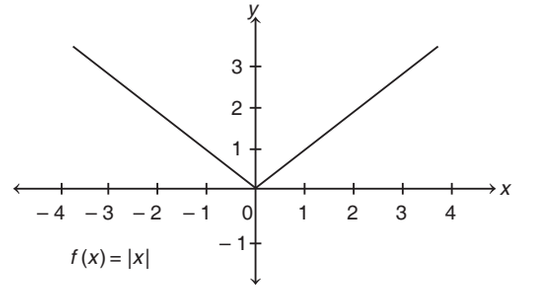


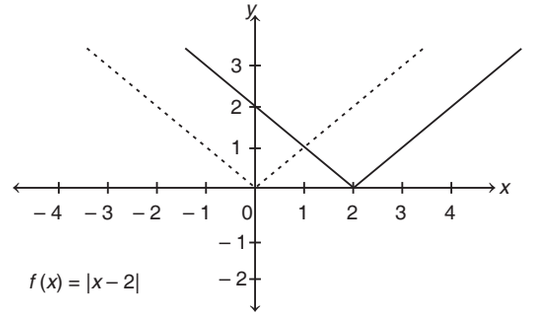
7. $\boldsymbol{f(x) \to f(x+k)}$ Shift the graph of $f(x)$ towards left by 'k'.



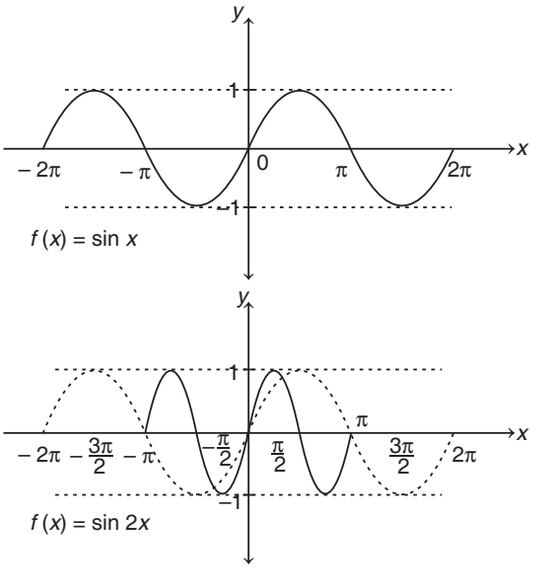


8. $\boldsymbol{f(x) \to f(x-k)}$ Shift the graph of $f(x)$ towards right by 'k'

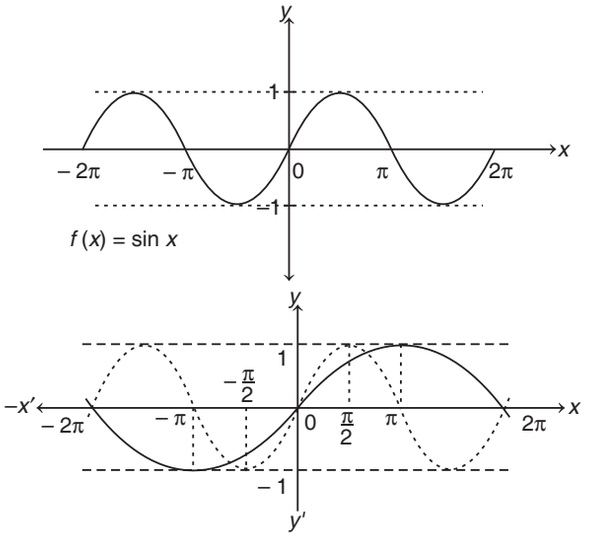




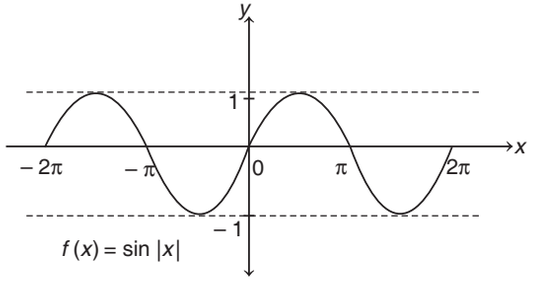
9. $f(x) \to f(kx)\ ;\ (k > 1)$ Shrink the graph of $f(x)$ 'k' times along x-axis.

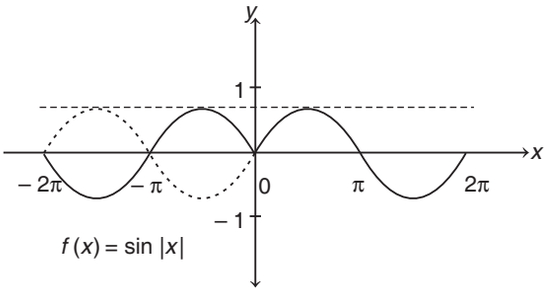


10. $f(x) \to f\left(\frac{x}{k}\right)$ Stretch the graph of $f(x)$ 'k' times along x-axis.



11. $f(x) \to f(-x)$ Turn the graph of $f(x)$ by 180° about y-axis or Take the mirror image of the graph of $f(x)$ in y-axis.

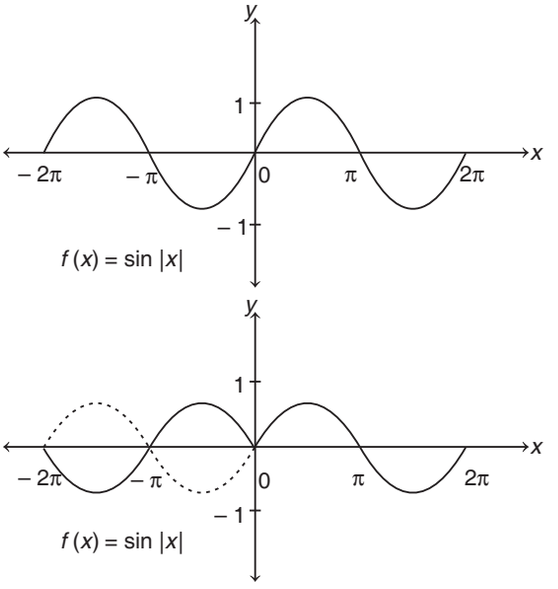




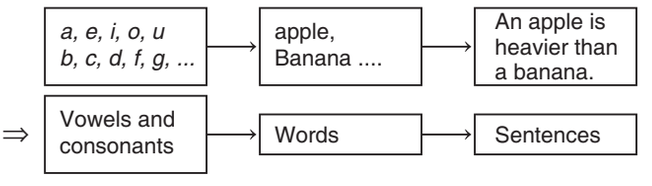
12. $f(x) \to f|x|$

$\because$ $$f|x| = \begin{cases} f(x) \text{ if } x \geq 0 \\ f(-x) \text{ if } x < 0 \end{cases}$$

$\therefore$ On the right of y-axis, plot the graph of $f(x)$ as such and on the left of y-axis, plot the mirror image of the graph of $f(x)$ of the portion lying on the right of y-axis.



17.8 Composite Functions

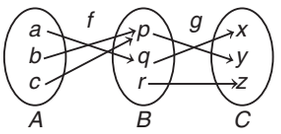


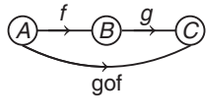
When the output of the first operation is the input for the second operation, then there is a composition of functions (operations).

If $f : A \to B$ and $g : B \to C$, then $(gof) : A \to C$

$\Rightarrow$ $$(gof)(a) = g\{f(a)\}$$

Exp. 1)





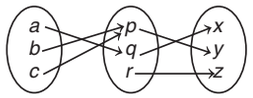
$(gof)(a) = g\{f(a)\} = g(q) = x$

$(gof)(b) = g\{f(b)\} = g(p) = y$

$(gof)(c) = g\{f(c)\} = g(p) = y$

Properties

1. **Associative :** If $f_1 : A \to B, f_2 : B \to C, f_3 : C \to D$ then $f_1 o(f_2 of_3) = (f_1 of_2) of_3$
2. **Non commutative :** Let $f(x) = \cos x$ and $g(x) = x^3$
   then, $gof(x) = g(f(x)) = g(\cos x) = \cos^3 x$
   and $fog(x) = f(x^3) = \cos x^3$
   Hence $gof \neq fog$
3. **Range** of (gof) may not be the same as the range of g



$(gof)(a) = x$

$(gof)(b) = y$

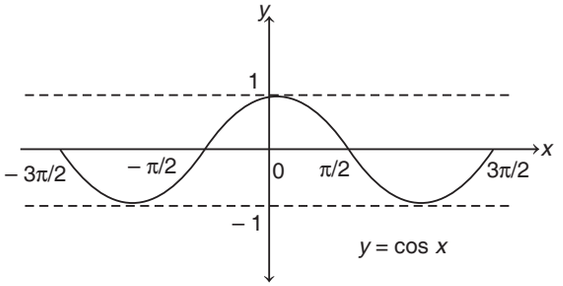
$(gof)(c) = y$

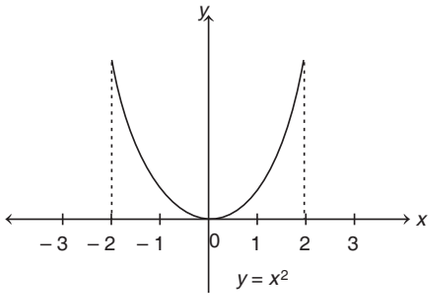
$\therefore$ Range of $(gof) = \{x, y\}$

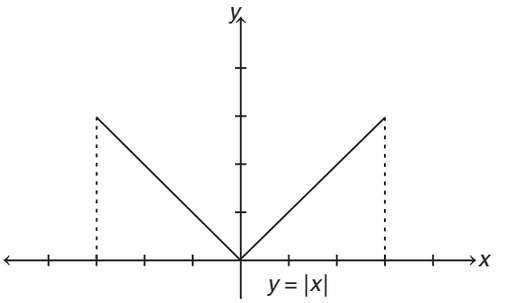
and Range of $g = \{x, y, z\}$

17.9 Even and Odd Functions

1. **Even function :** A function $y = f(x)$ is said to be an even function if $f(-x) = f(x)\ \forall\ x \in \text{Dom}(f)$
   e.g., $y = \cos x,\ y = x^{2n}\ \forall\ n \in N,\ y = |x|$

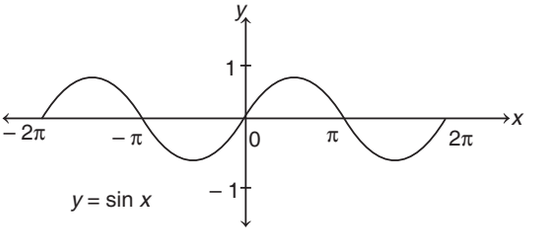


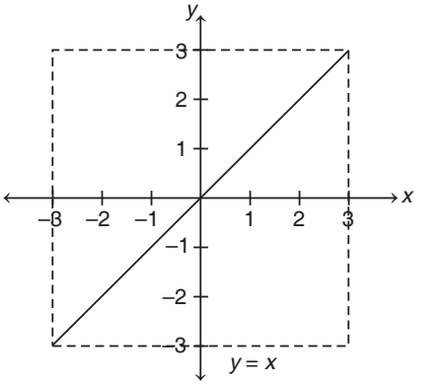


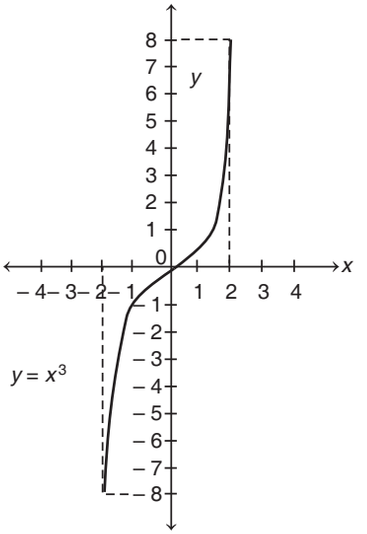


NOTE Graph of an even function is symmetric about y-axis.

2. **Odd function :** A function $y = f(x)$ is said to be an odd function if $f(-x) = -f(x),\ \forall\ x \in \text{Dom}(f)$
   e.g., $y = \sin x,\ y = x^{2n-1}\ \forall\ n \in N$







NOTE Graph of an odd function is symmetric about origin.

Properties of Even and Odd Functions

1. **Sum** : Even + Even = Even
Odd + Odd = Odd
Even + Odd = (neither even nor odd)
Odd + Even = (neither even nor odd)

2. **Difference** : Even – Even = Even
Odd – Odd = Odd
Even – Odd = (neither even nor odd)
Odd – Even = (neither even nor odd)

Remember Any function $y = f(x)$ can be expressed uniquely as the sum of an even and an odd function as follows :

$$f(x) = \frac{1}{2}[f(x) + f(-x)] + \frac{1}{2}[f(x) - f(-x)]$$

3. **Product:** Even × Even = Even
Odd × Odd = Even
Even × Odd = Odd
Odd × Even = Odd

NOTE If the number of odd functions in the product is odd → odd function. If the number of odd functions in the product is even → even function

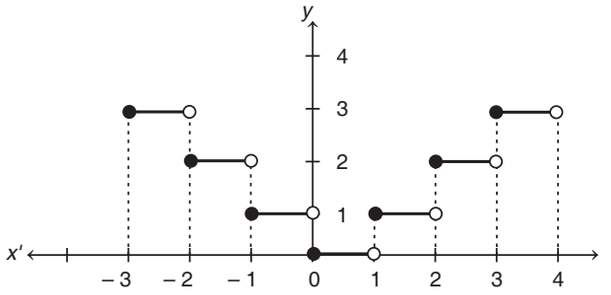
4. **Division :** Even ÷ Even = Even
÷ Odd = Even
Even ÷ Odd = Odd
Odd ÷ Even = Odd

5. **Composition :** Even (Even) = Even
Even (Odd) = Even
Odd (Even) = Even
Odd (Odd) = Odd

NOTE If all the functions in the composition are odd → Odd function. If at least one of the functions in the composition is even → even function.

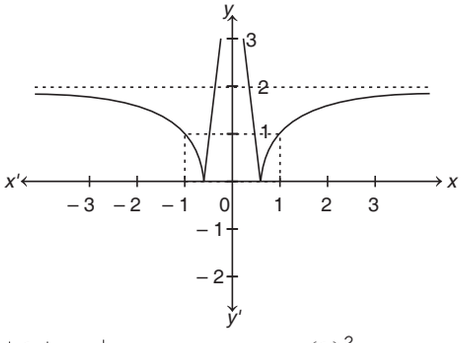
Introductory *Exercise 17.2*

1. Which one of the following is correct for the following graph?



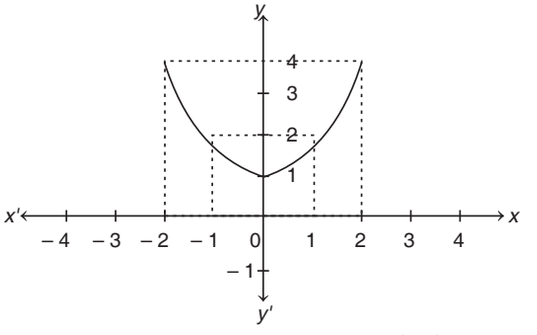
(a) $f(x) = \{x\}$ (b) $f(x) = [x]$
(c) $f(x) = |[x]|$ (d) none of these

2. Which one of the following is correct for the following graph?



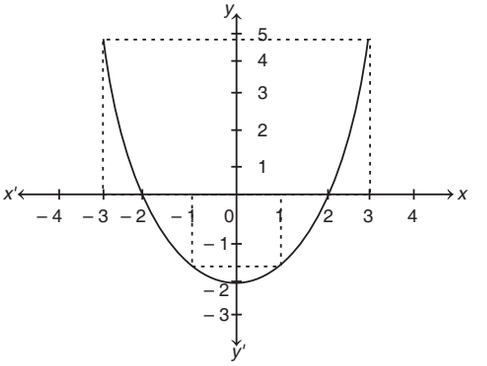
(a) $f(x) = \left|\left|\frac{1}{x}\right| - 2\right|$ (b) $f(x) = \left(\frac{1}{x}\right)^2$
(c) $f(x) = \left|\frac{1}{x^3}\right|$ (d) $f(x) = \log|x|$

3. Which one of the following is correct for the following graph?



(a) $f(x) = e^x$ (b) $f(x) = \log|x|$
(c) $f(x) = 2^{|x|}$ (d) $f(x) = x^2$

4. Which one of the following is correct for the given graph?



(a) $f(x) = |x^3 - 2|$ (b) $f(x) = x^2 - 2$
(c) $f(x) = \left|\frac{x^3}{4}\right| - 2$ (d) $f(x) = \log|x - 1|$

5. The equation $\frac{x^2}{1-|x-2|}=1$ has n real solutions, then
(a) $n=0$ (b) $n=1$ (c) $n=2$ (d) $n=3$

6. The number of real solutions of the equation $\log_{0.5}|x| = 2|x|$ is :
(a) 0 (b) 1
(c) 2 (d) none of these

7. The graph of the function $f: R \to R$ defined by $f(x)=\frac{|x|^3+|x|}{1+x^2}$ may lie in :
(a) Ist and IInd quadrant (b) IInd and IIIrd quadrant
(c) IIIrd and IVrd quadrant (d) none of these

8. The two roots of the equation $f(x)=f\left(\frac{x+8}{x-1}\right)$ are :
(a) 2, – 2 (b) 4, – 2
(c) – 4, – 2 (d) 2, 4

9. If the functions f, g, h are defined from 'R' to 'R' by $f(x)=x^2-1$, $g(x)=\sqrt{x^2+1}$, $h(x)=\begin{cases}0, & \text{if } x\le 0\\ x, & \text{if } x\ge 0\end{cases}$ then $hofog$ is equal to :
(a) x^2 (b) $\sqrt{x^4-1}$
(c) 0 (d) none of these

10. If $f(x)=(a-x^n)^{1/n}$, where $a>0$, then $f(f(x))$ is :
(a) x^n (b) x^2
(c) $2x$ (d) none of these

11. If $f(x)=\left(\frac{x-1}{x+1}\right)$, then $f(f(ax))$ in terms of $f(x)$ is equal to :
(a) $\frac{f(x)+1}{a\,(f(x)+1)}$ (b) $\frac{f(x)+1}{a\,(f(x)-1)}$
(c) $\frac{f(x)-1}{a\,(f(x)+1)}$ (d) $\frac{f(x)+1}{a\,(f(x)-1)}$

12. If $f(x)=\frac{x}{\sqrt{1+x^2}}$, then $fofof(x)$ is equal to :
(a) $\frac{x}{\sqrt{(1+3x^2)}}$ (b) $\frac{3x}{\sqrt{(1-x^2)}}$
(c) $\frac{3x}{\sqrt{(1+x^2)}}$ (d) none of these

13. If $f(x)=\begin{cases}1+|x| & ; x<-1\\ [x] & ; x\ge -1\end{cases}$ Also, [.] is greatest integer function then $f(f(-2.4))$ is equal to :
(a) – 3 (b) 2 (c) 3 (d) 4

14. If $f(x)=x^n$, $n\in N$ and $(gof)(x)=ng(x)$, then $g(x)$ can be
(a) $n|x|$ (b) $\sqrt[3]{x}$
(c) e^x (d) $\log x$

15. Let $f: N \to R$; $f(x)=2x-1$
$g: z \to R$; $g(x)=\frac{x^2}{2}$, then $(gof)(0)$ is :
(a) $-\frac{1}{2}$ (b) $\frac{1}{2}$
(c) 1 (d) none of these

16. Let $f\left(x+\frac{1}{x}\right)=x^2+\frac{1}{x^2}; (x\neq 0)$, then $f(x)$ is equal to :
(a) x^2-1 (b) x^2-2
(c) x^2 (d) none of these

17. Let $f(x)=\sqrt{x^5}$, then $f(5x)$ is equal to :
(a) $5x\sqrt{5x}$ (b) $25x^2\sqrt{5x}$
(c) $5x$ (d) $\sqrt{5x^5}$

18. If $f(x)=4x-5$, $g(x)=x^2$ and $h(x)=\frac{1}{x}$, then $f(g(h(x)))$ is :
(a) $\frac{4}{(x-5)}$ (b) $\frac{1}{(4x-5)^2}$
(c) $\left(\frac{x}{4}-5\right)$ (d) $\left(\frac{4}{x^2}-5\right)$

19. If $[x]$ is greatest integer function (GIF) and$\{x\}$ is smallest integer function (SIF), and $x\in R\sim I$, then $[x]-\{x\}$ is equal to :
(a) – 1 (b) 0
(c) 1 (d) 2

20. If the graph of the function $f(x)=\frac{a^x-1}{x^n\,(a^x+1)}$ is symmetric about y-axis, then n is equal to :
(a) $-\frac{1}{3}$ (b) $\frac{1}{4}$
(c) 2/3 (d) 2

21. $f(x)=\ln(x+\sqrt{x^2+1})$ is :
(a) an even function (b) an odd function
(c) neither even nor odd (d) none of these

22. If a function f satisfies the conditions $f(x+y)=f(x)+f(y)\ \forall, x, y\in R$, then f is :
(a) an even function (b) an odd function
(c) neither even nor odd (d) none of these

23. Which of the following function is an even function ?
a) $f(x)=\frac{a^x+1}{a^x-1}$ (b) $f(x)=\frac{a^x-a^{-x}}{a^x+a^{-x}}$
(c) $f(x)=x\frac{a^x+1}{a^x-1}$ (d) $f(x)=\sin x$

24. Which of the following function is odd ?

(a) $\ln\left(\frac{1+x^3}{1-x^3}\right)$ (b) $x \cdot \frac{e^{ax}-1}{e^{ax}+1}$

(c) $\frac{(1+2^x)^2}{2^x}$ (d) none of these

25. Which of the following function is even function ?

(a) $f(x) = \log \frac{1-x}{1+x}$

(b) $f(x) = x \cdot \frac{a^x+1}{a^x-1}$

(c) $f(x) = \log\left[x + \sqrt{(1+x^2)}\right]$

(d) $f(x) = \sqrt{(1+x+x^2)} - \sqrt{(1-x+x^2)}$

26. If $f(x) = \sqrt[3]{(1-x^2)} + \sqrt[3]{(1+x^2)}$, then $f(x)$ is:

(a) an even function (b) an odd function

(c) constant function (d) none of these

27. Which of the following function is an odd function ?

(a) $f(x) = 2^{-x^2}$ (b) $f(x) = 2^{x-x^4}$

(c) $f(x) = \cos x$ (d) none of these

28. The function $f(x) = \frac{x}{e^x-1} + \frac{x}{2} + 1$ is :

(a) even (b) odd

(c) constant (d) neither even nor odd

29. The graph of the function $y = f(x)$ is symmetrical about the line $x = 2$, then :

(a) $f(x+2) = f(x-2)$ (b) $f(2+x) = f(2-x)$

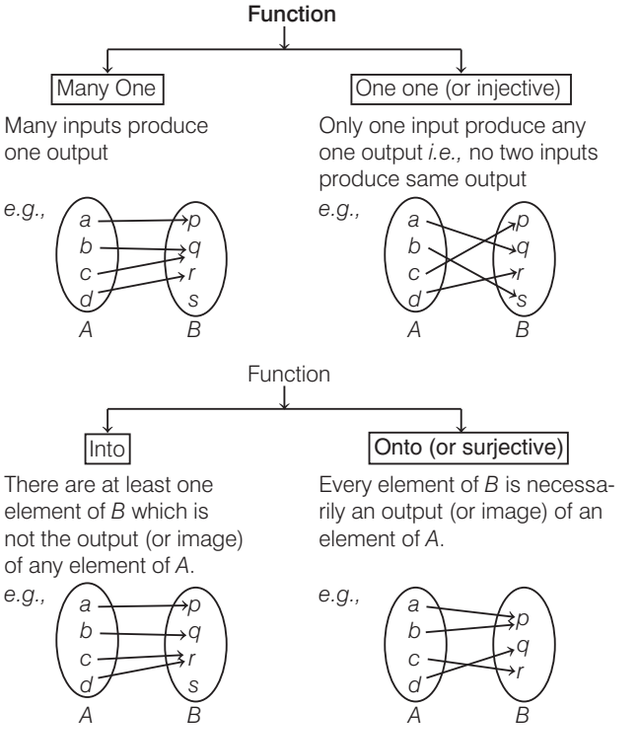
(c) $f(x) = f(-x)$ (d) none of these

30. Given $f(x) = \frac{1}{(1-x)}$, $g(x) = f(f(x))$ and $h(x) = f(f(f(x)))$, then the value of $f(x) \cdot g(x) \cdot h(x)$ is :

(a) 0 (b) – 1

(c) 1 (d) 2

17.10 Surjective and Injective Functions



One to One (or Injective) *Functions*

A function f is said to be one-to-one if it does not take the same values at two distinct points in its domain. For example, $f(x) = x^3$ is one to one whereas $f(x) = x^2$ is not, as $f(1) = 1$ and $f(-1) = 1$

In order to show that a function $f : A \to B$ is one-one we may take any x, $y \to A$ such that $f(x) = f(y)$ and try to show that $x = y$. Graphically,if every horizontal line intersects the graph of a given function at not more than one point, *i.e.,* the function is strictly increasing (or decreasing) then the function is one-one.

NOTE 1. Functions which are not one to one are called many-one function.
2. One many function does not exist.

Onto (or Surjective Function)

If a function $f : A \to B$ is such that each element in B is the f-image of at least one element in A, then we say that f is function of A 'onto' B. Equivalently a function f is an onto function if codomain of f = Range of f.

In order to show that a function $f : A \to B$ is onto we start with any $y \in B$ and try to find $x \in A$ such that $f(x) = y$.

NOTE If there exists at least one element in B which is not the f-image of any element of A, then f is called an into function.

Bijective Function : If a function f is both one-to-one and onto then f is said to be a bijective function *e.g.,* an identity function is a bijective function.

17.11 Inverse Function

If $f : A \to B$ is a bijection, we can define a new function from B to A which associates each element $y \in B$ to its pre-image $f^{-1}(y) \in A$.

Such a function is known as the inverse of function f and is denoted by f^{-1}.

- Inverse of a function is defined iff the function is one-to-one and onto.
- In the inverse function inputs and outpts interchange their roles.
- Inverse of a function is not defined if the given function is a many-one function or into function or both.
- If the graph of a function $f(x)$ is symmetric about the line $y=x$, then $f(x)$ and $f^{-1}(x)$ are identical function.
- The graph of $f(x)$ and $f^{-1}(x)$ is symmetric about

$$y=x$$

17.12 Binary Operations

Let S be a non-emply set. A function f from $S\times S$ to S is called a binary operation on S

i.e., $f: S\times S\to S$ is a binary operation on S.

Generally binary operations are represented by the symbols $*, \oplus$ etc. instead of letters f, g etc.

Types of Binary Operations

1. **Commutative binary operation :** A binary operation $*$ on a set S is said to be commutative if $a*b=b*a$ for all $a, b, \in S$.
2. **Associative binary operation :** A binary operation $*$ on a set S is said to be associative if
   $(a*b)*c=a*(b*c)$ for all $a, b, c\in S$.
3. **Distributive binary operation :** Let $*$ and $\oplus$ be two binary operations on a set S. Then $*$ is said to be :
   (i) Left distributive over $\oplus$ if
   $a*(b\oplus c)=(a*b)\oplus(a*c)$ for all $a, b, c\in S$,
   (ii) Right distributive over $\oplus$ if
   $(b\oplus c)*a=(b*a)\oplus(c*a)$ for all $a, b, c\in S$.

If $*$ is both left and right distributive over $\oplus$, then $*$ is said to be distributive over $\oplus$.

Composition table : Le $S=\{a_1, a_2, a_3, \ldots a_n\}$ be finite set and $*$ be a binary operation on S. Then the composition table is constructed in the manner given below :

$*$	a_1	a_2	…	a_i	…	a_j	…	a_n
a_1	a_1*a_1	a_1*a_2	…	a_1*a_i	…	a_1*a_j	…	a_1*a_n
a_2	a_2*a_1	a_2*a_2	…	a_2*a_i	…	a_2*a_j	…	a_2*a_n
…								
a_i	a_i*a_1	a_i*a_2	…	a_i*a_i	…	a_i*a_j	…	a_i*a_n
…			…					
a_j	a_j*a_1	a_j*a_2	…	a_j*a_i	…	a_j*a_j	…	a_j*a_n
a_n	a_n*a_1	a_n*a_2	…	a_n*a_i	…	a_n*a_j	…	a_n*a_n

Example Consider the set $S=\{1, 2, 3, 4\}$. Define a binary operation $*$ on S as follows :
For any $a, b\in S$ define $a*b=r$, where 'r' is the least non-negative remainder when ab is divided by 5.

Solution We have

$$1*1=1,\ 1*2=2,\ 1*3=3,\ 1*4=4$$
$$2*1=2,\ 2*2=4,\ 2*3=1,\ 2*4=3$$
$$3*1=3,\ 3*2=1,\ 3*3=4,\ 3*4=2$$
$$4*1=4,\ 4*2=3,\ 4*3=2,\ 4*4=1$$

Thus, the following is the composition table for the binary operation $*$ on S.

$*$	1	2	3	4
1	1	2	3	4
2	2	4	1	3
3	3	1	4	2
4	4	3	2	1

17.13 User Defined functions

These functions are defined as per the requirement of user. Basically these functions are not standard function. There are some examples illustrated below :

Exp. 1) If $f(A, B)=A\#B=A^4-B^3+A^2-B+AB$, then find the value of $f(3, 4)$.

Solution $f(3, 4)=3\#4=3^4-4^3+3^2-4+(3\times 4)$

$$=81-64+9-4+12=34$$

Exp. 2) If $A\#B=A+B+AB$. If for any A there is a number C such that $A\#C=A$, then $C=?$

Solution $A\#C=A$, we get

$$A+C+AC=A$$
$$\Rightarrow\quad C(1+A)=0$$
$$\Rightarrow\quad C=0 \quad \text{or} \quad A=-1$$

Exp. 3) If $f(a,b)=\frac{a+b}{2}; g(a,b)=a^2+b^2 h(a,b)=\max(a,b)$

Find the value of $f(g(3,9), h(-1,1))$.

Solution $f(g(3,9), h(-1,1))=f((3^2+9^2), 1)=f(90, 1)=45.5$

Exp. 4) $f_n=\begin{cases} f_{n-1} \text{ if } n \text{ is even} \\ 2f_{n-1} \text{ if } n \text{ is odd} \end{cases}$ and $f_0=1$, find the value of f_4+f_5

Solution $f_4+f_5=f_3+2f_4=2f_2+2f_3=2(f_2+f_3)=2(f_1+2f_2)$

$=2(2f_0+2f_1)=4(f_0+f_1)$

$=4(1+2f_0)=4(1+2)=12$

Exp. 5) $f_n=\begin{cases} f_{n-1} \text{ if } n \text{ is even} \\ 2f_{n-1} \text{ if } n \text{ is odd} \end{cases}$ and $f_0=1$, find the value of f_{16}.

Solution $f_{16}=f_{15}=2f_{14}=2f_{13}=2^2 f_{12}=2^2 f_{11}=2^3 f_{10}=.....$

$f_{16}=2^8 f_0=2^8=256$

Exp. 6) If $f(n)$ defines the number of pages read by a person in nth hour, where $f(n)=\{\sqrt{n}\}$; $\{x\} \rightarrow$ least integer greater than or equal to x and n is the n^{th} hour. If a person reads the book for 10 hours, then find the total number of pages read by him.

Solution Total number of pages read by him

$=f_1+f_2+f_3+...+f_{10}$

$f_1=\{\sqrt{1}\}=\{1\}=1$

$f_2=\{\sqrt{2}\}=\{1.414\}=2$

$f_3=\{\sqrt{3}\}=\{1.732\}=2$

$f_4=\{\sqrt{4}\}=2$

$f_5=\{\sqrt{5}\}=3$

$f_6=\{\sqrt{6}\}=3$

$f_7=\{\sqrt{7}\}=3$

$f_8=\{\sqrt{8}\}=3$

$f_9=\{\sqrt{9}\}=3$

$f_{10}=\{\sqrt{10}\}=4$

$\therefore$ Total number of pages read by a person

$=1+2+2+2+3+3+3+3+3+4=$ 26 pages

17.14 Maxima and Minima

In this topic we study the maximum and minimum value of various functions. In advance mathematics, we find the maxima and minima through differentiation of the function (As in calculus). But for those students who are not well-versed with calculus, they can solve these problems with some unconventional methods.

Recall that we have been already studied the maxima and minima in the chapter ''Theory of Equations.''

Exp. 1) What is the minimum value of the expression $x^2+8x+10$?

Solution

Method 1. $x^2+8x+10=x^2+8x+16-6$

$\Rightarrow \quad =(x+4)^2-6$

Now the smallest possible value of the above expression can be -6

Since, $(x+4)^2$ can be minimum 0, when $x=-4$

Method 2. Compare the given expression with the standard quadratic equation $ax^2+bx+c=0$

$\therefore \quad a=1, b=8, c=10$

Now, $\text{minima}=\frac{-(b^2-4ac)}{4a})$ $(D=b^2-4ac$

$D \rightarrow$ Discriminant)

$=\frac{-(64-40)}{4}=-6$

Method 3. By differentiating the given expression twice w.r. to the given variable, we get minima or maxima.

Let $y=x^2+8x+10$

$\therefore \quad \frac{dy}{dx}=y'=2x+8$

Again $\frac{d^2y}{dx^2}=y''=2$

Since, $\frac{d^2y}{dx^2}=2$ (+ve value), hence the given expression gives minima.

Now since $y'=2x+8$

Let $y'=0$

$\Rightarrow \quad 2x+8=0 \Rightarrow x=-4$

$\therefore \quad y=x^2+8x+10=(-4)^2+8(-4)+10=-6$

NOTE If $\frac{d^2y}{dx^2}$ is a –ve value then we get maxima.

Hence, the minimum value of the expression is -6.

Exp. 2) What is the maximum value of the expression $5-6x-x^2$

Solution

Method 1. $5-6x-x^2=14-(3+x)^2$

Thus the expression can have maximum value 14, when $x=-3$

Since, the minimum value of $(3+x)^2$ is zero.

Method 2. $-x^2-6x+5=0$ …(i)

Comparing the above expression with standard quadratic equation $ax^2+bx+c=0$, we get

$a=-1, \quad b=-6, \quad c=5$

Since, a is negative, therefore the expression gives maxima.

Now, $=\frac{-D}{4a}=\frac{-(b^2-4ac)}{4a}$

$=\frac{-(36+20)}{-4}=14$

Method 3. Let $y = -x^2 - 6x + 5$ …(i)

$\therefore \quad \frac{dy}{dx} = -2x - 6 \therefore \frac{d^2y}{dx^2} = -2$

Since, $\frac{d^2y}{dx^2} = -2$(–ve value), therefore we get maxima

Now, let q $\frac{dy}{dx} = 0 \Rightarrow -2x - 6 = 0 \Rightarrow x = -3$

Substituting $x = -3$ in equation (1), we get the

maxima $= -(-3)^2 - 6(-3) + 5$

$= -9 + 18 + 5 = 14$

Exp. 3) What is the maximum value of the function $y = \frac{2x^2 + 3x + 4}{x^2 + x + 3}$

Solution $y = \frac{2x^2 + 3x + 4}{x^2 + x + 3}$

$\Rightarrow \quad (y-2)x^2 + (y-3)x + (3y-4) = 0$

$\therefore \quad (y-3)^2 - 4(y-2)(3y-4) \geq 0$

$\Rightarrow \quad 11y^2 - 34y + 23 \leq 0 \quad \therefore \quad 1 \leq y \leq \frac{23}{11}$

$\therefore$ The maximum value of the expression is $\frac{23}{11}$

(and minimum value is 1)

Points to remember

(i) When $a_1 + a_2 + a_3 + \ldots a_n = k$, then the maximum value of $a_1 \cdot a_2 \cdot a_3 \ldots . a_n$ is obtained when

$a_1 = a_2 = a_3 = \ldots = a_n$.

(ii) When $a_1 \cdot a_2 \cdot a_3 \ldots a_n = k$, then the minimum value of $a_1 + a_2 + a_3 + \ldots a_n$ is obtained when

$a_1 = a_2 = a_3 = \ldots a_n$.

Exp. 4) If $a + b = 20$, then the maximum value of ab is :

(a) 19 (b) 75

(c) 100 (d) 120

Solution Maximum of $(ab) = 10 \times 10$ $(\because a + b = 20)$

$= 100$ $(a = b = 10)$

Exp. 5) If $a + b + c = 24$, then the maximum value of abc is

(a) 215 (b) 512 (c) 125 (d) 576

Solution abc can be maximum only when $a = b = c$ for a given sum $a + b + c = 24$

$\therefore \quad (abc)_{max} = (8 \times 8 \times 8)$ $(\because a = b = c)$

$= 512$

Exp. 6) If $ab = 25$, then the minimum value of $a + b$ is :

(a) 10 (b) 8 (c) 24 (d) 16

Solution Minimum value of $(a + b)$ can be obtained when $a = b$ then $a + b = 5 + 5$ $(\because ab = 25$ and $a = b)$

$= 10$

Exp. 7) If $f(x) = \min(4x + 3, x + 4)$ for $x \in [0, 2]$, what is the maximum value of $f(x)$?

Solution $f(x) = \min(4x + 3, x + 4)$ is an increasing function for every $x \in [0, 2]$

It means the value of $f(x)$ increases as x increases.

$\therefore$ at $x = 2$, $f(x)$ will be maximum

$f(x)_{max} = \min(11, 6)$ at $x = 2$

$f(x)_{max} = 6$

Hence, the maximum value of the function is 6.

Exp. 8) If $f(x) = \max(4x + 3, 3x + 6)$ for $x \in [-6, 10]$, Find the maximum value of $f(x)$.

Solution Since the function $f(x) = \max(4x + 3, 3x + 6)$ is an increasing function.Therefore at $x = 10$ we get the maximum value.

$f(x)_{max} = \max(43, 36)$

$f(x)_{max} = 43$

Exp. 9) What is the maximum value of $f(x) = \min(4 - 5x, x - 3)$ for every $x \in (0, 4)$?

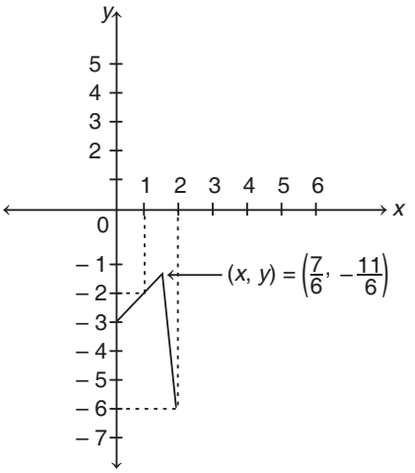
Solution At $x = 0$ $f(x) = \min(4, -3) = -3$

$x = 1, f(x) = \min(-1, -2) = -2$

$x = 2, f(x) = \min(-6, -1) = -6$

$x = 3, f(x) = \min(-11, 0) = -11$

$x = 4, f(x) = \min(-16, 1) = -16$ etc.



It is clear from the graph that $f(x)_{max}$ will lie between $x = 1$ and $x = 2$ *i.e.*, when $x \in (1, 2)$ and the $f(x)_{max}$ will be obtained when

$4 - 5x = x - 3 \Rightarrow 6x = 7 \Rightarrow x = \frac{7}{6}$

$\therefore \quad f(x)_{max} = \min(4 - 5x, x - 3)$

$= \min\left(-\frac{11}{6}, -\frac{11}{6}\right) = -\frac{11}{6}$

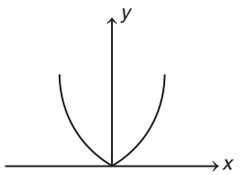
NOTE In case of $f(x)_{max} = \min(x, y)$ $f(x)_{max}$ will be obtained when $x = y$ Similarly in case of $f(x)_{min} = \max(x, y)$ $f(x)_{min}$ will be obtained when $x = y$

Introductory Exercise 17.3

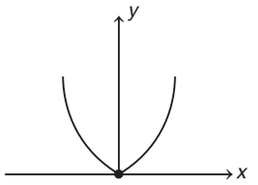
Directions (for Q. Nos. 1 to 4)

Mark (a) if function is one–one and into
Mark (b) if function is one–one and onto
Mark (c) if function is many one and into
Mark (d) if function is many one and onto

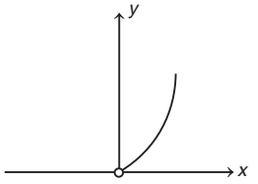
1. $f(x) = x^2$ $\quad f : R \to R$



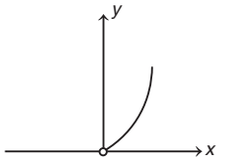
2. $f(x) = x^2$ $\quad f : R \to R^+ \cup \{0\}$



3. $f(x) = x^2$ $\quad f : R^+ \to R$



4. $f(x) = x^2$ $\quad f : R^+ \to R^+$



5. Let $f : R \to R$ be a function defined by $f(x) = \dfrac{e^{|x|} - e^{-x}}{e^x + e^{-x}}$, then :

(a) f is both one–one and onto
(b) f is one–one but not onto
(c) f is onto but not one–one
(d) f is neither one–one nor onto

6. Let $n(A) = 3$ and $n(B) = 5$, then the number of one–one functions from A to B is :

(a) 15 (b) 60 (c) 125 (d) 10

7. Let $A = R - \{3\}$, $B = R - \{1\}$. Let $f : A \to B$ be defined by $f(x) = \left(\dfrac{x-2}{x-3}\right)$, then

(a) f is bijective (b) f is one–one only
(c) f is onto only (d) f is one–one but not onto

8. The function $f : N \to N$ (N is the set of natural numbers defined by $f(n) = 2n + 3$ is :

(a) surjective (b) injective
(c) bijective (d) none of these

9. The function $f : R \to R$ defined by $f(x) = (x-1)(x-2)(x-3)$ is :

(a) one–one but not onto
(b) onto but not one–one
(c) both one–one and onto
(d) neither one-one nor onto

10. If the function $f : R \to R$ be such that $f(x) = x - [x]$, where $[k]$ denotes the greatest integer less than or equal to k, then $f^{-1}(x)$ is :

(a) $[x] - x$ (b) $1 / x - [x]$
(c) not defined (d) none of these

11. If $f(x) = x^2 + 2$ then $f^{-1}(x)$ is :

(a) $\sqrt{x-2}$ (b) $\sqrt{x+2}$ (c) $\sqrt{x} + 2$ (d) $x + 4$

12. If $f(x) = 5^x$, then $f^{-1}(x)$ is :

(a) x^5 (b) 5^{-x}
(c) $\log_5 x$ (d) none of these

13. If $f(x) = \dfrac{x}{x+1}$, then $f^{-1}(x)$ is :

(a) $\dfrac{x+1}{x}$ (b) $\dfrac{x}{1-x}$
(c) $\dfrac{x-1}{x}$ (d) none of these

14. If $f(x) = \dfrac{x-1}{x+1}$, then $f^{-1}(x)$ is :

(a) $\dfrac{1+x}{1-x}$ (b) $\dfrac{x+1}{x-1}$
(c) $\dfrac{1}{x+1}$ (d) none of these

15. Let $f : (-\infty, 1] \to (-\infty, 1]$ such that $f(x) = x(2-x)$, then $f^{-1}(x)$ is :

(a) $1 + \sqrt{1-x}$ (b) $1 - \sqrt{1-x}$
(c) $\sqrt{1-x}$ (d) none of these

16. If $f(x)$ is a one to one function, where $f(x) = x^2 - x + 1$, then find the inverse of the $f(x)$:

(a) $\left(x - \dfrac{1}{2}\right)$ (b) $\sqrt{x - \dfrac{3}{4}} + \dfrac{1}{2}$
(c) $\sqrt{x - \dfrac{3}{4}} - \dfrac{1}{2}$ (d) none of these

17. In the above question find the value of $f\left(\dfrac{3}{4}\right) + f^{-1}\left(\dfrac{3}{4}\right)$

(a) $\dfrac{21}{16}$ (b) $\dfrac{4}{5}$
(c) $\dfrac{16}{5}$ (d) none of these

CAT-Test

Questions Helping you bell the CAT

LEVEL 01 > BASIC LEVEL EXERCISE

Directions (for Q. Nos. 1 and 2)
$P(A, B) = A \times B,\ S(A, B) = A - B,\ D(A, B) = A + B$

1 $D(P(3, 5), S(5, 3))$ is equal to
(a) 15 (b) 17
(c) 0 (d) 30

2 $P(S(D(7, 3), P(2, 3)), P(6, 5))$ is equal to :
(a) 120 (b) 60
(c) 30 (d) none of these

Directions (for Q. Nos. 3 to 5) *For every* $a, b \in N$
$a @ b = a^2$ *when* $(a + b)$ *is even*
$= a^2 - b^2$ *when* $(a + b)$ *is odd*
$a \# b = b^2$ *when* $a \times b$ *is odd*
$= a^2 - b^2$ *when* $a \times b$ *is even*

3 Find the value of $20 \# (21 @ 22)$:
(a) 0 (b) 2249
(c) – 1849 (d) can't be determined

4 What is the value of $(a \# a) @ (a @ a)$?
(a) 0 (b) a^4
(c) either (a) or (b) (d) neither (a) nor (b)

5 Find the value of $(p \# q) - (q @ p)$; p is even and q is odd :
(a) 0 (b) $2(p^2 + q^2)$
(c) $2(p^2 - q^2)$ (d) none of these

6 If $M(a, b) = a^2 + b^2 + ab$; $N(a, b) = a^2 + b^2 - ab$. Find the value of $M(7, N(9, 4))$.
(a) 5197 (b) 3197
(c) 4197 (d) none of these

7 If $f(x) = x^3 - x^2$, then $f(x + 1)$ is :
(a) $x^3 - x^2 + 1$ (b) $x(x + 1)^2$
(c) $x^2(x - 1)$ (d) none of these

Directions (for Q. Nos. 8 to 10)

$$a \cup b = \begin{cases} a + b, \text{ if } a < b \\ a \vee b, \text{otherwise} \end{cases}$$

$$a \cup\cup b = \begin{cases} a \times b, \text{ if } a < b \\ a \vee\vee b, \text{otherwise} \end{cases}$$

$$a \cup\cup\cup b = \begin{cases} a^b, \text{ if } a < b \\ a \vee\vee\vee b, \text{otherwise} \end{cases}$$

$$a \vee b = \begin{cases} a - b, \text{ if } a \geq b \\ a \cup b, \text{otherwise} \end{cases}$$

$$a \vee\vee b = \begin{cases} \frac{a}{b}, \text{ if } a \geq b \\ a \cup\cup b, \text{otherwise} \end{cases}$$

$$a \vee\vee\vee b = \begin{cases} \frac{1}{a^b}, \text{ if } a \geq b \\ a \cup\cup\cup b, \text{otherwise} \end{cases}$$

8 Find the value of $[(5 \cup 4) \vee\vee (2 \cup\cup\cup 3)] \cup (8 \vee 3)$:
(a) 1 (b) 2
(c) 3 (d) 4

9 Which of the following is true?
(a) $2 \cup\cup 8 = 2 \cup\cup\cup 4$ (b) $8 \cup\cup 2 = 4 \cup\cup\cup 2$
(c) $8 \cup\cup\cup 2 = 2 \vee\vee\vee 5$ (d) none of these

10 Which one of the following is/are true?
(a) $a \cup b = a \vee b$ for all real values of a and b
(b) $a \vee\vee b = a \cup\cup b$ is true for integer values of a and b
(c) $a \vee\vee\vee b = a \cup\cup\cup b$ is true only for natural number a, b
(d) none of the above

Directions (for Q. Nos. 11 to14)

$$x @ y = (x + y)^2$$
$$x \# y = (x - y)^2$$

11 Find the value of $(20 @ 4) \# 35$:
(a) 280081 (b) 292681
(c) 262781 (d) 301756

12 Find the value of $12 \# (14 @ (12 \# 13))$:
(a) 4539
(b) 42336
(c) 45369
(d) 89719

13 Find the value of $(9 \# 7) @ (21 \# 5)$:
(a) 67600 (b) 62500
(c) 57600 (d) none of these

14 $(2 @ 2) + (3 \# 3) - (4 @ 4) + (5 \# 5)$ is equal to :
(a) 64 (b) – 48
(c) 28 (d) none of these

Directions (for Q. Nos. 15 and 16)

$$CAT(a, b) = \begin{cases} a^b, \text{ if } a > 0 \text{ and } b \in I \\ 0, \text{ otherwise} \end{cases}$$

$$MAT(a, b) = \begin{cases} b - a - 1, \text{ if } b > 0 \\ 1, \text{ otherwise} \end{cases}$$

$$XAT(a, b) = \begin{cases} \text{remainder } (b / a), \text{ if } a > 0 \\ 2, \text{ otherwise} \end{cases}$$

15 $\dfrac{\text{XAT [MAT } \{2, \text{CAT } (3, \text{XAT } [3, 2])\}, 5]}{\text{CAT [4, XAT } \{\text{MAT } (2, -5), 4\}]}$:

(a) 0 (b) 2
(c) 5 (d) none of these

16 $\dfrac{\text{XAT } (r, s)}{\text{MAT } (r, s)} = 2$:

(i) $r = 3, s = 5$ (ii) $r = -3, s = -5$
(a) (i) is true (b) (ii) is true
(c) both are true (d) none is true

Directions (for Q. Nos. 17 to 19) *a and b are any numbers and x and y are any non negative integers.*

$l(a)$ = *the greatest integer less than or equal to a*
$g(a)$ = *the smallest integer greater than or equal to a*
$r(x, y)$ = *the remainder when x is divided by y.*

17 $r(16, 7) - 2$ is equal to :

(a) 0 (b) 1
(c) 2 (d) 3

18 $g(4 . 7) - l(2)$ is equal to :

(a) 1 (b) 2
(c) 3 (d) 4

19 $r(x, y)$ with both x and y not equal to zero, is equal to :

(a) $l\left(\dfrac{x}{y}\right)$ (b) $x - \left[yl\left(\dfrac{x}{y}\right)\right]$
(c) $y - \left[xl\left(\dfrac{x}{y}\right)\right]$ (d) $\left[l\left(\dfrac{x}{y}\right) - y\right]$

Directions (for Q. Nos. 20 to 22)

$$x \# y = \begin{cases} x + 2y; \text{ if } |x + y| \text{ is even} \\ 2x @ 2y; \text{ if } |x + y| \text{ is odd} \end{cases}$$

$$x @ y = \begin{cases} 3x - y; \text{ if } |x + y| \text{ is even} \\ 2x \# 2y; \text{ if } |x + y| \text{ is odd} \end{cases}$$

20 Find the value of $2 \# ((7 @ (4 \# 5)) @ 3)$:

(a) 204 (b) 306
(c) 408 (d) 102

21 Which of the following is true?

(i) If $q = 2p$ and $p + q$ is even, then $p \# q = q \# p$
(ii) If $q = 3p$, $p @ q$ will always be zero
(iii) If $q = 2p$ and p is odd, then $p @ q$ will be even
(a) (ii) only
(b) (iii) only
(c) (i) and (iii) only
(d) (ii) and (iii) only

22 Which of the following is true?

(i) $6 @ 2 = 12 \# 2$
(ii) $6 \# 3 = (14 @ 12) + (2 @ 6)$
(iii) $(6 @ 2) + (6 \# 3) = (12 \# 2) + (14 @ 12) - (2 @ 6)$
(a) (i) and (ii) only (b) (i) and (iii) only
(c) (ii) and (iii) only (d) (i), (ii) and (iii)

Directions (for Q. Nos. 23 to 25)

$$a \# b = a^2 + b - 1$$
$$a \$ b = a^2 + b^2 + 1$$
$$\text{Max } (a, b) = |a + b|$$
$$\text{Min } (a, b) = |a - b|$$

23 Max $[(2 \#3) \$ (3 \#4), (3 \#4) \$ (4 \$ 4)]$ is equal to :

(a) 1234 (b) 1236
(c) 1335 (d) none of these

24 Max [Min $((1 \$ 2), (2 \$ 3))$, Max $((3 \# 4), (4 \# 5))$] is equal to :

(a) 24 (b) 40
(c) 42 (d) none of these

25 Find the value of
Min $[(1 \# 2) \$ 3, 4\#(5 \$ 6)] \$$ Max $(6 \# 7), (7 \# 8)]$:

(a) 13574 (b) 14573
(c) 13575 (d) 14674

26 If $a \Delta b = a^b + ab + \dfrac{a}{b}$, then $(9 \Delta 3)$ is equal to :

(a) 729 (b) 927
(c) 759 (d) none of these

27 $a * b \# c = (ab)^c$:
$a \# b * c = a^b . c$, then find the value of $3 \# 4 * 5 + 3 * 4 \# 5$

(a) 35287 (b) 249237
(c) 12345 (d) none of these

Directions (for Q. Nos. 28 and 29)

$$a \# b = (-1)^{ab} (a^b + b^a)$$
$$f(x) = x^2 - 2x \text{ if } x \geq 0$$
$$= 0 \text{ if } x < 0$$
$$g(x) = 2x \text{ ; if } x \geq 0$$
$$= 1 \text{ ; if } x < 0$$

28 Find the value of $f(2 \# 3) \# g(3 \# 4)$:

(a) 2045 (b) $(17)^{18}$
(c) $(180)^{81}$ (d) none of these

29 Find the value of $f(g(2 \# 3)) + g(f(1 \# 2))$:

(a) 9401 (b) 1049
(c) 1094 (d) none of these

Directions (for Q. Nos. 30 and 31)

$$a \oplus b = (a + b)^2 - ab$$
$$a * b = (ab)^2 - ab$$
$$a @ b = (a - b)^2 - ab$$

30 Find the value of $(5 \oplus 6) - (6 @ 3) + (2 * 4)$

(a) 156 (b) 256
(c) 1056 (d) none of these

31 Find the vlaue of $(((1 \oplus 2) * 3) @ 20)$:

(a) 151600 (b) 141500
(c) 161500 (d) none of these

Directions (for Q. Nos. 32 and 33)
If $m < n$ then $m\ Dn = m\ Cn$ else $mDn = nCm$

If $m = n$ then $mEn = mn$ else $mEn = mCn$ where $mCn = \frac{m}{n}$

32 Find the value of (3 D 4) D (12 D 5) :

(a) $\frac{9}{5}$ (b) $\frac{5}{9}$
(c) $\frac{2}{3}$ (d) $\frac{5}{3}$

33 Find the value of (12 D 60) E (2 C 10) :

(a) 1 (b) $\frac{1}{5}$
(c) 1/25 (d) 0

Directions (for Q. Nos. 34 to 38) *The operands in the Devic Mathematics are as follows :*

$+ \rightarrow$ *multiplication*
$- \rightarrow$ *division*
$\times \rightarrow$ *addition*
$/ \rightarrow$ *subtraction*
$\wedge \rightarrow$ *power (or index) for exponential expression.*

But Devic Mathematics must follow the same conventional BODMAS rule of mathematics. Solve the following questions in Devic Mathematics.

34 $30 + 20 - 4 \times 6$ is equal to :

(a) 156 (b) 276
(c) 330 (d) none of these

35 $50 / 40 - 5 + 4 \times 54$ is equal to :

(a) 720 (b) 72
(c) 144 (d) none of these

36 $(5 \wedge 5) \times (4 \wedge 4) / (3 \wedge 3) \times (2 \wedge 2) / (1 \wedge 1)$ is equal to :

(a) 2987 (b) 4013
(c) 3357 (d) none of these

37 The value of the following expression in Devic mathematics is :

$$[(x^2 \times y^2) - (x + y)^2] + \left[(x + y)^3 - \left\{\left(\frac{x}{y}\right)^2 \times 2 + x + y\right\}\right]$$

(a) $\frac{x}{y}$ (b) $x + y$
(c) $x \times y$ (d) $x \wedge y$

38 The value of the following expression in Devic mathematics is $a + a + a - a + a + a / a + a - a$:

(a) 1 (b) 0
(c) $1 - a$ (d) $\frac{1}{a}$

Directions (for Q. Nos. 39 and 40)

$P\Delta Q = P + Q$, if $PQ < 0$ $\quad P\Delta Q = P - Q$, if $PQ > 0$

39 $[(2\Delta 3)\ \Delta\ (-2\Delta 3)]$ is equal to :

(a) 0 (b) 1
(c) 2 (d) 3

40 If $(a\Delta b)\ \Delta\ (a\Delta - b) = 0$ and $a > 0$ then which of the following is true?

(a) $a < b$ and $b > 0$ (b) $|a| > |b|$ and $b < 0$
(c) $a > b$ and $b > 0$ (d) all of these

41 If $f(x) = x^3 + 3x^2 + 3x$, then $f(x + 1)$ is equal to

(a) $x^3 + 6x^2 + 12x + 7$ (b) $x^3 + 4x^2 + 5$
(c) $3x^3 + 12x^2 + 4x + 1$ (d) $2x^3 + 6x^2 + 3$

42 $x @ y = xy - 1$, if $x > y = 0$; otherwise

and $x \# y = \frac{x + y}{x - y}$ if $x \geq 0,\ y \geq 0 = 1$; otherwise.

The value of $\frac{(4 \# 2) @ (9 \# (-1))}{(2 @ 3) \# (5 @ 2)}$:

(a) 1 (b) – 2
(c) 0 (d) none of these

Directions (for Q. Nos. 43 and 44) *The following functions are defined for any two distinct, non zero integers a and b*

$$f_1(a, b) = |a| \times b^2;\ f_2(a, b) = a^2 \times |b|$$

$$f_3(a, b) = \frac{(a^2 + b^2)}{2};\ f_4(a, b) = \left(\frac{a}{2} + \frac{b}{2}\right)$$

43 Which of the following is equal to $(a + b)^2$?

(a) $f_3(a, b) \div f_4(a, b)$ (b) $2 \times f_3(a, b) \times f_4(a \times b)$
(c) $4 \times f_3(a, b) \times f_4(a, b)$ (d) none of these

44 Which one of the following is necessarily greater than zero?

(a) $f_1(a, b) \times f_2(a, b) \times f_3(a, b)$
(b) $f_1(a, b) \times f_2(a, b) \times f_4(a, b)$
(c) $f_1(a, b) \times f_3(a, b) \times f_4(a, b)$
(d) $f_2(a, b) \times f_3(a, b) \times f_4(a, b)$

Directions (for Q. Nos. 45 to 47)

lt $(p) \rightarrow$ the least possible integer greater than or equal to p.
gt $(p) \rightarrow$ the greatest possible integer less than or equal to p.

$$\Delta(p, q) = \text{Min (lt } (p), \text{ gt } (q))$$

45 What is the value of lt (8.3) – gt (5.3) + lt (6.8) + gt (9.4)

(a) 15 (b) 20
(c) 19 (d) none of these

46 Find the value of
$\Delta(3, 2) - \Delta(2, 3) + \text{gt}(4.8) - \text{lt}(2.7) + \Delta(4, 5)$

(a) 4 (b) 5
(c) 6 (d) none of these

47 Which of the following statements is always true about $(a-b)$ where $a=\frac{p+q}{2}$ and $b=\frac{\text{lt}(p)+\text{gt}(q)}{2}$

(a) $-\frac{1}{4}\le(a-b)\le\frac{1}{4}$, always

(b) $-\frac{1}{2}\le(a-b)\le\frac{1}{2}$

(c) $-1\le(a-b)\le1$

(d) $-1\le(a-b)\le1$, except zero

Directions (for Q. Nos. 48 and 49)

$$a\,@\,b=\frac{a}{a+b}\text{ and }b\,\#\,a=\frac{a+b}{b}$$

48 Which of the following is true ?

(a) $\frac{a\,@\,b}{b\,\#\,a}=\frac{a}{b}$ (b) $(a\,@\,b)(b\,\#\,a)=a^2b^2$

(c) $(a\,@\,b)(b\,\#\,a)=\frac{a}{b}$ (d) $\frac{a\,@\,b}{b\,\#\,a}=\frac{a+b}{b+a}$

49 Which of the following is true?

(a) $a\,@\,b+b\,\#\,a=\frac{a^2+b^2+3ab}{a(b+a)}$

(b) $a\,@\,b-b\,\#\,a=\frac{a^2+b^2+ab}{b(b+a)}$

(c) $b\,\#\,a-a\,@\,b=\frac{a^2+b^2+ab}{b(a+b)}$

(d) $a\,@\,b+b\,\#\,a=1$

Directions (for Q. Nos. 50 and 51) *The following operations are defined for any two real number a and b.*

$$mn\,(p,q)=\min\,(p,q)$$
$$mx\,(p,q)=\max\,(p,q)$$
$$md\,(p)=|\,p\,|$$

50 Find the value of $mn\,(md\,(p),\,mx\,(q,\,mn\,(p,\,md(q))))$; if $p=-2,\,q=5$:

(a) -2 (b) 2

(c) 3 (d) -7

51 Find the value of $md\,(mn\,(P,\,mx\,(md\,(q),\,mn\,(P,\,r))))$; if $p=-2,\,q=5,\,r=7$.

(a) -1 (b) 0

(c) 2 (d) none of these

Directions (for Q. Nos. 52 and 53)

$$a\,@\,b=(a+b)(ab+b)$$
$$a\,\#\,b=(a-b)(ab-b)$$
$$a\Delta b=(a\,@\,b)-(a\,\#\,b)$$

52 Find the value of $((1\,@\,(2\Delta\,3))\,\#\,4)$:

(a) 35500 (b) 482420

(c) 123400 (d) none of these

53 Find the value of $(1\,@\,1)\,\Delta\,(2\,\#\,2)$

(a) 5 (b) 22

(c) 17 (d) none of these

Directions (for Q. Nos. 54 and 55)

$$a\,@\,b=|\,a-b\,|$$
$$a*b=ab$$
$$a\,\#\,b=|\,a^2-b^2\,|$$
$$a\,\Delta\,b=a^2+b^2$$

where $a,\,b\in R$ and $a\ne b$ and the real algebraic operations are unchanged.

54 Find the value of $(a\,\Delta\,b)+(a\,\#\,b)$:

(a) $2a^2$ (b) $2b^2$

(c) $2(a^2+b^2)$ (d) can't be determined

55 The value of the expression

$$[(a\,\#\,b)\div(a\,@\,b)]^2-2(a*b)$$

(a) $a\,\#\,b$

(b) $a\,\Delta\,b$

(c) $(a\,\#\,b)(a\,@\,b)$

(d) can't be determined

Directions (for Q. Nos. 56 to 58) *A function $f(x)=\log\,(g(x))$, where $g(x)$ is any function of x.*

56 For what value of $g(x)$, $g(x)=g(f(x))$?

(a) e (b) e^x

(c) $\log\,x$ (d) none of these

57 For what value of $g(x)$ is the function of $f(x)=g(x)$?

(a) $g(x)=e$ (b) $g(x)=e^x$

(c) $g(x)=\log\,x$ (d) none of these

58 If $g(x)=e^x$, then $f(f(x))$ is equal to :

(a) e (b) e^x

(c) $\log\,x$ (d) none of these

59 If $f(x)=2x+3$ and $g(x)=9x+6$, then find $g[f(x)]-f[g(x)]$

(a) 18 (b) 22

(c) 20 (d) none of these

60 If $f\,(x)=x^2+2x+2\,;\,x\ge-1$

$$=-x^3+3x+1;\,x<-1$$

then find the value of $f(f(-2))$:

(a) 15 (b) 17

(c) 22 (d) none of these

Directions (for Q. Nos. 61 to 63)

$[m]$ *is defined as the greatest integer less than m.*

$\{m\}$ *is defined as the least integer greater than m.*

$$f(x,y)=\{x\}+[y]$$
$$g(x,y)=[x]-\{y\}$$
$$F\,(f(x,y))=\{f(x,y)\}-[g\,(x,y)]$$
$$G(g\,(x,y))=[f(x,y)]-\{g(x,y)\}$$

61 Given that $x^2=4$ and $y^2=9$ and $|\,F\,(f(x,y))\,|=|\,G\,(g(x,y))\,|$ then find the vlaue of $x+y$:

(a) -1 (b) 0

(c) 1 (d) 5

62 If x and y are consecutive integers, then find $g(x, y)$
(a) -1 (b) -3
(c) -1 or -3 (d) none of these

63 Which of the following is false?
(a) $f(x, y) + g(x, y) = F(f(x, y)) + G(g(x, y))$
(b) $F(f(x, y)) - G(g(x, y)) = -2[g(x, y)]$
(c) $F(f(x, y) + G(g(x, y)) = 2\{f(x, y)\} + 2$
(d) none of the above

Directions (for Q. Nos. 64 to 66) *A decimal number 'm' (say) can be expressed as*

$$m = I + D$$

where $I \rightarrow$ *integral part*
and $D \rightarrow$ *decimal part,* $0 \le D < 1$
and $[m]$ = *greatest integer less than or equal to m if* $0 < D < 0.5$
also $\{m\}$ = *least integer greater than or equal to m if* $0.5 \le D < 1$

$$\text{Hence, } f(x, y) = \begin{cases} [x + y] \text{ if } 0 < D < 0.5 \\ \{x + y\} \text{ if } 0.5 \le D < 1 \\ (x + y) \text{ otherwise} \end{cases}$$

Also, $F(f(x, y)) = -f(x, y)$
and $G(f(x, y)) = -F(f(x, y))$

64 What is the value of the following
$f(G(f(1.2, 1.3)))$, $f(F(f(0,1)))$, $G(f(0.8, 0.4)))$?
(a) 1 (b) 2 (c) 3 (d) 4

65 Which of the following statements is true if x and y are positive ?
(a) $F(f(x, y)) \cdot G(f(x, y)) = -F(f(x, y)) \cdot G(f(x, y))$
(b) $F(f(x, y)) \cdot G(f(x, y)) > -F(f(x, y)) \cdot G(f(x, y))$
(c) $F(f(x, y)) \cdot G(f(x, y)) \ne G(f(x, y)) \cdot F(f(x, y))$
(d) $F(f(x, y)) + G(f(x, y)) + F(x, y)) = F(x, y)$

66 Which of the following expressions will yield a number which has a positive integral square root if x, y are positive
(a) $G(f(1.2, 1.3)) \times f(F(f(2, 1), G(f(4, 1))$
(b) $F(f(2, 2)) + G(f(2, 2))$
(c) $f(1.1, 1.2) \times G(f(1.1, 1.2))$
(d) $G(f(0, 1)) \times G(f(0, 1))$

67 $f(x) = \frac{1}{x}; g(x) = \left(x + \frac{1}{x}\right)$, then which of the following is true?
(a) $f(g(x)) \cdot g(f(x)) = 1$ (b) $\frac{f(g(x))}{g(f(x))} = 1$
(c) $f(g(x)) + g(f(x)) = 1$ (d) none of these

68 If $f(x) = 2x^2 + 7x - 9$ and $g(x) = 2x + 3$, then find the value of $g(f(x))$ at $x = 2$
(a) 92
(b) 39
(c) 29
(d) none of the above

69 Find $f(f(f(f(f(2)))))$ if $f(x) = \frac{x+1}{x-1}; x \ne 1$
(a) 1 (b) 2
(c) 3 (d) 5

Directions (for Q. Nos. 70 and 71)

$$f(x) = 1 - h(x),\ g(x) = 1 - k(x),\ h(x) = f(x) + 1$$
$$j(x) = g(x) + 1,\ k(x) = j(x) + 1$$

70 Find the value of $\frac{j(f(x)) + k(h(x))}{h(k(x)) + f(j(x))}$:
(a) 0 (b) 1
(c) 2 (d) none of these

71 $\frac{h(f(k(x))) + j(g(h(x))) + k(j(f(x)))}{[f(x) + j(x) + k(x)][f(x) \cdot j(x)\, k(x)]}$ is equal to :
(a) 0 (b) 3
(c) 3/2 (d) none of these

72 If $f(x)$ and $g(x)$ are odd functions of x, then which of the following is true?
(a) $f + g$ is odd, fg is odd (b) $f + g$ is odd, fg is even
(c) $f + g$ is even, fg is odd (d) $f + g$ is even, fg is even

73 If $f(x)$ is an even function of x and $g(x)$ is an odd function then which of the following is true?
(a) $f[g(x)]$ is odd , $g[f(x)]$ is even
(b) $f[g(x)]$ is odd, $g[f(x)]$ is odd
(c) $f[g(x)]$ is even, $g[f(x)]$ is even
(d) $f[g(x)]$ is even, $g[f(x)]$ is odd

74 If $y = \min(x^2 + 2, 6 - 3x)$, then the greatest value of y for $x > 0$
(a) 1 (b) 2
(c) 3 (d) none of these

75 If $p^2 + q^2 + r^2 = 1$, then the maximum value of pqr is :
(a) 1 (b) $\frac{1}{3\sqrt{3}}$
(c) 3 (d) none of these

Directions (for Q. Nos. 76 to 78) *Following functions are defined for three distinct positive numbers, such that* $x < y < z$.

$f(x, y, z) = \min(\max(x + y, y + z), \max(z + x, x + y))$
$g(x, y, z) = \max(\min(x + y, y + z), \min(z + x, x + y))$
$h(x, y, z) = \max(\max(x + y, y + z), \max(z + x, x + y))$
$j(x, y, z) = \min(\min(x + y, y + z), \min(z + x, x + y))$
$k(x, y, z) = \text{int.}((x + y + z) / 3)$
such that $k(x, y, z) \le (x + y + z)/3$
$l(x, y, z) = \min(x, y, z)$; $m(x, y, z) = \max(x, y, z)$

76 Which of the following expression is necessarily equal to 1?
(a) $\frac{(f(x, y, z) - m(x, y, z))}{(m(x, y, z) - l(x, y, z))}$ (b) $\frac{g(x, y, z)}{j(x, y, z)}$
(c) $\frac{(m(x, y, z) - f(x, y, z))}{k(x, y, z) + j(x, y, z)}$ (d) $\frac{(h(x, y, z) - f(x, y, z))}{f(x, y, z)}$

77 Which of the following expression gives negative value?

(a) $\frac{(m(x, y, z) - f(x, y, z))}{h(x, y, z) \times k(x, y, z) \times l(x, y, z)}$

(b) $\frac{(m(x, y, z) - l(x, y, z) + j(x, y, z))}{k(x, y, z)}$

(c) $\frac{l(x, y, z) - m(x, y, z)}{g(x, y, z) - j(x, y, z)}$

(d) $\frac{h(x, y, z) - g(x, y, z)}{k(x, y, z)}$

78 Which of the following expressions is necessarily greater than 1 ?

(a) $\frac{[h(x, y, z) - j(x, y, z)]}{k(x, y, z)}$

(b) $[g(x, y, z) - j(x, y, z)] \times m(x, y, z)$

(c) $\frac{g(x, y, z)}{j(x, y, z)}$

(d) $\frac{f(x, y, z) + h(x, y, z) - g(x, y, z)}{j(x, y, z)}$

Directions (for Q. Nos. 79 to 83)

$A(x, y, z) = \min(x + y, y + z, z + x)$
$B(x, y, z) = \max(x - y, y - z, z - x)$
$C(x, y, z) = \max(A(x, y, z), B(x, y, z))$
$D(x, y, z) = \min(A(x, y, z), B(x, y, z))$

79 The value of $C(1, 2, 3)$ is :

(a) 1 (b) 2 (c) 3 (d) 4

80 The value of $D(0, 1, 2)$ is :

(a) – 1 (b) 1
(c) 0 (d) none of these

81 What is the value of $A(2, 3, 4) + B(2, 3, 4)$?

(a) 13 (b) 4
(c) 7 (d) none of these

82 What is the value of $C(0, 1, D(1, 2, 3))$?

(a) 1 (b) 2
(c) – 2 (d) none of these

83 What is the value of $D(1, 2, C(0, 1, 2))$?

(a) 1 (b) 2
(c) 3 (d) 4

84 What is the maximum possible value of xy, where $|x + 5| = 8$ and $y = 9 - |x - 4|$

(a) 401
(b) 124
(c) 104
(d) none of these

85 For real x, y, such that $f(x) \neq 0$, if $f(x + y) = f(x) \cdot f(y)$, what's the value of $f(100x)$?

(a) $(f(x))^{100}$ (b) $(f(x))^{99}$
(c) $99(f(x))^{100}$ (d) $\frac{(f(x))^{99}}{100}$

86 Find the number of solutions of $|x| \cdot e^{|x|} = 9$.

(a) 0 (b) 1 (c) 2 (d) 3

LEVEL 02 > HIGHER LEVEL EXERCISE

1 Let a function is defined as $f(x) = \frac{a^x + a^{-x}}{2}$; $a > 0$, what is the value of $f(x + y) + f(x - y)$?

(a) $f(x) + f(y)$ (b) $f(x) f(y)$
(c) $2f(x) f(y)$ (d) $4f(x) f(y)$

2 If $\left|\frac{30 - x}{5}\right| < 4$, then find x :

(a) $-6 < x < 6$ (b) $10 < x < 50$
(c) $x > 10$ (d) none of these

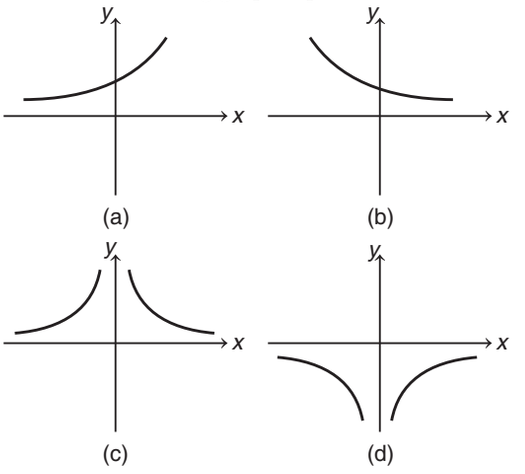
3 Let $f(x, y) = |x + y|$ and $g(x, y) = |x - y|$, then how many ordered pairs of the form (x, y) would satisfy $f(x, y) = g(x, y)$?

(a) 1 (b) 2
(c) 4 (d) infinitely many

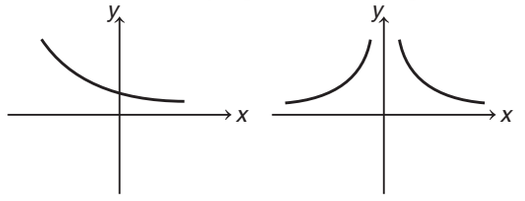
4 What is the value of x if $|x - 1| + |x| = 2$:

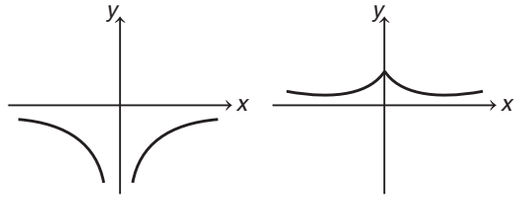
(a) $-\frac{1}{2}$ (b) $\frac{3}{2}$
(c) both (a) and (b) (d) none of these

5 Which of the following graph represents e^{-x} ?



6 Which of the following represents the graph of e^{-x^2} :



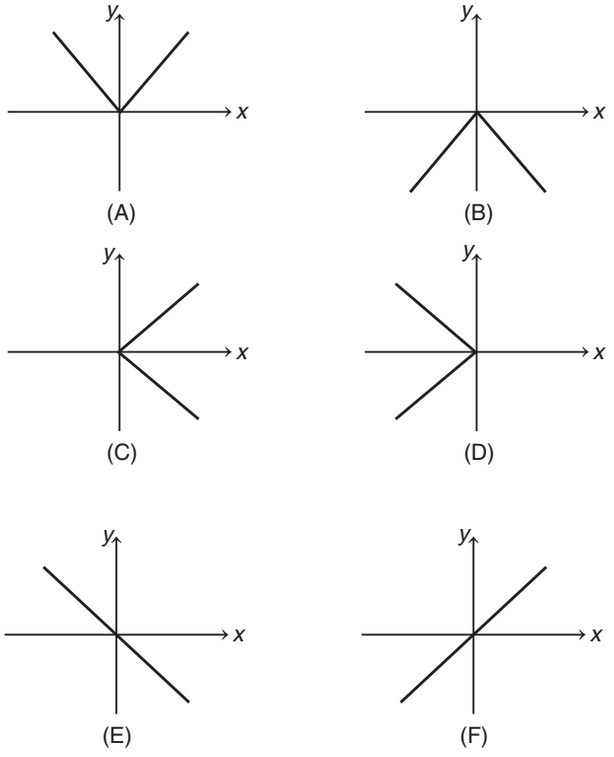


7 A function is defined as $f(x) = a^x \ \forall\ x \in R$ and $0 < a < 1$, then which of the following is true?

(i) It is an increasing function
(ii) It is a decreasing function
(iii) All such functions must meet at (0, 1)

(a) only (i) is true (b) only (ii) is true
(c) (i) and (iii) are true (d) (ii) and (iii) are true

Directions (for Q. Nos. 8 to 13) *The following figure represents various functions. Match the figure with the appropriate function.*



8 $f(x) = -x$:

(a) *B* (b) *C* (c) *E* (d) *D*

9 $f(x) = |x|$:

(a) *A* (b) *B* (c) *C* (d) *D*

10 $f(x) = -|x|$:

(a) *E* (b) *B* (c) *A* (d) *F*

11 $f(x) = x$:

(a) *E* (b) *F* (c) *A* (d) *B*

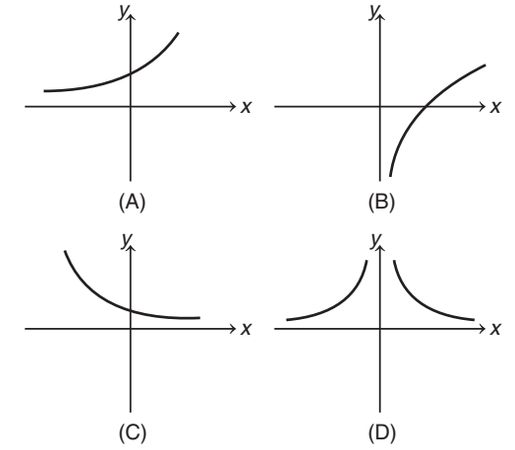
12 $f(x) = |x| - x$:

(a) *A* (b) *C*
(c) *B* (d) none of these

13 $f(x) = ||x| - x|$:

(a) *B* (b) *D*
(c) *A* (d) none of these

14 If $x = 10^y$ then the graph of inverse of this function is :



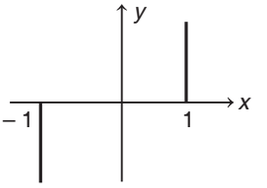
(a) *A* (b) *B* (c) *C* (d) *D*

15 If $f(x) = \begin{cases} 1 - x, & 0 \le x \le 2 \\ x - 1, & 2 \le x \le 4, \\ 1, & 4 \le x \le 6 \end{cases}$

then find, $f(0) + f\left(\frac{1}{2}\right) + f(1) + f\left(\frac{45}{18}\right)$:

(a) 1 (b) 2
(c) 3 (d) none of these

16 Which one of the following is true about the given graph ?



(a) $x = \frac{|y|}{y},\ y \neq 0$

(b) $y = \frac{|x|}{x},\ x \neq 0$

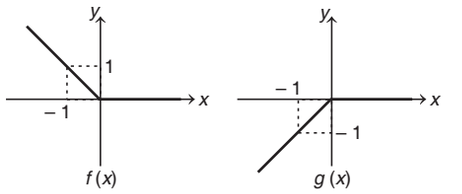
(c) $x = -\frac{|y|}{y},\ y \neq 0$

(d) $y = \frac{-|x|}{x},\ x \neq 0$

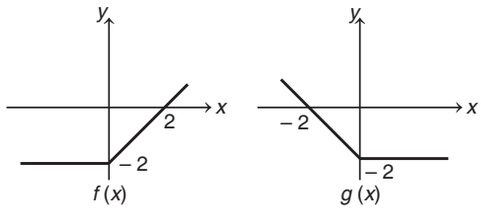
Directions (for Q. Nos. 17 and 18) *In each question there are two graphs $f(x)$ and $g(x)$ for the real values of x.*

Mark (a) if $g(x) = f(-x)$
Mark (b) if $g(x) = -f(x)$
Mark (c) if $g(x) = |f(x)|$
Mark (d) if none of the above is true.

17



18



Directions (for Q. Nos. 19 to 22) *In the following questions a function is represented by the graph.*

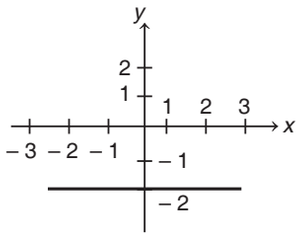
Mark (a) if $f(x) = f(-x)$

Mark (b) if $f(x) = -f(-x)$

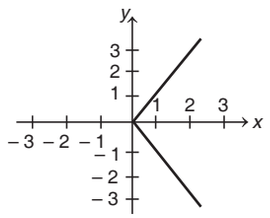
Mark (c) if $f(x)$ *does not exist*

Mark (d) if none of the above is true.

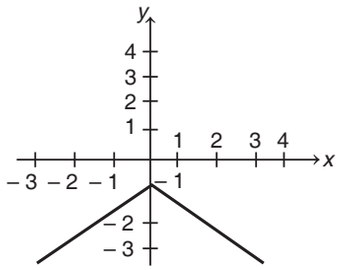
19



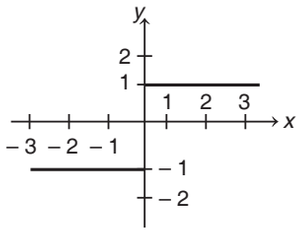
20



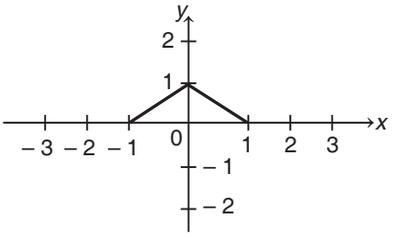
21



22



23 In the following graph for $x \in [-1, 1]$, $f(x)$ is defined by :



(a) $|x| + 1$ (b) $-|x| + 1$

(c) $-|x + 1|$ (d) $-|x| - 1$

24 How many times does the graph of $y = x^3 - 3x^2 - x + 3$ intersects the x-axis :

(a) 1 (b) 2

(c) 3 (d) none of these

25 Which one of the following is true for $x \in R$:

(a) $f(x) = \log|x|$ (b) $f(x) = \dfrac{|x|}{\log|x|}$

(c) $f(x) = \log(x^2 + 2)$ (d) $f(x) = \log_x 100$

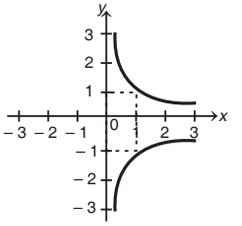
26 Which one of the following is correct about the given graph of $f(x)$:

(a) $|xy| = 1$

(b) $|x| y = 1$

(c) $x|y| = 1$

(d) $|x||y| = 1$



27 A function is defined as $f(x) = \dfrac{25}{(x+5)^2}$, then the value of $f(x)$:

(a) decreases as the value of x increases, only if x is negative

(b) increases as the value of x increases, only if x is negative

(c) decreases as the value of x increases, only if x is positive.

(d) both (a) and (c) are true

Directions (for Q. Nos. 28 and 29) *The following functions are defined for the set of variables* $x_1, x_2, x_3, \ldots . x_n$

$$f(x_i, x_j) = \begin{cases} x_{i+j} \text{ if } i + j \le n^2 \\ x_{i+j-n} \text{ if } i + j > n^2 \end{cases}$$

$g(x_i, x_j) = x_m$,

where m is the remainder when $i \times j$ is divided by n.

28 Find the value of $f(f(x_2, x_3), f(x_5, x_6))$ if $n = 3$

(a) x_5

(b) x_{10}

(c) x_{13}

(d) none of the above

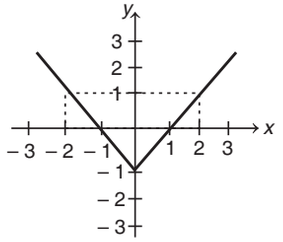
29 Find the value of $g(g(x_2, x_3), g(x_7, x_8))$ if $n = 5$

(a) x_1 (b) x_2

(c) x_5 (d) none of these

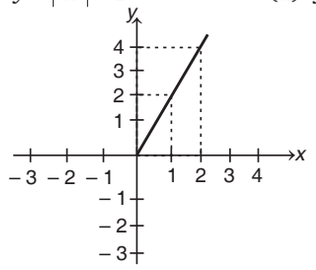
Directions (for Q. Nos. 30 to 34) *In each of the following questions a graph of a function is being shown. Select the correct equation of the function of the graph.*

30



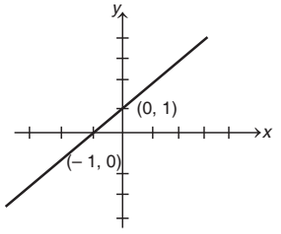
(a) $y = |x-1|$ (b) $x = |y|+1$
(c) $y = |x|-1$ (d) $y = |x|-2$

31



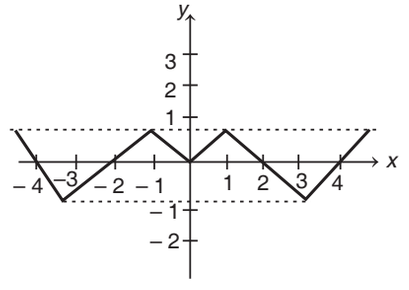
(a) $x = |y|+y$ (b) $y = |x|+x$
(c) $y = |x|$ (d) $x = |y|$

32



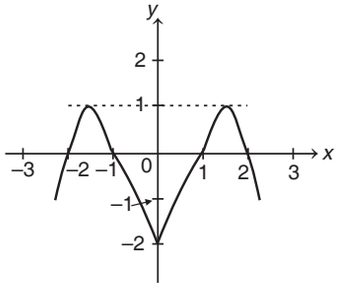
(a) $x = y+1$ (b) $y = x-1$ (c) $x = y-1$ (d) $y = 1-x$

33



(a) $y = |x-1||x-2|$ (b) $y = |||x|-1|-2|-1$
(c) $y = |||x|-2|-1|$ (d) none of these

34

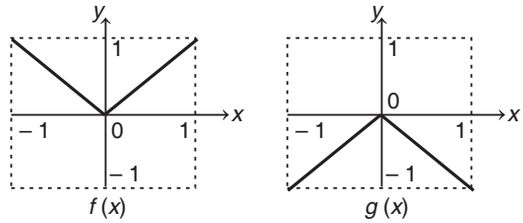


(a) $y = |x-1||x-2|$ (b) $y = -(|x|-1)(|x|-2)$
(c) $y = |||x|-1|-2|$ (d) $y = (|x|-1)(|x|-2)$

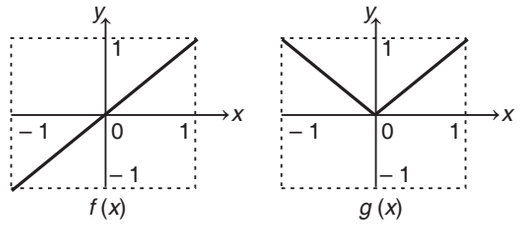
Directions (for Q. Nos. 35 to 37) *In each of the following questions a pair of graphs $f(x)$ and $g(x)$ is given, defined for every $x \in (-1, 1)$. Choose the correct answer as*

(a) if $f(x) = -g(x)$ for every x
(b) if $f(x) = g(x)$ for $x < 0$ and $f(x) = -g(x)$ $x > 0$
(c) if $f(x) = -g(x)$ for $x < 0$ and $f(x) = g(x)$, $x > 0$
(d) none of the above

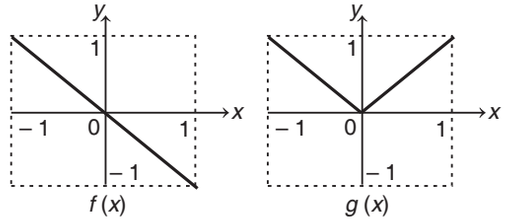
35



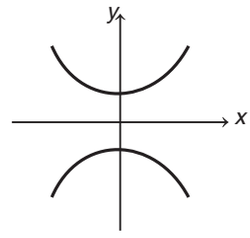
36



37



38 In the adjacent diagram two graphs of equal magnitude are being shown. Their maxima and minima are also same, then the correct choice for the two equation of functions is :



(a) $y = ax^2 + b$ and $y = ax^2 - b$
(b) $f(x) = ax^2$ and $f(x) = bx^2$; $a \neq b$
(c) $f(x) = ax^2 + bx$ and $f(x) = -ax^2 + bx$
(d) $y + ax^2 + c = 0$ and $y - ax^2 - c = 0$

39 If $f(x) = \frac{1}{x}$; $x \neq 0$ and $f^{n+1}(x) = f^n(f(x))$, find the product of $f^{11}(1) \cdot f^{33}(1) \cdot f^{55}(1)$ $f^{77}(1) \cdot f^{99}(1)$:

(a) 110 (b) 88
(c) 275 (d) 1

40 If $f(x)=\frac{1}{x}$, $x \neq 0$ $f^n(x) = f(f^{n-1}(x))$ and $f^{12} = 11$, what is the value of $f(x) = ?$

(a) 1 (b) 2
(c) 1/11 (d) none of these

Directions (for Q. Nos. 41 to 43) *A program module is given below with various steps involved , which starts with the values of a, b, c as 1, 2, 3 respectively. These values remain unchanged till step 1.*
The program is executed with the help of following operators.

$$Milan\ 2(P) = P \times 2$$
$$Milaap\ 2(P) = P + 2$$

and $b = a$ means the value of a is assigned to b.
START
Step 1. Read (a, b, c)
Step 2. Milan 2(a)
Step 3. Milaap 2(b)
Step 4. $c = a + b$
Step 5. If, $c > 111$, then go to step 6 else go to step 2.
Step 6. STOP

41 How many times in the above program does c take a perfect square value ?

(a) 1 (b) 2
(c) 0 (d) none of these

42 In a particular cycle a, b and c get the values such that $9a = 8c$, then the value of b is :

(a) 6 (b) 8 (c) 16 (d) none of these

43 How many times is the program module repeated?

(a) 6 (b) 7
(c) 5 (d) none of these

Directions (for Q. Nos. 44 to 46) *In the following algorithm x, y and z are variables which change their values in each step such that the value of the expression on the right hand side is assigned to the variable on the left hand side of the equation. Each cycle consists of 5 steps. S_1, S_2, S_3... are the sum of each corresponding cycle 1, 2, 3....*

START
Step 0. $x = 1$, $y = -2$, $z = 3$
Step 1. $x = y - z$
Step 2. $y = z - x$
Step 3. $z = x - y$
Step 4. $S = x + y + z$
Step 5. Go to step 1.

44 Which one of the following is correct for each cycle?

(a) $S = 2x$ (b) $S = 3x$
(c) S is an odd number (d) none of these

45 What is the value of S_4 ?

(a) 987 (b) 754
(c) – 178 (d) none of these

46 Which of the following is correct?

(a) S_{11} is an odd number (b) S_{13} is a negative number
(c) S_{15} is an even number (d) both (b) and (c)

Directions (for Q. Nos. 47 and 48) *There are three bottles of water K, L, M whose capacities are 9 litres, 5 litres and 4 litres respectively. For transferring water from one bottle to another and to drainout the bottles, there exists a piping system. The flow through these pipes is computer controlled. The computer that controls the flow through these pipes can be fed with three types of instructions, as explained below. Initially K is completely filled up with water and L, M are empty.*

Instruction type	Explanation of the instruction
Fill (X, Y)	Fill bottle labelled X from the water in bottle labelled Y, where the remaining capacity of X is less than or equal to the amount of water in Y.
Empty (X, Y)	Empty out the water in bottle labelled X into bottle labelled Y, where the amount of water in X is less than or equal to remaining capacity of Y.
Drain (X)	Drain out all the water contained in bottle X.

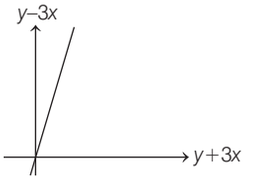
47 How much water would be there in bottle labelled L after the execution of the sequence of the following four instructions :
First instruction : Fill (L, K)
Second instruction : Fill (M, L)
Third instruction : Empty (L, K)
Fourth instruction : Empty (M, L)

(a) 0 litre (b) 4 litres
(c) 5 litres (d) none of these

48 After executing a sequence of 6 instructions, bottle K has half of the water that the bottles L and M together have and the bottle L has half of the water that the bottle M has. Find the fourth instruction if the rest instructions are given below.
Instruction 1. Fill (L, K)
Instruction 2. Fill (M, L)
Instruction 3. Empty (M, K)
Instruction 5. Fill (L, K)
Instruction 6. Fill (M, L)

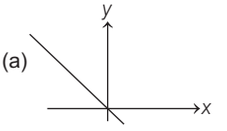
(a) Fill (L, M) (b) Empty (L, M)
(c) Fill (M, K) (d) Empty (M, L)

49 The graph of $y - 3x$ against $y + 3x$ is shown in the adjacent.

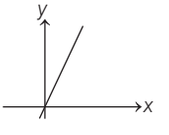


All graphs in questions are drawn to scale and the same scale has been used on each axis. Which of the following shows the graph of y against x?

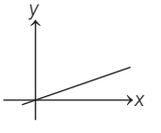
(a)



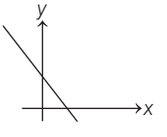
(b)



(c)



(d)



LEVEL 03 > Final Round

(The questions in this exercise given are very similar to the questions which are asked in XAT for XLRI, XIM etc.

Directions (for Q. Nos. 1 to 10) *Solve the following questions on the basis of following functions*

(a) $P_{(n+1)} = P_{(n)} - P_{(n-1)}$, *P is the term of the sequence and* $P_{(0)} = 0, P_{(1)} = 1$

(b) $Q_{(n+1)} = Q_{(n)} + Q_{(n+1)}$; *Q is the term of the sequence and* $Q_{(0)} = 0, Q_{(1)} = 1$

1 What is the 10^{th} term of series $Q_{(n+1)}$ starting from $n = 0$?
(a) 34 (b) 89
(c) – 1 (d) 55

2 What is the 12^{th} term of the series $P_{(n+1)}$ starting from $n = 0$?
(a) – 1 (b) 0
(c) 1 (d) none of these

3 The value of Q cannot be :
(a) 144 (b) 55 (c) 98 (d) 34

4 The value of P cannot be :
(a) – 1 (b) 0 (c) 1 (d) 4

5 Which of the following can be a positive value of $Q_n + P_{(n+1)}$?
(a) 55 (b) 234
(c) 146 (d) none of these

6 The value of $Q_n + P_n$ cannot be :
(a) 2 (b) 22 (c) 55 (d) 88

7 The value of $Q_{[Q(n+1)]}$ can be :
(a) 55 (b) 13 (c) 21 (d) 89

8 The value of $Q_n \times P_n$ can be :
(a) – 34 (b) 89 (c) – 233 (d) 377

9 The value of $[Q_{(n)}]^{P_n}$ can be :
(a) – 1 (b) 0.2 (c) – 13 (d) 5.5

10 The value of $Q_{(n-1)} + Q_{(n+1)} + L_{(n-1)} + L_{(n+1)}$ cannot be :
(a) 30 (b) 75
(c) 18 (d) 122

Directions (for Q. Nos. 11 to 14) *Let S be a sequence of the form* $[K(1), K(2), \ldots K(m)]$. *Each term can be defined by the following four functions :*

$P[K(x)] = 3Q[K(x)] - 4$

$Q[K(x)] = 2R[K(x)] + R[K(2x)]$

$R[K(x)] = S[K(2x)] - S[K(x)]$

$$S[K(x)] = \begin{cases} 0 \text{ if } x < 0 \\ 3x + 4 \text{ if } 0 \le x \le 6 \\ 4x + 3 \text{ if } x > 6 \end{cases}$$

Also if $Q[K(x)] = y$ then $PQ[K(x)] = P[K(y)]$

11 What is the value of $P[K(3)]$?
(a) 3 (b) 5 (c) 32 (d) 137

12 What is the value of $QRS[K(1)]$:
(a) 112 (b) 224
(c) 448 (d) none of these

13 What is the value of $R[K(5)] - S[K(10)]$:
(a) 43 (b) – 19
(c) 14 (d) none of these

14 What is the value of $\sum_{x=-\infty}^{+\infty} R[K(x)]$ if $\sum_{x=1}^{4} R[K(x)]$ $= R[K(1)] \times R[K(2)] \times R[(K(3)] \times R[K(4)]$?
(a) – 1 (b) 0
(c) 1 (d) none of these

Directions (for Q. Nos. 15 to 20) *These questions are based on the given data.*

A polynomial can be represented in an equivalent sequence form.

The polynomial $P_1x^{k_1} + P_2x^{k_2} + P_3x^{k_3} + \ldots P_nx^{k_n}$ *where* $k_1 > k_2 > k_3 \ldots > k_n$ *and* $a_i \neq 0$ *for* $1 \le i \le n$ *will be represented as the sequence* $(P_1, k_1, P_2, k_2, P_3, k_3 \ldots P_n, k_n)$

Also, we add, subtract, multiply as we do for corresponding polynomials. The resulting polynomial is again represented as a sequence.

15 (3, 4, 2, 2, 5, 1) + (2, 4, 3, 3, 7, 2) equals :
(a) (5, 4, 3, 4, 9, 3, 5, 1) (b) (5, 4, 5, 5,12, 3)
(c) (5, 4, 3, 3, 9, 2,5,1) (d) none of these

16 (6, 5, 7, 4, 8,3) – (3, 5, 5,3, 7, 1) equals
(a) (3, 5, 2, 2, 1, 2) (b) (3, 5, 7, 4, 3, 3, – 7, 1)
(c) (3, 5, 7, 3, 8, 2) (d) none of these

17 (1, 1, 2, 0) × (1, 1, 2, 0) × (1, 1, 2, 0) equals :
(a) (1, 3, 6, 2, 12,1, 8, 0) (b) (1, 3, 2, 2, 3, 1, 4, 0)
(c) (1, 8, 2,4, 3, 2) (d) none of these

18 The expression $\frac{3, 3, -10, 2, 7, 1}{3, 2, -7, 1}$ equals :
(a) (1, 1, –1, 1) (b) (1, 1, – 1, 0)
(c) (2, 2, – 2, 0) (d) none of these

19 Which of the following is incorrect?
(a) $(1, 1, 1, 0) \times (1, 2, -1, 1, 1, 0) = (1, 3, 1, 0)$
(b) $(2, 2, 1, 1) \times (4, 4, 4, 4) = (16, 6, 10, 5)$
(c) $\frac{(1, 2, 4, 1, 4, 0)}{(1, 1, 2, 0)} = (1, 1, 2, 0)$
(d) none of the above

20 (4, 4, 3,3) × (2, 2, 1, 1) + (2, 2, 1, 1) – (3, 5, 2, 4) equals :
(a) (8, 6, 5, 5, 7, 4, 2, 3, 2, 1)
(b) (8, 6, 7, 5, 1, 4,2, 2, 1, 1)
(c) (8,6,7,5,2, 4, 3,2, 1,1)
(d) none of the above

Directions (for Q. Nos. 21 to 25)
If p, q, r, s be the distinct integers such that :
$f(p, q, r, s)$ = *maximum of* (p, q, r, s)
$g(p, q, r, s)$ = *minimum of* (p, q, r, s)
$h(p, q, r, s)$ = *remainder when* $p \times q$ *is divided by* $r \times s$ *if*
$p \times q > r \times s$
= *remainder when* $r \times s$ *is divided by*
$p \times q$ *if* $r \times s > p \times q$
Also, the same operations are valid with two variable functions of the form $f(p, q)$
Also a function $fgh(p, q, r, s)$
$= f(p, q, r, s) \times g(p, q, r, s) \times h(p, q, r, s)$

21 What is the value of $h(3, 2, 8, 7) \div g(4, 7, 10, 8)$?
(a) 1 (b) 1/2
(c) 24 (d) none of these

22 What is the value of $h(fg(2, 5, 7, 3), 9)$?
(a) 2 (b) 3
(c) 5 (d) none of these

23 What is the value of $h(h(7, 13, 5, 9), h(4, 6, 12, 14)$?
(a) 1 (b) 1/7
(c) 7 (d) not defined

24 If $A = h(3, 7, 6, 5)$, $B = h(16, 11, 13, 3)$
$C = h(9, 4, 8, 7)$, $D = h(19, 14, 18, 7)$, then which of the following is true?
(i) $A > B > C > D$ (ii) $D > A > C$
(iii) $A < D < B$ (iv) $B = C < D$
(a) only (i) is true (b) only (iii) is true
(c) (ii) and (iii) are true (d) (iii) and (iv) are true.

25 If $a_k \times b_k$ is an integral multiple of
$c_k \times d_k$ or $c_k \times d_k$ is an integral multiple of $a_k \times b_k$, which of the following is indeterminable ?
(a) $f(g(a_1, b_1, c_1, d_1), h(a_2, b_2, c_2, d_2))$
(b) $h(h(a_1, b_1, c_1, d_1), h(a_2, b_2, c_2, d_2))$
(c) $h(hh(a_1, b_1, c_1, d_1), g(a_2, b_2, c_2, d_2))$
(d) none of the above

Directions (for Q. Nos. 26 to 32) *Following questions are based on the given information for the following functions* $f(x)$
$f(x) = 2bx + f(-x)$; if $x < 0$
$f(x) = a$ if $x = 0$; $f(x) = b + c - 2cx + f(x - 1)$; if $x > 0$

26 $f(8)$ equals :
(a) $a + 8b - 32c$ (b) $a + 8(b - 8c)$
(c) $8(a + b - c)$ (d) none of these

27 $f(-19)$ equals :
(a) $a - 19b + 361c$ (b) $a + 19(b - 19c)$
(c) $a - 19(b + 19c)$ (d) none of these

28 If $a = 15$, $b = 11$, $c = -3$, then $f(7)$ equals :
(a) 239 (b) 115
(c) – 147 (d) none of these

29 If $a = 10$, $b = -7$, $c = 6$, then $f(-10)$ equals :
(a) – 660 (b) – 520
(c) – 250 (d) none of these

30 If $a = 4$, $b = -17$ and $c = -18$, then for what value of x, $f(x) = 0$?
(a) 4 or 9 (b) $\frac{1}{2}$ or $\frac{4}{9}$ (c) – 1 or 18 (d) none

31 If $a = 12$, $b = 10$ and $c = 8$, then for what value of x , $f(x) < 0$?
(a) $\frac{3}{4}$ (b) 1 (c) – 2 (d) none

32 If $b = -a$, $c = a$, $f(f(1))$ equals :
(a) $a + a^2 + a^3$ (b) $a + a^2 - a^3$
(c) $a - a^2 + a^3$ (d) none of these

Directions (for Q. Nos. 33 to 37)
A function $f(z_1, z_2, z_3, \ldots z_n) = f(z_1, z_n) + f(z_2, z_3, \ldots z_{n-1})$
$+ (z_1 + z_2 + \ldots z_n)$; for $n > 0$
$f(y, z) = f(z, 0) + f(0, y)$; $f(y, 0) = y + f(y - 1, 0)$
$f(0, y) = y - f(0, y - 1)$; $f(0, 0) = 1$

33 Find the value of $f(1, 2, 3, 4, \ldots n)$, where n is a perfect cube less than 50 and n is greater than 25 :
(a) 1665 (b) 1089
(c) 729 (d) not defined

34 Find the value of $f(0, 1, 0, 1)$:
(a) 2 (b) 4
(c) 8 (d) none of these

35 Find the value of $f(8, 8, 8, 2, 2, 2)$:
(a) 22 (b) 88 (c) 77 (d) 66

36 Find the value of $f(1, 1, 3, 1, 1, 3)$:
(a) 17 (b) 28 (c) 21 (d) none

37 $f(9, 2, k, 0, 9, 4) = 124$, then the value of k is :
(a) 0 (b) 5 (c) 9 (d) none

Directions (for Q. Nos. 38 to 40) *A function is defined as follows :*
$f(a_1, a_2, a_3, \ldots, a_n) = a_1 2^{n-1} + a_2 2^{n-2} + a_3 2^{n-3} + \ldots a_n 2^0$
The above function is repeated until the value of function reduces to a single digit number.

38 $f(128)$ equals :
(a) 1 (b) 2 (c) 4 (d) 8

39 What is the value of $f[f(888222) + f(113113)]$:
(a) 6 (b) 7 (c) 8 (d) 9

40 $f(9235) + f(9450)$ equals :
(a) 5 (b) 3
(c) 2 (d) none of these

41 Let f, g and h be real-valued functions defined on the interval [0, 1] by $f(x) = e^{x^2} + e^{-x^2}$, $g(x) = xe^{x^2} + e^{-x^2}$, $h(x) = x^2 e^{x^2} + e^{-x^2}$
If a, b and c denote, respectively, the absolute maximum of f, g and h on [0, 1], then
(a) $a = b$ but $b \neq c$ (b) $a = c$ but $a \neq b$
(c) $a \neq b$ but $b \neq c$ (d) $a = b = c$

42 If the functions $f(x)$ and $g(x)$ are defined on $R \to R$ such that

$$f(x)=\begin{cases}0, & x \in \text{rational}\\ x, & x \in \text{irrational}\end{cases} \text{ and } g(x)=\begin{cases}0, & x \in \text{irrational}\\ x, & x \in \text{rational}\end{cases}$$

(a) One-one and onto (b) neither one-one nor onto
(c) One-one but onto (d) onto but not one-one

43 If $\frac{x^2-1}{x^2+1}$, for every real number x, then the minimum value of f is

(a) Does not exist (b) 1
(c) -1 (d) 0

44 Range of the function $f(x)=\frac{x^2+x+2}{x^2+x+1}$; $x \in R$ is

(a) $(1, \infty)$ (b) $(1, 11/7)$ (c) $(1, 7/3)$ (d) $(1, 7/5)$

45 Let $f\left[x+\frac{1}{x}\right]=\left[x^2+\left(\frac{1}{x^2}\right)\right]$; $(x \neq 0)$, then $f(x)$ is equal to

(a) x^2-1 (b) x^2-2
(c) x^2 (d) None of these

Hints & Solutions

☑ Introductory Exercise 17.1

1 x is defined for all real numbers (R)
$\therefore$ Domain of x is R

2 $\because \sqrt{x}$ is not defined for negative values of x
hence $x \geq 0$

$\therefore \quad x \in R^+ \cup \{0\}$

3 Since a rational number is not defined if denominator is zero.

Hence $\frac{1}{x}$ is defined for only non zero numbers.

Thus $x < 0$ and $x > 0$

$\Rightarrow \quad (-\infty < x < 0) \cup (0 < x < \infty)$

$\Rightarrow \quad x \in (-\infty, 0) \cup (0, \infty)$

$\Rightarrow \quad x \in R - \{0\}$

4 $\because x$ is defined for all real values

$\therefore |x|$ is also defined for all real values

Hence $|x| \in R$

5 $\because \quad |x| \geq 0 \ \forall \ x \in R$

$\therefore \sqrt{|x|}$ is defined for all real values of x.

Hence, domain of $\sqrt{|x|}$ is R.

6 Since domain of $\sqrt{x}$ is $[0, \infty)$

therefore domain of $|\sqrt{x}|$ is also $[0, \infty)$

7 $\sqrt{x}$ is defined only when $x \geq 0$

but $\frac{1}{\sqrt{x}}$ is defined only when $x > 0$

Since rational expressions are not defined for zero denominator so, $\sqrt{x} \neq 0$

$\therefore$ Domain of $\frac{1}{\sqrt{x}}$ is $(0, \infty)$ i.e., R^+

8 Since x^2 is positive for all values of x

i.e., $x^2 \geq 0 \ \forall \ x \in R$

$\therefore \sqrt{x^2}$ is defined for all values of R

Hence domain of $\sqrt{x^2}$ is R.

9 Since $\sqrt{x}$ is defined for only non-negative real numbers.
Hence domain of $(\sqrt{x})^2$ is $[0, \infty)$

10 $\log_a x$ is defined only for $x > 0$
Hence the domain of $\log_{10} x$ is $(0, \infty)$

11 x^2 is positive for all values of x except at $x = 0$

Since $\log_a b$ is defined only if $b > 0$

$\therefore$ Domain of $\log_{10} x^2$ is $R - \{0\}$

12 $\log_{10} x$ is defined for only $x > 0$
also denominator must be non-zero

$\therefore$ Domain of $f(x) = \frac{1}{\log_{10} x}$ is $R^+ - \{1\}$

13 $\log x$ is defined for only $x > 0$
Also denominator be non-zero real number
Again square root of negative numbers is not defined.

Hence domain of $f(x) = \frac{1}{\sqrt{\log_{10} x}}$ is $1 < x < \infty$

i.e., $R^+ - (0, 1]$

14 $f(x) = \sqrt{3x - 4}$ $(\because \sqrt{k}$ is not defined for $k < 0)$

$\Rightarrow \quad 3x - 4 \geq 0$

$\Rightarrow \quad 3x \geq 4 \quad \Rightarrow \quad x \geq \frac{4}{3}$

$\therefore \quad \frac{4}{3} \leq x < \infty$

$\Rightarrow \quad x \in \left[\frac{4}{3}, \infty\right)$

15 $f(x) = \sqrt{4x - 3} + \sqrt{2x - 6}$

$\therefore \quad 4x - 3 \geq 0$ and $2x - 6 \geq 0$

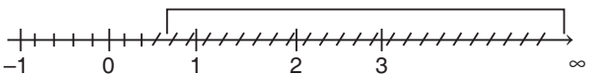
$\Rightarrow \quad 4x \geq 3$ and $2x \geq 6$

$\Rightarrow \quad x \geq \frac{3}{4}$ and $x \geq 3$

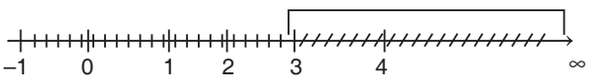
$\therefore \quad x \in [3, \infty)$

(since if $x < 3$, $\sqrt{2x - 6}$ is not defined)

Therefore we consider only common values of domain.



Domain of $\sqrt{4x - 3} = \left[\frac{3}{4}, \infty\right)$



Domain of $\sqrt{2x - 6} = [3, \infty)$

16 $|x| - x > 0$ $(\because |x| - x \neq 0)$
$\Rightarrow |x| > x$ also $|x| - x > 0$ for the condition of square root.
Since $|x|$ is positive value and $|x|$, x are numerically equal.
Therefore $x < 0$

Hence, the domain of $f(x) = \frac{1}{\sqrt{|x| - x}}$ is $(-\infty, 0)$

17 $x \in R$

but $x^2 - 3x + 2 > 0$

$\Rightarrow (x-1)(x-2) > 0 \quad (\because x^2 - 3x + 2 \neq 0)$

$\Rightarrow x < 1 \quad \text{and} \quad x > 2$

$\therefore$ Domain of $f(x) = \dfrac{x}{\sqrt{x^2 - 3x + 2}}$ is $(-\infty, 1) \cup (2, \infty)$

18 $(\sqrt{6-x} + \sqrt{x-4}) > 0$

Also $(6-x) > 0 \quad \text{and} \quad (x-4) > 0$

$\Rightarrow 6 > x \quad \text{and} \quad x > 4$

$\therefore 4 < x < 6$

$\therefore$ domain of given function is $(4, 6)$.

19 $(1-x) > 0 \Rightarrow 1 > x$

$\Rightarrow x < 1 \quad \ldots(i)$

Also $\log_{10}(1-x) \neq 0$

$\Rightarrow 10^{\circ} \neq (1-x) \Rightarrow 1 \neq 1 - x$

$\Rightarrow 0 \neq -x \Rightarrow x \neq 0 \quad \ldots(ii)$

Again $(x+2) \geq 0 \Rightarrow x \geq -2 \quad \ldots(iii)$

$\therefore x \in [-2, 0) \cup (0, 1)$

or $x \in [-2, 1) - \{0\}$

or $-2 \leq x < 1$, excluding zero.

20 $f(x) = \dfrac{\log_2(x+3)}{x^2 + 3x + 2}$

$(x+3) > 0 \Rightarrow x > -3 \quad \ldots(i)$

Also $x^2 + 3x + 2 \neq 0$

$\Rightarrow (x+1)(x+2) \neq 0$

$\Rightarrow x \neq -1 \quad \text{or} \quad x \neq -2 \quad \ldots(ii)$

$\therefore$ Domain of $f(x) = (-3, \infty) - \{-1, -2\}$

or $(-3, -2) \cup (-2, -1) \cup (-1, \infty)$

NOTE

'o' indicates absence of domain

'###' indicates presence of domain on the real number line.

21 Domain of $\sin x$ is R and Domain of $\cos x$ is also R

$\therefore$ Domain of given function is R

22 $\log_{10} \dfrac{1}{|\sin x|} \geq 0$

$\Rightarrow 10^0 \leq \dfrac{1}{|\sin x|} \Rightarrow 1 \leq \dfrac{1}{|\sin x|}$

$\Rightarrow |\sin x| \leq 1$

$\Rightarrow -1 \leq \sin x \leq 1$

$\Rightarrow x \in R$

but $\dfrac{1}{|\sin x|} > 0$

$\Rightarrow |\sin x| > 0$

$\Rightarrow x \in R \ (\because |k| \text{ is always positive})$

Again $|\sin x| \neq 0$

$\Rightarrow x \neq n\pi, \quad n \in I$

$\therefore$ Domain of $f(x)$ is $R \sim \{n\pi, n \in I\}$

23 $f(x) = (x^2 + x + 1)^{-3/2}$

Now $x^2 + x + 1 \neq 0$

$\Rightarrow \left(x + \dfrac{1}{2}\right)^2 + \dfrac{3}{4} \neq 0$

$\left(x + \dfrac{1}{2}\right)^2$ is always positive for all the values of real numbers and the whole expression is never zero and never negative for any value of R.

Hence domain of $f(x) = (x^2 + x + 1)^{-3/2}$ is R.

24 $5x - 6 - x^2 > 0$

$\Rightarrow x^2 - 5x + 6 < 0$

$\Rightarrow (x-2)(x-3) < 0$

$\Rightarrow 2 < x < 3$

$\Rightarrow x \in (2, 3)$

25 $y = \log_x 5 = \dfrac{\log 5}{\log x}$

$\log x \neq 0 \Rightarrow x \neq 1$

and $x > 0$

$\therefore x \in (0, \infty) \sim \{1\}$

or $x \in (0, 1) \cup (1, \infty)$

26 $f(x) = 9 - \sqrt{9 - x^2}$

$\therefore 9 - x^2 \geq 0$

$\Rightarrow x^2 - 9 \leq 0$

$\Rightarrow (x-3)(x+3) \leq 0$

$\Rightarrow -3 \leq x \leq 3$

$\Rightarrow x \in [-3, 3]$

27 $x^2 - 5x + 6 \geq 0$

but $x^2 - 5x + 6 \neq 0$

$\therefore x^2 - 5x + 6 > 0$

$\Rightarrow \quad (x-2)(x-3) > 0$

$\Rightarrow \quad x < 2 \quad \text{or} \quad x > 3$

$\Rightarrow \quad x \in (-\infty, 2) \cup (3, \infty)$

or $\quad x \in (-\infty, \infty) \sim [2, 3]$

28 Clearly $\frac{x^2}{1+x^4} \geq 0$ for any $x \in R$

Again $\quad (x^2-1)^2 \geq 0$

$\Rightarrow \quad x^4 + 1 - 2x^2 \geq 0$

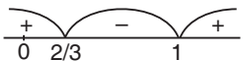
$\Rightarrow \quad x^4 + 1 \geq 2x^2$

$\therefore \quad \frac{x^2}{1+x^4} \leq \frac{x^2}{2x^2}$

$\Rightarrow \quad \frac{x^2}{1+x^4} \leq \frac{1}{2}$

Hence, the range of f is $\left[0, \frac{1}{2}\right]$.

29 Let $\quad y = \frac{x^2-2}{x^2-3}$



$\Rightarrow \quad yx^2 - 3y = x^2 - 2$

$\Rightarrow \quad x^2(y-1) = 3y - 2$

$\Rightarrow \quad x^2 = \frac{3y-2}{y-1}$

$\therefore \quad \frac{3y-2}{y-1} \geq 0$

$\therefore \quad y \in \left(-\infty, \frac{2}{3}\right] \cup (1, \infty)$

30 Let $y = \frac{x^2+2x+3}{x}$

$\Rightarrow \quad x^2 + (2-y)x + 3 = 0$

$\because \quad x \in R$

$\therefore \quad (2-y)^2 - 4 \times 1 \times 3 \geq 0$

$\Rightarrow \quad y^2 - 4y + 4 - 12 \geq 0$

or $\quad y^2 - 4y - 8 \geq 0$

or $\quad [y - (2-2\sqrt{3})][y - (2+2\sqrt{3})] \geq 0$

$\Rightarrow \quad y \in (-\infty, 2-2\sqrt{3}] \cup [2+2\sqrt{3}, \infty)$

i.e., $\quad y \in R - (2-2\sqrt{3}, 2+2\sqrt{3})$

31 Domain of $f(x) = \sqrt{x^2}$ is R i.e., $x \in (-\infty, \infty)$

Domain of $g(x) = (\sqrt{x})^2$ is $R^+ \cup \{0\}$ i.e., $x \in [0, \infty)$

$\therefore \quad \sqrt{x^2} \neq (\sqrt{x})^2$

Again co-domain of $f(x) = \frac{1}{\sqrt{x^2}}$ is $R^+ \sim \{0\}$

and co-domain of $g(x) = \frac{x}{x^2}$ is R^+ i.e., $g(x) \in (0, \infty)$

i.e, $\quad g(x) \in (-\infty, 0) \cup (0, \infty)$

$\therefore \quad \frac{1}{\sqrt{x^2}} \neq \frac{x}{x^2}$

Again, Domain of $f(x) = \log(x-1) + \log(x-2)$ is $(2, \infty)$

and Domain of $g(x) = \log(x-1)(x-2)$ is

$(-\infty, 1) \cup (2, \infty)$

$\therefore \quad \log(x-1) + \log(x-2) \neq \log(x-1)(x-2)$

Since in each point domain of definition of $f(x)$ is unequal, therefore the given pairs of functions are not identical.

Hint See the concept of "Equal functions".

32 Domain of $f(x) = \frac{1}{\sqrt{|x| - x}}$ is $(-\infty, 0)$

and $\quad$ domain of $g(x) = \frac{1}{\sqrt{x - |x|}}$ is ϕ

$\therefore \quad$ dom $f \neq \phi$

and $\quad$ dom $g = \phi$

Hint $\phi \rightarrow$ There is no any single value of x, which satisfy the given function.

33 Dom. of $f(x) = x$ is $(-\infty, \infty)$

Dom. of $g(x) = \sqrt{x^2}$ is $(-\infty, \infty)$, but Range $\equiv [0, \infty)$

Dom. of $h(x) = \frac{x^2}{x}$ is $(-\infty, \infty) \sim \{0\}$

$\therefore$ The common domain is $[-0, \infty) \sim \{0\} = R^+$

(Since for every $f(x)$, $g(x)$, $h(x) \in R^+$ the range of each $f(x)$, $g(x)$ and $h(x)$ is same)

34 Dom. $f(x)$ is $R - \{0\}$ i.e., $(-\infty, 0) \cup (0, \infty)$

and Dom. $g(x)$ is R^+ i.e., $(0, \infty)$

$\therefore$ Common domain of $f(x)$ and $g(x)$ is $(0, \infty)$

Hence if $x \in (0, \infty)$, then $f(x) = g(x)$

35 Since $\quad [x] \leq x \quad \text{or} \quad x \geq [x]$

$\Rightarrow \quad x - [x] \geq 0$

$\therefore \quad 1 + x - [x] > 0$

$\therefore \quad f(g(x)) = f(1 + x - [x]) = 1$

Hint See the definition of Signum function.

36 $f(x) = 64x^3 + \frac{1}{x^3} = \left(4x + \frac{1}{x}\right)^3 - 3 \cdot 4\left(4x + \frac{1}{x}\right)$

So $\quad f(\alpha) = 2^3 - 3 \cdot 4 \cdot 2 = -16$

Also $\quad f(\beta) = 2^3 - 3 \cdot 4 \cdot 2 = -16$

Hence option(d).

37 Let $y = \dfrac{x}{\sqrt{1+x^2}}$

$$\therefore \quad f(f(x)) = f(y) = \frac{y}{\sqrt{1+y^2}} = \frac{x/\sqrt{1+x^2}}{\sqrt{1+\left(\dfrac{x}{\sqrt{1+x^2}}\right)^2}}$$

$$= \frac{x}{\sqrt{1+2x^2}} = z \text{ (say)}$$

$$\therefore f(f(f(x))) = f(z) = \frac{z}{\sqrt{1+z^2}} = \frac{x/\sqrt{1+2x^2}}{\sqrt{1+\left(\dfrac{x}{\sqrt{1+2x^2}}\right)^2}}$$

$$= \frac{x}{\sqrt{1+3x^2}}$$

38 $f(x) = \dfrac{4^x}{4^x+2} \therefore \; f(1-x) = \dfrac{4^{1-x}}{4^{1-x}+2} = \dfrac{2}{2+4^x}$

$$\therefore \quad f(x) + f(1-x) = \frac{4^x}{4^x+2} + \frac{2}{4^x+2} = 1$$

Hence (c) is correct

39 $f(x) = 1 - f(1-x) \Rightarrow f(x) + f(1-x) = 1$

Now, $f\left(\dfrac{1}{999}\right) + f\left(\dfrac{2}{999}\right) + \ldots f\left(\dfrac{997}{999}\right) + f\left(\dfrac{998}{999}\right)$

$$= \left[f\left(\frac{1}{999}\right) + f\left(\frac{998}{999}\right)\right] + \left[f\left(\frac{2}{999}\right) + f\left(\frac{997}{999}\right)\right] + \ldots$$

$$= \left[f\left(\frac{1}{999}\right) + f\left(1 - \frac{1}{999}\right)\right] + \left[f\left(\frac{2}{999}\right) + f\left(1 - \frac{2}{999}\right)\right] + \ldots.$$

$= 1 + 1 + 1 + \ldots 499$ times $= 499$

40 $f(3) = 9$

$\therefore \quad g(f(3)) = g(9) = 3$

Alternatively $\text{gof} = g(f(x)) = g(x^2) = \sqrt{x^2} = x$

41 Solve through options

Let us consider $f(x) = 3x + 2$

$\therefore \quad g(f(x)) = (3x+2)^2 - (3x+2) + 7$

$\Rightarrow \quad gof(x) = 9(x^2 + x + 1)$

$\Rightarrow \quad \left(\dfrac{1}{9}\right) gof(x) = x^2 + x + 1$

Hence choice (b) is correct.

42 $f(x+1) = \dfrac{(x+1)}{(x+1)+3} = \dfrac{x+1}{x+4}$

43 $\dfrac{1}{f(x+1)} - f\left(\dfrac{1}{x+1}\right) = \dfrac{x+4}{x+1} - \dfrac{1/(x+1)}{1/(x+1)+3}$

$$= \frac{x+4}{x+1} - \frac{1/(x+1)}{(3x+4)/(x+1)}$$

$$= \frac{x+4}{x+1} - \frac{1}{(3x+4)} = \frac{3(x^2+5x+5)}{3x^2+7x+4}$$

44 $f(2) = \dfrac{2+1}{2-1} = 3 \Rightarrow f(f(2)) = f(3) = \dfrac{3+1}{3-1} = 2$

$$f(f(f(2))) = f(f(3)) = f(2) = \frac{2+1}{2-1} = 3$$

$$f(f(f(f(2)))) = f(3) = \frac{3+1}{3-1} = 2$$

$$f(f(f(f(f(2))))) = f(2) = \frac{2+1}{2-1} = 3$$

☑ Introductory Exercise 17.2

1 Choice (a) is ruled out since the given graph is the graph of GIF (greatest integer function). Again the graph of $[x]$ is parallel to the graph of $y = x$. But since in the left part (i.e., left of y-axis) all the values of y are positive which are transformed by the modulus.

Go through options and put the values (e.g., $-3, -2, -1, 0, 1, 2, 3$, etc) and then verify the correct option.

2 Best way is to check the option by substituting the values of x eg., $x = -3, -2, -1, 0, 1, 2, 3, \ldots$.

choice (b) is wrong since at $x = 2$, $f(x) = \dfrac{1}{4}$

choice (d) is wrong since at $x = 1$, $f(x) = 0$

choice (c) is wrong since at $x = 2$, $f(x) = \dfrac{1}{8}$

$\therefore$ choice (a) is correct, since at $x = 1$, $f(x) = 1$

at $x = 2$, $f(x) = \dfrac{3}{2}$

at $x = \dfrac{1}{2}$, $f(x) = 0$, etc.

3 Choice (a) is wrong, since graph is even

also at $x = 1$, $e^x = f(x) = 2.714$

choice (d) is wrong since at $x = 0$, $f(x) = 0$

choice (b) is wrong since at $x = 1$, $f(x) = 0$

also at $x = 0$, $f(x)$ is not defined

choice (c) is correct, since at $x = 0$, $f(x) = 1$

at $x = 1$, $f(x) = 2$

at $x = 2$, $f(x) = 4$

at $x = -1$, $f(x) = 2$

at $x = -2$, $f(x) = 4$

4 Choice (a) is wrong since at $x = 1,\ f(x) = 1$

at $x = 2,\ f(x) = 6$

choice (b) is wrong since at $x = 2,\ f(x) = 2$

choice (d) is wrong since at $x = 0\ f(x) = 0$

choice (c) is correct since at $x = 0,\ f(x) = -2$

at $x = 2,\ f(x) = 0$

at $x = 3,\ f(x) = 4.25$

at $x = -2,\ f(x) = 0$

at $x = -3,\ f(x) = 4.25$

5 Algebraic solution

x^2 is always positive $\forall\ x \in R$

$1 - |x - 2|$ is positive , if $1 < x < 3\ (x - 2 \neq 1)$

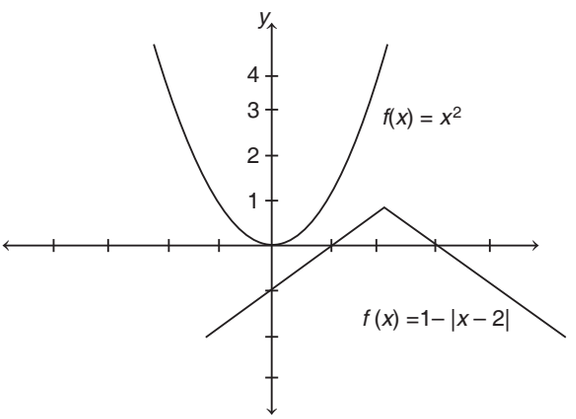
but when $1 < x < 3,\ x^2 \in (1, 9)$

and $(1 - |x - 2|) \in (0, 1)$

therefore there is no real solution of the given expression.
Graphical solution :

$$\frac{x^2}{1 - |x - 2|} = 1$$

$$\Rightarrow \quad x^2 = 1 - |x - 2|$$



Hence it is clear from the graph that there is no real solution, since the two graphs do not cut each other at any point.

6 Algebraic solution :

$$\log_{0.5}|x| = 2|x|$$

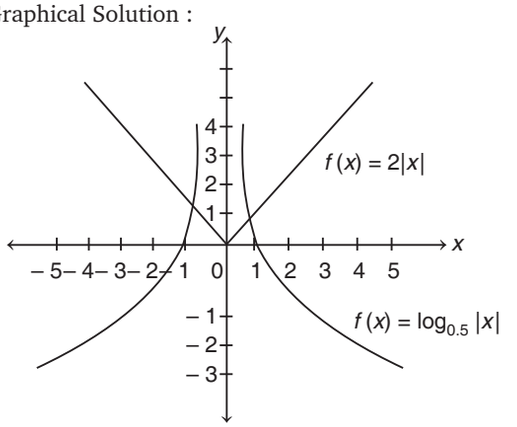
$$\Rightarrow \quad (0.5)^{2|x|} = |x|$$

$$\Rightarrow \quad \left(\frac{1}{2}\right)^{2|x|} = |x|$$

$$\Rightarrow \quad \left(\frac{1}{2}\right)^{|x|} = |x|^{1/2}$$

$$\Rightarrow \quad x = -\frac{1}{2}, \frac{1}{2}$$

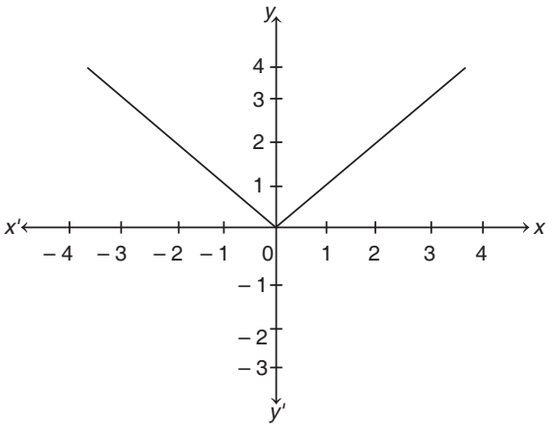
Graphical Solution :



Clearly at $x = -\frac{1}{2}$ and $x = \frac{1}{2}$ the graphs of $\log_{(0.5)}|x|$ and $2|x|$ intersect each other.

Thus there are two solutions.

7



$$f(x) = \frac{|x|^3 + |x|}{1 + x^2}$$

8 $$f(x) = f\left(\frac{x + 8}{x - 1}\right)$$

$$\Rightarrow \quad x = \frac{x + 8}{x - 1}$$

$$\Rightarrow \quad x^2 - 2x - 8 = 0 \Rightarrow\ x = 4, -2$$

Alternatively Go through options

9 $$g(x) = \sqrt{x^2 + 1}$$

$$f(g(x)) = (\sqrt{x^2 + 1})^2 - 1$$

$$\Rightarrow \quad f(g(x)) = x^2$$

$$\therefore \quad h(f(g(x))) = h(x^2) = x^2 \qquad (\because\ h(x) = x,\ x \geq 0)$$

10 $$f(x) = (a - x^n)^{1/n}$$

$$\therefore \quad f(f(x)) = (a - (f(x))^n)^{1/n}$$

$$= (a - ((a - x^n)^{1/n})^n)^{1/n}$$

$$= (a - (a - x^n))^{1/n} = (x^n)^{1/n} = x$$

11 At $y = f(x) = \dfrac{x-1}{x+1}$

$\Rightarrow \quad y(x+1) = x - 1$

$\Rightarrow \quad x = \dfrac{y+1}{1-y} \qquad \ldots(i)$

Now, $f(f(x)) = f\left(\dfrac{x-1}{x+1}\right) = \dfrac{\dfrac{x-1}{x+1} - 1}{\dfrac{x-1}{x+1} + 1} = -\dfrac{1}{x}$

$\therefore \quad f(f(ax)) = -\dfrac{1}{ax} = -\dfrac{1}{a\left(\dfrac{y+1}{1-y}\right)}$

$= \dfrac{y-1}{a(y+1)} = \dfrac{f(x)-1}{a(f(x)+1)}$

12 $f(x) = \dfrac{x}{\sqrt{1+x^2}}$

$\therefore \quad f(f(x)) = \dfrac{\dfrac{x}{\sqrt{1+x^2}}}{\sqrt{1+\left(\dfrac{x}{\sqrt{1+x^2}}\right)^2}} = \dfrac{x}{\sqrt{1+2x^2}}$

$\therefore \quad f(f(f(x))) = \dfrac{\dfrac{x}{\sqrt{1+2x^2}}}{\sqrt{1+\left(\dfrac{x}{\sqrt{1+2x^2}}\right)^2}} = \dfrac{x}{\sqrt{1+3x^2}}$

Alternatively Consider some value for x, then match the correct option

$$f(2) = \frac{2}{\sqrt{1+4}} = \frac{2}{\sqrt{5}}$$

$\therefore \quad f(f(2)) = f\left(\dfrac{2}{\sqrt{5}}\right) = \dfrac{\dfrac{2}{\sqrt{5}}}{\sqrt{1+\left(\dfrac{2}{\sqrt{5}}\right)^2}} = \dfrac{2}{3}$

$\therefore \quad f(f(f(2))) = f\left(\dfrac{2}{3}\right) = \dfrac{\dfrac{2}{3}}{\sqrt{1+\left(\dfrac{2}{3}\right)^2}} = \dfrac{2}{\sqrt{13}}$

Now, verify the options.

Consider option (a)

$$f(f(f(2))) = \frac{2}{\sqrt{1+3(2)^2}} = \frac{2}{\sqrt{13}}$$

Hence option (a) is correct.

13 $f(-2.4) = 1 + |-2.4|$

$(\because -2.4 < -1);\ f(-2.4) = 3.4$

$\therefore \quad f(f(-2.4) = f(3.4) = [3.4] \qquad (\because 3.4 > -1)$

$= 3$

14 Go through options

Let us consider $g(x) = \log x$,

$\therefore \quad f(x) = x^n$

and $g(f(x)) = g(x^n) = \log x^n$

$= n \log x = ng(x)$

Hence, choice (d) is correct.

15 Since $f : N \to R$

but $0 \notin N$

$\therefore f(0)$ is not defined

Hence (d) is correct

16 Go through options.

Let us consider $f(x) = x^2 - 2$

$\therefore \quad f\left(x + \dfrac{1}{x}\right) = \left(x + \dfrac{1}{x}\right)^2 - 2$

$= x^2 + \dfrac{1}{x^2} + 2 - 2 = x^2 + \dfrac{1}{x^2}$

Hence choice (b) is correct.

17 $f(x) = \sqrt{x^5}$

$\therefore \quad f(5x) = \sqrt{(5x)^5} = 25x^2\sqrt{5x}$

18 $h(x) = \dfrac{1}{x}$

$g(h(x)) = g\left(\dfrac{1}{x}\right) = \left(\dfrac{1}{x}\right)^2$

$f(g(h(x))) = f\left(\left(\dfrac{1}{x}\right)^2\right) = \left(4 \cdot \dfrac{1}{x^2}\right) - 5 = \dfrac{4}{x^2} - 5$

19 Let $x = 2.6$, then $[x] - \{x\} = 2 - 3 = -1$

and $x = 3.8$, then $[x] - \{x\} = 3 - 4 = -1$

and $x = -3.6$, then $[x] - \{x\} = (-4) - (-3) = -1$

and $x = -7.3$, then $[x] - \{x\} = (-8) - (-7) = -1$

Hence (a) is the correct choice

20 $f(x) = \dfrac{a^x - 1}{x^n(a^x + 1)} = \underbrace{\dfrac{1}{x^n}}_{g(x)} \cdot \underbrace{\dfrac{a^x - 1}{a^x + 1}}_{h(x)}$

(By breaking the function)

$f(x)$ is even since graph of $f(x)$ is symmetric about y-axis.

Now, $h(-x) = \dfrac{a^{-x} - 1}{a^{-x} + 1} = \dfrac{1 - a^x}{1 + a^x} = -h(x)$

i.e., $h(x)$ is an odd function.

Hence, $g(x) \times$ odd function = even function

$\therefore g(x)$ is an odd function

($\because$ odd $\times$ odd = Even but even $\times$ odd = odd)

$\therefore g(x) = \dfrac{1}{x^n}$ is an odd function, which is positive only when

$$n = -\frac{1}{3}$$

21 $f(x) = \ln (x + \sqrt{x^2 + 1})$

$\therefore \quad f(-x) = \ln (-x + \sqrt{(-x)^2 + 1}\,)$

$= \ln (-x + \sqrt{x^2 + 1})$

Here it is not obvious whether f is an odd or even function. So in such case we check for

$f(x) + f(-x) = 0 \quad \Rightarrow \quad f$ is an odd function

$f(x) - f(-x) = 0 \quad \Rightarrow \quad f$ is an even function

Now, $f(x) + f(-x) = \ln (x + \sqrt{x^2 + 1})$

$+ \ln (-x + \sqrt{x^2 + 1})$

$= \ln ((\sqrt{x^2 + 1} + x)(\sqrt{x^2 + 1} - x))$

$= \ln (x^2 + 1 - x^2)$

$(\because \ln x + \ln y = \ln x \cdot y)$

$= \ln 1 = 0 \qquad (\because \ln 1 = 0)$

Hence, f is an odd function.

23 $f(x) = \dfrac{a^x + 1}{a^x - 1}$

$\therefore \quad f(-x) = \dfrac{a^{-x} + 1}{a^{-x} - 1} = \dfrac{1 + a^x}{1 - a^x}$

$\Rightarrow f(x) \neq f(-x)$, hence $f(x)$ is not an even function

Again $f(x) = \dfrac{a^x - a^{-x}}{a^x + a^{-x}}$

$\therefore \quad f(-x) = \dfrac{a^{-x} - a^x}{a^{-x} + a^x}$

$\therefore \quad f(x) \neq f(-x)$, hence $f(x)$ is not an even function

Again $f(x) = x \cdot \dfrac{a^x + 1}{a^x - 1}$

$\therefore \quad f(-x) = (-x)\dfrac{a^{-x} + 1}{a^{-x} - 1} = (-x)\dfrac{\dfrac{(1 + a^x)}{a^x}}{\dfrac{1 - a^x}{a^x}}$

$= (-x)\dfrac{1 + a^x}{1 - a^x} = (-x)\dfrac{1 + a^x}{-(a^x - 1)}$

$= x\dfrac{1 + a^x}{a^x - 1} = x \cdot \dfrac{a^x + 1}{a^x - 1}$

$\therefore \quad f(x) = f(-x)$

Hence, $f(x)$ is an even function.

24 $f(x) = \ln \left(\dfrac{1 + x^3}{1 - x^3}\right)$ (ln → natural logarithm)

$\therefore \quad f(-x) = \ln \left(\dfrac{1 + (-x)^3}{1 - (-x)^3}\right) = \ln \left(\dfrac{1 - x^3}{1 + x^3}\right)$

$\therefore \quad -f(-x) = -\ln \left(\dfrac{1 - x^3}{1 + x^3}\right)$

$= \ln \left(\dfrac{1 - x^3}{1 + x^3}\right)^{-1} = \ln \left(\dfrac{1 + x^3}{1 - x^3}\right)$

$\Rightarrow \quad f(x) = -f(-x)$

Hence $f(x) = \ln \left(\dfrac{1 + x^3}{1 - x^3}\right)$ is an odd function.

25 $f(x) = \log \dfrac{(1 - x)}{(1 + x)}$ is an odd function.

$f(x) = x \cdot \dfrac{a^x + 1}{a^x - 1}$ is an even function.

$f(x) = \log [x + \sqrt{(1 + x^2)}\,)$ is an odd function.

$f(x) = \sqrt{(1 + x + x^2)} - \sqrt{(1 - x + x^2)}$ is an odd function

26 $f(x) = \sqrt[3]{(1 - x^2)} + \sqrt[3]{(1 + x^2)}$

$\therefore \quad f(-x) = \sqrt[3]{(1 - (-x)^2)} + \sqrt[3]{1 + (-x)^2}$

or $f(-x) = \sqrt[3]{1 - x^2} + \sqrt[3]{1 + x^2} \Rightarrow f(x) = f(-x)$

Hence $f(x)$ is even function

27 $f(x) = 2^{-x^2}$

$\therefore \quad f(-x) = 2^{-(-x)^2} = 2^{-x^2}$

$\because \ f(x) = f(-x)$, hence $f(x)$ is an even function

Again $f(x) = 2^{x - x^4} = \dfrac{2^x}{2^{x^4}}$

$\therefore \quad f(-x) = 2^{-x-(-x)^4} = 2^{-x-x^4} = \dfrac{1}{2^{x + x^4}}$

$\because \ f(x) = -f(-x)$, Hence $f(x)$ is not an odd function.

Again $f(x) = \cos x$ is an even function

Hence (d).

28 $f(x) = \dfrac{x}{e^x - 1} + \dfrac{x}{2} + 1$

$\therefore \quad f(-x) = \dfrac{-x}{e^{-x} - 1} + \dfrac{(-x)}{2} + 1$

$= \dfrac{-xe^x}{1 - e^x} - \dfrac{x}{2} + 1 = \dfrac{xe^x}{e^x - 1} - \dfrac{x}{2} + 1$

If $f(x) - f(-x) = 0$, then $f(x)$ is an even function.

$\therefore \quad f(x) - f(-x) = \left(\dfrac{x}{e^x - 1} + \dfrac{x}{2} + 1\right) - \left(\dfrac{xe^x}{e^x - 1} - \dfrac{x}{2} + 1\right)$

$= \dfrac{x(1 - e^x)}{(e^x - 1)} + \left(\dfrac{x}{2} + \dfrac{x}{2}\right) + (1 - 1)$

$= \dfrac{-x(e^x - 1)}{(e^x - 1)} + x + 0 = -x + x$

$f(x) - f(-x) = 0$, hence the given function is an even function.

30 $f(x)=\dfrac{1}{1-x}$ …(i)

$\therefore \quad g(x)=f(f(x))=f\left(\dfrac{1}{1-x}\right)$

$\Rightarrow \quad g(x)=\dfrac{1}{1-\left(\dfrac{1}{1-x}\right)}=\dfrac{1-x}{-x}=\dfrac{x-1}{x}$ …(ii)

$\therefore \quad h(x)=f(f(f(x)))=f(g(x))=f\left(\dfrac{x-1}{x}\right)$

$\Rightarrow \quad h(x)=\dfrac{1}{1-\left(\dfrac{x-1}{x}\right)}$

$h(x)=x$ …(iii)

$\therefore \quad f(x)\cdot g(x)\cdot h(x)=\dfrac{1}{1-x}\times\dfrac{(1-x)}{-x}\times x=-1$

☑ Introductory Exercise 17.3

1 $f(x)=x^2$

$f(1)=1$

and $f(-1)=1$

$\Rightarrow f(x)$ is many-one

$\because \quad f:R\to R$

$(x) \quad (y)$

but the negative values of y are not the actual output (or images) of any element of x. Hence function is into.

2 $f:R\to R^+\cup\{0\}$

$f(x)=x^2;\ f(1)=1$

and $f(-1)=1$

Hence $f(x)$ is many-one

again $f:\ \underbrace{R}_{(x)}\to\underbrace{R^+\cup\{0\}}_{(y)}$

Since each element of y is the actual output of some element of x therefore function is onto.

3 $f:R^+\to R$

$f(x)=x^2 \quad\Rightarrow\quad f(0)=0,\ f(1)=1,\ f(2)=4$ etc.

Since non-positive values of x (i.e., input) are not in the domain therefore no two inputs produce same output hence function is one-one.

Also function is into since non-positive values of y are not the images (output) of any value of x (i.e., input)

4 $f:R^+\to R^+$

$f(x)=x^2$

$f(1)=1$

$f(2)=4;\ f(3)=9$ etc.

Since there are no two inputs which produce same output hence the function is one-one.

Again the function is onto since every element of y is an actual output/image of some element of x.

5 f is not one-one as $f(0)=0$ and $f(-1)=0$

f is not onto as for $y=1$, there is no $x\in R$

such that $f(x)=1$

If there is such a $x\in R$ then $e^{|x|}-e^{-x}=e^x+e^{-x}$ clearly

$x\neq 0$ $(\because \text{at } x=0,\ f(x)\neq 1)$

Again for $x>0$, this equation gives $-e^{-x}=e^{-x}$ which is not possible

Again for $x<0$, the above equation gives $-e^{-x}=e^x$, which is also not possible.

6 If $n(A)=m$ and $n(B)=n\geq m$, then the number of one-one functions from A to B is ${}^nP_m : n>m$

$${}^nP_m=\frac{n!}{(n-m)!}$$

Hence $n=5$ and $m=3$

$\therefore$ Number of one-one function from A to B

$$={}^5P_3=\frac{5!}{2!}=\frac{5\cdot 4\cdot 3\cdot 2\cdot 1}{2}=60$$

7 Let $x,\ y\in A$ be such that $f(x)=f(y)$

$$\Rightarrow \quad \frac{x-2}{x-3}=\frac{y-2}{y-3}$$

$$\Rightarrow \quad xy-3x-2y+6=xy-3y-2x+6$$

$$\Rightarrow \quad -2y+3y=3x-2x\Rightarrow x=y$$

Hence f is one-one.

Let $y\in B$, we want to got $x\in A$ such that $f(x)=y$,

i.e., $$\frac{x-2}{x-3}=y$$

$\Rightarrow x=\dfrac{3y-2}{y-1}\in A$, Hence f is onto

Thus f is bijective.

8 For any $x,\ y\in N$, we have

$f(x)=f(y) \quad\Rightarrow\quad 2x+3=2y+3 \quad\Rightarrow\quad x=y$

Also, f is not surjective

$\because 1\in N$ does not have its pre image.

9 We have, $f(x)=(x-1)(x-2)(x-3)$

$\Rightarrow \quad f(1)=f(2)=f(3)=0$

$\Rightarrow f(x)$ is not one-one

For every $y\in R$, there exists $x\in R$ such that $f(x)=y$. Therefore f is onto.

Hence $f:R\to R$ is onto but not one-one.

10 Since $x-[x]=0$ for all integral values of x.

Therefore, the function is many-one and therefore inverse function is not defined.

11 $y = x^2 + 2 \Rightarrow x^2 = y - 2$

$\Rightarrow x = \sqrt{y-2}$

$\Rightarrow f^{-1}(x) = \sqrt{x-2}$

12 $y = 5^x \Rightarrow \log_5 y = x \Rightarrow x = \log_5 y$

$\Rightarrow f^{-1}(x) = \log_5 x$

13 $y = \dfrac{x}{x+1} \Rightarrow yx + y - x = 0$

$\Rightarrow x(y-1) = -y$

$\Rightarrow x = -\dfrac{y}{y-1} = \dfrac{y}{1-y} \Rightarrow f^{-1}(x) = \dfrac{x}{1-x}$

14 $y = \dfrac{x-1}{x+1} \Rightarrow yx + y = x - 1$

$\Rightarrow yx - x = -(y+1)$

$\Rightarrow x(y-1) = -(y+1)$

$\Rightarrow x = \dfrac{-(y+1)}{(y-1)} = \dfrac{y+1}{1-y} = \dfrac{1+y}{1-y} \Rightarrow f^{-1}(x) = \dfrac{1+x}{1-x}$

15 Let $f(x) = y = x(2-x)$

$\Rightarrow x^2 - 2x - y = 0$

$\Rightarrow x = \dfrac{2 \pm 2\sqrt{1-y}}{2} = 1 \pm \sqrt{1-y}$

But $x < 1$

So $x = 1 - \sqrt{1-y}$

$\therefore f^{-1}(x) = 1 - \sqrt{1-x}$

16 $y = x^2 - x + 1$

$\Rightarrow y = x^2 - x + \dfrac{1}{4} + \dfrac{3}{4} \Rightarrow y = \left(x - \dfrac{1}{2}\right)^2 + \dfrac{3}{4}$

$\Rightarrow y - \dfrac{3}{4} = \left(x - \dfrac{1}{2}\right)^2 \Rightarrow \left(x - \dfrac{1}{2}\right) = \sqrt{y - \dfrac{3}{4}}$

$\Rightarrow x = \sqrt{y - \dfrac{3}{4}} + \dfrac{1}{2} \Rightarrow y = \sqrt{x - \dfrac{3}{4}} + \dfrac{1}{2}$

17 $f(x) + f^1(x) = (x^2 - x + 1) + \sqrt{x - \dfrac{3}{4}} + \dfrac{1}{2}$

$= \left(\dfrac{3}{4}\right)^2 - \dfrac{3}{4} + 1 + \sqrt{\dfrac{3}{4} - \dfrac{3}{4}} + \dfrac{1}{2}$

$= \dfrac{9}{16} + \dfrac{1}{4} + \dfrac{1}{2} = \dfrac{9+4+8}{16} = \dfrac{21}{16}$

☑ Level 01 *Basic Level Exercise*

1 $P(3, 5) = 3 \times 5 = 15$

$S(5, 3) = 5 - 3 = 2$

$D(P(3, 5)), S(5, 3) = D(15, 2) = 15 + 2 = 17$

2 $P(S(10, 6), 30)) = P(4, 30) = 120$

3 $20 \# (-43)$ ($\because 21 @ 22 = -43$)
We cannot determine further the value of $20 \# (-43)$ since we don't know $a \# b$ takes what value in case of negative product as a, b is defined only for natural numbers.
Hence (d)

4 $(a \# a) @ (a @ a)$
Since, it is given that a and b are natural numbers. Two cases arise.
Case I. a is even

$a \# a = a^2 - a^2 = 0$

$a @ a = a^2$

$\therefore 0 @ a^2 = 0$ ($\because 0 + a^2$ is even)

Case II. a is odd

$a \# a = a^2$, which is odd

$\therefore a^2 @ a^2 = a^4$ ($\because a^2 + a^2$ will be even)

Hence (c) is correct.

5 $(p \# q) - (q @ p)$
Since p is even and q is odd

$p \# q = p^2 - q^2$

$q @ p = q^2 - p^2$

$\therefore p^2 - q^2 - (q^2 - p^2)$

$= 2p^2 - 2q^2 = 2(p^2 - q^2)$

6 $M(7, N(9, 4)) = M(7, (9^2 + 4^2 - 9 \cdot 4))$

$= M(7, 61) = 7^2 + 61^2 + 7 \cdot 61 = 4197$

7 $f(x) = x^3 - x^2$

$\therefore f(x+1) = (x+1)^3 - (x+1)^2$

$= (x+1)^2 (x + 1 - 1) = (x+1)^2 (x)$

8 $[(5 \cup 4) \vee\vee (2 \cup\cup\cup 3)] \cup (8 \vee 3) = [1 \vee\vee 8] \cup (5)$
$= 8 \cup 5 = 3$

9 $2 \cup\cup 8 = 2 \times 8 = 16$

and $2 \cup\cup\cup 4 = 2^4 = 16$

Hence (a) is true.

10. $a \cup b = a \vee b$ if $a \geq b$

$a \vee b = a \cup b$ if $a < b$

$\therefore a \cup b = a \vee b$ for all real values.

11. $(20 @ 4) \# 35 = 576 \# 35$

$= (541)^2 = 292681$

12. $12 \# (14 @ (12 \# 13)) = 12 \# (14 @ 1)$

$= 12 \# 225 = (-213)^2 = 45369$

13. $(9 \# 7) @ (21 \# 5) = 4 @ 256 = (260)^2 = 67600$

14. $(2 @ 2) + (3 \# 3) - (4 @ 4) + (5 \# 5)$

$= 16 + 0 - 64 + 0 = -48$

15. $\dfrac{XAT\,[MAT\,\{2,\ CAT\,(3,\ XAT\,[3,\ 2])\},\ 5]}{CAT\,[4,\ XAT\,\{MAT\,(2,\ -5),\ 4\}]}$

$= \dfrac{XAT\,[MAT\,\{2,\ CAT\,(3,\ 2)\},\ 5]}{CAT\,[4,\ XAT\,\{1, 4)\}]}$

$= \dfrac{XAT\,[MAT\,\{2,\ 9\},\ 5]}{CAT\,[4,\ 0]}$

$= \dfrac{XAT\,[6,\ 5]}{1} = 5$

16. $\dfrac{XAT\,(3, 5)}{MAT\,(3,\ 5)} = \dfrac{2}{1} = 2$, hence true

and $\dfrac{XAT\,(-3, -5)}{MAT\,(-3, -5)} = \dfrac{2}{1} = 2$, hence true

Thus, (c) is correct.

17. $r\,(16, 7) - 2 = 2 - 2 = 0$

18. $g(4.7) - l(2) = 5 - 2 = 3$

19. $\because$ Dividend = Divisor $\times$ Quotient + Remainder

$\therefore \quad x = y \times k + r \qquad (k \text{ is a quotient and } k \in I)$

But $\quad k = l\left(\dfrac{x}{y}\right)$

$\therefore \quad r = x - yk$

$\Rightarrow \quad r = x - \left[y \cdot l\left(\dfrac{x}{y}\right)\right]$

20. $2 \# ((7 @ (4 \# 5)) @ 3) = 2\# ((7 @ 14) @ 3)$

$= 2\# (70 @ 3)$

$= 2 \# 152 = 306$

21. (i) $\begin{cases} p \# q = p \# 2p = 5p \\ q \# p = 2p \# p = 4p \end{cases}$ $(\because p + q \text{ is even})$

(ii) $p @ q = p @ 3p = 0$ $(\because p + 3p = 4p \text{ is even})$

(iii) $p @ q = p @ 2p$ $(p + 2p \text{ is odd})$

$= 2p \# 4p$ $(2p + 4p = 6p \text{ is even})$

$= 2p + 8p$

$= 10p$, which is even

Hence (ii) and (iii) are true
Thus (d) is correct.

22 $6 @ 2 = 18 - 2 = 16$

$12 \# 2 = 12 + 4 = 16$

Hence (i) is true

Again $6 \# 3 = 12 @ 6 = 36 - 6 = 30$

$(14 @ 12) + (2 @ 6) = 30 + 0 = 30$

Hence (ii) is true

Again $(6 @ 2) + (6 \# 3) = 16 + 30 = 46$

$(12 \# 2) + (14 @ 12) - (2 @ 6) = 16 + 30 - 0 = 46$

Hence (iii) is also true
Thus (d) is correct option.

23 $\text{Max}\,[(2 \# 3)\ \$\ (3 \# 4),\ (3 \# 4)\ \$\ (4\ \$\ 4)]$

$= \text{Max}\,[(6\ \$\ 12),\ (12\ \$\ 33)]$

$= \text{Max}\,[181, 1234]$

$= |\,181 + 1234\,| = 1415$

24 $\text{Max}\,[\text{Min}\,((1\ \$\ 2),\ (2\ \$\ 3)),\ \text{Max}\,((3 \# 4),\ (4 \# 5))]$

$= \text{Max}\,[\text{Min}\,(6,\ 14),\ \text{Max}\,(12,\ 20)]$

$= \text{Max}\,[8, 32] = 40$

25 $\text{Min}\,[(1 \#\ 2)\ \$\ 3,\ 4 \#\ (5\ \$\ 6)]\ \$\ \text{Max}\,[(6 \# 7),\ (7 \# 8)]$

$= \text{Min}\,[(2\ \$\ 3),\ (4 \# 62)]\ \$\ \text{Max}\,[42, 56]$

$= \text{Min}\,[14, 77]\ \$\,[98]$

$= 63\ \$\ 98 = 13574$

26 $9 \,\Delta\, 3 = 9^3 + 9 \times 3 + \dfrac{9}{3} = 729 + 27 + 3 = 759$

27 $3 \# 4 * 5 + 3 * 4 \# 5$

$= 3^4 \times 5 + (3 \times 4)^5 = 81 \times 5 + (12)^5$

$= 405 + 248832 = 249237$

28 $f(2 \# 3) \# g(3 \# 4) = f(17) \# g(145)$

$= 255 \# 290$

$= 255^{290} + 290^{255}$

29 $f(g(2 \# 3)) + g(f(1 \# 2)) = f(g(17)) + g(f(3))$

$= f(34) + g(3)$

$= 1088 + 6 = 1094$

30 $(5 \oplus 6) - (6 @ 3) + (2 * 4) = 91 - (-9) + 56$

$= 91 + 9 + 56 = 156$

31 $(((1 \oplus 2) * 3) @ 20) = ((7 * 3) @ 20)$

$= (420 @ 20)$

$= 160000 - 8400$

$= 151600$

32 $(3\,D\,4)\,D\,(12\,D\,5) = \left(\dfrac{3}{4}\right) D \left(\dfrac{5}{12}\right) = \dfrac{\frac{5}{12}}{\frac{3}{4}} = \dfrac{5}{9}$

33 $(12\,D\,60)\,E\,(2\,C\,10) = \left(\dfrac{1}{5}\right) E \left(\dfrac{1}{5}\right) = \dfrac{1}{25}$

34 $30 + 20 - 4 \times 6 = 30 \times 20 \div 4 + 6$

$= 30 \times 5 + 6 = 156$

35 $50 / 40 - 5 + 4 \times 54$

$= 50 - 40 \div 5 \times 4 + 54 = 50 - 8 \times 4 + 54$

$= 50 - 32 + 54 = 72$

36 $(5 \wedge 5) \times (4 \wedge 4) / (3 \wedge 3) \times (2 \wedge 2) / (1 \wedge 1)$

$= (5^5) + (4^4) - (3^3) + (2^2) - (1^1)$

$= 3125 + 256 - 27 + 4 - 1 = 3357$

37 $[(x^2 \times y^2) - (x+y)^2 + [(x+y)^3 - \{(x/y)^2 \times 2 + x + y\}]$

$= [(x^2 + y^2) \div (xy)^2] \times [(xy)^3 \div \{(x-y)^2 + 2xy\}]$

$= \left[\frac{x^2+y^2}{(xy)^2}\right] \times \left[\frac{(xy)^3}{(x-y)^2+2xy}\right]$

$= \left[\frac{(x^2+y^2)}{(xy)^2} \times \frac{(xy)^3}{(x^2+y^2)}\right] = xy$

$= x + y$ (In Devic Mathematics)

38 $a + a + a - a + a + a / a + a - a$

$= a \times a \times a \div a \times a \times a - a \times a \div a$

$= a^3 \div a^3 - a^2 \div a = 1 - a$

$= \frac{1}{a}$ (In Devic maths)

39 $[(2 \Delta 3) \Delta (-2 \Delta 3)] = [(2-3) \Delta (-2+3)]$

$[(-1) \Delta (1)] = -1 + 1 = 0$

40 $\because \quad a \Delta a = 0 \ \forall \ a \in R$

Given $a > 0$

If $b > 0$

$(a \Delta b) \Delta (a \Delta (-b)) = (a-b) \Delta (a-b) \quad (\because a \times -b < 0)$

$= 0$

Again if $b < 0$, then

$(a \Delta b) \Delta (a \Delta (-b)) \quad (\because b$ is negative, $\therefore -b$ is positive)

$= (a+b) \Delta (a+b) = 0$

Hence, (d).

41 $f(x) = x^3 + 3x^2 + 3x$

$\therefore f(x+1) = (x+1)^3 + 3(x+1)^2 + 3(x+1)$

$= x^3 + 1 + 3x(x+1) + 3(x^2 + 1 + 2x) + 3x + 3$

$= x^3 + 1 + 3x^2 + 3x + 3x^2 + 3 + 6x + 3x + 3$

$= x^3 + 6x^2 + 12x + 7$

42 $\frac{(4 \# 2) @ (9 \# (-1))}{(2 @ 3) \# (5 @ 2)} = \frac{3 @ 1}{0 \# 9} = \frac{2}{-1} = -2$

43 Solve the options as per the directions.

44 Since, f_4 can assume negative values also, but f_1, f_2 and f_3 always give positive values only.
Hence choice (b), (c) and (d) are not possible.

45 $lt\ (8.3) - gt(5.3) + lt\ (6.8) + gt(9.4)$

$= 9 - 5 + 7 + 9 = 20$

46 $\Delta(3, 2) - \Delta(2, 3) + gt(4.8) - lt\ (2.7) + \Delta(4, 5)$

$= 2 - 2 + 4 - 3 + 4 = 5$

47 $a = \frac{p+q}{2}$, $b = \frac{lt\ (p) + qt\ (q)}{2}$

Now, $lt\ p = p + k\ ; \quad 0 \le k \le 1$

$gt\ q = q - m; \quad 0 \le m \le 1$

where $p, q \notin I$

Also $k + m = 1$ (Actually it is just less than 1)

$\therefore \quad (a-b) = \frac{p+q}{2} - \frac{(p+k)+(q-m)}{2}$

$\Rightarrow \quad (a-b) = \frac{p+q}{2} - \frac{p+q+k-m}{2}$

$\Rightarrow \quad (a-b) = \frac{k-m}{2}$

Now, $(a-b) = \frac{k-(1-k)}{2} \quad (\because k + m = 1)$

$= k - \frac{1}{2}$

and $(a-b) = \frac{(1-m)-m}{2} \quad (\because k + m = 1)$

$= \frac{1}{2} - m$

$(a-b) = k - \frac{1}{2}$

$\Rightarrow \quad \frac{1}{2} \le (a-b) \le \frac{1}{2} \quad (\because 0 \le k \le 1)$

(Similarly $-\frac{1}{2} \le (a-b) \le \frac{1}{2}$, since $0 \le m \le 1$)

NOTE The correct result (in practical) is $-\frac{1}{2} < (a-b) < \frac{1}{2}$ since $0 \le k < 1$ and $0 \le m < 1$.

48 $(a @ b)(b \# a) = \frac{a}{a+b} \times \frac{a+b}{b} = \frac{a}{b}$

Hence (c) is correct.

49 $b \# a - a @ b = \frac{(a+b)}{b} - \frac{a}{(a+b)} = \frac{(a+b)^2 - ab}{b(a+b)}$

$= \frac{a^2 + b^2 + 2ab - ab}{b(a+b)} = \frac{a^2 + b^2 + ab}{b(a+b)}$

50 $mn\ (md\ (-2), mx\ (5, mn\ (-2, md\ (5))))$

$= mn\ (2, mx(5, mn\ (-2, 5)))$

$= mn\ (2, mx\ (5, -2)) = mn\ (2, 5) = 2$

51 $md\ (mn\ (-2, mx\ (md(5), mn\ (-2, -7))))$

$= md(mn\ (-2, mx\ (5, -7)))$

$= md\ (mn\ (-2, 5)) = md\ (-2) = 2$

52 $((1 @ (2 \Delta 3)) \# 4) = ((1 @ ((2 @ 3) - (2 \# 3)) \# 4))$

$= ((1 @ (45 - (-3)) \# 4$

$= ((1 @ 48) \# 4)$

$= (4704 \# 4) = 88416400$

53 $(1 @ 1) \Delta (2 \# 2) = 4 \Delta 0 = (4 @ 0) - (4 \# 0) = 0 - 0 = 0$

54 $(a \Delta b) + (a \# b) = (a^2 + b^2) + (|\ a^2 - b^2\ |)$

Case I. When $(a^2 - b^2)$ is positive

$(a^2 + b^2) + (a^2 - b^2) = 2a^2$

Case II. When $(a^2 - b^2)$ is negative

$(a^2 + b^2) - (a^2 - b^2) = 2b^2$

Hence we cannot determine the required value.

Hint $|\ k\ | \Rightarrow \pm k$

55 $[(a \# b) \div (a @ b)]^2 - 2(a * b)$

$= [|a^2 - b^2| \div |a - b|]^2 - 2ab \qquad (\because |k| \geq 0)$

$= (|a + b|)^2 - 2ab$

$= a^2 + b^2 = a \Delta b$

56 Consider $g(x) = e^x$ (from the given options)

$\therefore \quad e^x = g(f(x))$

$\Rightarrow \quad e^x = g \log (g(x))$

$\Rightarrow \quad e^x = g \log (e^x)$

$\Rightarrow \quad e^x = g(x)$

$\Rightarrow \quad e^x = e^x$

Hence, choice (b) is correct.

57 Going through options, we find that none of the choices (a), (b) and (c) satisfy the relation, hence (d)

58 None of the options (a), (b) and (c) satisfy the given conditions.

59 $g[f(x) - f[g(x)] = g(2x + 3) - f(9x + 6)$

$= [9(2x + 3) + 6] - [2(9x + 6) + 3]$

$= [18x + 27 + 6] - [(18x + 12) + 3] = 18$

60 $f(f(-2)) = f(8 - 6 + 1)$

$(\because -2 < -1)$

$= f(3)$

$= (9 + 6 + 2) \qquad (\because 3 > -1)$

$= 17$

61 $x^2 = 4 \Rightarrow x = \pm 2; y^2 = 9 \Rightarrow y = \pm 3$

	(2, 3)	(– 2, 3)	(– 2, – 3)	(2, – 3)
$f(x, y)$ =	5	1	– 5	– 1
$g(x, y)$ =	– 3	– 7	– 1	3
$F(f(x, y))$ =	10	10	– 2	– 2
$G(g(x, y))$ =	2	– 6	– 6	2

Also, $|F(f(x, y))| = |G(g(x, y))|$, which is true for $x = 2$ and $y = -3$

$\therefore \quad x + y = -1$

62 Let $x = 8, \quad y = 9$

$\therefore \quad [x] = 7 \quad \text{and} \quad \{y\} = 10$

$\therefore \quad g(x, y) = -3$

Again if $x = 9 \quad \text{and} \quad y = 8$, then

$[x] = 8 \quad \text{and} \quad \{y\} = 9 \quad \therefore g(x, y) = -1$

Hence (c) is correct choice.

Hint There are two cases (i) when $x < y$ (ii) when $x > y$

Alternatively Let $x = n \therefore y = n + 1$

$\therefore \quad g(x, y) = (n - 1) - (n + 1 + 1) = -3$

Also, if $x = n, \quad y = n - 1$

$g(x, y) = (n - 1) - (n - 1 + 1) = -1$

Hence (c).

63 $f(x, y) = x + 1 + y - 1 = x + y$

$g(x, y) = x - 1 - y - 1 = x - y - 2$

$F(f(x, y)) = x + y + 1 - x + y + 2 + 1 = 2y + 4$

$G(g(x, y)) = x + y - 1 + x - y - 2 + 1 = 2x - 2$

Hence, only (a) is false.

64 $F(f(x, y)) = -f(x, y)$

$G(f(x, y)) = -F(f(x, y)) = f(x, y)$

$\therefore f(G(f(1.2, 1.3)), f(F(f(0, 1)), G(f(0.8, 0.4))))$

$= f(f(1.2, 1.3)), f(-f(0, 1)), f(0.8, 0.4)))$

$= f(\{2.5\}), f(-(1)), [1.2]))$

$= f(3, f(-1, 1)) = f(3, 0)$

$= 3$, hence (c) is correct.

65 $F(f(x, y)) + G(f(x, y)) = 0$

Hence (d) is correct.

66 $f(1.1, 1.2) \times G(f(1.1, 1.2)) = f(1.1, 1.2) \times f(1.1, 1.2)$

$= [2.3] \times [2.3] = 2 \times 2 = 4$

67 $f(g(x)) = f\left(x + \frac{1}{x}\right) = \frac{1}{x + \frac{1}{x}} = \frac{x}{x^2 + 1}$

$g(f(x)) = g\left(\frac{1}{x}\right) = \frac{1}{x} + x = \frac{x^2 + 1}{x}$

$\therefore \quad f(g(x)) \cdot g(f(x)) = \frac{x}{x^2 + 1} \times \frac{x^2 + 1}{x} = 1$

68 $g(f(x)) = g(f(2)) = g(13) = 29$

$\because \quad f(2) = 2 \cdot (2)^2 + 7(2) - 9 = 13$

and $g(13) = 2 \times 13 + 3 = 29$

69 $f(f(f(f(f(2))))) = f(f(f(f(3)))) \qquad \left(\because f(2) = \frac{2+1}{2-1} = 3\right)$

$= f(f(f(2))) \qquad \left(\because f(3) = \frac{3+1}{3-1} = 2\right)$

$= f(f(3)) = f(2) = 3$

Solutions (for Q. Nos. 70 and 71)

$f(x) = 1 - h(x) \qquad \ldots(i)$

$g(x) = 1 - k(x) \qquad \ldots(ii)$

$h(x) = f(x) + 1 \qquad \ldots(iii)$

$j(x) = g(x) + 1 \qquad \ldots(iv)$

$k(x) = j(x) + 1 \qquad \ldots(v)$

From eqs. (i) and (iii)

$f(x) + h(x) = 1 - h(x) + f(x) + 1$

$\Rightarrow \quad h(x) = 1 \qquad \ldots(vi)$

$\Rightarrow \quad f(x) = 0 \qquad \ldots(vii)$

From eqs. (ii) and (iv)

$g(x) = 1 - k(x) = 1 - (j(x) + 1)$

$g(x) = -j(x) \qquad \ldots(viii)$

From eqs. (iv) and (viii)

$j(x) - g(x) = 1$

and $g(x) = -j(x)$

$\Rightarrow \quad j(x) = \frac{1}{2} \quad \ldots(ix)$

$\therefore \quad g(x) = -\frac{1}{2} \quad \ldots(x)$

$\therefore \quad k(x) = j(x) + 1 = \frac{3}{2} \quad \ldots(xi)$

Hence $f(x) = 0$

$g(x) = -\frac{1}{2}$

$h(x) = 1$

$j(x) = \frac{1}{2}$

$k(x) = \frac{3}{2}$

Thus all the functions are constant.

70 $\frac{j(f(x)) + k(h(x))}{h(k(x)) + f(j(x))} = \frac{\frac{1}{2} + \frac{3}{2}}{1 + 0} = \frac{2}{1} = 2$

71 $\frac{1 + \frac{1}{2} + \frac{3}{2}}{\left(0 + \frac{1}{2} + \frac{3}{2}\right)\left(0 \cdot \frac{1}{2} \cdot \frac{3}{2}\right)} = \frac{3}{0} = \infty$

i.e., not defined

72 Since, odd function + odd function = odd function and (odd function) (odd function) = even function.

73 Even (Odd) = Even and Odd (Even) = Even

74 y is maximum when $x^2 + 2 = 6 - 3x$

i.e., $x^2 + 3x - 4 = 0 \Rightarrow x^2 + 4x - x - 4 = 0$

$\Rightarrow \quad x(x + 4) - 1(x + 4) = 0$

$\Rightarrow \quad x = 1 \quad \text{or} \quad x = -4$

$\therefore$ at $x = 1$, $y = 3 (\because x > 0)$

75 $p^2 \times q^2 \times r^2$ is maximum when $p^2 = q^2 = r^2 = \frac{1}{3}$

$\therefore \quad (pqr)^2_{\max} = \frac{1}{27} \Rightarrow (pqr)_{\max} = \frac{1}{3\sqrt{3}}$

76 $\frac{g(x, y, z)}{j(x, y, z)} = \frac{3}{3} = 1$

77 $\frac{(m(x, y, z) - f(x, y, z))}{h(x, y, z) \times k(x, y, z) \times l(x, y, z)} = \frac{3 - 4}{5 \times 2 \times 1} = \frac{-1}{10}$

78 $\frac{f(x, y, z) + h(x, y, z) - g(x, y, z)}{j(x, y, z)} = \frac{4 + 5 - 3}{3} = 2 > 1$

79 $C(1, 2, 3) = \max(A(1, 2, 3), B(1, 2, 3)) = \max(3, 2) = 3$

80 $D(0, 1, 2) = \min(A(0, 1, 2), B(0, 1, 2)) = \min(1, 2) = 1$

81 $A(2, 3, 4) + B(2, 3, 4) = 5 + 2 = 7$

82 $C(0, 1, D(1, 2, 3)) = C(0, 1, \min(A(1, 2, 3), B(1, 2, 3)))$
$= C(0, 1, \min(3, 2)) = C(0, 1, 2)$
$= \max(A(0, 1, 2), B(0, 1, 2))$
$= \max(1, 2) = 2$

83 $D(1, 2, C(0, 1, 2)) = D(1, 2, 2) \quad (\because C(0, 1, 2) = 2)$
$= \min(A(1, 2, 2), B(1, 2, 2))$
$= \min(3, 1) = 1$

84 $|x + 5| = 8 \Rightarrow x = 3 \quad \text{and} \quad x = -13$

and $9 - |x - 4| = y = f(x)$

for $x = 3, \; y = f(x) = 8$

and for $x = -13$, $y = f(x) = -8$

Max. $(x \cdot y) = (-13) \times (-8) = 104$

85 $f(100x) = f(x + 99x)$

$= f(x) \cdot f(99x) = \ldots = \underbrace{f(x) \cdot f(x) \ldots f(x) \cdot f(x)}_{100 \text{ times}}$

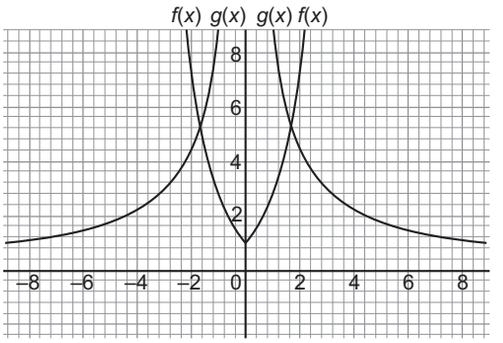
$\Rightarrow \quad f(100x) = (f(x))^{100}$

Hence, choice (a) is the correct one.

86 $|x| \cdot e^{|x|} = 9 \Rightarrow e^{|x|} = \frac{9}{|x|}$

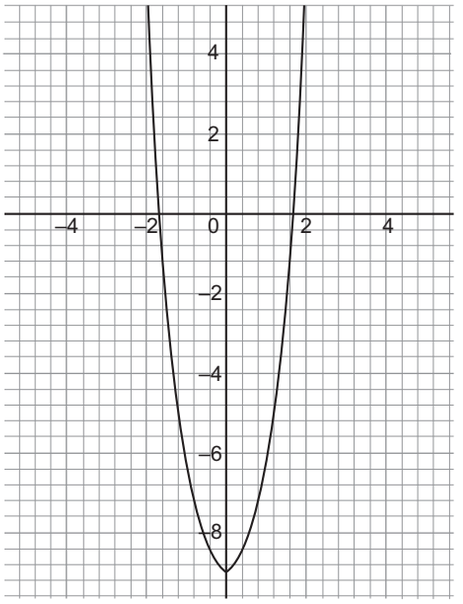
Let $f(x) = e^{|x|}$ and $g(x) = \frac{9}{|x|}$

Now, look at the graphs of $f(x)$ and $g(x)$, as given below.



Since the graphs intersect at 2 distinct points, so the number of solutions is 2. Hence, choice (c) is the correct one.

NOTE The actual graph of the given equation is shown below.



☑ Level 02 *Higher Level Exercise*

1 $f(x)=\dfrac{a^x+a^{-x}}{2}, \quad f(y)=\dfrac{a^y+a^{-y}}{2}$

$\therefore \quad f(x+y)=\dfrac{a^{x+y}+a^{-(x+y)}}{2} \quad \ldots(i)$

and $\quad f(x-y)=\dfrac{a^{x-y}+a^{-(x-y)}}{2} \quad \ldots(ii)$

adding eqs. (i) and (i), we get

$$f(x+y)+f(x-y)=\frac{a^{x+y}+a^{-x-y}}{2}+\frac{a^{x-y}+a^{-x+y}}{2}$$

$$=\frac{1}{2}[a^x(a^y+a^{-y})+a^{-x}(a^y+a^{-y})]$$

$$=\frac{1}{2}(a^x+a^{-x})(a^y+a^{-y})=2f(x)\,f(y)$$

2 $\left|\dfrac{30-x}{5}\right|<4$

$\Rightarrow \quad |30-x|<20$

$\Rightarrow \quad -20<(30-x)<20$

$\Rightarrow \quad -20<30-x<20$

$\Rightarrow \quad -50<-x<-10$

$\Rightarrow \quad 50>x>10 \text{ or } 10<x<50$

3 $|x+y|=|x-y| \Rightarrow (x+y)^2=(x-y)^2 \quad \Rightarrow \quad 4xy=0$

$\Rightarrow \quad$ either $x=0 \quad$ or $\quad y=0$

If $x=0$ and y is any real number, we have infinite possible values of y as $|0+y|=|0-y| \quad \Rightarrow \quad |y|=|-y|$

Similarly $(x, 0)$ where x can be any real number also satisfies $|x+0|=|x-0|$

So there are infinite number of solutions.

6 $e^{-x^2}=\dfrac{1}{e^{x^2}}$

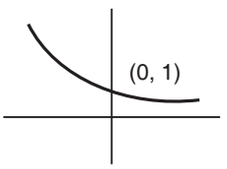
Since x^2 is an even function therefore e^{-x^2} is also an even function, hence it is symmetric about y-axis.

Also it is always positive.

and at $x=0, \quad e^{-x^2}=1$

Hence (b) is not true. Thus only choice (d) is correct.

7 $y=a^x \Rightarrow$ at $x=0, y=1$



Hence (iii) statement is true.

at $\quad a=\dfrac{1}{2}, f(x)=\left(\dfrac{1}{2}\right)^x$

e.g., $a=\dfrac{1}{2}$, then $f(x)=a^x=\left(\dfrac{1}{2}\right)^x$

Hence the function is decreasing.

14 Inverse of an exponential function is a logarithmic function.

$\therefore \quad x=10^y \quad \Rightarrow \quad \log_{10} x=y$

graph (A) is an exponential function

graph (B) is a logarithmic function

graph (C) is also an exponential function

graph (D) represents inverse function like $\left|\dfrac{1}{x}\right|$

Logarithmic function is defined only for positive values hence choice (a), (c) and (d) are wrong.

Also the inverse function (i.e., $f^{-1}(x)$ of a function $f(x)$) is symmetric about $x=y$

15 $f(0)=1-0=1, f\left(\dfrac{1}{2}\right)=1-\dfrac{1}{2}=\dfrac{1}{2}=0.5$

$f(1)=1-1=0, f\left(\dfrac{45}{18}\right)=2.5-1=1.5$

$\therefore f(0)+f\left(\dfrac{1}{2}\right)+f(1)+f\left(\dfrac{45}{18}\right)=1+0.5+0+1.5=3$

16 $x=\dfrac{|y|}{y}, y\neq 0$ if $y>0, x=\dfrac{y}{y}=1$

$\therefore$ for all values of $y>0, x=1$

and for all values of $y<0, x=-1$

17 Since the reflection of $g(x)$ is about x-axis therefore $g(x)=-f(x)$

18 Since the reflection of $g(x)$ is about y-axis

$\therefore \quad g(x)=f(-x)$

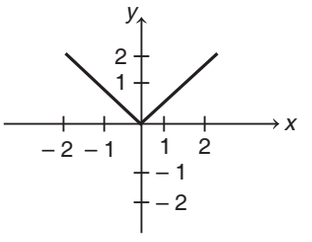
19 $f(x)$ is an even function

20 Since for each x there are more than 1 value of $f(x)$

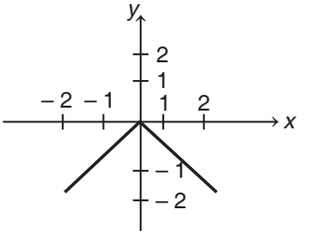
21 $f(x)$ is an even function

22 $f(x)$ is an odd function

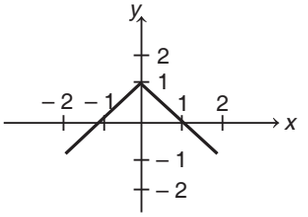
23 $f(x)=|x|$



$f(x)=-|x|$

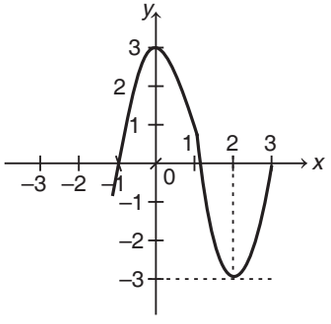


$f(x) = -|x| + 1$



24 $f(x) = x^3 - 3x^2 - x + 3$

$f(x) = (x-1)(x+1)(x-3)$



$\Rightarrow \quad x = -1, 1, 3$

Thus the graph of $f(x)$ intersects the x-axis three times viz., at $x = -1, 1, 3$

25 Choice (a) $\rightarrow$ at $x = 0$ $f(x)$ is not defined

Choice (b) $\rightarrow$ at $x = 0$ and $x = 1$, $f(x)$ is not defined

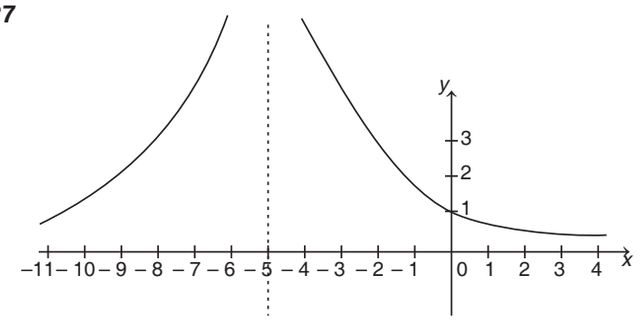
Choice (d) $\rightarrow$ x is defined for only positive real numbers except 1.

Hence choice (c) is correct as x^2 is always positive and $x^2 + 2 \neq 0$

26 Since x is always positive and y can assume both positive and negative values therefore (c) is the correct choice.

$$x|y| = 1 \quad \Rightarrow \quad x = \frac{1}{|y|} \qquad \text{for } x > 0$$

27



28 $f(x_2, x_3) = x_{2+3} = x_5 \qquad (\because 2 + 3 < (3)^2)$

$f(x_5, x_6) = x_{5+6-3} = x_8 \qquad (\because 5 + 6 > (3)^2)$

$\therefore \quad f(f(x_2, x_3), f(x_5, x_6)) = f(x_5, x_8) = x_{5+8-3}$

$= x_{10} \qquad (\because 5 + 8 > (3)^2)$

29 $g(x_2, x_3) = x_1 \qquad \left[\because \frac{2 \times 3}{5} \rightarrow m = 1\right]$

$g(x_7, x_8) = x_1 \qquad \left[\because \frac{7 \times 8}{5} \rightarrow m = 1\right]$

$\therefore \quad g(g(x_2, x_3), g(x_7, x_8))$

$= g(x_1, x_1) = x_1 \qquad \left[\because \frac{1 \times 1}{5} \rightarrow m = 1\right]$

30 $\because$ at $x = 1 \quad y = 0$

$x = -1 \quad y = 0$

$x = 0 \quad y = -1$

$x = 2 \quad y = 1$

$x = -2 \quad y = 1$

31 $y = |x| + x$

at $x = 0 \quad y = 0$

$x = 1 \quad y = 2$

$x = 2 \quad y = 4$

$x = -1, \quad y = 0$

$x = -2, \quad y = 0$

32 $x = y - 1$

$\Rightarrow \quad y = x + 1$

at $x = 0, \quad y = 1$

$x = -1, \quad y = 0$

$x = 1, \quad y = 2$

$x = -2, \quad y = 1$

33 Option (a) is wrong since at $x = 1, 2, \ y = 0$

Option (c) is wrong since at $x = 0, y = 1$

Option (b) is correct since at $x = -2, 2; y = 0$

also $x = 0$, $y = 0$ etc. Also the graph is symmetric about y-axis hence $|x|$ is must to be appeared.

34 The graph intersects x-axis at four different points therefore choice (c) is wrong. Since graph is symmetric about y-axis therefore choice (a) is wrong since at $x = 1$, $y = 0$ but at $x = -1$, $y = 6$

choice (d) is wrong since at $x = 0$, $y = +2$

Hence choice (b) is correct.

35 $f(x) = \begin{cases} -x & x < 0 \\ x & x > 0 \end{cases}$

$g(x) = \begin{cases} x & x < 0 \\ -x & x > 0 \end{cases} \qquad \therefore f(x) = -g(x)$

36 $f(x) = \begin{cases} x & \forall\ x < 0 \\ x & \forall\ x > 0 \end{cases}$

$g(x) = \begin{cases} -x & x < 0 \\ x & x > 0 \end{cases}$

$\therefore \qquad f(x) = -g(x)$ for $x < 0$

and $\qquad f(x) = g(x)$ for $x > 0$

37 $f(x) = \begin{cases} -x & x < 0 \\ -x & x > 0 \end{cases} \quad \Rightarrow \quad g(x) = \begin{cases} -x & x < 0 \\ x & x > 0 \end{cases}$

$\therefore \qquad f(x) = g(x)$ for $x < 0$

and $\qquad f(x) = -g(x)$ for $x > 0$

38 Choice (b) is wrong since at $x = 0$, $f(x) = 0$. Choices (a) and (c) are also wrong. Now, choice (d) is correct, since

$$y = -(ax^2 + c) \quad \text{and} \quad y = (ax^2 + c)$$

These two equations give equal but opposite values.

39 $f(1) = 1;\ f^2(1) = f(f(1)) = 1$

$f^3(1) = f^2(f(1)) = f^2(1) = 1$

$f^4(1) = f^3(f(1)) = f^3(1) = 1$

therefore $f^{11}(1)\, f^{33}(1) \cdot f^{55}(1)\, f^{77}(1)\, f^{99}(1)$

$$= 1 \times 1 \times 1 \times 1 \times 1 = 1$$

40 $f^2(x) = f(f(x)) = f\left(\frac{1}{x}\right) = x$

$f^3(x) = f(f^2(x)) = f(x) = \frac{1}{x}$

$\therefore \quad f^2(x) = f^4(x) = f^6(x) = f^8(x) \ldots = x$

and $\quad f(x) = f^3(x) = f^5(x) = f^7(x) \ldots = \frac{1}{x}$

$\therefore \quad f^{12}(x) = f^2(x) = 11 \quad \therefore \ f(f(x)) = 11$

$\Rightarrow \quad f\left(\frac{1}{x}\right) = 11 \quad \Rightarrow f(x) = \frac{1}{11}$

Solutions (for Q. Nos. 41 to 43)

Cycle	Values of		
	a	b	c
Start	1	2	3
1	2	4	6
2	4	6	10
3	8	8	16
4	16	10	26
5	32	12	44
6	64	14	78
7	128	16	144

41 16 and 144

42 $b = 16$

43 Basically the module takes 7 cycles to reach step 6 (i.e., to stop), Hence the number of repetitions

$$= 7 - 1 = 6$$

Solutions (for Q. Nos. 44 to 47)

Cycle	x	y	z	Sum
C_0	1	– 2	3	$2 = S_0$
C_1	– 5	8	– 13	$-10 = S_1$
C_2	21	– 34	55	$42 = S_2$
C_3	– 89	144	– 233	$-178 = S_3$
C_4	377	– 610	987	$754 = S_4$

44 We can see from the above table that sum of each cycle is twice the each corresponding value of x in the same cycle.

45 $S_4 = 754$

46 $S_1, S_3, S_5, S_7 \ldots$ etc are negative integers. Hence S_{13} is negative and each sum $S_1, S_2, S_3, S_4, S_5, S_6 \ldots$ is an even number. Hence (d)

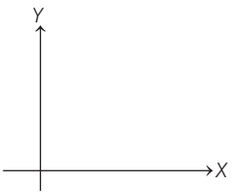
47.

	K	L	M
initially	9	0	0
Fill (L, K)	4	5	0
Fill (M, L)	4	1	4
Empty (L, K)	5	0	4
Empty (M, L)	5	4	0

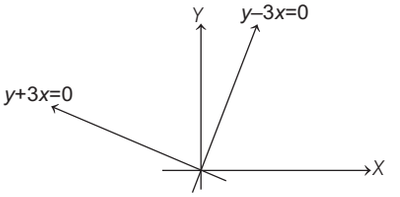
$\therefore$ L has 4 litres of water.

48 Note that we can feed the instruction of Empty (L, M) since the amount of water in L is less than the remaining capacity of M.

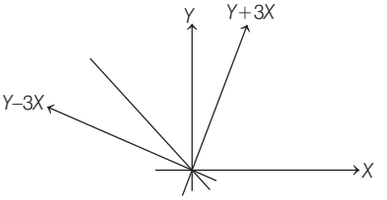
49 In the normal coordinate plane the equation of X-axis corresponds to $y = 0$ and the equation of Y-axis corresponds to $x = 0$.



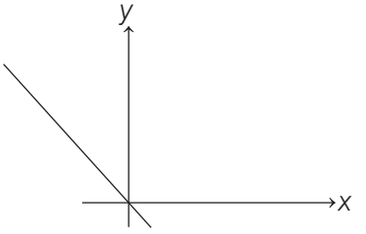
But $y - 3x = 0 \Rightarrow y = 3x$ and $y + 3x = 0 \Rightarrow y = -3x$. And these two lines are perpendicular to each other. So you can show them in the $x - y$ coordinate plane as shown below, fig. (ii).



Now, since $y - 3x = 0$ corresponds to $Y + 3X$ axis and $y + 3x = 0$ corresponds to $Y - 3X$ axis. Therefore comparing the given graph with the above graph you will get the following graph (iii).



Thus from the above graph (iii) you can filter out the requisite information as shown in the following graph (iv).



Hence, choice (a) is the correct one.

☑ Level 03 *Final Round*

Solutions (for Q. Nos. 1 to 10)

P_0	P_1	P_2	P_3	P_4	P_5	P_6	P_7	P_8	P_9	P_{10}	P_{11}	P_{12}
0	1	1	0	– 1	– 1	0	1	1	0	– 1	– 1	0
Q_0	Q_1	Q_2	Q_3	Q_4	Q_5	Q_6	Q_7	Q_8	Q_9	Q_{10}	Q_{11}	Q_{12}
0	1	1	2	3	5	8	13	21	34	55	89	144

5 $Q_{13} = 233, \quad P_{14} = 1$

$\therefore \quad Q_{13} + P_{14} = 234$

6 $Q_{10} + P_{10} = 55 + (-1) = 54$

7 $Q_6 = 8 \ \therefore Q_8 = 21$

i.e. $Q_{[Q_{(6)}]} = Q_{[8]} = 21$

8 $\because$ (a), (b) and (c) are wrong

9 $(Q_5)^{P_5} = (5)^{-1} = \frac{1}{5} = 0.2$

Solutions (for Q. Nos. 11 to 14)

11 $P[k(3)] = 3Q[k(3)] - 4 = 3(2R[k(3)] + R[k(6)]) - 4$

$= 3(2(S[k(6)]) - S[k(3)] + (S[k(12)] - S[k(6)])) - 4$

$= 3(2(22 - 13) + (51 - 22)) - 4$

$= 3(18 + 29) - 4 = 141 - 4 = 137$

12 $S[k(1)] = 7$

$R[k(7)] = S[k(14)] - S[k(7)]$

$= 59 - 31 = 28$

$Q[k(28)] = 2R[k(28)] + R[k(56)]$

$= 2(S[k(56)] - S[k(28)] + S[k(112) - S(k(56))]$

$= 2(227 - 115) + (451 - 227)$

$= 2(112) + (224) = 448$

$\therefore \quad QRS[k(1)] = QR[k(7)] = Q[k(28)] = 448$

13 $R[k(5)] = S[k(10)] - S[k(5)]$

$= 43 - 19 = 24$

and $S[k(10)] = 43$

$\therefore \quad R[k(5)] - S[k(10)] = 24 - 43 = -19$

14 $\forall\ x < 0, R[k(x)]$ and $S[k(x)]$ are equal to zero. Therefore the whole product will be zero.

Solutions (for Q. Nos. 15 to 20)

15 $(3x^4 + 2x^2 + 5x) + (2x^4 + 3x^3 + 7x^2)$

$= 5x^4 + 3x^3 + 9x^2 + 5x$

$= (5, 4, \ 3, 3, \ 9, 2, \ 5, 1)$

16 $(6, 5, \ 7, 4, \ 8, 3) - (3, 5, \ 5, 3, \ 7, 1)$

$= (6x^5 + 7x^4 + 8x^3) - (3x^5 + 5x^3 + 7x)$

$= (3x^5 + 7x^4 + 3x^3 - 7x)$

$= (3, 5, \ 7, 4, \ 3, 3, \ -7, 1)$

17 $(1, 1, 2, 0) \to (x + 2)$

$\therefore \quad (x + 2)^3 = x^3 + 6x^2 + 12x + 8$

$= (1, 3, \ 6, 2, \ 12, 1, \ 8, 0)$

18 $(3, 3, -10, 2, \ 7, 1) \div (3, 2, \ -7, 1)$

$= (3x^3 - 10x^2 + 7x) \div (3x^2 - 7x)$

$= x(3x^2 - 10x + 7) \div x(3x - 7)$

$= x(x - 1)(3x - 7) \div x(3x - 7)$

$= (x - 1) = (1, 1, -1, 0)$

20 $(4x^4 + 3x^3) \times (2x^2 + x) + (2x^2 + x) - (3x^5 + 2x^4)$

$= (8x^6 + 10x^5 + 3x^4) + (2x^2 + x - 3x^5 - 2x^4)$

$= (8x^6 + 7x^5 + x^4 + 2x^2 + x)$

$= (8, 6, \ 7, 5, 1, 4, 2, 2, \ 1, 1)$

Solutions (for Q. Nos. 21 to 25)

21 $h(3, 2, 8, 7) \div g(4, 7, 10, 8) = 2 \div 4 = \frac{1}{2}$

22 $h(fg(2, 5, 7, 3), 9) = h(f(2, 5, 7, 3) \times g(2, 5, 7, 3), 9)$

$= h((7 \times 2), 9) = h(14, 9) = 5$

23 $h(h(7, 13, 5, 9), h(4, 6, 12, 14)) = h(1, 0)$

$= \frac{1}{0}$, which is not defined

24 $A = 9, B = 20, C = 20, D = 14$

$\therefore \quad B = C > D > A$

Hence (b) is the appropriate answer

25 $h(h(a_1, b_1, c_1, d_1), h(a_2, b_2, c_2, d_2)) = h(0, 0)$

$= \frac{0}{0}$ is not defined, while $0 \times 0 = 0$ is defined

Solutions (for Q. Nos. 26 to 32) *In case of $x > 0$, we get the following pattern.*

$f(1) = b + c - 2c + a = a + b - c$

$f(2) = b + c - 4c + a + b - c = a + 2b - 4c$

$f(3) = b + c - 6c + a + 2b - 4c = a + 3b - 9c$

$f(4) = b + c - 8c + a + 3b - 9c = a + 4b - 16c$

(i.e., $f(x) = a + bx - cx^2$)

26 Hence $f(8) = a + 8b - 64c = a + 8(b - 8c)$

Hence (b) is correct.

27 $f(-19) = 2b \times (-19) + f(-(-19))$

$= -38b + f(19)$

$= -38b + a + 19b - 361c$

$= a - 19b - 361c = a - 19(b + 19c)$

Hint For $x < 0$ i.e., $f(-x) = a + b(-x) - c(-x)^2$

28 $f(7) = a + 7b - 49c$

$\therefore$ when $a = 15, \quad b = 11$ and $c = -3$

$f(7) = 15 + 7 \times 11 - 49(-3)$

$= 15 + 77 + 147 = 239$

29 $f(-10) = a - 10b - 100c$

$\therefore$ at $a = 10$, $b = -7$ and $c = 6$

$$f(-10) = 10 - 10(-7) - 100 \times 6$$
$$= 10 + 70 - 600 = -520$$

30 $f(x) = a + b(x) - c(x)^2$ for every x

$\therefore \quad 0 = 4 - 17x + 18x^2$

Now, for convenience go through options.

31 $f(x) < 0$

$\Rightarrow \quad a + b(x) - c(x)^2 < 0$

$\Rightarrow \quad 12 + 10(x) - 8(x)^2 < 0 \quad \ldots(i)$

Now, for convenience go through options.

Alternatively Solve the quadratic inequality (i) and then get the required set of values.

32 $f(1) = a + b - c = -a \quad (\because b = -a, c = a)$

$\therefore \quad f(f(1)) = f(-a)$

$$= a + b(-a) - c(-a)^2$$
$$= a - ab - ca^2$$
$$= a + a^2 - a^3$$

Solutions (for Q. Nos. 33 to 37)

$$f(y, 0) = y + f(y-1, 0)$$
$$= y + (y-1) + f(y-2, 0)$$
$$= y - (y-1) + (y-2) + \ldots + 1 + f(0, 0)$$
$$= \frac{y(y+1)}{2} + 1$$

and $f(0, y) = y - f(0, y-1)$

$$= y - [(y-1) - f(0, y-2)]$$
$$= y - (y-1) + f(0, y-2)$$
$$= 1 + (y-2) - f(0, y-3)$$
$$= 1 + (y-2) - (y-3) + f(0, y-4)$$
$$= 2 + f(0, y-4)$$

Thus, $f(0, y) = \begin{cases} \frac{y-1}{2}, \text{ if } y \text{ is odd} \\ \frac{y+2}{2}; \text{ if } y \text{ is even} \end{cases}$

33 $f(y_1, y_2, y_3, \ldots y_n)$ is not defined for every odd n.

Here $n = 27$

34 $f(0, 1, 0, 1) = f(0, 1) + f(1, 0) + (0 + 1 + 0 + 1)$

$= 0 + 2 + 2 = 4$

35 $f(8, 8, 8, 2, 2, 2) = f(8, 2) + f(8, 8, 2, 2)$

$+ (8 + 8 + 8 + 2 + 2 + 2)$

$= f(2, 0) + f(0, 8) + [f(8, 2) + f(8, 2)$

$+ (8 + 8 + 2 + 2)] + 30$

$= 4 + 5 + [2f(8, 2) + 20] + 30$

$= 9 + [2(9) + 20] + 30 = 9 + [38] + 30 = 77$

36 $f(1, 1, 3, 1, 1, 3)$

$= f(1, 3) + f(1, 3, 1, 1) + (1 + 1 + 3 + 1 + 1 + 3)$

$= f(3, 0) + f(0, 1) + [f(1, 1) + f(3, 1) + (1 + 3 + 1 + 1)] + 10$

$= 7 + 0 + [f(1, 0) + f(0, 1) + f(1, 0) + f(0, 3) + 6] + 10$

$= 17 + [2 + 0 + 2 + 1 + 6] = 17 + 11 = 28$

37 $f(9, 2, k, 0, 9, 4)$

$= f(9, 4) + f(2, k, 0, 9) + (9 + 2 + k + 0 + 9 + 4)$

$= f(4, 0) + f(0, 9) + [f(2, 9) + f(k, 0)$

$+ (2 + k + 0 + 9)] + 24 + k$

$= 11 + 4 + [\{f(9, 0) + f(0, 2)\} + f(k, 0)$

$+ (11 + k)] + 24 + k$

$= 15 + [48 + f(k, 0) + (11 + k)] + 24 + k$

$= 98 + 2k + f(k, 0) = 98 + 2k + \left[\frac{k(k+1)}{2} + 1\right] = 124$

$\Rightarrow \quad k^2 + 5k - 50 = 0$

$\Rightarrow \quad k = -10 \quad \text{or} \quad k = 5$

Since k is a positive integer, hence $k = 5$

38 $f(128) = 1 \cdot 2^2 + 2 \cdot 2^1 + 8 \cdot 2^0 = 4 + 4 + 8 = 16$

$\therefore \quad f(16) = 1 \cdot 2^1 + 6 \cdot 2^0$

$= 2 + 6 = 8$

39 $f(888222) = 8 \cdot 2^5 + 8 \cdot 2^4 + 8 \cdot 2^3 + 2 \cdot 2^2 + 2 \cdot 2^1 + 2 \cdot 2^0$

$= 2^8 + 2^7 + 2^6 + 2^3 + 2^2 + 2^1$

$= 2^6(7) + 14$

$= 448 + 14 = 462$

$f(462) = 4 \cdot 2^2 + 6 \cdot 2^1 + 2 \cdot 2^0 = 30$

$f(30) = 3 \cdot 2^1 + 0 \cdot 2^0 = 6$

Again $f(113113) = 1 \cdot 2^5 + 1 \cdot 2^4 + 3 \cdot 2^3 + 1 \cdot 2^2 + 1 \cdot 2^1 + 3 \cdot 2^0$

$= 32 + 16 + 24 + 4 + 2 + 3 = 81$

$f(81) = 8 \cdot 2^1 + 1 \cdot 2^0$

$= 16 + 1 = 17$

$f(17) = 1 \cdot 2^1 + 7 \cdot 2^0$

$= 2 + 7 = 9$

$\therefore \quad f[f(888222) + f(113113)] = f(6 + 9]$

$= f(15) = 1 \cdot 2^1 + 5 \cdot 2^0$

$= 2 + 5 = 7$

40 $f(9235) = 9 \cdot 2^3 + 2 \cdot 2^2 + 3 \cdot 2^1 + 5 \cdot 2^0$

$= 72 + 8 + 6 + 5 = 91$

$f(91) = 9 \cdot 2^1 + 1 \cdot 2^0 = 19$

$f(19) = 1 \cdot 2^1 + 9 \cdot 2^0 = 11s$

$f(11) = 1\cdot2^1 + 1\cdot2^0 = 3$

$f(9450) = 9\cdot2^3 + 4\cdot2^2 + 5\cdot2^1 + 0\cdot2^0$

$= 72 + 16 + 10 = 98$

$f(98) = 9.2^1 + 8.2^0 = 26$

$f(26) = 2.2^1 + 6.2^0 = 10$

$f(10) = 1.2^1 + 0.2^0 = 2$

$\therefore \quad f(9235) + f(9450) = 3 + 2 = 5$

41 $f(x) = e^{x^2} + e^{-x^2} \Rightarrow f(x) = e^{x^2} + \frac{1}{e^{x^2}}$

$g(x) = xe^{x^2} + e^{-x^2} \Rightarrow g(x) = xe^{x^2} + \frac{1}{e^{x^2}}$

$h(x) = x^2e^{x^2} + e^{-x^2} \Rightarrow h(x) = x^2e^{x^2} + \frac{1}{e^{x^2}}$

$f(x)$, $g(x)$ and $h(x)$ all of them are the increasing functions in the interval [0, 1], so the maximum value of f, g and h will be attained at $x = 1$.

$\therefore \quad f_{\max} = f(1) = e + \frac{1}{e}$ and $g_{\max} = g(1) = e + \frac{1}{e}$

and $\quad h_{\max} = h(1) = e + \frac{1}{e}$

$\therefore \quad f_{\max} = g_{\max} = h_{\max} \Rightarrow a = b = c$

Hence, choice (d) is the answer.

Hint e, e^x, e^{x^2} all are increasing functions. So the other terms, given in the problem, are also increasing. The best way to test the increasing/decreasing nature of the function, in case you don't know differentiation method of calculus, is to substitute the values from the given interval in the stated function.

To get the maximum value replace x by 1, the highest value of the interval [0, 1], as the functions are increasing.

42 Let $h(x) = (f - g)(x)$

$\Rightarrow \quad h(x) = f(x) - g(x)$

$\Rightarrow \quad h(x) = \begin{cases} x, & x \in \text{irrational} \\ -x, & x \in \text{rational} \end{cases}$

It implies that the function $h(x)$ is one-one and onto.

Hence, choice (a) is the answer.

43 $f(x) = \frac{x^2 - 1}{x^2 + 1}$

$\Rightarrow f(x) = 1 - \frac{2}{x^2 + 1}$

When $x = 0$, $x^2 + 1$ will be minimum, so $\frac{2}{x^2 + 1}$ will be maximum and so $1 - \frac{2}{x^2 + 1}$ will be minimum.

Therefore, minimum of $f(x) = 1 - \frac{2}{x^2 + 1} = 1 - 2 = -1$

Hence, choice (c) is the answer.

44 $f(x) = \frac{x^2 + x + 2}{x^2 + x + 1} = 1 + \frac{1}{x^2 + x + 1} = 1 + \frac{1}{\left(x + \frac{1}{2}\right)^2 + \frac{3}{4}}$

Now, when the denominator $\left(x + \frac{1}{2}\right)^2 + \frac{3}{4}$ will be highest, $f(x)$ will be lowest which can be achieved when x is highest (close to infinity) and thus $f(x) > 1$

Similarly, when the denominator $\left(x + \frac{1}{2}\right)^2 + \frac{3}{4}$ will be least, $f(x)$ will be greatest which can be achieved when $x = \frac{-1}{2}$, and thus $f(x) = \frac{7}{3}$

Therefore, the range of $f(x)$ is (1, 7/3)

Hence, choice (c) is the answer.

45 The best way is to go through the choice. Let us consider choice (b), then $f(x) = x^2 - 2$

$\Rightarrow \quad f\left(x + \frac{1}{x}\right) = \left(x + \frac{1}{x}\right)^2 - 2$

$= x^2 + \frac{1}{x^2}$

Hence, choice (b) is the answers

CHAPTER 18

Sequence, Series & Progressions

This is one of the chapters which contributes really very logical problems which can be solved easily by some innovative methods rather than conventional methods (like applying formulae etc.) Basically CAT is an exam where logic prevails over pure mathematics.

Therefore the students who use their ingenuity to solve these problems score better than those who rely on the formula based approach. In the starting of the chapter I have given the proper mathematical methods, then later on I have gradually moved towards novel techniques for faster and smarter calculation. Remember that almost 1–2 questions are necessarily asked in CAT and this chapter is also important for rest of the entrance tests eg. XAT, FMS, IIFT, CET, MAT etc. Once again I would like to advise you that maximum problems must be attempted with the help of given choices. Besides most of the problems can be solved by substituting the values of variables *e.g., n, x*, etc. for *n*th term or sum of the series/progression. The above method is so smart that it reduces the time of problem solving upto 80% for some complex and typical problems.

Chapter Checklist

- *Sequence*
- *Series*
- *Progressions*
- *Arithmetic Progression (AP)*
- *Geometric Progression (GP)*
- *Harmonic Progression*
- *Arithmetico-Geometric Sequence*
- ***CAT Test***

18.1 Sequence

A set of numbers occuring in a definite order or by a rule is called a sequence. Thus any set of numbers $a_1, a_2, a_3, \ldots, a_n$ such that to each positive integer n, there corresponds a number a_n, is sequence. The numbers $a_1, a_2, a_3, \ldots, a_n$ are called elements (or members) of the sequence.

e.g., $1, \frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \frac{1}{5}, \ldots, \frac{1}{n}$ is a sequence, since the number occur in a definite order. A sequence can be finite or infinite according to the number of elements in it. If there are finite number of elements, then it is a finite sequence and if there are infinite number of elements in it, then it is an infinite sequence and is denoted by $\{a_n\}$.

18.2 Series

Let $u_1, u_2, u_3, \ldots, u_n$ be a given sequence of n numbers, where n is a specified positive integer. Then their sum *i.e.* $u_1 + u_2 + u_3 + \ldots + u_n$ is called a finite series and the numbers $u_1, u_2, u_3, \ldots, u_n$ are called terms of the series.

If $S_n = u_1 + u_2 + u_3 + \ldots + u_n$, then S_n is called the sum to n terms (or the sum of the first n terms) of

the series and is denoted by $\sum_{r=1}^{n} u_r$ or Σu_r. *e.g.,* $2+4+6+\ldots+30$ is a finite series and can be denoted as $\sum_{n=1}^{15}(2n)$ ($\Sigma \rightarrow$ Sigma, summation notation)

18.3 **Progressions**

Sequences of special types are called progressions. The sequences $a_1, a_2, \ldots, a_n \ldots$ or $\{a_n\}$ is known when its nth term a_n is given. **For example :**

(i) If $a_n = 2n$, then the sequence is 2, 4, 6, 8, …

(ii) If $a_n = 2n-1$, then the sequence is 1, 3, 5, 7, ….

But to define a sequence we may not always have a formula for the nth term. For example, the sequence of the prime numbers is 2, 3, 5, 7, 11, 13, … for which a formula for the nth term may not be given. In this chapter we study basically Arithmetic Progression (A.P.) and Geometric Progression (G.P.) and get a overview of Harmonic Progression (H.P.) also.

18.4 **Arithmetic Progression** (AP)

A sequence $a_1, a_2, a_3, \ldots, a_n$ is said to be in arithmetic progression, when $a_2 - a_1 = a_3 - a_2 = \ldots$ *i.e.,* when the quantities increase or decrease continuously by a common quantity and this constant (or common) quantity is called the common difference of the AP *e.g.,*

Progressions	**Common Difference**
1, 3, 5, 7, 9, …	$\rightarrow 2$
12, 9, 6, 3, 0, –3, – 6, …	$\rightarrow -3$
7, 12, 17, 22, …	$\rightarrow 5$
– 6, – 4, – 2, 0, 2, 4, 6, …	$\rightarrow 2$

General Term (or *n*th term) *of an AP*

Let us look at the following : 1, 4, 7, 10, 13, …

Each next term in the above sequence is being increased by 3 (which is the common difference). So you can see that from the second term onwards 3 is being added to every next term *i.e.,*

$1 = 1$

$4 = 1+3$

$7 = 1+3+3$

$10 = 1+3+3+3$

$13 = 1+3+3+3+3$ etc.

Let if a be the first term of the progression and d be the common difference, then the

First term $\longrightarrow$ a

Second term $\longrightarrow$ $a+d$

Third term $\longrightarrow$ $a+2d$

Fourth term $\longrightarrow$ $a+3d$

Fifth term $\longrightarrow$ $a+4d$

And nth term $\longrightarrow$ $a+(n-1)d$

The general term or nth term is denoted by T_n.

Hence, $T_n = a+(n-1)d$.

Also $l = a+(n-1)d$ where l is the last term of AP

Exp. 1) Find the 11th term of – 7, – 2, 3, 8, 13, ….

Solution $T_{11} = -7 + (11-1)5 = 43$ ($\because$ $a = -7$, $d = 5$ and $n = 11$)

Sum of First n terms of an AP Let us look at the following :

1, 4, 7, 10, 13, …

Let the sum of 'n' terms is denoted by S_n, then

$S_1 = 1$

$S_2 = 1+4 = 5$, $S_3 = 1+4+7 = 12$

$S_4 = 1+4+7+10 = 22$

$S_5 = 1+4+7+10+13 = 35$

$\therefore$ $S_n = T_1 + T_2 + T_3 + \ldots + T_n$

$= (a) + (a+d) + (a+2d) + \ldots + (a+(n-1)d)$

$= na + \dfrac{n(n-1)d}{2} \Rightarrow S_n = \dfrac{n}{2}[2a + (n-1)d]$

Alternatively $S_n = \left(\dfrac{a+l}{2}\right)n$,

($l \rightarrow$ last term of the progression)

NOTE In my own experience the alternative formula of S_n is better for problem solving since in this formula we have to just take the product of average of first and last term with number of terms. Also for our convenience to use this formula we can consider any term as last term.

Exp. 2) Find the sum of 11 terms of – 7, – 2 , 3, 8, …

Solution $a = -7$

$l = -7 + (10)\cdot 5 = 43 \therefore$ $S_{11} = \dfrac{-7+43}{2} \times 11$

$S_{11} = 198$

NOTE Personally I hardly use the formula $S_n = \dfrac{n}{2}[2a + (n-1)d]$

Since, I prefer $S_n = \left(\dfrac{a+l}{2}\right)n$.

Sum of First n Terms of an A.P.

Let us look at the following :

1, 4, 7, 10, 13, …

Let the sum of 'n' terms is denoted by S_n, then

$S_1 = 1$

$S_2 = 1+4 = 5$

$S_3 = 1+4+7 = 12$

$S_4 = 1+4+7+10 = 22$

$S_5 = 1+4+7+10+13 = 35$

$\therefore$ $S_n = T_1 + T_2 + T_3 + \ldots + T_n$

$= (a) + (a+d) + (a+2d) + \ldots + (a+(n-1)d)$

$= na + \dfrac{n(n-1)d}{2}$

$S_n = \dfrac{n}{2}[2a + (n-1)d]$

Arithmetic Mean (AM)

When three quantities are in AP, the middle one is called arithmetic mean (A.M.) of the other two.

Let a, m, b are in AP, then A.M. of a and b *i.e.*, $m = \frac{a+b}{2}$

$\therefore$ $\text{A.M.} = \frac{a+b}{2}$

In general, if $a, m_1, m_2, m_3, \ldots, m_n, b$ are in AP then the intermediate numbers $m_1, m_2, m_3, \ldots, m_n$ are called the n arithmetic means between a and b also the AM of $a_1, a_2, a_3, \ldots, a_n$, which are in AP is

$$\text{AM} = \frac{(a_1 + a_2 + a_3 + \ldots + a_{n)}}{n}$$

How to Insert *n* Arithmetic Means Between *a* and *b* If a and b are the first and last term respectively between which we have to insert n arithmetic means $m_1, m_2, m_3, \ldots, m_n$, then common difference $d = \frac{b-a}{n+1}$. Thus, $m_1 = a + \left(\frac{b-a}{n+1}\right)$

$\Rightarrow$ $m_2 = a + 2\left(\frac{b-a}{n+1}\right) \Rightarrow m_3 = a + 3\left(\frac{b-a}{n+1}\right)$

… … … … …

… … … … …

$m_n = a + n\left(\frac{b-a}{n+1}\right)$

Exp. 3) Insert 3 arithmetic means between 5 and 21.

Solution $d = \frac{21-5}{3+1} = 4$

$\therefore$ First A.M. $= a + d = 5 + 4 = 9$

Second A.M. $= a + 2d = 5 + 2(4) = 13$

Third A.M. $= a + 3d = 5 + 3(4) = 17$

Hence the new sequence is 5, 9, 13, 17, 21, where all the terms are in AP

Properties of Arithmetic Progressions (AP)

1. If a certain number is added or subtracted to each term of a given AP, then the resulting sequence is also an AP and it has the same common difference as that of the given AP

   e.g., 1, 4, 7, 10, 13, 16, …, then

   3, 6, 9, 12, 15, 18, … is also an AP

   and 2, 5, 8, 11, 14, 17, … is also an AP

   In the second sequence each term is increased by 2 than that of the first sequence and each term of the third sequence is decreased by 1 than that of second sequence.

2. If each term of an AP is multiplied by a fixed constant (or divided by a non-zero fixed constant), then the resulting sequence is also an AP *e.g.*, 6, 12, 18, 24, 30, 36, …, then 9, 18, 27, 36, 45, 54, … is also an AP and 3, 6, 9, 12, 15, 18, … is also an AP.

   In the second sequence each term is 3/2 times that of the first sequence and in the third sequence each term is half of the each term of the first sequence.

3. If $m_1, m_2, m_3, \ldots, m_k$ and $n_1, n_2, n_3, \ldots, n_k$ are in AP, then $(m_1 + n_1), (m_2 + n_2), (m_3 + n_3), \ldots, (m_k + n_k)$ are also in AP

   e.g., $S_1 = 3, 7, 11, 15, 19, \ldots$ and $S_2 = 5, 11, 17, 23, 29, \ldots$,

   then $S_1 + S_2 = (3+5), (7+11), (11+17), (15+23), (19+29) \ldots \Rightarrow S_1 + S_2 = 8, 18, 28, 38, 48, \ldots$ is also an AP

4. If $m_1, m_2, m_3, \ldots, m_k$ and $n_1, n_2, n_3, \ldots, n_k$ are in AP, then $(m_1 - n_1), (m_2 - n_2), (m_3 - n_3), \ldots, (m_k - n_k)$ are also in AP *e.g.*, $S_1 = 7, 12, 17, 22, 27, \ldots$, $S_2 = 4, 13, 22, 31, 40, \ldots$. Then $S_1 - S_2 = (7-4), (12-13), (17-22), (22-31), (27-40) \ldots$

   $\Rightarrow$ $S_1 - S_2 = 3, -1, -5, -9, -13, \ldots$ is also an AP

5. If there are odd number of terms in an AP as $a_1, a_2, a_3, \ldots, a_n$, then the middle most term is the A.M. of the given sequence. *e.g.*, 4, 10, 16, 22, 28

   Then, $\frac{4+10+16+22+28}{5} = 16$

   Also $\frac{4+28}{2} = \frac{10+22}{2} = 16\ (\text{AM})$

   (It is the most important point for logical problems.)

6. If there are even number of terms in an AP as $a_1, a_2, a_3, \ldots, a_n$, then

   $a_1 + a_n = a_2 + a_{n-1} = a_3 + a_{n-2} = a_4 + a_{n-3}$ etc.

   e.g., 4, 10, 16, 22, 28, 34, 40, 46

   Then, $4 + 46 = 10 + 40 = 16 + 34 = 22 + 28$

   also $\frac{4+46}{2} = \frac{10+40}{2} = \frac{16+34}{2} = \frac{22+28}{2} = 25\ (\text{A.M.})$

7. The sum of an AP with n terms is given by

   $S_n = n\ (\text{A.M.})$

   e.g. (1) 3, 7, 11, 15, 19, then $S_5 = 5 \times 11 = 55$

   (2) 5, 8, 11, 14, 17, 20

   $\therefore$ $S_6 = 6 \times \frac{25}{2} = 75$

8. If we have to take three terms in AP it is convenient to take them as $(m-k), m, (m+k)$ where $(m-k), m$ and $(m+k)$ are consecutive terms of an AP and k is the common difference. Similarly, we can take five terms in AP as $(m-2k), (m-k), m, (m+k), (m+2k)$.

Exp. 4) If the sum of five terms of an AP is 75, then find the third term of the AP

Solution $(m-2k)+(m-k)+m+(m+k)+(m+2k)=75$

$\Rightarrow \quad 5m=75$

$\Rightarrow \quad m=15$

Hence, the third term (*i.e.* middle most term) is 15.

NOTE In general to take odd number of terms, we assume m as the middlemost term and take other terms with common difference k, as per their position.

9. If we have to take 4 terms in AP, it is convenient to take them as $(m-3k), (m-k), (m+k), (m+3k)$

where $(m-3k), (m-k), (m+k), (m+3k)$ are consecutive terms of an AP and '$2k$' is the common difference. Similarly, we can take six terms in AP as $(m-5k), (m-3k), (m-k), (m+k), (m+3k), (m+5k)$.

Exp. 5) If the sum of 4 terms of an AP is 36, then find the A.M. of the AP

Solution $(m-3k)+(m-k)+(m+k)+(m+3k)=36$

$\Rightarrow \quad 4m=36$

$\therefore \quad S_4=4m=36$

$\therefore \quad \text{A.M.}=\dfrac{S_4}{4}=\dfrac{4m}{4}$

$=\dfrac{36}{4}=9$

10. The sum of first n natural numbers

$$\Sigma n=1+2+3+\ldots+n=\frac{n(n+1)}{2}$$

Exp. 6) Find the sum of first 10 natural numbers.

Solution $\Sigma 10=1+2+3+\ldots+10=\dfrac{10\times 11}{2}=55$

11. The sum of squares of first 'n' natural numbers

$$\Sigma n^2=1^2+2^2+3^2+\ldots+n^2$$

$$=\frac{n(n+1)(2n+1)}{6}$$

Exp. 7) Find the sum of squares of first 11 natural numbers.

Solution $\Sigma n^2=1^2+2^2+3^2+\ldots+11^2=\dfrac{11\times 12\times 23}{6}=506$

12. The sum of cubes of first 'n' natural numbers

$$\Sigma n^3=1^3+2^3+3^3+\ldots+n^3=\left[\frac{n(n+1)}{2}\right]^2=[\Sigma n]^2$$

Exp. 8) Find the sum of cubes of first 10 natural numbers.

Solution $\Sigma(10)^3=1^3+2^3+3^3+\ldots+10^3=\left(\dfrac{10\times 11}{2}\right)^2=3025$

13. The sum of first 'n' odd numbers

i.e., $\quad 1+3+5+7+\ldots+(2n-1)=n^2$

Exp. 9) Find the sum of $1+3+5+7+\ldots+11$

Solution $1+3+5+7+\ldots+11=(11)^2=121$

14. The sum of first n even numbers

i.e., $\quad 2+4+6+\ldots+2n=n(n+1)$

Exp. 10) Find the sum of first 10 even numbers.

Solution $2+4+6+8\ldots 20=10\times 11=110$

Introductory *Exercise 18.1*

1. Find the 41st term of the progression 3, 8, 13, 18, ...:
(a) 102 (b) 203
(c) 304 (d) none of these

2. Find the 25th term of the AP 10, 6, 2, – 2, – 6, – 10, ... :
(a) – 86 (b) 106
(c) 96 (d) none of these

3. What term of the AP 2, 5, 8, ... is 56 ?
(a) 20 (b) 21
(c) 19 (d) 15

4. What is the 10th term of the sequence 2, 4, ... ?
(a) 18 (b) 20
(c) 1024 (d) can't be determined

5. If the 3rd and 7th terms of an AP are 17 and 27 respectively. Find the first term of the AP :
(a) 9 (b) 12
(c) 14 (d) none of these

6. Find the nth term of an AP whose 6th and 8th terms are 12 and 22 respectively :
(a) $7n-30$ (b) n^2-24
(c) $5n-18$ (d) none of these

7. If 7 times the seventh term of an AP is equal to 11 times its eleventh term, the value of eighteenth term of the AP is
(a) 0 (b) – 8 (c) 18 (d) 77

8. If the pth, qth and rth terms of an AP are a, b, c respectively, then the value of
$a(q-r)+b(r-p)+c(p-q)$ is :
(a) 0 (b) 1 (c) abc (d) pqr

9. If the pth term of an AP is q and its q th term is p, then its mth term is :
(a) $\dfrac{pq}{m}$ (b) $pq-m$ (c) $p+q-m$ (d) pqm

10. Find the sum of the AP 11, 13, 15, ..., 99 :
(a) 2475 (b) 2500 (c) 1122 (d) 1580

11. Find the number of terms in the AP 22, 28, 34, ..., 616
(a) 80 (b) 78 (c) 99 (d) 100

12. Find the sum of 222, 224, 226, ..., 888 :
(a) 185370 (b) 195300 (c) 183000 (d) 899000

13. If the second and seventh terms of an AP are 2 and 22 respectively. Find the sum of first 35 terms :
(a) 2310 (b) 3210
(c) 2130 (d) none of these

14. The 12th term of an AP is – 13 and the sum of the first four terms of it is 24. Find the sum of its first ten terms
(a) – 48 (b) – 26 (c) 0 (d) 52

15. The third term of an AP is $\frac{1}{5}$ and the 5th term is $\frac{1}{3}$. Find the sum to 15 terms of the AP :
(a) 1/15 (b) 3/5 (c) 8 (d) 15

16. How many terms of the AP 1, 4, 7, ... are needed to give the sum 925 ?
(a) 20 (b) 22 (c) 24 (d) 25

17. How many terms of the series $20 + 16 + 12 + \ldots$ amounts to 48 ?
(a) 3 (b) 5
(c) 8 (d) both a and c

18. p, q, r, s, t are first five terms of an AP such that $p + r + t = -12$ and $p \cdot q \cdot r = 8$. Find the first term of the above AP :
(a) 3 (b) 2 (c) 4 (d) – 4

19. The sum of all the terms of the AP $7, 10, 13, \ldots$ l is 1242, where l is the last term of the AP Find the value of l.
(a) 67 (b) 79 (c) 85 (d) 102

20. Find the sum of all the integers between 55 and 5555 which are divisible by 7 :
(a) 678 (b) 786
(c) 876 (d) none of these

21. How many terms are there in AP whose first and fifth terms are – 14 and 2 respectively and the sum is 40 :
(a) 12 (b) 10 (c) 16 (d) 8

22. The first and last terms of an AP are – 7 and 233 and the sum of the AP is 9153. Find the number of terms in the AP :
(a) 83 (b) 81 (c) 49 (d) 99

23. The sum of three numbers in AP is 12 and sum of their cubes is 408. Find the product of the numbers :
(a) 17 (b) 35 (c) 28 (d) 36

24. The series of natural numbers is written as follows :

1
2 3 4
5 6 7 8 9
... ...
... ...

Find the sum of the numbers in the nth row :
(a) $n^3 + 1$ (b) $(2n)^2 - 1$
(c) $n^3 + (n-1)^3$ (d) none of these

25. If you save ₹ 1 today, ₹ 2 the next day, ₹ 3 the succeeding day and so on, what will be your total savings in 365 days ?
(a) 66579 (b) 66795
(c) 56795 (d) none of these

26. The ratio of the 7th to the 3rd terms of an AP is 12 : 5, find the ratio of the 13th to 4th term :
(a) 13 : 7 (b) 4 : 3
(c) 10 : 3 (d) none of these

27. Find the sum of the first hundred even natural numbers divisible by 5 :
(a) 50500 (b) 55000
(c) 50050 (d) 50005

28. If m times the mth term of an AP is equal to n times its nth term, find $(m + n)$ th term of the AP :
(a) – 1 (b) 0 (c) mn (d) 4

29. The sum of the first fifteen terms of an AP is 105 and the sum of the next fifteen terms is 780. Find the common difference of AP :
(a) 4 (b) 3 (c) 6 (d) 5

30. If the first term of an AP is 2 and the sum of the first five terms is equal to one-fourth of the sum of the next five terms, then find the 20th term ?
(a) – 114 (b) – 82
(c) – 112 (d) none of these

31. The sum of the first six terms of an AP is 42. The ratio of the 10th term to the 30th term of AP is $\frac{1}{3}$. Find the 40th term of the AP :
(a) – 60 (b) 20 (c) 39 (d) 80

32. The sum of n terms of two arithmetic series are in the ratio of $\frac{7n+1}{4n+27}$. Find the ratio of their 11th terms :
(a) 4 : 3 (b) 5 : 4
(c) 7 : 4 (d) none of a, b, c

33. The sum of three numbers in AP is 15 and sum of their squares is 93. Find the greatest number :
(a) 6 (b) 10
(c) 8 (d) 7

34. If the nth term of an AP is $4n - 1$, find the 30th term and the sum of first 30 terms.
(a) 119 and 1830 (b) 69 and 1665
(c) 119 and 1380 (d) none of these

35. The sum of n terms of a series is $3n^2 + 5n$. Find the value of n if nth term is 152 :
(a) 15 (b) 18
(c) 20 (d) 25

36. Find the number of terms of the AP 98, 91, 84, ... must be taken to give a sum of zero :
(a) 14 (b) 15 (c) 31 (d) 29

37. What is the greatest possible sum of the AP 17, 14, 11, ... :
(a) 51 (b) 73 (c) 57 (d) 75

38. What is the least possible sum of the AP – 23, – 19, – 15, ... :
(a) – 3 (b) – 78 (c) – 87 (d) none

39. Find the sum of all odd numbers of four digits which are divisible by 9 :
(a) 2784491 (b) 2478429
(c) 2754000 (d) 2448729

40. If a, b, c be the pth, qth and rth terms of an AP, then $p(b-c)+q(c-a)+r(a-b)$ equals to :
(a) 0 (b) 1 (c) 3 (d) $\frac{abc}{pqr}$

41. If a, b, c be respectively the sum of first p, q, r terms of an AP, then $\frac{a}{p}(q-r)+\frac{b}{q}(r-p)+\frac{c}{r}(p-q)$ equals
(a) pqr
(b) $ap+bq+cr$
(c) 0
(d) $p+q+r$

42. Divide 20 into four parts which are in AP and such that the product of the first and fourth is to the product of the second and third in the ratio 2 : 3. Find the product of the first and fourth term of the AP :
(a) 12 (b) 16
(c) 20 (d) 25

43. The sum of the first p terms of an AP is q and the sum of the first q terms is p. Find the sum of the first $(p+q)$ terms :
(a) pq (b) $p-q$ (c) $-(p+q)$ (d) 0

18.5 **Geometric Progression** (G.P.)

Geometric Progression

A sequence $a_1, a_2, a_3, \ldots, a_n$ is said to be in Geometric Progression when

$$\frac{a_2}{a_1}=\frac{a_3}{a_2}=\frac{a_4}{a_3}=\ldots r(\text{say})$$

and $a_1, a_2, a_3, \ldots, a_n$ are all non-zero numbers and r is said to be the common ratio of the G.P. *e.g.*,

(i) $2, 4, 8, 16, \ldots \to r=2$
(ii) $1, 3, 9, 27, 81 \ldots \to r=3$
(iii) $-3, 6, -12, 24, -48, 96 \ldots \to r=-2$
(iv) $\frac{1}{2}, \frac{3}{2}, \frac{9}{2}, \frac{27}{2} \ldots \to = r=3$
(v) $k, kr, kr^2, kr^3, kr^4, \ldots \to r=r$
(vi) $64, 16, 4, 1, \frac{1}{4}, \frac{1}{16}, \ldots \to r=\frac{1}{4}$

General term (or *n*th term) *of* a *G.P.*

Let us look at the following $1, 3, 9, 27, 81, 243, 729, 2187, \ldots$

Each next term in the above sequence is becoming thrice (*i.e.* 3 times) which is called as common ratio.

$$1=1$$
$$3=1\times 3$$
$$9=1\times 3\times 3$$
$$27=1\times 3\times 3\times 3$$
$$81=1\times 3\times 3\times 3\times 3$$
$$243=1\times 3\times 3\times 3\times 3\times 3$$
$$729=1\times 3\times 3\times 3\times 3\times 3\times 3$$

and nth term $=a\times r\times r\times r\times \ldots \times (n-1)$ times $T_n=a\cdot r^{(n-1)}$

$\therefore$ The general term or nth term is represented by T_n

Hence, $T_n=a\cdot r^{(n-1)}$

Also $l=a\cdot r^{(n-1)}$

where l is the last term of the G.P.

Exp. 1) Find the 7th term of the sequence $2, 10, 50, 250, \ldots$

Solution The given sequence is a G.P. with common ratio

$$=5 \qquad \left(\because \frac{10}{2}=\frac{50}{10}=5\right)$$

and first term $(a)=2$

$\therefore$ $T_7=2\cdot(5)^6$ $(\because T_n=a\cdot r^{n-1})$

$T_7=31250$

Sum of First *n* terms of a G.P.

Let us look at the following : 3, 6, 12, 24, 48, 96, ...
Let the sum of n terms is denoted by S_n, then

$S_1=3$
$S_2=3+6=9,\ S_3=3+6+12=21$
$S_4=3+6+12+24=45$
$S_5=3+6+12+24+48=93$

$\therefore$ $S_n=T_1+T_2+T_3+\ldots+T_n$

$\therefore$ $S_n=\frac{a\cdot(r^n-1)}{(r-1)}$ if $r>1$

and $S_n=\frac{a\cdot(1-r^n)}{(1-r)}$ if $r<1$ also, $S_n=\frac{lr-a}{r-1}$

NOTE The above formulae for S_n fails when $r=1$, as the form $\frac{0}{0}$ is undefined. However,

$$S_n=a+a+a+\ldots \text{ to } n \text{ terms}=n\cdot a$$

Exp. 2) Find the sum of the first 6 terms of the G.P.

$$3, \frac{9}{2}, \frac{27}{4}, \frac{81}{8}, \ldots$$

Solution Here $a = 3, r = \frac{3}{2}$ and $n = 6$, then

$$S_6 = \frac{3 \cdot \left[\left(\frac{3}{2}\right)^6 - 1\right]}{\left(\frac{3}{2} - 1\right)} = \frac{3 \cdot \left(\frac{729}{64} - 1\right)}{\frac{1}{2}} = \frac{3 \cdot \left(\frac{665}{64}\right)}{\frac{1}{2}}$$

$$= \frac{3 \times 665 \times 2}{64 \times 1} = 62.34375$$

Exp. 3) Find the sum of first five terms of the G.P. 1, 2, 4, …

Solution $S_5 = \frac{1 \cdot (2^5 - 1)}{(2 - 1)} = 31$

Geometric Mean (G.M.)

If three quantities are in G.P., the middle one is called the geometric mean (G.M.) of the other two quantities.

If a, m, b are in G.P., then m is the G.M. of a and b

and since $\frac{m}{a} = \frac{b}{m}$

$\therefore$ $m^2 = ab \Rightarrow m = \pm\sqrt{ab} = \pm (ab)^{1/2}$

In general, if $a_1, a_2, a_3, \ldots, a_n$ are in G.P., then

$$\text{G.M.} = (a_1 \,.\, a_2 \,.\, a_3 \,\ldots..\, a_n)^{1/n}$$

Exp. 4) Find the G.M. of 4, 12, 36, which are in G.P.

Solution G.M. of 4, 12, $36 = (4 \times 12 \times 36)^{1/3}$

$$= (1728)^{1/3} = (12^3)^{1/3} = 12$$

Exp. 5) Find the G.M. of 3, 6, 12, 24, 48.

Solution G.M. $= (3 \times 6 \times 12 \times 24 \times 48)^{1/5} = (12^5)^{1/5} = 12$

How to Insert *n* Geometric Means between *a* and *b* If a and b are the first and last term respectively between which we have to insert n geometric means $m_1, m_2, m_3, \ldots, m_n$, then

Common ratio, $r = \left(\frac{b}{a}\right)^{\frac{1}{n+1}}$

Thus, $m_1 = a \cdot \left(\frac{b}{a}\right)^{\frac{1}{n+1}}$

$m_2 = a \cdot \left(\frac{b}{a}\right)^{\frac{2}{n+1}}$

$m_3 = a \cdot \left(\frac{b}{a}\right)^{\frac{3}{n+1}}$

… … …

… … …

$m_n = a \cdot \left(\frac{b}{a}\right)^{\frac{n}{n+1}}$

Exp. 6) Insert 3 geometric means between 3 and 48.

Solution $r = \left(\frac{48}{3}\right)^{\frac{1}{3+1}} = (2^4)^{\frac{1}{4}} = 2$

$\therefore$ $m_1 = 3 \cdot 2 = 6$

$\Rightarrow$ $m_2 = 3 \cdot (2)^2 = 12$

$m_3 = 3 \cdot (2)^3 = 24$

Hence the new sequence is 3, 6, 12, 24, 48 where all the terms are in G.P.

Properties of Geometric Progression

1. If each term of a G.P. is multiplied or divided by a certain non-zero constant, then the resulting sequence is also a G.P. e.g., 3, 6, 12, 24, 48, 96,… then 9, 18, 36, 72, 144, 288, … is also a G.P. and $\frac{9}{2}$, 9, 18, 36, 72, 144, … is also a G.P.

   In the second sequence each term is multiplied by 3 and each term of the third sequence is divided by 2 (compare with the second sequence)

2. If $a_1, a_2, a_3, \ldots$ and $b_1, b_2, b_3, \ldots$ are two geometric progressions, then the sequence $a_1 b_1, a_2 b_2, a_3 b_3, \ldots$ is also a G.P.
   e.g., 2, 6, 18, 54, 162, … and 1, 2, 4, 8, 16, … then $(2 \times 1), (6 \times 2), (18 \times 4), (54 \times 8), (162 \times 16) \ldots$
   i.e. 2, 12, 72, 432, 2592 is also a G.P.
   (Similarly $\frac{2}{1}, \frac{6}{2}, \frac{18}{4}, \frac{54}{8}, \frac{162}{16}, \ldots$
   i.e., $2, 3, \frac{9}{2}, \frac{27}{4}, \frac{81}{8}, \ldots$ is also a G.P.)

3. If there are odd number of terms in a G.P. as $a_1, a_2, a_3, \ldots, a_n$ then the middle most term is the G.M. of the given sequence. *e.g.*,2, 4, 8, 16, 32 then $(2 \times 4 \times 8 \times 16 \times 32)^{1/5} = (2^{15})^{1/5} = 2^3 = 8$
   Also, $(2 \times 32)^{1/2} = (4 \times 16)^{1/2} = 8$

NOTE In this case without knowing all the terms we can find the G.M. of the G.P.

4. If there are even number of terms in a G.P. as $a_1, a_2, a_3, \ldots, a_n$, then
   $\sqrt{a_1 \cdot a_n} = \sqrt{a_2 \cdot a_{n-2}} = \sqrt{a_3 \cdot a_{n-3}} = \ldots$ G.M.

5. If we have to take three terms in G.P., it is convenient to take them as $\frac{m}{k}, m, mk$; where $\frac{m}{k}, m$ and mk are consecutive terms of G.P. and k is the common ratio. Similarly we can take five terms of G.P. as $\frac{m}{k^2}, \frac{m}{k}, m, mk, mk^2$.

Exp. 7) If the product of five consecutive terms of G.P. is 1024, then find the third term of this set.

Solution $\frac{m}{k^2} \times \frac{m}{k} \times m \times mk \times mk^2 = 1024$

$\Rightarrow \quad m^5 = 1024 = 2^{10} = 4^5 \Rightarrow m = 4$

Hence the third term (*i.e.* middle most term) is 4.

In general to take odd number of terms, we assume m as the middle most term and take other terms with common ratio k, as per their position.

6. If we have to take 4 terms in G.P. it is convenient to take them as $\frac{m}{k^3}, \frac{m}{k}, mk, mk^3$ where $\frac{m}{k^3}, \frac{m}{k}, mk$ and mk^3 are four consecutive terms of a G.P. and k^2 is the common ratio. Similarly we can take six terms in G.P. as $\frac{m}{k^5}, \frac{m}{k^3}, \frac{m}{k}, mk, mk^3, mk^5$

Exp. 8) If the product of 4 terms of a G.P. is 729, then find the G.M. of the G.P.

Solution $\frac{m}{k^3} \times \frac{m}{k} \times mk \times mk^3 = 729$

$\Rightarrow \quad m^4 = 729 = 3^6 \Rightarrow m = 3^{6/4} = 3^{3/2} \Rightarrow m = \sqrt{27}$

7. If $a_1, a_2, a_3, \ldots, a_n$ are in G.P. then $a_1^m, a_2^m, a_3^m, \ldots, a_n^m$ are also in G.P.

   e.g. 1, 2, 4, 8, 16, … then 1, 4, 16, 64, 256, … are also in G.P.

8. If $a_1, a_2, a_3, \ldots, a_n$ are in G.P. (for every $a_i > 0$; $i \in I^+$ then $\log a_1, \log a_2, \log a_3, \ldots$ are in AP

   (The converse of the above is also true)

Sum of an Infinite G.P.

$$S_\infty = \frac{a}{1-r}; |r| < 1$$

where a is the first term and r is the common ratio of the G.P. of infinite terms.

Exp. 9) Find the sum of an infinite G.P. whose first term is 28 and the second term is 4.

Solution $a = 28, \; T_2 = ar = 4 \Rightarrow r = \frac{1}{7}$

$\therefore \qquad S_\infty = \frac{a}{1-r} = \frac{28}{1-\frac{1}{7}} = \frac{28}{6} \times 7 = \frac{98}{3}$

Introductory *Exercise 18.2*

1. Find the 22nd term of the G.P. – 2, 2, –2, ...:
(a) – 22 (b) – 2
(c) 2 (d) none of these

2. Find the 7th term of the series $-\frac{1}{8} + \frac{1}{4} - \frac{1}{2} + 1 \ldots$:
(a) 8 (b) – 16
(c) – 8 (d) none of these

3. The 5th, 8th and 11th terms of a G.P. are a, b, c respectively, then which one of the following is true ?
(a) $2b = ac$ (b) $b^2 = ac$
(c) $a + b + c = 0$ (d) none of these

4. The 5th and 12th terms of a G.P. are 32 and 4096 respectively. Find the nth term of the G.P. :
(a) 2^n (b) n^2
(c) $2n^2$ (d) none of these

5. What is the least number of terms of the G.P. $5 + 10 + 20 + \ldots$ whose sum would surely exceed 10^6?
(a) 17 (b) 18
(c) 19 (d) 21

6. The A.M. of two positive numbers is 15 and their G.M. is 12. What is the smaller number ?
(a) 8 (b) 12
(c) 6 (d) 24

7. The sum of 3 numbers in G.P. is 38 and their product is 1728. Find the greatest number :
(a) 24 (b) 18 (c) 16 (d) 8

8. The sum of first three terms of a G.P. is to the sum of the first six terms is 125 : 152. Find the common ratio of the G.P. :
(a) 3/5 (b) 3
(c) 2/5 (d) 5/8

9. The sum of three numbers in G.P. is 14. If the first two terms are each increased by 1 and the third term is decreased by 1, the resulting numbers are in AP Find the product of these three numbers :
(a) 125 (b) 64
(c) 216 (d) 124

10. The third term of a G.P. is 4. The product of first five terms is :
(a) 4^3 (b) 4^4
(c) 4^5 (d) none of these

11. The sum of first three terms of a G.P. is 21 and sum of their squares is 189. Find the common ratio :
(a) $\frac{1}{2}$ or 2 (b) 3 or $\frac{1}{3}$
(c) 4 or $\frac{1}{4}$ (d) none of these

12. The sum of the first and the third terms of a G.P. is 15 and that of the 5th and the 7th terms is 240. Find the 9th term
(a) 678 (b) 786
(c) 867 (d) 768

13. Sum of three consecutive terms in a G.P. is 42 and their product is 512. Find the largest of these numbers
(a) 28 (b) 16
(c) 32 (d) none of these

14. The sum of three numbers in G.P. is 70, if the two extremes be multiplied each by 4 and the mean by 5, the new numbers so formed are in AP Find the product of original numbers :
(a) 8000
(b) 6000
(c) 7000
(d) none of the above

15. The sum of four terms in G.P. is 312. The sum of first and fourth terms is 252. Find the product of second and third terms :
(a) 500 (b) 150
(c) 60 (d) none of these

16. A bouncing tennis ball rebounds each time to a height equal to one half the height of the previous bounce. If it is dropped from a height of 16 m, find the total distance it has travelled when it hits the ground for the 10th time :
(a) $47\frac{15}{16}$ (b) $37\frac{5}{16}$
(c) $67\frac{11}{16}$ (d) none of these

17. Find the sum to n terms of the series
$$7 + 77 + 777 + 7777 + \ldots$$
(a) $\frac{7}{9}\{10(10^n - 1) - n\}$
(b) $\frac{7}{9}\left\{\frac{10}{9}(10^n - 1) - n\right\}$
(c) $7\left\{\frac{10}{9}(10^n - 1) - n\right\}$
(d) none of the above

18. Find the sum to n terms of $0.8 + 0.88 + 0.888 + \ldots$
(a) $\frac{8}{9}\left[\frac{1}{9}\{1 - (0.1)^n\}\right]$ (b) $\frac{8}{9}\left[\frac{1}{10}\{1 - (0.1)^n\}\right]$
(c) $\frac{8}{9}\left[n - \frac{1}{9}\{1 - (0.1)^n\}\right]$ (d) none of these

19. If the pth, qth and rth terms of a G.P. be respectively a, b, and c then the value of $a^{q-r} \cdot b^{r-p} \cdot c^{p-q}$ is :
(a) 0 (b) 1
(c) 3 (d) $\frac{abc}{pqr}$

20. If a, b, c are respectively the xth, yth and zth terms of a G.P, then the value of
$(y - z)\log a + (z - x)\log b + (x - y)\log c$:
(a) 0 (b) 1
(c) 3 (d) none of these

21. There are four numbers such that the first three of them form an Arithmetic Progression and the last three form a Geometric Progression. The sum of the first and the third is 2 and that of second and fourth is 26. What is the sum of first and fourth numbers?
(a) $85\frac{13}{25}$ (b) $25\frac{73}{85}$
(c) 83 (d) none of these

22. Find the sum to n terms of the series
$1 + 3 + 7 + 15 + \ldots$
(a) $[(2^n - 1) - n]$ (b) $[(2^n - 1) + n]$
(c) $[2(2^n - 1) - n]$ (d) none of these

23. Find the sum of $\frac{1}{2} + \frac{3}{2^2} + \frac{5}{2^3} + \ldots + \frac{2n-1}{2^n}$:
(a) $\left(\frac{2n-3}{2^n}\right)$ (b) $\left(3 - \frac{2n+3}{2^n}\right)$
(c) $\left(\frac{2n+3}{2^n}\right)$ (d) none of these

24. Find the sum to n terms of the series
$$11 + 102 + 1003 + 10004 + \ldots :$$
(a) $(10^n - 1) + \frac{n(n+1)}{2}$
(b) $\frac{10}{9}(10^n - 1) + \frac{n(n+1)}{2}$
(c) $10^n + n^2 - 1$
(d) none of the above

25. Find the sum to first n groups of
$(1) + (1 + 3) + (1 + 3 + 9) + (1 + 3 + 9 + 27) + \ldots$
(a) $\frac{1}{2}(3^n - 1)$ (b) $\frac{3}{4}(3^n - 1) - \frac{n}{2}$
(c) $n^2 + 1$ (d) none of these

26. Find the sum to n terms of the following series :
$$2 + 5 + 14 + 41 + \ldots$$
(a) $\frac{3}{4}(3^{n-1}) + \frac{n}{2}$ (b) $\frac{3}{4}(3^n - 1) + \frac{n}{2}$
(c) $(3n + 1)$ (d) none of these

27. Find the sum to n terms :
$$1 + 2x + 3x^2 + 4x^3 + \ldots; x \neq 1 :$$
(a) $1 + nx^n$ (b) $\frac{x(x+1)}{2} + x^n$
(c) $\frac{1 - x^n}{(1 - x)^2}$ (d) $\left\{\frac{1 - x^n}{(1 - x)^2} - \frac{nx^n}{(1 - x)}\right\}$

28. Find the sum to n terms of $1 + 3x + 5x^2 + 7x^3 + \ldots$, $x \neq 1$.

(a) $2(1 - x^{n-1})$ (b) $\frac{2x(1 - x^{n-1})}{(1 - x^2)}$

(c) $\frac{2x(1 - x^{n-1})}{(1 - x)^2} + \frac{1 - (2n - 1)x^n}{(1 - x)}$

(d) none of these

29. Find the sum to first n terms :

$$1 + \frac{2}{3} + \frac{3}{3^2} + \frac{4}{3^3} + \ldots$$

(a) $\frac{3}{4} - \frac{3 + 2n}{4(3^{n-1})}$ (b) $\frac{9}{4} - \frac{3}{4}\left[\frac{3 + 2n}{3^n}\right]$

(c) $2n - \left(\frac{1}{n}\right)^2$ (d) none of these

30. Find the sum to n terms of

$$3 \cdot 2 + 5 \cdot 2^2 + 7 \cdot 2^3 + \ldots$$

(a) $2^{n+2} - 2^{n+1} - 2$ (b) $n \cdot 2^{n+2} - 2^{n+1} + 2$

(c) $n \cdot 2^{n+2} + 2^{n-2}$ (d) none of these

31. Find the sum of the series :

$$1 + \frac{4}{5} + \frac{7}{5^2} + \frac{10}{5^3} + \ldots \text{ to } n \text{ terms :}$$

(a) $\frac{35}{16} + \frac{7n}{5}$ (b) $\frac{12n - 7}{16(5^{n-1})}$

(c) $\frac{35}{16} - \left[\frac{12n + 7}{16(5^{n-1})}\right]$ (d) none of these

32. Find the sum of the series

$$1 \cdot 3^2 + 2 \cdot 5^2 + 3 \cdot 7^2 + \ldots \text{ to 20 terms :}$$

(a) 12896 (b) 187898

(c) 98970 (d) 188090

33. Find the sum of the series

$$\frac{1^3}{1} + \frac{1^3 + 2^3}{1 + 3} + \frac{1^3 + 2^3 + 3^3}{1 + 3 + 5} + \ldots \text{ to 16 terms}$$

(a) 224 (b) 446

(c) 2356 (d) none of these

34. In a set of four numbers, the first three are in G.P. and the last three are in AP with common difference 6. If the first number is the same as the fourth, find the third number :

(a) – 8 (b) 4

(c) 2 (d) can't be determined

35. The sum of an infinite G.P. is 16 and the sum of the squares of its terms is $153\frac{3}{5}$. Find the fourth term of the progression :

(a) $\frac{7}{16}$ (b) $\frac{5}{32}$

(c) $\frac{3}{16}$ (d) none of these

36. If $x = 1 + a + a^2 + \ldots$ to ∞ and $y = 1 + b + b^2 + \ldots$ to ∞, and $|a| < 1, |b| < 1$, then the value of :

$$1 + ab + a^2b^2 + \ldots \text{ to } \infty \text{ is :}$$

(a) $\frac{xy}{x + y}$ (b) $\frac{x + y + 1}{xy}$

(c) $\frac{xy}{x - y}$ (d) $\frac{xy}{x + y - 1}$

37. A person is entitled to receive an annual payment which for each year is less by one tenth of what it was for the year before. If the first payment is 100, then find the maximum possible payment which he can receive, however long he may live :

(a) 900

(b) 9999

(c) 1000

(d) none of the above

38. Find the sum of the series $\frac{1}{4} - \frac{3}{16} + \frac{9}{64} - \frac{27}{256} + \ldots$

(a) $\frac{1}{3}$ (b) $\frac{1}{4}$

(c) $\frac{1}{7}$ (d) none of these

39. The sum of first two terms of a G.P. is $\frac{5}{3}$ and the sum to infinity of the series is 3. Find the first term :

(a) 1 (b) $\frac{2}{3}$

(c) 5 (d) both (a) and (c)

40. A ball is dropped from a height of 96 ft and it rebounds $\frac{2}{3}$ of the height it falls. If it continues to fall and rebound, find the total distance that the ball can travel before coming to rest.

(a) 240 ft (b) 360 ft

(c) 480 ft (d) none of these

18.6 Harmonic Progression

A series of quantities $a_1, a_2, a_3, a_4 \ldots, a_n$ is said to be in H.P. when their reciprocals $\frac{1}{a_1}, \frac{1}{a_2}, \frac{1}{a_3}, \ldots, \frac{1}{a_n}$ are in AP

NOTE The converse is also true.

$\therefore$ If a, b, c are in H.P., then $\frac{1}{a}, \frac{1}{b}, \frac{1}{c}$ are in AP

Simply there is no general formula for the sum of any number of quantities in H.P. All questions in H.P. are generally solved by inverting the terms and making use of the properties of the corresponding AP

Harmonic Mean (H.M.)

When three quantities are in H.P., the middle one is called the Harmonic Mean (H.M.) between the other two.

If a, H, b are in H.P., then H is the H.M. of a, b and $\frac{1}{a}, \frac{1}{H}, \frac{1}{b}$ are in AP

$\therefore \quad \frac{1}{H} - \frac{1}{a} = \frac{1}{b} - \frac{1}{H}$ or $\frac{2}{H} = \frac{1}{a} + \frac{1}{b} = \frac{a+b}{ab} \therefore H = \frac{2ab}{a+b}$

Exp. 1) Find the 10th term of the H.P.1, $\frac{1}{3}, \frac{1}{5}, \frac{1}{7}, \frac{1}{9}, \frac{1}{11}, \ldots$

Solution Since $\frac{1}{1}, \frac{1}{3}, \frac{1}{5}, \frac{1}{7}, \ldots$ are in H.P.

$\therefore$ 1, 3, 5, 7, … are in AP

$\therefore \quad T_{10} = 1 + 9 \times 2, \; T_{10} = 19$

Since 10th term of the AP is 19

therefore 10th term of the H.P. is 1 / 19.

Exp. 2) If the 4th and the 7th terms of an H.P. are 1 / 2 and 2 / 7 respectively. Find the first term.

Solution 4th term in H.P. = 1 / 2

$\therefore$ 4th term in AP = 2, 7th term in H.P. = 2 / 7

$\therefore$ 7th term in AP = 7 / 2

$\therefore \; T_4 = a + 3d = 2$ and $T_7 = a + 6d = \frac{7}{2} \Rightarrow d = \frac{1}{2}$

$\therefore \quad a = \frac{1}{2}$ (which is the first term of the AP)

$\therefore$ the first term of H.P. = 2.

18.7 Arithmetico-Geometric Sequence

If $a_1, a_2, a_3, \ldots, a_n$ are in AP and $b_1, b_2, b_3 \ldots, b_n$ are in G.P., then the sequence $a_1b_1, a_2b_2, a_3b_3, \ldots, a_nb_n$ is said to be in arithmetico-geometric sequence.

An Arithmetico- Geometric sequence is of the form $ab, (a+d)br, (a+2d)\, br^2, (a+3d)br^3, \ldots$

$\therefore \quad S_n = \frac{ab}{1-r} + \frac{dbr(1-r^{n-1})}{(1-r)^2} - \frac{[a+(n-1)d]br^n}{1-r}$

and $S_\infty = \frac{ab}{1-r} + \frac{dbr}{(1-r)^2}$

Exp. 3) Find the sum to n terms of the series

$$1 + \frac{4}{5} + \frac{7}{5^2} + \frac{10}{5^3} + \ldots$$

Solution This is an A.G. series

$\therefore \quad S_n = 1 + \frac{4}{5} + \frac{7}{5^2} + \frac{10}{5^3} + \ldots + \frac{3n-2}{5^{n-1}}$

$\therefore \quad \frac{S_n}{5} = \frac{1}{5} + \frac{4}{5^2} + \frac{7}{5^3} + \ldots + \frac{3n-5}{5^{n-1}} + \frac{3n-2}{5^n}$

subtracting we get

$$\frac{4}{5}S_n = 1 + \frac{3}{5} + \frac{3}{5^2} + \frac{3}{5^3} + \ldots + \frac{3}{5^{n-1}} - \frac{3n-2}{5^n}$$

or $$\frac{4}{5}S_n = 1 + \frac{\frac{3}{5}\left(1 - \frac{1}{5^{n-1}}\right)}{1 - \frac{1}{5}} - \frac{3n-2}{5^n}$$

$$= \frac{35}{16} - \frac{12n+7}{16(5^{n-1})}$$

Exp. 4) In the above example find the sum to infinite number of terms.

Solution $S_\infty = \frac{ab}{1-r} + \frac{dbr}{(1-r)^2} = \frac{1 \times 1}{1 - \frac{1}{5}} + \frac{3 \times 1 \times \frac{1}{5}}{\left(1 - \frac{1}{5}\right)^2}$

$$= \frac{1}{\frac{4}{5}} + \frac{\frac{3}{5}}{\frac{16}{25}} = \frac{5}{4} + \frac{15}{16} = \frac{35}{16}$$

Introductory *Exercise 18.3*

1. Which one of the following is true about A.M., G.M. and H.M.
(a) H.M. ≥ G.M. ≥ A.M.
(b) A.M. ≥ H.M. ≥ G.M.
(c) A.M. ≥ G.M. ≥ H.M.
(d) G.M. ≥ H.M. ≥ A.M.

2. If a, b, c are in AP b, c, d are in G.P. and c, d, e are in H.P., then which one of the following is true :
(a) $2c = a + e$ (b) $ae = c^2$ (c) $c = \frac{2ae}{a+e}$ (d) $ab = de$

3. If A.M. and G.M. of two numbers is 10 and 8 respectively then find their H.M. :
(a) 9 (b) 12 (c) 6 (d) 6.4

CAT-Test

Questions Helping you bell the CAT

LEVEL 01 > BASIC LEVEL EXERCISE

1 Find the number of terms in the G.P. whose first term is 3, sum is $\frac{4095}{1024}$ and the common ratio is $\frac{1}{4}$:

(a) 4 (b) 5
(c) 6 (d) none of these

2 Find the common ratio of the G.P. whose first and last terms are 5 and $\frac{32}{625}$ respectively and the sum of the G.P. is $\frac{5187}{625}$:

(a) $\frac{1}{5}$ (b) $\frac{2}{5}$ (c) $\frac{5}{3}$ (d) $\frac{4}{5}$

3 Find the sum of the series $2\sqrt{3}, 2\sqrt{2}, \frac{4}{\sqrt{3}}, \ldots$

(a) $6(\sqrt{3}+\sqrt{2})$ (b) $6(\sqrt{3}-\sqrt{2})$
(c) $\frac{6}{(\sqrt{3}+\sqrt{2})}$ (d) none of these

4 The number of terms in an A.P. is even, the sum of odd terms is 63 and that of even terms is 72 and the last term exceeds the first term by 16.5. Find the number of terms :

(a) 8 (b) 12 (c) 9 (d) 10

5 There are two pockets, each containing 3 coins of different denominations, which are in A.P. and the total value of coins in each pocket is ₹ 21. The common difference of the first set of coins is greater than that of the second set by 1, and the product of the first set is the product of the second set as 8 to 9. Find the value of the coin of largest denomination, among the six coins :

(a) 9 (b) 8
(c) 11 (d) 10

6 Find the sum of the three numbers in G.P. whose product is 216 and the sum of the products of them taken in pairs is 126 :

(a) 28 (b) 21
(c) 35/4 (d) none of these

7 The sum of four consecutive terms in A.P. is 36 and the ratio of product of the first and fourth is to the product of the second and third is 9 : 10. Find the largest of the numbers :

(a) 9 (b) 10
(c) 8 (d) 12

8 The sum of four integers in A.P. is 24 and their product is 945. Find the product of the smallest and greatest integers :

(a) 30 (b) 27 (c) 35 (d) 39

9 In an A.P. consisting of 23 terms, the sum of the three terms in the middle is 114 and that of the last three is 204. Find the sum of first three terms :

(a) 14 (b) 42 (c) 24 (d) 69

10 The sum of an infinite G.P. is 4 and the sum of their cubes is 192. Find the first term :

(a) 4 (b) 8 (c) 6 (d) 2

11 Vibhor joined as an area manager of Quick Corporation in the pay scale of ₹ 12,000 – 500 – 18,500. Minimum how many years he has to work in the corporation to avail the salary of ₹ 18,500 per month :

(a) 12 years (b) 10 years
(c) 13 years (d) 11 years

12 How many terms are common in two arithmetic progression 1, 4, 7, 10. … upto 63 terms and 3, 7, 11, 15, … upto 47 terms :

(a) 12 (b) 16
(c) 15 (d) none of these

13 The value of $3^{1/3} \cdot 9^{1/18} \cdot 27^{1/81} \ldots$:

(a) 3 (b) 9
(c) 27 (d) none of these

14 The sum to n terms of the series

$$1 + (1 + 3) + (1 + 3 + 5) + \ldots \text{ is}$$

(a) $\left[\frac{n(n+1)}{2}\right]^2$ (b) n^2
(c) $\frac{n(n+1)(2n+1)}{6}$ (d) none of these

15 The sum to n terms of the series

$$1^2 + (1^2 + 3^2) + (1^2 + 3^2 + 5^2) + \ldots \text{ is :}$$

(a) $\frac{1}{3}(n^4 + 2n^2)$ (b) $\frac{1}{3}(n^3 + 3n^2 - n)$
(c) $\frac{1}{6}n(n+1)(2n^2 + 2n - 1)$ (d) none of these

16 If x, y, z are in G.P. and $a^x = b^y = c^z$, then :

(a) $\log_b a = \log_c b$ (b) $\log_b a = \log_a c$
(c) $\log_c b = \log_a c$ (d) none of these

17 The sum of integers from 113 to 113113 which are divisible by 7 is :
(a) 92358576 (b) 913952088
(c) 94501895 (d) 912952066

18 The sum of n terms of a progression is $3n^2 + 5$. The number of terms which equals 123 is :
(a) 12 (b) 18 (c) 21 (d) 23

19 If a, b, c are in A.P., $b - a, c - b$ and a are in G.P, then $a : b : c$ is :
(a) 4 : 3 : 2 (b) 2 : 3 : 4 (c) 1 : 2 : 3 (d) 3 : 4 : 5

20 The sum of first n terms of the series $\frac{1}{2} + \frac{3}{4} + \frac{7}{8} + \frac{15}{16} + \ldots$
(a) $2^n - 1$ (b) $1 - 2^{-n}$
(c) $2^n - n + 1$ (d) $n + 2^{-n} - 1$

21 The sum of all 4 digit numbers which when divided by 4 leave the remainder 1 :
(a) 12372750 (b) 12327027
(c) 12370705 (d) 109980

22 If n arithmetic means are inserted between two quantities a and b, then their sum is equal to :
(a) $n(a + b)$ (b) $\frac{n}{2}(a + b)$ (c) $2n(a + b)$ (d) $\frac{n}{2}(a - b)$

23 The product of n geometric means between two given numbers a and b is :
(a) $(ab)^n$ (b) $(ab)^{2n}$
(c) $(ab)^{n/2}$ (d) none of these

24 If $a_1, a_2, a_3, \ldots$ is an A.P. such that
$$a_1 + a_5 + a_{10} + a_{15} + a_{20} + a_{24} = 225,$$
then $a_1 + a_2 + a_3 + \ldots + a_{23} + a_{24}$ is equal to :
(a) 999 (b) 900 (c) 1225 (d) none

25 The sum to n terms of the series, where n is an even number
$$1^2 - 2^2 + 3^2 - 4^2 + 5^2 - 6^2 + \ldots$$
(a) $n(n + 1)$ (b) $\frac{n(n+1)}{2}$
(c) $-\frac{n(n+1)}{2}$ (d) none of these

26 $\underbrace{(666\ldots 6)}_{n\text{-digits}} + \underbrace{(888\ldots 8)}_{n\text{-digits}}$ is equal to :
(a) $14(n^2 - 1)$ (b) $\frac{48}{9}(10^{2n} - 1)$
(c) $\frac{14}{9}(10^n - 1)$ (d) none of these

27 The cubes of the natural numbers are grouped as $1^3, (2^3, 3^3), (4^3, 5^3, 6^3), \ldots$ then the sum of the numbers in the nth group is :
(a) $\frac{n^3}{12}(n^2 + 2)(n^2 + 4)$ (b) $\frac{1}{8}n^3(n^2 + 1)(n^2 + 3)$
(c) $\frac{n^3}{6}(n^2 + 1)(n^2 + 2)$ (d) none of these

28 Three non-zero real numbers form an A.P. and the squares of these numbers taken in the same order form a G.P. Then the number of all possible common ratio of the G.P. is :
(a) 1 (b) 2
(c) 3 (d) none of these

29 If three positive real numbers a, b, c are in A.P. such that $a \cdot b \cdot c = 4$, then the minimum value of b is :
(a) $2^{1/2}$ (b) $2^{1/3}$
(c) $2^{2/3}$ (d) $2^{3/2}$

30 Three numbers form an increasing G.P. If the middle number is doubled, then the new numbers are in A.P. The common ratio of the G.P. is :
(a) $2 - \sqrt{3}$ (b) $2 + \sqrt{3}$
(c) $\sqrt{3} - 2$ (d) $3 + \sqrt{2}$

31 If a, b, c $(a > 0)$ are three successive terms of a G.P. with common ratio r, the value of r for which $c > 4b - 3a$ holds given by :
(a) $1 < r < 3$ (b) $-3 < r < -1$
(c) $r < 1$ and $r > 3$ (d) none of these

32 Let a_n be the nth term of an A.P and $a_7 = 22$, then the value of the common difference (d) that would make $a_3 \cdot a_7 \cdot a_{11}$ greatest is :
(a) 4 (b) 2
(c) 0 (d) 7

33 If the A.M of two positive numbers a and b, $(a > b)$, is twice their G.M., then $a : b$ is :
(a) $2 : \sqrt{3}$ (b) $2 : 7 + 4\sqrt{3}$
(c) $2 + \sqrt{3} : 2 - \sqrt{3}$ (d) $7 + 4\sqrt{3} : 7 - 4\sqrt{3}$

34 The number of common terms to the two sequences 17, 21, 25, …, 417 and 16, 21, 26, …, 466 is :
(a) 19 (b) 20
(c) 21 (d) 84

35 The sum to n terms of the series
$$\frac{1}{\sqrt{1} + \sqrt{3}} + \frac{1}{\sqrt{3} + \sqrt{5}} + \frac{1}{\sqrt{5} + \sqrt{7}} + \ldots \text{ is :}$$
(a) $\sqrt{2n + 1}$ (b) $\frac{1}{2}\sqrt{2n + 1}$
(c) $\sqrt{2n - 1}$ (d) $\frac{1}{2}\{\sqrt{2n + 1} - 1\}$

36 Let T_r be the rth term of an A.P. for $r = 1, 2, 3, \ldots$. If for some positive integers m, n we have $T_m = \frac{1}{n}$ and $T_n = \frac{1}{m}$, then T_{mn} equals :
(a) $\frac{1}{mn}$ (b) $\frac{1}{m} + \frac{1}{n}$
(c) 1 (d) 0

37 Find the sum to n terms of the series $3 + 6 + 10 + 16 + \ldots$
(a) $\frac{n(n-1)}{2} - 1$ (b) $n(n + 1) + 2^n - 1$
(c) $n(n + 2) + 1$ (d) $3(2n + 1) - 2^n$

38 In a certain colony of cancerous cells, each cell divides into two every minute. How many cells will be produced from a single cell if the rate of division continues for 12 minutes :
(a) 9180 (b) 8190 (c) 8910 (d) none

39 Divakar and Subhank set out to meet each other from Delhi and Saharanpur, 330 km apart. Divakar travels 30 km on the first day 28 km on the second day, 26 km on the third day and so on. Subhank travels 20 km on the first day, 24 km on the second day, 28 km on the third day and so on. In how many days they meet, if they started moving towards each other at the same time ?
(a) 4 (b) 5
(c) 6 (d) none of these

40 Find the sum to n terms of the series
$1 + (1 + 2) + (1 + 2 + 3) + (1 + 2 + 3 + 4) + \ldots$:
(a) $\frac{n(n+1)(2n+1)}{6}$ (b) $\frac{n(n+1)(n+2)}{6}$
(c) $\frac{n(n+1)(n+2)}{12}$ (d) $\frac{n(n+1)}{2}$

41 If a, b, c are in H.P., then the value of
$\left(\frac{1}{b}+\frac{1}{c}-\frac{1}{a}\right)\left(\frac{1}{c}+\frac{1}{a}-\frac{1}{b}\right)$ is
(a) $\frac{3}{b^2}-\frac{2}{ab}$ (b) $a^2 + b^2 + c^2$
(c) $\frac{2}{bc}-\frac{1}{b^2}$ (d) both (a) and (c)

42 Find the sum to n terms of the series
$1 \cdot 3 \cdot 5 + 3 \cdot 5 \cdot 7 + 5 \cdot 7 \cdot 9 + \ldots$ is :
(a) $n(8n^3 + 11n^2 - n + 3)$ (b) $n(2n^3 + 8n^2 + 7n - 2)$
(c) $8n^3 + 12n^2 - 2n - 3$ (d) none of the above

43 What is the sum of 100 terms of the series
$1 - 2 + 3 - 4 + 5 - 6 + \ldots$?
(a) 100 (b) 50
(c) 550 (d) none of these

44 An infinite G.P. has first term x and its sum is 5, then the value of x is
(a) $x < -10$ (b) $-10 < x < 0$
(c) $0 < x < 10$ (d) $x > 10$

45 The next term of the sequence 1, 5, 14, 30, 55, … is
(a) 91 (b) 85
(c) 90 (d) 95

46 In an AP the total number of terms is 51. The 9th term of the AP is $7\frac{3}{17}$ and 26th term of the same AP is $21\frac{9}{17}$. What is the ratio of the sum of the first 17 terms and that the last 34 terms of the AP?
(a) 1 : 3 (b) 1 : 8
(c) 1 : 9 (d) 1 : 4

47 What's the sum of
$3 \cdot 4 \cdot 5 + 4 \cdot 5 \cdot 6 + 5 \cdot 6 \cdot 7 + \ldots + 28 \cdot 29 \cdot 30$?
(a) 300003 (b) 188760
(c) 287695 (d) 178764

48 Find the value of $p^{21} + p^{22} + p^{23} + \ldots + p^{399}$, if p is one of the roots of $x^7 - 1 = 0$, where $p \neq 1$.
(a) p (b) 400
(c) 21 (d) 1

49 If $0 < a < 1$ and $9 \leq b \leq 10$, then
(a) $9 \leq a + b \leq 11$ (b) $9 \leq a + b < 11$
(c) $9 < a + b \leq 11$ (d) $9 < a + b < 11$

LEVEL 02 > HIGHER LEVEL EXERCISE

1 An A.P. whose first term is unity and in which the sum of the first half of any even number of terms to that of the second half of the same number of terms is in constant ratio, the common difference 'd' is given by :
(a) 1 (b) 2
(c) 3 (d) 4

2 The number of divisors of 187, 637 and 1001 are in :
(a) A.P. (b) G.P.
(c) H.P. (d) none of these

3 The sum to n terms of the series
$1^2 + (1^2 + 3^2) + (1^2 + 3^2 + 5^2) + \ldots$ is :
(a) $\frac{1}{3}(n^3 + n^2 + 1)$ (b) $\frac{1}{6}n(n+1)(2n^2 + 2n - 1)$
(c) $\frac{1}{3}(2n^2 + 2n - 1)$ (d) none of these

4 If $|a| < 1$ and $|b| < 1$, then the sum of the series
$a(a + b) + a^2(a^2 + b^2) + a^3(a^3 + b^3) + \ldots$ upto ∞ is :
(a) $\frac{a^2}{b} + 1$ (b) $\frac{a^2}{1 - ab}$
(c) $\frac{a^2}{1 - a^2} + \frac{ab}{1 - ab}$ (d) $\frac{a^2}{b^2} + \frac{1}{ab}$

5 The sum to n terms of the series
$\frac{3}{1^2 \cdot 2^2} + \frac{5}{2^2 \cdot 3^2} + \frac{7}{3^2 \cdot 4^2} + \ldots$ is :
(a) $\frac{n^2 - 2n}{(n-1)^2}$ (b) $\frac{n^2 + 2n}{(n+1)^2}$
(c) $\frac{2n^2 + 1}{n}$ (d) none of these

6 The natural numbers are written as follows :

1
2 3
4 5 6
7 8 9 10
… … …
… … …

The sum of numbers in the nth row is :

(a) $\frac{n(n+1)}{2}$ (b) $\frac{n^2+1}{2}$

(c) $\frac{n(n^2+1)}{2}$ (d) none of these

7 The number $\underbrace{1\,1\,1\,1\ldots1}_{119 \text{ times}}$ is a :

(a) prime number (b) composite number
(c) multiple of 3 (d) none of these

8 The interior angles of a polygon are in A.P. If the smallest angle is 120° and the common difference is 5°, then the number of sides in the polygon is :

(a) 8 (b) 12 (c) 9 (d) 6

9 If $n \in N$ and n is an odd number, then

$10^0 + 10^4 + 10^8 + 10^{12} + \ldots + 10^{4n}$ is a :

(a) prime number (b) composite number
(c) a multiple of 10 (d) none of these

10 The value of $0.1\overline{23}$ is :

(a) $\frac{61}{495}$ (b) $\frac{71}{485}$ (c) $\frac{62}{719}$ (d) $\frac{123}{999}$

11 If n is a positive integer, then $\underbrace{1\,1\,1\ldots1}_{2n \text{ times}} - \underbrace{2\,2\,2\ldots2}_{n \text{ times}}$ is :

(a) a perfect square (b) a perfect cube
(c) prime number (d) none of these

12 One side of an equilateral triangle is 24 cm. The mid-points of its sides are joined to form another triangle whose mid points are in turn joined to form still another triangle. This process continues indefinitely. Find the sum of the perimeters of all the triangles :

(a) 144 cm (b) 72 cm
(c) 536 cm (d) 676 cm

13 The odd positive integers are arranged in a triangle as follows :

1
3 5
7 9 11
13 15 17 19
21 23 25 27 29
… … … … …
… … … … …

Find the sum of the numbers in the nth row of this arrangement :

(a) $n^2 + n$ (b) $2n^2 - 2 + n$
(c) n^3 (d) none of these

14 Find the sum to n terms of the series

$\log a + \log \frac{a^3}{b} + \log \frac{a^5}{b^2} + \log \frac{a^7}{b^3} + \ldots$

(a) $\log \left(\frac{a^{2n}}{b^{n-1}}\right)^{n/2}$ (b) $\log \frac{a^{2n-1}}{b^{n-1}}$

(c) $\log \frac{a^{2n}}{b^n}$ (d) none of these

15 The value of $(0.2)^{\log_{\sqrt{5}}\left(\frac{1}{4}+\frac{1}{8}+\frac{1}{16}+\ldots\right)}$:

(a) 2 (b) $\frac{1}{2}$
(c) 4 (d) none of these

16 If a, b, c are in H.P., then $\frac{b+a}{b-a} + \frac{b+c}{b-c}$ equals:

(a) 1 (b) 2 (c) $\frac{b-c}{a-b}$ (d) $\frac{ab}{c}$

17 Let a, b, c are in G.P. with common ratio $r\,(0 < r < 1)$. Then $a, 2b, 3c$ are in A.P., if r equals :

(a) $\frac{1}{2}$ (b) $\frac{1}{\sqrt{2}}$
(c) $\frac{1}{3}$ (d) none of these

18 The sum of the series

$\frac{5}{13} + \frac{55}{(13)^2} + \frac{555}{(13)^3} + \frac{5555}{(13)^4} + \ldots \infty$:

(a) $\frac{55}{39}$ (b) $\frac{65}{39}$ (c) $\frac{110}{169}$ (d) $\frac{65}{36}$

19 The sum of the infinite series

$\frac{1}{1\cdot4} + \frac{1}{4\cdot7} + \frac{1}{7\cdot10} + \ldots \infty$ is equal to :

(a) $\frac{1}{3}$ (b) $\frac{1}{4}$
(c) $\frac{38}{27}$ (d) none of these

20 A sequence $a_1, a_2, a_3, \ldots, a_n$ of real numbers is such that $a_1 = 0$, $|a_2| = |a_1 + 1|$, $|a_3| = |a_2 + 1|$, …, $|a_n| = |a_{n-1} + 1|$, then the A.M. $\left(i.e. \frac{a_1 + a_2 + a_3 + \ldots + a_n}{n}\right)$ can not be less than :

(a) $\frac{1}{2}$ (b) $-\frac{1}{2}$
(c) 1 (d) can't be determind

21 Find the A.M. of second and third term of a G.P. of real numbers such that the sum of its first four terms is equal to 30 and the sum of the squares of the first four terms is 340.

(a) 5 (b) 6 (c) 8 (d) 10

22 A square is drawn by joining the mid points of the sides of a given square. A third square is drawn inside the second square in the same way and this process continues indefinitely. If a side of the first square is 4 cm, determine the sum of the areas of all the squares :

(a) 32 cm^2 (b) 16 cm^2
(c) 20 (d) none of these

23 An A.P. and a G.P. with positive terms have the same number of terms and their first terms as well as last terms are equal. Then what can be said about the sum of the A.P. and G.P. if A_s and G_s denote the sum of the A.P. and G. P. respectively :
(a) $A_S \geq G_S$ (b) $A_S \leq G_S$
(c) $A_S = G_S$ (d) can't be determined

24 An A.P. and a G.P. have all the terms positive. Also the first and second terms of the progressions are equal, If a_i and g_i denote the terms of A.P. and G.P. respectively for every $i \in N$ and $i > 2$, then which one of the following is true ?
(a) $a_i \geq g_i$ (b) $a_i \leq g_i$
(c) $a_i = g_i$ (d) none of these

25 $1^k + 2^k + 3^k + \ldots + n^k$ is divisible by $1 + 2 + 3 + \ldots n$ for every $n \in N$, then k is :
(a) even (b) odd
(c) only prime (d) none of these

26 If pth, qth, rth and sth terms of an A.P. are in G.P. then $p - q$, $q - r$, $r - s$ are in :
(a) A.P. (b) G.P.
(c) H.P. (d) none of these

27 In our country 'Dreamland' the currency consists of a set of notes of different denominations. If the sum of all the denominations is 63 units of currency then what is the minimum number of denominations that can be there so that all the transactions can be made (in integers).
(a) 3 (b) 5 (c) 6 (d) 9

28 A retailer has n stones by which he can measure (or weigh) all the quantities from 1 kg to 121 kg (in integers only. *e.g.,* 1 kg, 2 kg, 3 kg, etc) keeping these stones on either side of the balance. What is the minimum value of n?
(a) 3 (b) 4 (c) 5 (d) 11

29 What will be the 33rd term of the sequence 1, 7, 25, 79, ...?
(a) $33^3 - 1$ (b) $3^{33} - 2$
(c) $3(33^3 - 2)$ (d) none of these

30 All the four angles of a quadrilateral are in G.P. with common ratio r ($r \in N$). Any two angles are acute and other two angles are obtuse, then the measure of the smallest angle of the quadrilateral is :
(a) 18° (b) 32° (c) 24° (d) 36°

Directions (for Q. Nos. 31 and 32) *In the kingdom of YAMRAJ, there are certain number of souls in a particular day. Where a single soul can merge with another soul in every second and thus two souls reduced to a single soul and if any soul can not merge with anyother soul in a particular second then it has to become a ghost and suffer in the hell. Thus every soul tries to avoid to become a ghost, but after a certain time it has to go to hell after maximum possible survival.*

31 In a particular day there were $(2^{43200} - 1)$ souls after how many seconds will all the souls become ghost :
(a) 43200 (b) 43199
(c) 43201 (d) 21600

32 If after n seconds there are k souls left, then what is the maximum number of souls there can be initially in a particular day ?
(a) $2^{k \cdot n}$ (b) $2^{kn} + 2k$
(c) $2^n k + 2^n - 1$ (d) $2^k n + 2^n + 1$

33 The income of HBI on the nth day is ₹ $(n^2 + 2)$ and the expenditure of HBI on the nth day is ₹ $(2n + 1)$.
Also income = expenditure + savings
In how many days his total saving will be ₹ 1240. :
(a) 10 (b) 12 (c) 15 (d) 16

Directions (for Q. Nos. 34 and 35) *In the zoolozical park Lucknow there are four kinds of animals viz. Elephant, monkey, lion and tiger which are in increasing G.P. and in the local zoo in Kanpur there are the same kinds of animals but in A.P. The number of elephants is least and equal in each of the places. Also the number of monkeys in each of the places is same but just greater than that of elephants. Total number of animals in zoological park is 50% more than that of local zoo. Also the common ratio of the G.P. is same as the common difference of the A.P. Number of tigers in both the places is maximum.*

34 What is the number of elephants in each of the places ?
(a) 1 (b) 2 (c) 3 (d) 4

35 What is the number of lions in zoological park Lucknow :
(a) 5 (b) 6
(c) 8 (d) can't be determine

36 What is the sum of n terms of the series
$-1 + 1^2 - 2 + 2^2 - 3 + 3^2 \ldots$?
(a) $\frac{n(n^2+1)}{3}$ (b) $n^2 + n$
(c) $\frac{n(n^2-1)}{3}$ (d) none of these

37 Find the sum of $1 + \frac{2}{3} + \frac{4}{9} + \frac{6}{27} + \frac{8}{81} + \frac{10}{243} + \ldots \infty$:
(a) $\frac{2}{3}$ (b) $\frac{5}{2}$ (c) $\frac{19}{45}$ (d) $\frac{81}{17}$

38 Sum of n terms of the series
$\log a + \log\left(\frac{a^2}{b}\right) + \log\left(\frac{a^3}{b^2}\right) + \log\left(\frac{a^4}{b^3}\right) + \ldots$ is :
(a) $\log\left\{\frac{a^n}{b^{n-1}}\right\}^{n/2}$ (b) $\log\left\{\frac{a^{n+1}}{b^{n-1}}\right\}^{n/2}$
(c) $\log\left\{\frac{a^n}{b^n}\right\}^{n/2}$ (d) $\log\left\{\frac{a^{n+1}}{b^n}\right\}^{n/2}$

39 If $a_1, a_2, a_3, \ldots, a_n$ are in A.P. where $a_i > 0$ for all i, then the value of $\frac{1}{\sqrt{a_1} + \sqrt{a_2}} + \frac{1}{\sqrt{a_2} + \sqrt{a_3}} + \ldots + \frac{1}{\sqrt{a_{n-1}} + \sqrt{a_n}}$:
(a) $\frac{n-1}{\sqrt{a_1} + \sqrt{a_2}}$ (b) $\frac{n+1}{\sqrt{a_1} + \sqrt{a_2}}$
(c) $\frac{n}{\sqrt{a_1} - \sqrt{a_2}}$ (d) none of these

40 If $\log_5 2, \log_5(2^x - 3)$ and $\log_5\left(\frac{17}{2} + 2^{x-1}\right)$ are in A.P. then the value of x is :
(a) 2 (b) 3 (c) $\log_2 3$ (d) $\log_2 5$

41 If 1, $\log_y x$, $\log_z y$, $-15\log_x z$ are in A.P., then which is correct ?
(a) $x = z^3$ (b) $x = \frac{1}{y}$
(c) $y = \frac{1}{z^3}$ (d) all of these

42 If x, y, z are in G.P. and $a^x = b^y = c^z$, then $\log_b a \cdot \log_b c$ is equal to :
(a) 0 (b) 1
(c) ac (d) none of these

43 If $\log_2(5\cdot 2^x + 1)$, $\log_4(2^{1-x} + 1)$ and 1 are in A.P. then x equals :
(a) $\log_2 5$ (b) $1 - \log_5 2$
(c) $\log_5 2$ (d) none

44 If 1, $\log_9(3^{1-x} + 2)$ and $\log(4\cdot 3^x - 1)$ are in A.P. then x is equal to :
(a) $\log_4 3$ (b) $\log_3 4$ (c) $1 - \log_3 4$ (d) $\log_3\left(\frac{1}{4}\right)$

45 If $x > 1$, $y > 1$, $z > 1$ are in G.P., then $\frac{1}{1+\ln x}, \frac{1}{1+\ln y}, \frac{1}{1+\ln z}$ are in :
(a) A.P. (b) H.P.
(c) G.P. (d) none of the above

46 Let $a_1, a_2, \ldots, a_{10}$ be in A.P. and $h_1, h_2, \ldots, h_{10}$ be in H.P. If $a_1 = h_1 = 2$ and $a_{10} = h_{10} = 3$, then $a_4 h_7$ is:
(a) 2 (b) 3 (c) 5 (d) 6

47 Let $S_1, S_2, \ldots$ be squares such that for each $n \geq 1$, the length of a side of S_n equals the length of a diagonal of S_{n+1}. If the length of a side of S_1 is 10 cm, then for which of the following values of n is the area of S_n less than 1 square cm ?
(a) 7 (b) 8 (c) 6 (d) 4

Directions (for Q. 48-50) *Answer the following three questions based on the information given below :*

Let A_1, G_1, H_1 denote the arithmetic, geometric and harmonic means, respectively, of two distinct positive numbers. For $n \geq 2$, let A_{n-1} and H_{n-1} has arithmetic, geometric and harmonic means as A_n, G_n, H_n respectively.

48 Which of the following statements is correct?
(a) $G_1 > G_2 > G_3 > \ldots$
(b) $G_1 < G_2 < G_3 < \ldots$
(c) $G_1 = G_2 = G_3 = \ldots$
(d) $G_1 < G_3 < G_5 < \ldots$ and $G_2 > G_4 > G_6 > \ldots$

49 Which of the following statements is correct?
(a) $A_1 > A_2 > A_3 > \ldots$
(b) $A_1 > A_3 > A_5 > \ldots$ and $A_2 < A_4 < A_6 < \ldots$
(c) $A_1 < A_2 < A_3 < \ldots$
(d) $A_1 < A_3 < A_5 < \ldots$ and $A_2 > A_4 > A_6 > \ldots$

50 Which of the following statements is correct?
(a) $H_1 > H_2 > H_3 > \ldots$
(b) $H_1 > H_3 > H_5 > \ldots$ and $H_2 < H_4 < H_6 < \ldots$
(c) $H_1 < H_2 < H_3 < \ldots$
(d) $H_1 < H_3 < H_5 < \ldots$ and $H_2 > H_4 > H_6 > \ldots$

51 Let $a_1, a_2, \ldots a_{100}$ be an arithmetic progression such that $a_1 = 3$ and $S_p = \sum_{i=1}^{p} a_i$, where $1 \leq p \leq 100$.

For any integer n with $1 \leq n \leq 20$, let $m = 5n$. If $\frac{S_m}{S_n}$ does not depend on n, then a_2 is
(a) 10 (b) 9
(c) 5 (d) -1

52 The harmonic mean (HM) of the roots of the equation $(5+\sqrt{2})x^2 - (4+\sqrt{5})x + 8 + 2\sqrt{5} = 0$ is
(a) 2 (b) 4
(c) 6 (d) 8

53 Let $a_1, a_2, \ldots, a_{10}$ be in A.P. and $h_1, h_2, \ldots, h_{10}$ be in H.P. If $a_1 = h_1 = 2$ and $a_{10} = h_{10} = 3$, then $a_4 h_7$ is
(a) 2 (b) 3
(c) 5 (d) 6

54 For a positive integer n, let $a(n) = 1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \ldots + \frac{1}{(2^n)-1}$. Then, which of the following are correct?
(i) $a(100) \leq 100$ (ii) $a(100) > 100$
(iii) $a(200) \leq 100$ (iv) $a(200) > 100$
(a) Only (iii) and (iv) (b) Only (i) and (iv)
(c) Except (i) and (ii) (d) (i), (ii) and (iii) only

55 Which one of the following options is true about the series given below?
$S = 1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \ldots + \frac{1}{2^{32}}$
(a) $5 < S < 8\frac{1}{2}$ (b) $9 < S < 16\frac{1}{2}$
(c) $17 < S < 32\frac{1}{2}$ (d) $33 < S < 64\frac{1}{2}$

56 If $apq = 9b$ and a, b, p, q are positive real numbers, find the minimum value of $a^3p + b^3q$.
(a) $6ab^2$ (b) $9a^2b$
(c) $6a^2b^2$ (d) $3\sqrt{3}ab^2$

57 Two friends Akhil and Manish decide to finish a 10 hour trip on the same bicycle. Akhil rides it for a hrs, then Manish enjoys on the pillion and when Manish rides it for b hrs, then Akhil enjoys on the pillion. If Akhil rides at the speed of $3a$ km/hr and Manish rides at the speed of b km/hr, what is the minimum possible distance (in km) they travel during this 10 hr trip, with no halts during the trip?
(a) 75 (b) 42
(c) 96 (d) 84

58 The minimum value of the sum of the real numbers a^{-5}, a^{-4}, $3a^{-3}$, 1, a^8 and a^{10} with $a > 0$ is
(a) 8 (b) 9
(c) 3 (d) none of these

59 If a, b, c are positive real number and $p = [(1 + a)(1 + b)(1 + c)]^7$, then
(a) $p > 33^7 a^3b^3c^3$
(b) $p > 3^7 a^{21}b^{14}c^7$
(c) $p > 77(1 + a)^7 (1 + b)^7 (1 + c)^7$
(d) $p > 7^7 a^4b^4c^4$

60 What's the minimum positive integer n for which $\sqrt{n}^{\sqrt{n+1}} > \sqrt{n+1}^{\sqrt{n}}$
(a) 4 (b) 6
(c) 7 (d) 9

LEVEL 03 > Final Round

1 A bacteria gives birth to two new bacterias in each second and the life span of each bacteria is 5 seconds. The process of the reproduction is continuous untill the death of the bacteria. Initially there is one newly born bacteria at time $t = 0$, then find the total number of live bacterias just after 10 seconds :
(a) $\frac{3^{10}}{2}$ (b) $3^5(3^5 - 1)$
(c) $3^{10} - 2^{10}$ (d) $3^{10} - 2^5$

2 If S_n be defined as the sum of n terms of the series S. Such that $S \equiv 2^{66} - 2^{65} - 2^{64} \ldots$ Find S_{20}:
(a) 400 (b) 2^{47}
(c) 2^{20} (d) none of these

3 If U_m be defined as the sum of m terms of the series V, where $V = S_m + S_{m+1} + S_{m+2} + \ldots$. Find U_{34} :
(a) $2^{33} - 1$ (b) $2^{33} + 1$
(c) $2^{34} - 1$ (d) none of these

4 Let $a_1, a_2, a_3, \ldots, a_n$ be an A.P. and S_1, S_2 and S_3 be the sum of first n, $2n$ and $3n$ terms respectively then $S_3 - S_2 - S_1$ is equal to, if a is first term and d is common difference :
(a) $3a - 2n - d$ (b) $a(n + 2d)$
(c) $3a + 2nd$ (d) $2n^2d$

5 Consider the sets
$$T_n = \{n, n + 3, n + 5, n + 7, n + 9\}$$
where $n = 1, 2, 3, \ldots, 99$. How many of these sets contain 5 or any integral multiple there of (*i.e.* any one of the numbers 5, 10, 15, 20, 25, ...) ?
(a) 81 (b) 79
(c) 80 (d) none of these

6 If $\{x\}$ is the least integer greater than or equal to x, then find the value of the following series :
$$\{\sqrt{1}\} + \{\sqrt{2}\} + \{\sqrt{3}\} + \{\sqrt{4}\} + \ldots + \{\sqrt{99}\} + \{\sqrt{100}\}$$
(a) 715 (b) 55 (c) 157 (d) 835

7 If $[x]$ is the greatest integer less than or equal to x, then find the value of the following series
$$[\sqrt{1}] + [\sqrt{2}] + [\sqrt{3}] + [\sqrt{4}] + \ldots + [\sqrt{323}]$$
(a) 3237 (b) 2373
(c) 3723 (d) none of these

Directions (for Q. Nos. 8 to 14) *King Dashratha of Ayodhya on his birthday decided to offer 100 coins of gold among his 4 sons and 3 wives. The denomination of each coin is ₹ 1. He put all the 100 coins in 7 bags in such a way that by taking a proper combination of various bags any integral sum (i.e. ₹ 1, 2, 3, 4, ..., 100) can be obtained and it is known that the only whole sum of any bag can be taken.*

8 What is the maximum amount received by any one of the recipient ?
(a) ₹ 79 (b) ₹ 96
(c) ₹ 37 (d) none of these

9 If all the coins, of these who have odd number of coins, are combined then minimum how many people are required to combine their coins to make the same amount having even number of coins :
(a) 2 (b) 3
(c) 4 (d) can't be determined

10 If the two least amounts are combined with highest one then minimum how many persons combined their coins to get the same amount :
(a) 2 (b) 3
(c) 4 (d) 5

11 If the king wanted to distribute the amount equally among them, then how many people would have received more amount (number of coins) than that of previously retaining two coins with himself :
(a) 6 (b) 3
(c) 4 (d) none

12 If the king also included Hanuman another 8th candidate, on this occassion and distributed 200 coins in similar fashion so that the combination of two or more person's coin could yield any integral sum from 1 to 200, then what was the maximum amount (in ₹) that anybody had received ?
(a) 128 (b) 73
(c) 37 (d) 64

13 In the previous problem (number 12), if the people who had obtained the coins equal to odd powers of 2 (*i.e.* 2^1, 2^3, 2^5, ... etc.) can not combine their money with any other. Then maximum how many different sums can be made ?
(a) 5 ! (b) 28
(c) 31 (d) 158

14 In the problem number 12 if we assume Hanuman as a special guest who received the maximum amount but he distributed his sum in the same proportion as others had received previously leaving the person who had received initally the second highest amount. The number of coins that Hanuman was left with :

(a) 10 (b) 13
(c) 11 (d) 9

15 The sum of an infinite geometric progression (G.P.) is 2 and the sum of the G.P. made from the cubes of the terms of this infinite series is 24. The values a and r respectively (where a is the first term and r denotes common ratio of the series) :

(a) $-2, 3$ (b) $3, -\frac{1}{2}$
(c) $0, \frac{1}{2}$ (d) can't be determined

16 The sum of first ten terms of an A.P. is 155 and the sum of first two terms of a G.P. is 9. The first term of the A.P. is equal to the common ratio of the G.P. and the first term of the G.P. is equal to the common difference of the A.P. which can be the A.P. as per the given conditions ?

(a) 2, 4, 6, 8, 10,… (b) $\frac{25}{2}, \frac{79}{6}, \frac{83}{6}, \ldots$
(c) 2, 5, 8, 11,… (d) both (b) and (c)

17 The sum of an infinite geometric series is 162 and the sum of its first n terms is 160. The inverse of its common ratio is an integer, then how many values of the common ratio (r) are possible ?

(a) 1 (b) 2
(c) 4 (d) 5

18 In the previous question how many values of n are possible ?

(a) 1 (b) 2
(c) 3 (d) 4

19 Let $a_1, a_2, a_3, \ldots, a_{11}$ be the real numbers satisfying $a_1 = 15$, $27 - 2a_2 > 0$ and $a_k = 2a_{k-1} - a_{k-2}$ for $k = 3, 4, 5, \ldots, 11$.
If $\frac{a_1^2 + a_2^2 + \ldots a_{11}^2}{11} = 90$, then the value of
$\frac{a_1 + a_2 + a_3 + \ldots + a_{11}}{11}$ is equal to

(a) 0 (b) $3\sqrt{10}$
(c) 270 (d) 270/11

Directions (for Q 20-22) *Answer the following three questions based on the information given below :*

Let V_r denote the sum of the first r terms of an arithmetic progression (A.P.) whose first term is r and the common difference is $(2r-1)$. Let $T_r = V_{r+1} - V_r - 2$ and $Q_r = T_{r+1} - T_r$ for $r = 1, 2, 3, \ldots$

20 The sum $V_1 + V_2 + \ldots + V_n$ is

(a) $\frac{1}{12} n(n+1)(3n^2 - n + 1)$
(b) $\frac{1}{12} n(n+1)(3n^2 + n + 2)$
(c) $\frac{1}{2} n(2n^2 - n + 1)$
(d) $\frac{1}{3}(2n^2 - 2n + 3)$

21 T_r is always

(a) an odd number (b) an even number
(c) a prime number (d) a composite number

22 Which one of the following is a correct statement?

(a) $Q_1, Q_2, Q_3, \ldots$ are in A.P. with common difference 5.
(b) $Q_1, Q_2, Q_3, \ldots$ are in A.P. with common difference 6.
(c) $Q_1, Q_2, Q_3, \ldots$ are in A.P. with common difference 11.
(d) $Q_1 = Q_2 = Q_3, \ldots$

23 If $a_n = \frac{3}{4} - \left(\frac{3}{4}\right)^2 + \left(\frac{3}{4}\right)^3 + \ldots (-1)^{n-1}\left(\frac{3}{4}\right)^n$ and $b_n = 1 - a_n$, then find the minimum natural number n_0 such that $b_n > a_n$; $\forall\ n > n_0$.

(a) 4 (b) 8
(c) 9 (d) 6

24 If total number of runs scored in n matches is $\left(\frac{n+1}{4}\right)(2^{n+1} - n - 2)$ when $n > 1$, and the runs scored in the k^{th} match are given by $k \cdot 2^{n+1-k}$, where $1 \le k \le n$. Find n.

(a) 9 (b) 6
(c) 7 (d) 3

25 Let $S_1, S_2, \ldots$ be squares such that for each $n \ge 1$, the length of a side of S_n equals the length of a diagonal of S_{n+1}. If the length of a side of S_1 is 10 cm, then for which of the following value of n is the area of S_n less than 0.5 sq. cm?

(a) 7 (b) 8
(c) 9 (d) 10

Hints & Solutions

☑ Introductory Exercise 18.1

1 $T_{41} = 3 + 40 \times 5 = 203$ $(\because\ T_n = a + (n-1)d)$

2 $T_{25} = 10 + 24(-4) = -86$ $(a = 10,\ d = -4)$

3 $T_n = l = a + (n-1)d \Rightarrow 2 + (n-1)3 = 56$

$\Rightarrow 3(n-1) = 56 - 2 \Rightarrow n = 19$

4 Since there are only two consecutive terms so we can not find the pattern of the sequence that whether it is a non-progression sequence or A.P. or G.P. or H.P. etc. Hence (d) is correct.

5 $T_3 = a + 2d = 17$ …(i)

$T_7 = a + 6d = 27$ …(ii)

$\therefore$ Subtracting eq. (i) from eq. (ii), we get

$4d = 10 \Rightarrow d = 2.5$

$\therefore a + 2 \times 2.5 = 17$

$\Rightarrow a = 12$

6 $T_6 = a + 5d = 12$ …(i)

$T_8 = a + 7d = 22$

$\Rightarrow 2d = 10$ or $d = 5$

$\therefore a + 25 = 12$ [from eq. (i)]

$\Rightarrow a = -13$

$\therefore T_n = -13 + (n-1)5$

$\Rightarrow T_n = 5n - 18$

Alternatively Check the options.

$5n - 18 \Rightarrow 5 \times 6 - 18 = 12$

and $5 \times 8 - 18 = 22$

Hence option (c) is correct.

7 $T_7 = a + 6d$

$T_{11} = a + 10d$

$\because\ 7 \cdot T_7 = 11 \cdot T_{11}$

$\Rightarrow 7(a + 6d) = 11(a + 10d)$

$\Rightarrow 4a = -68d$

$\Rightarrow a = -17d$

Now $T_{18} = a + 17d$

$\Rightarrow T_{18} = -17d + 17d \Rightarrow T_{18} = 0$

8 $T_p = a_1 + (p-1)d$

$T_q = a_1 + (q-1)d$

$T_r = a_1 + (r-1)d$

$\therefore$ L.H.S. $= a(q-r) + b(r-p) + c(p-q)$

$= \{a_1 + (p-1)d\}(q-r) + \{a_1 + (q-1)d\}(r-p)$

$+ \{a_1 + (r-1)d\}(p-q)$

$= a_1 \cdot (q - r + r - p + p - q) + d[(p-1)(q-r)$

$+ (q-1)(r-p) + (r-1)(p-q)]$

$= 0$

Alternatively Let us assume an A.P.

2, 5, 8, 11, 14, 17, 20, …

Again assume $p = 2,\ q = 4,\ r = 5$

$\therefore T_p = T_2 = 5 = a$

$T_q = T_4 = 11 = b$

and $T_r = T_5 = 14 = c$

$\therefore\ a(q-r) + b(r-p) + c(p-q) = 5(-1) + 11(3) + 14(-2)$

$= -5 + 33 - 28 = 0$

Hence (a) is the correct choice.

9 $T_p = a + (p-1)d = q$ …(i)

and $T_q = a + (q-1)d = p$ …(ii)

and $T_m = a + (m-1)d$ …(iii)

From eqs. (i) and (ii), we get

$a = q - (p-1)d$

and $a = p - (q-1)d$

$\Rightarrow q - (p-1)d = p - (q-1)d$

$\Rightarrow (q-p) = -d$ $[(q-1) - (p-1)]$

$\Rightarrow d = -1$

Again, $a + (p-1)d = q$

$\Rightarrow a + (p-1) \times -1 = q$

$\Rightarrow a = p + q - 1$

$\therefore T_m = (p + q - 1) + (m-1) \times -1$

$\Rightarrow T_m = p + q - m$

10 $11 + 13 + 15 + \ldots + 99$

Here number of terms $= 50 - 5 = 45$

or Number of terms $= \left(\frac{99 - 11}{2}\right) + 1 = 45$

NOTE When both the extremes of a sequence are counted then number of terms $= \left(\frac{l - a}{d}\right) + 1$

Now the sum of the progression $= \left(\frac{a + l}{2}\right)n$

$= \left(\frac{11 + 99}{2}\right) \times 45 = 2475$

Alternatively $11 + 13 + \ldots + 99$

$= (1 + 3 + 5 + \ldots + 99) - (1 + 3 + \ldots + 9)$

$= (50)^2 - (5)^2 = 2475$

11 Number of terms $= \left(\frac{616 - 22}{6}\right) + 1 = \frac{594}{6} + 1 = 100$

Alternatively 22, 28, 34, …, 616

$= (4, 10, 16, 22, 28, \ldots, 616) - (4, 10, 16)$

$\Rightarrow$ $(6, 12, 18, 24, 30, \ldots, 618) - (6, 12, 18)$

$\Rightarrow$ $(1, 2, 3, 4, 5, \ldots, 103) - (1, 2, 3)$

$\Rightarrow$ $103 - 3 = 100$

Alternatively 22, 28, 34, …, 616

$\Rightarrow$ 24, 30, 36, …, 618

$\Rightarrow$ 4, 5, 6, …, 103

$\Rightarrow$ $103 - 3 = 100$

12 Number of terms $= \left(\frac{888 - 222}{2}\right) + 1 = 334$

$\therefore \quad S_{334} = \left(\frac{222 + 888}{2}\right) \times 334$

$= 555 \times 334 = 185370$

Alternatively $222 + 224 + \ldots + 888$

$= (2 + 4 + 6 + \ldots + 888) - (2 + 4 + 6 + \ldots + 220)$

$= (444 \times 445) - (110 \times 111)$

$= 111(4 \times 445 - 110) = 111(1780 - 110)$

$= 111 \times 1670 = 185370$

13 $T_2 = a + d = 2 \quad \ldots(i)$

$T_7 = a + 6d = 22 \quad \ldots(ii)$

$\Rightarrow \quad 5d = 20$ (subtracting eq. (i) from eq. (ii))

$\Rightarrow \quad d = 4$

$\therefore \quad a = -2$ (substituting 'd' in eq. (i))

$\therefore \quad l = T_{35} = -2 + 34 \times 4 = 134$

$\therefore \quad S_{35} = \left(\frac{-2 + 134}{2}\right) \times 35 = 2310$

14 $T_{12} = a + 11d = -13 \quad \ldots(i)$

$S_4 = 24 = \left(\frac{a + T_4}{2}\right) \times 4 \qquad \left\{\because S_n = \left(\frac{a + l}{2}\right) n\right\}$

$\Rightarrow \quad a + T_4 = 12$

$\Rightarrow \quad a + a + 3d = 12$

$\Rightarrow \quad 2a + 3d = 12 \quad \ldots(ii)$

From eqs. (i) and (ii), we get

$$\begin{array}{r} 2a + 22d = -26 \\ 2a + 3d = 12 \\ - \quad - \quad - \\ \hline 19d = -38 \end{array}$$

$\Rightarrow \quad d = -2$

$\therefore \quad a = 9$

Hence $S_{10} = \left(\frac{a + T_{10}}{2}\right) 10$

$= \left[\frac{9 + (-9)}{2}\right] \times 10 = 0 \qquad \{\because T_{10} = -9\}$

15 $T_3 = a + 2d = \frac{1}{5} \quad \ldots(i)$

$T_5 = a + 4d = \frac{1}{3} \quad \ldots(ii)$

$\Rightarrow \quad 2d = \frac{1}{3} - \frac{1}{5} = \frac{2}{15}$

$\Rightarrow \quad d = \frac{1}{15} \quad \therefore \quad a = \frac{1}{15}$

$\therefore \quad S_{15} = \left(\frac{a + T_{15}}{2}\right) 15$

$= \left(\frac{1/15 + 1}{2}\right) \times 15 \qquad (\because T_{15} = 1)$

$= \frac{\left(\frac{16}{15}\right)}{2} \times 15 = 8$

16 Let $n = 24$, then

$T_{24} = 1 + 23 \times 3 = 70$

$\therefore \quad S_{24} = \left(\frac{1 + 70}{2}\right) \times 24 = 71 \times 12 = 852$

$\therefore \quad S_{24} = 852 < 925$, hence wrong

Thus it is obvious that n must be greater than 24, which gives us $n = 25$, as per the choices given.

$\therefore \quad S_{25} = \left(\frac{a + T_{25}}{2}\right) 25 \qquad (\because T_{25} = T_{24} + d = 73)$

$= \left(\frac{1 + 73}{2}\right) \times 25 = 925$

Hence (d) is correct.

Alternatively $S_n = 925 = \frac{n}{2}[2 \times 1 + (n - 1)3]$

$\Rightarrow \quad 1850 = 2n + 3n^2 - 3n$

$\Rightarrow \quad 3n^2 - n - 1850 = 0$

$\Rightarrow \quad 3n^2 - 75n + 74n - 1850 = 0$

$\Rightarrow \quad 3n(n - 25) + 74(n - 25) = 0$

$\Rightarrow \quad n = 25 \quad \text{or} \quad n = -\frac{74}{3}$

The only admissible value of $n = 25$

Since number of terms cannot be negative and as a fraction too.

Hence (d) is correct.

17 Best way is to go through options

$20 + 16 + 12 = 48,$

hence number of terms = 3

Again $20 + 16 + 12 + 8 + 4 + 0 + (-4) + (-8) = 48$

hence number of terms = 8

Thus choice (d) is most appropriate answer.

Alternatively

$S_n = 48 = \frac{n}{2}[2 \times 20 + (n - 1)(-4)]$

$\Rightarrow \quad 96 = 40n - 4n^2 + 4n$

$\Rightarrow \quad n^2 - 11n + 24 = 0$

$\Rightarrow \quad (n - 8)(n - 3) = 0$

$\Rightarrow \quad n = 8 \quad \text{or} \quad n = 3$

Hence (d) is the correct answer.

18 $p = (r - 2d), \quad q = (r - d), \quad r = r$

$s = (r + d), t = (r + 2d)$

$\therefore \quad p + r + t = 3r = -12$

$\Rightarrow \quad r = -4$

Again $p \cdot q \cdot r = 8$

$\Rightarrow$ $p \cdot q = -2$ $(\because\ r = -4)$

$\Rightarrow$ $(r - 2d)(r - d) = -2$

$\Rightarrow$ $(-4 - 2d)(-4 - d) = -2$

$\Rightarrow$ $(2 + d)(4 + d) = -1$

$\Rightarrow$ $d^2 + 6d + 9 = 0$

$\Rightarrow$ $(d + 3)^2 = 0$

$\Rightarrow$ $d = -3$

$\therefore$ $p = (r - 2d) = -4 - 2 \times (-3) = 2$

Alternatively Go through options.

Let us consider choice (a)

If $p + r + t = -12$

$\Rightarrow$ $r = -4$ $(\because\ r$ is the A.M. of $p, r, t)$

Now if $p = 3$, then

p	q	r	s	t
3	$-\frac{1}{2}$	-4	$-\frac{15}{2}$	-11

$\therefore$ $p \cdot q \cdot r = 3 \times \left(-\frac{1}{2}\right) \times (-4) = 6$, which is wrong.

Again consider choice (b)

p	q	r	s	t
2	-1	-4	-7	-10

$\therefore$ $p \cdot q \cdot r = 2 \times (-1) \times (-4) = 8$, which is correct.

Hence (b) is the right choice.

19 $l = a + (n - 1)d$

$l = 7 + (n - 1)3$

$\Rightarrow$ $l = 3n + 4$

Let us assume option (d), then

$102 = 3n + 4$

$\Rightarrow n = \frac{98}{3}$, which is inadmissible

Since number of terms can never be a fraction.

Now, assume option (b)

$79 = 3n + 4 \Rightarrow n = 25$

$\therefore$ $S_{25} = \left(\frac{7 + 79}{2}\right) \times 25 = 1075$

But since $S_{25} = 1075 < 1242$

Hence l must be greater than 79, therefore choice (c) is possible.

Let us consider choice (c).

$l = 85 = 3n + 4 \Rightarrow n = 27$

$\therefore$ $S_{27} = \left(\frac{7 + 85}{2}\right) \times 27 = 1242$

Hence (c) is correct.

Alternatively $S_n = \frac{n}{2}[2a + (n - 1)d]$

$1242 = \frac{n}{2}[14 + (n - 1)3]$

$\Rightarrow$ $n(3n + 11) = 2484$

$\Rightarrow$ $3n^2 + 11n - 2484 = 0$

$\Rightarrow$ $3n^2 - 81n + 92n - 2484 = 0$

$\Rightarrow$ $3n(n - 27) + 92(n - 27) = 0$

$\Rightarrow$ $n = 27$ or $n = -\frac{92}{3}$

Hence $n = 27$ is the only admissible value.

$\therefore$ $l = a + (n - 1)d = 7 + 26 \times 3 = 85$

20 The required numbers are 56, 63, 70, …, 5551.

Number of terms = 786

$\therefore$ $S_{786} = 56 + 63 + \ldots + 5551$

$= \left(\frac{56 + 5551}{2}\right) \times 786 = 2203551$

21 $T_1 = a = -14$

$T_5 = a + 4d = 2 \Rightarrow d = 4$

Now, $S_n = \frac{n}{2}[2a + (n - 1)d]$

$40 = \frac{n}{2}[-28 + (n - 1)4]$

$\Rightarrow$ $n^2 - 8n - 20 = 0$

$\Rightarrow$ $n = 10$ or $n = -2$

Since number of terms can not be negative, hence $n = 10$.

Alternatively Since S_n is very small, therefore we can solve it physically within seconds.

$T_1 = -14, T_5 = 2$

T_1	T_2	T_3	T_4	T_5	T_6	T_7	T_8	T_9	T_{10}
-14	-10	-6	-2	2	6	10	14	18	22
0								40	

$\Rightarrow$ $T_1 + T_2 + \ldots + T_{10} = 0 + 40 = 40$

22 $S_n = \left(\frac{a + l}{2}\right)n$

$9153 = \left(\frac{-7 + 233}{2}\right)n$

$\Rightarrow$ $9153 = 113 \times n$

$\Rightarrow$ $n = 81$

23 Let the three consecutive numbers in A.P. be p, q, r such that

$p = (q - d)$ and $r = (q + d)$

$\therefore$ $p + q + r = 12$

$\Rightarrow$ $q = 4$

and $p^3 + q^3 + r^3 = 408$

$\Rightarrow$ $p^3 + r^3 = 344$ $(\because\ q = 4)$

and $p + q + r = 12$

$\Rightarrow$ $p + r = 8$

Now, let us assume $p = 1$, then $r = 7$

$\therefore$ $p^3 + r^3 = 344$, which is true.

Hence $p=1,\quad q=4 \quad \text{and} \quad r=7$

$\therefore \quad p\cdot q\cdot r = 1\times 4\times 7 = 28$

NOTE Another possible value of $p=7$ and $r=1$.

Alternatively $p+q+r=12$

$\Rightarrow \quad q=4 \qquad (\because\ q \text{ is A.M. of } p, q, r)$

$\Rightarrow \quad p+r=8$

and $\quad p^3+q^3+r^3=408$

$\Rightarrow \quad p^3+r^3=344 \qquad (\because\ q^3=64)$

Now, $\quad (p+r)^3 = p^3+r^3+3pr(p+r)$

$(8)^3 = 344+3pr(8)$

$\Rightarrow \quad pr=7$

$\therefore \quad pqr = q\,.\,pr = 4\times 7 = 28$

Alternatively $p=(q-d)$

$q=q$

$r=(q+d)$

$\therefore \quad (q-d)+q+(q+d)=12$

$\Rightarrow \quad q=4$

and $\quad (q-d)^3+q^3+(q+d)^3=408$

$\Rightarrow \quad q^3+2qd^2=136$

$\Rightarrow \quad 8d^2=72 \qquad (\because\ q=4)$

$\Rightarrow \quad d=\pm 3$

$\therefore \quad p=1 \quad \text{and} \quad r=7 \qquad \text{when } d=+3$

and $\quad p=7 \quad \text{and} \quad r=1 \qquad \text{when } d=-3$

$\therefore \quad p\cdot q\cdot r = 1\times 4\times 7 = 7\times 4\times 1 = 28$

24 Go through options.

Let us consider choice (c)

for $n=1 \quad S_1=(1)^3+(1-1)^3=1$

for $n=2 \quad S_2=(2)^3+(2-1)^3=9$

for $n=3 \quad S_3=(3)^3+(3-1)^3=35$

Hence choice (c) is correct.

25 $S_{365} = \dfrac{365\times 366}{2} \qquad \left(S_n=\dfrac{n(n+1)}{2}\right)$

or $\quad S_{365}=66795$

26 $\dfrac{T_7}{T_3}=\dfrac{a+6d}{a+2d}=\dfrac{12}{5}$

$\Rightarrow \quad 5(a+6d)=12(a+2d)$

$\Rightarrow \quad \dfrac{a}{d}=\dfrac{6}{7}$

Now, $\quad \dfrac{T_{13}}{T_4}=\dfrac{a+12d}{a+3d}=\dfrac{\frac{a}{d}+12}{\frac{a}{d}+3}=\dfrac{\frac{6}{7}+12}{\frac{6}{7}+3}=\dfrac{10}{3}$

27 The numbers which are even and divisible by 5 also are 10, 20, 30 … 1000.

$\therefore \quad S_{100}=10+20+30+\ldots+1000$

$=10(1+2+3+\ldots+100)$

$=10\times\dfrac{100\times 101}{2}=50500$

28 $m\cdot T_m = n\cdot T_n$

$m[a+(m-1)d]=n[a+(n-1)d]$

$\Rightarrow \quad m[a+md-d]=n[a+nd-d]$

$\Rightarrow \quad ma+m^2d-md=na+n^2d-nd$

$\Rightarrow \quad (m-n)a=(n^2-m^2)d+(m-n)d$

$\Rightarrow \quad (m-n)a=-(m+n)(m-n)d+(m-n)d$

$\Rightarrow \quad (m-n)a=(m-n)\,d[1-(m+n)]$

$\Rightarrow \quad a=[1-(m+n)]d$

Now $\quad T_{(m+n)}=a+[(m+n)-1]d$

$=[1-(m+n)]d+[(m+n)-1]d=0$

29 $S_{15}=\dfrac{15}{2}[2a+14d]=105$

$\Rightarrow \quad 2a+14d=14 \qquad \ldots(i)$

and $\quad S_{30}=\dfrac{30}{2}[2a+29d]=105+780=885$

$\Rightarrow \quad 2a+29d=59 \qquad \ldots(ii)$

$\therefore$ From eqs. (i) and (ii)

$15d=45 \quad \Rightarrow \quad d=3$

30 $a\to 2$

and $\quad S_5=\dfrac{1}{4}(S_{10}-S_5)$

$\Rightarrow \quad 5(S_5)=S_{10}$

$\Rightarrow \quad 5\left[\dfrac{5}{2}(4+4d)\right]=\dfrac{10}{2}[4+9d] \Rightarrow d=-6$

$\therefore \quad T_{20}=a+19d=2+19\times(-6)=-112$

31 $S_6=42$

$\Rightarrow \quad \dfrac{6}{2}[2a+5d]=42$

$\Rightarrow \quad 2a+5d=14 \qquad \ldots(i)$

Now, $\quad \dfrac{T_{10}}{T_{30}}=\dfrac{a+9d}{a+29d}=\dfrac{1}{3} \quad \Rightarrow a=d$

$\therefore$ from eq. (i)

$a=d=2$

$\therefore \quad T_{40}=2+39\times 2=80$

32 $\dfrac{S_n}{S'_n}=\dfrac{7n+1}{4n+27}$

$\Rightarrow \quad \dfrac{\frac{n}{2}[2a+(n-1)d]}{\frac{n}{2}[2a'+(n-1)d']}=\dfrac{7n+1}{4n+27}$

$\Rightarrow \quad \dfrac{2a+(n-1)d}{2a'+(n-1)d'}=\dfrac{7n+1}{4n+27} \qquad \ldots(i)$

Now, $\quad \dfrac{T_{11}}{T'_{11}}=\dfrac{a+10d}{a'+10d'}$

Substituting $n = 21$ in Eq. (i), we get

$$\frac{2a + 20d}{2a' + 20d'} = \frac{148}{111} \Rightarrow \frac{a + 10d}{a' + 10d'} = \frac{148}{111} = \frac{4}{3}$$

33 $a + b + c = 15$

or $(b - d) + b + (b + d) = 15$

$d \rightarrow$ common difference

$\Rightarrow \quad b = 5$

Again $a^2 + b^2 + c^2 = 93$

$\Rightarrow \quad (b - d)^2 + b^2 + (b + d)^2 = 93$

$\Rightarrow \quad (b - d)^2 + (b + d)^2 = 68$

$\Rightarrow \quad (5 - d)^2 + (5 + d)^2 = 68$

$\Rightarrow \quad 2(5^2 + d^2) = 68$

$\Rightarrow \quad 25 + d^2 = 34$

$\Rightarrow \quad d = \pm 3$

$\therefore$ If $d = 3$, then $a = 2$ and $c = 8$

If $d = -3$, then $a = 8$ and $c = 2$

Therefore the greatest value is 8.

Alternatively Go through option.

Since middle term $b = 5$

and let $c = 10$, then $a = 0$

$\therefore \quad a^2 + b^2 + c^2 = 125 \neq 93$, hence wrong

Again let $c = 8$, then $a = 2$

$\therefore \quad a^2 + b^2 + c^2 = 4 + 25 + 64 = 93$ hence correct.

34 $T_n = 4n - 1$

$\therefore \quad T_{30} = 119$

$\therefore \quad T_1 = 3, \quad T_2 = 7, \quad T_3 = 11, \ldots, 8, \quad T_{30} = 119$

$\therefore \quad S_{30} = \left(\frac{T_1 + T_{30}}{2}\right) \times 30 = \left(\frac{3 + 119}{2}\right) \times 30$

or $S_{30} = 1830$

35 $S_n = 3n^2 + 5n$

$T_n = S_n - S_{(n-1)}$

$152 = [3n^2 + 5n] - [3(n - 1)^2 + 5(n - 1)]$

$152 = 6n + 2$

$\Rightarrow \quad n = 25$

Alternatively Go through options.

$[3 \times (25)^2 + 5 \times 25] - [3 \times (24)^2 + 5 \times 24]$

$= (2000) - (1848) = 152$

Hence (d) is correct.

36 $S_n = \frac{n}{2}[2a + (n - 1)d]$

$0 = \frac{n}{2}[196 + (n - 1) \times (-7)]$

$\Rightarrow \quad 0 = n(203 - 7n)$

$\Rightarrow \quad 7n = 203 \quad \text{or} \quad n = 0$

$\Rightarrow \quad n = 29$

Since $n = 0$ is not acceptable.

The A.P. is 98, 91, 84, … 0, …, – 91, – 98

(Try to understand it as it is a problem of common sense, there is no need to calculate with the help of formula.)

37 It is possible only when all the terms of A.P. are non-negative.

$\therefore$ Let T_n be the least possible non-negative term of the A.P. Then

$T_n \geq 0$

$\therefore \quad a + (n - 1)d \geq 0$

$17 + (n - 1) \times (-3) \geq 0$

$\Rightarrow \quad 20 - 3n \geq 0$

$\Rightarrow \quad n \leq \frac{20}{3}$

$\Rightarrow \quad n \leq 6$ (only integral part is considerable)

$\therefore \quad n = 6$

$\therefore \quad T_6 = 17 + 0.5 \times (-3)$

$T_6 = 2$

$\therefore \quad S_6 = \left(\frac{17 + 2}{2}\right) \times 6 = 57$

(The required A.P. is 17, 14, 11, 8, 5, 2).

38 The least possible sum can be obtained only when all the terms of A.P. be non-positive.

Let the last term be T_n which must be non-positive.

$\therefore \quad T_n \leq 0$

$a + (n - 1)d \leq 0$

$-23 + (n - 1)4 \leq 0$

$4n \leq 27$

$n \leq 6$

$\therefore \quad n = 6$

$\therefore \quad T_n = T_6 = -23 + 5 \times 4 = -3$

$\therefore \quad S_6 = \left[\frac{(-23) + (-3)}{2}\right] \times 6 = -78$

(The required A.P. is – 23, – 19, – 15, – 11, – 7, – 3).

39 The required numbers are 1017, 1035, 1053, …, 9999

Total number of terms = 500 $\left[\because \quad n = \left(\frac{9999 - 1017}{18}\right) + 1\right]$

$\therefore$ Sum of all the numbers $= \left(\frac{1017 + 9999}{2}\right) \times 500$

$= 2754000$

40 Let an A.P. be 3, 7, 11, 15, 19, 23, 27, …

and Let $p = 2, \quad q = 3, \quad r = 7$

then $T_p = a = 7$

$T_q = b = 11$

$T_r = c = 27$

$\therefore \quad p(b - c) + q(c - a) + r(a - b)$

$= 2(11 - 27) + 3(27 - 7) + 7(7 - 11)$

$= -32 + 60 - 28 = 0$

Hence (a) is true.

41 Let an A.P. be 2, 5, 8, 11, 14, 17, 20, 23, …
and let $p = 3, q = 5, r = 6$
then $S_p = a = (2 + 5 + 8) = 15$
and $S_q = b = (2 + 5 + 8 + 11 + 14) = 40$
and $S_r = c = (2 + 5 + \ldots + 14 + 17) = 57$
$\therefore \quad \frac{a}{p}(q - r) + \frac{b}{q}(r - p) + \frac{c}{r}(p - q)$
$= \frac{15}{3}(5 - 6) + \frac{40}{5}(6 - 3) + \frac{57}{6}(3 - 5)$
$= -5 + 24 - 19 = 0$
Hence (c) is correct.

42 Let p, q, r, s be the four consecutive terms in A.P., then
$p = (m - 3d)$
$q = (m - d)$
$r = (m + d)$
$s = (m + 3d)$
$\therefore\ p + q + r + s = (m - 3d) + (m - d) + (m + d) + (m + 3d) = 20$
$\Rightarrow \quad 4m = 20$
$\Rightarrow \quad m = 5 \quad \ldots(i)$
Again $(m - 3d)(m + 3d) : (m - d)(m + d) = 2 : 3$
$\Rightarrow \quad \frac{m^2 - 9d^2}{m^2 - d^2} = \frac{2}{3}$
$\Rightarrow \quad m = 5d$
$\therefore \quad d = 1$ (from eq. (i))
Hence $(m - 3d)(m + 3d) = (5 - 3)(5 + 3) = 16$
Alternatively Since p, q, r and s are in A.P.
and $p + q + r + s = 20$
$\Rightarrow \quad p + s = 10$
and $q + r = 10$
Let $p = 1$, then $s = 9$
$\therefore \quad q = 1 + \frac{8}{3} = \frac{11}{3} \quad \left(\because\ d = \frac{8}{3}\right)$
and $r = \frac{11}{3} + \frac{8}{3} = \frac{19}{3}$
$\therefore \quad \frac{p \cdot s}{q \cdot r} = \frac{1 \times 9}{\frac{11}{3} \times \frac{19}{3}} = \frac{9 \times 9}{11 \times 19} = \frac{81}{209} \neq \frac{2}{3}$
Hence the values of p, q, r and s are wrong.
Again if $p = 2$, then $s = 8$
$\therefore \quad q = 2 + 2 = 4 \quad (\because\ d = 2)$
and $r = 4 + 2 = 6$
$\therefore \quad \frac{p \cdot s}{q \cdot r} = \frac{2 \times 8}{4 \times 6} = \frac{2}{3}$, hence true.
Thus the values of p, q, r and s are correct.
Hence $p \cdot s = 2 \times 8 = 16$

43 $S_p = \frac{p}{2}[2a + (p - 1)d] = q \quad \ldots(i)$
and $S_q = \frac{q}{2}[2a + (q - 1)d] = p \quad \ldots(ii)$
From eq. (i) $2a + (p - 1)d = \frac{2q}{p} \quad \ldots(iii)$
and from eq. (ii) $2a + (q - 1)d = \frac{2p}{q} \quad \ldots(iv)$
Subtracting eq. (iv) from Eq. (iii), we get
$(p - q)d = \frac{-2(p + q)(p - q)}{pq}$
$\Rightarrow \quad d = \frac{-2(p + q)}{pq}$
Now, from eq. (iii)
$2a + (p - 1)\left(\frac{-2(p + q)}{pq}\right) = \frac{2p}{q}$
$\Rightarrow \quad a = \frac{p^2 + q^2 + pq - (p + q)}{pq}$
$\therefore \quad S_{p+q} = \frac{(p + q)}{2}[2a + (p + q - 1)d]$
$= \frac{(p + q)}{2}\left[\frac{2(p^2 + q^2 + pq - (p + q))}{pq} - \frac{2(p + q - 1)(p + q)}{pq}\right]$
$= \frac{(p + q)}{2}\left[\frac{2}{pq}(p^2 + q^2 + pq - p - q - p^2 - q^2 - pq + p + q - pq)\right]$
$= \frac{(p + q)}{pq}(-pq) \Rightarrow S_{(p+q)} = -(p + q)$

☑ Introductory Exercise 18.2

1 Every even term is equal to 2
common ratio of the G.P. is -1

2 $r = -2 \quad \left(\because\ r = \frac{\frac{1}{4}}{-\frac{1}{8}} = \frac{\frac{-1}{2}}{\frac{1}{4}} = -2\right)$
$\therefore \quad T_7 = \frac{-1}{8} \cdot (-2)^6 = -\frac{1}{8} \times 64 = -8$

3 $T_5 = a_1 \cdot r^4 = a$
$T_8 = a_1 \cdot r^7 = b$
$T_{11} = a_1 \cdot r^{10} = c$
$\therefore$ Let $b^2 = ac$
then $(a_1 r^7)^2 = a_1 r^4 \cdot a_1 r^{10}$
$\Rightarrow \quad a_1^2 r^{14} = a_1^2 r^{14}$
Hence (b) is correct.

4 $T_5 = ar^4 = 32$

$T_{12} = ar^{11} = 4096$

$\therefore \quad r^7 = \dfrac{4096}{32} = 2^7 \Rightarrow r = 2$

$\therefore \quad a = 2 \qquad (\because \ ar^4 = 32)$

$\therefore \quad T_n = ar^{n-1} = 2 \cdot 2^{n-1} = 2^{1+n-1} = 2^n$

5 $S_n > 10^6$, for least possible $n \in I^+$

then, $\dfrac{5(2^n - 1)}{(2-1)} > 10^6$

$\Rightarrow \quad 2^n - 1 > 2 \times 10^5$

$\Rightarrow \quad 2^n > 200001$

at $n = 17$, $2^n = 2^{17} = 131072$

and at $n = 18$, $2^n = 2^{18} = 262144$

Hence the least possible value of $n = 18$

6 Let a, b be the two numbers then

$$\text{A.M.} = \frac{a+b}{2} = 15$$

$\Rightarrow \quad a + b = 30$

and $\quad \text{G.M.} = \sqrt{ab} = 12$

$\Rightarrow \quad ab = 144$

Now go through options

let $\quad a = 6$, then $b = 24$

$\therefore \quad a \cdot b = 6 \times 24$

Hence choice (c) is correct.

Alternatively $(a-b)^2 = (a+b)^2 - 4ab$

$= (30)^2 - 4 \times 144$

$= 900 - 576 = 324$

$\Rightarrow \quad a - b = \pm 18$

$\therefore \quad (a, b) = (6, 24)$ or $(24, 6)$

7 Let a, b, c be the three numbers in G.P., then

$a + b + c = 38$

and $\quad abc = 1728$

$\Rightarrow \quad b = (abc)^{1/3} = (1728)^{1/3} = 12$

$\therefore \quad a \times c = 144$

and $\quad a + c = 26$

Now, go through options

Let $c = 18$, then $a = 8$

$\therefore \quad a \cdot c = 8 \times 18 = 144$

Hence choice (b) is correct

Alternatively Let the three numbers in G.P. be

$$\frac{a}{r},\ a,\ ar$$

$\therefore \quad \dfrac{a}{r} + a + ar = 38 \qquad \ldots(i)$

and $\quad \dfrac{a}{r} \cdot a \cdot ar = 1728 \qquad \ldots(ii)$

$\Rightarrow \quad a = 12$

$\therefore \quad \dfrac{12}{r} + 12 + 12r = 38$

or $\quad \dfrac{6}{r} + 6 + 6r = 19$

$\Rightarrow \quad 6r^2 - 13r + 6 = 0$

$\Rightarrow \quad 6r^2 - 9r - 4r + 6 = 0$

$\Rightarrow \quad (2r - 3)(3r - 2) = 0$

$\Rightarrow \quad r = \dfrac{3}{2}$ or $r = \dfrac{2}{3}$

$\therefore$ Three numbers in G.P. are 8, 12, 18 or 18, 12, 8.

Hence (b) is correct.

8 $$\frac{S_3}{S_6} = \frac{125}{152} = \frac{\dfrac{a(r^3-1)}{(r-1)}}{\dfrac{a(r^6-1)}{(r-1)}} = \frac{r^3-1}{r^6-1}$$

$\Rightarrow \quad \dfrac{r^3 - 1}{(r^3)^2 - 1} = \dfrac{125}{152}$

$\Rightarrow \quad \dfrac{(r^3-1)}{(r^3+1)(r^3-1)} = \dfrac{125}{152} \Rightarrow \dfrac{1}{r^3+1} = \dfrac{125}{152}$

$\Rightarrow \quad r^3 + 1 = \dfrac{152}{125}$

$\Rightarrow \quad r^3 = \dfrac{27}{125}$

$\Rightarrow \quad r = \dfrac{3}{5}$

Alternatively Go through options.

9 $a + b + c = 14$

Let $\quad abc = 125$

$\Rightarrow \quad b = 5$

let $a = 1$, then $c = 25$

$\therefore a + b + c = 31$, which is wrong.

Again let $\quad a \cdot b \cdot c = 64 \Rightarrow b = 4$

Let $a = 1$ then $c = 16$

$\Rightarrow a + b + c = 21$, which is wrong

again if $a = 2$, then $c = 8$

$\therefore \quad a + b + c = 2 + 4 + 8 = 14$

Hence (b) may be correct

$a = 2, \quad b = 4, \quad c = 8$

$a' = 3, \quad b' = 5, \quad c' = 7$

$\because a'$, b' and c' are in A.P.

Hence choice (b) is correct.

Alternatively $a + b + c = 14 \qquad \ldots(i)$

since $(a+1)$, $(b+1)$ and $(c-1)$ are in A.P.

$\therefore \quad (b+1) - (a+1) = (c-1) - (b+1)$

$\Rightarrow \quad 2b + 2 = a + c$

Now, from Eq. (i), we get

$$3b + 2 = 14$$

$\Rightarrow$ $b = 4$

Again $a = \frac{b}{r}$ and $c = br$

$\therefore$ $a + b + c = 14$

$\Rightarrow$ $\frac{b}{r} + b + br = 14$

$\Rightarrow$ $\frac{4}{r} + 4 + 4r = 14$

$\Rightarrow$ $2r^2 - 5r + 2 = 0$

$\Rightarrow$ $r = 2$ or $r = \frac{1}{2}$

$\therefore$ $a \cdot b \cdot c = 2 \times 4 \times 8 = 8 \times 4 \times 2 = 64$

Shortcut : Since $b = 4$

$\therefore$ $abc = b^3$ ($\because$ a, b, c are in G.P.)

$\therefore$ $abc = 64$

10 Let a, b, c, d, e be five consecutive terms in G.P., then

$$a = \frac{c}{r^2}, \quad b = \frac{c}{r}, \quad d = cr, \quad e = cr^2$$

$\therefore$ $a \cdot b \cdot c \cdot d \cdot e = \frac{c}{r^2} \cdot \frac{c}{r} \cdot c \cdot cr \cdot cr^2 = c^5$

$\therefore$ $a \cdot b \cdot c \cdot d \cdot e = 4^5$ ($\because$ $c = 4$)

11 Let a, b, c be in G.P., then

$$a + b + c = 21 = 3(7) = 3(1 + 2 + 4)$$

and $a^2 + b^2 + c^2 = 189 = 9(21) = 9(1 + 4 + 16)$

Hence common ratio = 2

Alternatively $a + ar + ar^2 = 21$

$\Rightarrow$ $a(1 + r + r^2) = 21$ ...(i)

and $a^2 + (ar)^2 + (ar^2)^2 = 189$

$\therefore$ $a^2(1 + r^2 + r^4) = 189$

$\Rightarrow$ $a^2[(1 + r^2)^2 - r^2] = 189$

$\Rightarrow$ $a^2[(1 + r^2 + r)(1 + r^2 - r)] = 189$ ...(ii)

Dividing eq. (ii) by equation (i), we get

$$a(1 - r + r^2) = 9 \quad \text{...(iii)}$$

Dividing eq. (i) by equation (iii), we get

$$\frac{1 + r^2 + r}{1 + r^2 - r} = \frac{21}{9} = \frac{7}{3}$$

$\Rightarrow$ $\frac{(1 + r^2) + r}{(1 + r^2) - r} = \frac{7}{3} \Rightarrow \frac{1 + r^2}{r} = \frac{5}{2}$

(By componendo and dividendo)

$\Rightarrow$ $2r^2 - 5r + 2 = 0$

$\Rightarrow$ $r = 2$ or $r = \frac{1}{2}$

12 $T_1 + T_3 = a + ar^2 = 15$ ...(i)

and $T_5 + T_7 = ar^4 + ar^6 = 240$ ...(ii)

From eq. (i) $a(1 + r^2) = 15$

and eq. (ii) becomes $ar^4(1 + r^2) = 240$

$\therefore$ $r^4 = 16$

$\Rightarrow$ $r = \pm 2$

$\therefore$ $a = 3$ (from eq. (i))

$\therefore$ $T_9 = a \cdot r^8 = 3 \cdot (2)^8 = 768$

13 $a + b + c = 42$

$abc = 512$

$\Rightarrow$ $b = 8$ ($\because$ $(abc)^{1/3} = b = 8$)

$\therefore$ $ac = 64$

and $a + c = 34$

Now, go through options (or by hit and trial)

$\therefore$ Either $a = 2$, then $c = 32$

or $a = 32$, then $c = 2$

Hence, (c) is correct.

14 $a + b + c = 70$

and $4a, 5b, 4c$ are in A.P.

$\therefore$ $10b = 4(a + c)$

$\Rightarrow$ $a + c = \frac{5b}{2}$

$\therefore$ $a + b + c = \frac{7b}{2} = 70$

$\Rightarrow$ $b = 20$

$\therefore$ $a + c = 50$

By hit and trial $a = 10$ and $c = 40$

Now $4a = 40, \quad 5b = 100$

and $4c = 160$

Hence, $a \times b \times c = 10 \times 20 \times 40 = 8000$

Alternatively $\frac{b}{r} + b + br = 70$

$\Rightarrow$ $\frac{20}{r} + 20 + 20r = 70$

$\Rightarrow$ $\frac{2}{r} + 2 + 2r = 7$

$\Rightarrow$ $2r^2 - 5r + 2 = 0$

$\Rightarrow$ $r = 2$ or $r = \frac{1}{2}$

$\therefore$ $a, b, c = 10, 20, 40$ or $40, 20, 10$

$\therefore$ $abc = 8000$

15 $a + b + c + d = 312$

$a + ar + ar^2 + ar^3 = 312$

and $a + d = 252$

and $b + c = 312 - 252 = 60$

$\Rightarrow$ $a + ar^3 = 252$

and $ar + ar^2 = 60$

$\Rightarrow$ $a(1 + r^3) = 252$

and $a(r + r^2) = 60$

$\therefore \quad \frac{a(1 + r^3)}{a(r + r^2)} = \frac{252}{60} = \frac{21}{5} \quad \Rightarrow \frac{1 + r^3}{r + r^2} = \frac{21}{5}$

$\Rightarrow \quad \frac{(1 + r)(1 + r^2 - r)}{r(1 + r)} = \frac{21}{5}$

$(\because \ a^3 + b^3 = (a + b)(a^2 + b^2 - ab))$

$\Rightarrow \quad \frac{1 + r^2 - r}{r} = \frac{21}{5}$

$\Rightarrow \quad 5r^2 - 26r + 5 = 0$

$\Rightarrow \quad r = 5 \quad \text{or} \quad r = \frac{1}{5}$

$\therefore \quad a = 2 \quad \text{and} \quad ar \times ar^2 = 500 \qquad (\text{when } r = 5)$

and $\quad a = 250 \quad \text{and} \quad ar \times ar^2 = 500 \qquad (\text{when } r = \frac{1}{5})$

Alternatively Go through options.

16 Distance travelled before the first hit = 16 m

Distance travelled before the second hit $= 16 + \frac{1}{2} \times 16 \times 2$

$= (16 + 16)$ m

Distance travelled before the third hit

$= 16 + 16 + \frac{1}{2} \times 8 \times 2$

$= (16 + 16 + 8)$ m

Distance travelled before the fourth hit

$= 16 + 16 + 8 + \frac{1}{2} \times 4 \times 2$

$= (16 + 16 + 8 + 4)$ m

and so on.

Hence the required distance

$= 16 + 16 + 8 + 4 + 2 + 1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16}$

$= 16 + \left(16 + 8 + 4 + \ldots + \frac{1}{16}\right)$

$= 16 + \frac{16\left(1 - \left(\frac{1}{2}\right)^9\right)}{1 - \frac{1}{2}} = 16 + 16 \times \left(\frac{511}{512}\right) \times \frac{2}{1}$

$= 16 + \frac{511}{16} = 47\frac{15}{16}$

17 $S_n = 7 + 77 + 777 + \ldots$ to n terms

$= 7(1 + 11 + 111 + \ldots$ to n terms$)$

$= \frac{7}{9}(9 + 99 + 999 + \ldots$ to n terms$)$

$= \frac{7}{9}\{(10 - 1) + (100 - 1) + (1000 - 1) + \ldots$ to n terms$\}$

$= \frac{7}{9}\{(10 + 100 + 1000 + \ldots$ to n terms$)$

$- (1 + 1 + 1 + \ldots$ to n terms$)\}$

$= \frac{7}{9}\left\{\frac{10 \cdot (10^n - 1)}{10 - 1} - n\right\}$

$= \frac{7}{9}\left\{\frac{10}{9}(10^n - 1) - n\right\}$

Alternatively Best way is to go through options.

Consider $n = 2$, then $S_2 = 7 + 77 = 84$

Now, put $n = 2$ in choice (b).

NOTE This type of questions necessarily be solved by options and must take at least two values for $n = 2, 3$ etc. as a measure of safety.

18 It is very similar to the previous question.

19 Let a G.P. be 1, 3, 9, 27, 81, 243, 729, …

Consider $\quad p = 2, \ q = 5, \quad r = 6$

$\therefore \quad T_p = 3 = a$

$T_q = 81 = b$

$T_r = 243 = c$

$\therefore \quad a^{q-r} \cdot b^{r-p} \cdot c^{p-q} = 3^{(5-6)} \cdot 81^{(6-2)} \cdot 243^{(2-5)}$

$= 3^{-1} \cdot 81^4 \cdot 243^{-3}$

$= 3^{-1} \cdot 3^{16} \cdot 3^{-15}$

$= 3^{-16} \cdot 3^{16} = 3^0 = 1$

20 Let the G.P. be 1, 2, 4, 8, 16, 32, 64, …

Let $\quad x = 3, \quad y = 5 \quad \text{and} \quad z = 6$

$\therefore \quad T_x = 4 = a$

$T_y = 16 = b$

$T_z = 32 = c$

$\therefore \ (y - z)\log a + (z - x)\log b + (x - y)\log c$

$= -1 \cdot \log 4 + 3 \log 16 + (-2) \log 32$

$= \log 2^{-2} + \log 2^{12} + \log 2^{-10}$

$= \log 2^0 = \log 1 = 0$

21 Let a, b, c, d be four numbers such that a, b, c are in A.P. and b, c, d are in G.P.

$\therefore \quad a + c = 2b \qquad \ldots(i)$

and $\quad bd = c^2 \qquad \ldots(ii)$

Also $\quad a + c = 2 \qquad \ldots(iii)$

and $\quad b + d = 26 \qquad \ldots(iv)$

$\Rightarrow \quad b = 1$

from Eq. (iv), $d = 25$

$\therefore \quad$ from Eq. (ii) $c = \pm 5$

when $\quad c = 5$, then $a = -3$

when $\quad c = -5$, then $a = 7$

Hence the four numbers are $-3, 1, 5, 25$ or $7, 1, -5, 25$

22. $S_n = 1 + 3 + 7 + 15 + \ldots + t_n \qquad \ldots(i)$

and $\quad S_n = 1 + 3 + 7 + \ldots + t_{n-1} + t_n \qquad \ldots(ii)$

subtracting, we get

$0 = (1 + 2 + 4 + 8 + \ldots +$ to n terms$) - t_n$

$\Rightarrow \quad t_n = 1 + 2 + 4 + 8 + \ldots$ to n terms

$\Rightarrow \quad t_n = \dfrac{1\cdot(2^n-1)}{(2-1)} = 2^n - 1$

again $S_n = t_1 + t_2 + t_3 + \ldots + t_n$

$= (2-1) + (2^2-1) + (2^3-1) + \ldots + (2^n-1)$

$= (2 + 2^2 + 2^3 + \ldots 2^n) - (n)$

$= \dfrac{2(2^n-1)}{(2-1)} - n = 2(2^n-1) - n$

Alternatively Go through options.

23 $S = \dfrac{1}{2} + \dfrac{3}{2^2} + \dfrac{5}{2^3} + \dfrac{7}{2^4} + \ldots + \dfrac{2n-3}{2^{n-1}} + \dfrac{2n-1}{2^n}$

and $\dfrac{1}{2}S = \dfrac{1}{2^2} + \dfrac{3}{2^3} + \dfrac{5}{2^4} + \ldots + \dfrac{2n-3}{2^n} + \dfrac{2n-1}{2^{n+1}}$

subtracting, we get

$\dfrac{1}{2}S = \dfrac{1}{2} + \dfrac{2}{2^2} + \dfrac{2}{2^3} + \ldots + \dfrac{2}{2^n} - \dfrac{2n-1}{2^{n+1}}$

$= \dfrac{1}{2} + 2\left(\dfrac{1}{2^2} + \dfrac{1}{2^3} + \dfrac{1}{2^4} + \ldots + \dfrac{1}{2^n}\right) - \dfrac{2n-1}{2^{n+1}}$

$= \dfrac{1}{2} + \dfrac{2\cdot\dfrac{1}{2^2}\left\{1 - \left(\dfrac{1}{2}\right)^{n-1}\right\}}{1-\dfrac{1}{2}} - \dfrac{2n-1}{2^{n+1}}$

$\therefore \quad S = 3 - \dfrac{2n+3}{2^n}$

24 Go through options.

Alternatively $11 + 102 + 1003 + \ldots$

$= (10 + 1) + (100 + 2) + (1000 + 3)$

$= (10 + 100 + 1000 + \ldots) + (1 + 2 + 3 + \ldots)$

25 Go through options.

Alternatively $T_n = 1 + 3 + 9 + \ldots$

or $T_n = \dfrac{1}{2}(3^n - 1)$

$\therefore \quad S_n = t_1 + t_2 + t_3 + \ldots + t_n$

$S_n = \dfrac{1}{2}[(3^1 + 3^2 + 3^3 + \ldots + 3^n) - n]$

$= \dfrac{1}{2}\left[\dfrac{3(3^n-1)}{2} - n\right]$

$= \dfrac{1}{4}[3(3^n-1) - 2n] = \dfrac{3}{4}(3^n-1) - \dfrac{n}{2}$

26 $S_n = 2 + 5 + 14 + 41 + \ldots$ to n terms …(i)

and $S_n = 2 + 5 + 14 + 41 + \ldots$ to n terms …(ii)

subtracting, we get

$0 = 2 + 3 + 9 + 27 + \ldots - t_n$

$\Rightarrow \quad t_n = 2 + 3 + 9 + 27 + \ldots$

$\Rightarrow \quad t_n = 2 + \{3 + 9 + 27 + \ldots \text{ to } (n-1) \text{ terms}\}$

$\Rightarrow \quad t_n = 2 + \dfrac{3(3^{n-1}-1)}{2}$

$\therefore \quad S_n = t_1 + t_2 + t_3 + \ldots + t_n$

$S_n = \Sigma t_n = t_1 + t_2 + t_3 + \ldots + t_n$

$= \Sigma\left\{2 + \dfrac{3(3^{n-1}-1)}{2}\right\}$

$= \Sigma\left\{2 + \dfrac{3^n}{2} - \dfrac{3}{2}\right\} = \Sigma\left\{\dfrac{1}{2} + \dfrac{3^n}{2}\right\}$

$= \left\{\dfrac{n}{2} + \dfrac{1}{2}(3 + 3^2 + 3^3 + \ldots + 3^n)\right\}$

$= \left\{\dfrac{n}{2} + \dfrac{1}{2}\left(\dfrac{3\cdot(3^n-1)}{2}\right)\right\}$

$= \left\{\dfrac{n}{2} + \dfrac{1}{4}3\cdot(3^n-1)\right\}$

$= \dfrac{3}{4}(3^n-1) + \dfrac{n}{2}$

Alternatively You should go through options.

Consider $n = 1$, 2 or 3 and verify the correct option.

As, when you put $n = 1$, in the correct formula you will get $S_1 = 2$

and at $n = 2, S_2 = 7$ $(2 + 5)$

and at $n = 3, S_3 = 21$ $(2 + 5 + 14)$

27 $S_n = 1 + 2x + 3x^2 + 4x^3 + \ldots$

$x\cdot S_n = x + 2x^2 + 3x^3 + 4x^4 + \ldots$

subtracting, we get

$(1-x)S_n = (1 + x + x^2 + x^3 + \ldots + x^{n-1}) - nx^n$

$(1-x)\,S_n = \dfrac{1-x^n}{(1-x)} - nx^n$

$\Rightarrow \quad S_n = \dfrac{1-x^n}{(1-x)^2} - \dfrac{nx^n}{(1-x)}$

Alternatively Go through options.

28 Solve through options.

NOTE This is very similar to the previous problem.

29 Let $S_n = 1 + \dfrac{2}{3} + \dfrac{3}{3^2} + \dfrac{4}{3^3} + \ldots + \dfrac{n}{3^{n-1}}$

$\therefore \quad \dfrac{1}{3}S_n = \dfrac{1}{3} + \dfrac{2}{3^2} + \dfrac{3}{3^3} + \dfrac{4}{3^4} + \ldots + \dfrac{n-1}{3^{n-1}} + \dfrac{n}{3^n}$

subtracting, we get

$\dfrac{2}{3}S_n = \left(1 + \dfrac{1}{3} + \dfrac{1}{3^2} + \dfrac{1}{3^3} + \dfrac{1}{3^4} + \ldots\right) - \dfrac{n}{3^n}$

$\Rightarrow \quad \dfrac{2}{3}S_n = \left[\dfrac{1\left\{1 - \left(\dfrac{1}{3}\right)^n\right\}}{1-\dfrac{1}{3}}\right] - \dfrac{n}{3^n}$

$\Rightarrow \quad \dfrac{2}{3}S_n = \dfrac{3}{2}\left\{1 - \left(\dfrac{1}{3}\right)^n\right\} - \dfrac{n}{3^n}$

$\Rightarrow \quad S_n = \dfrac{9}{4} - \dfrac{3}{4}\left(\dfrac{3+2n}{3^n}\right)$

30. Let $S_n = 3\cdot 2 + 5\cdot 2^2 + 7\cdot 2^3 + \ldots + (2n-1)\cdot 2^n$

$\therefore\ 2S_n = 3\cdot 2^2 + 5\cdot 2^3 + \ldots + (2n-1)\cdot 2^n + (2n+1)\cdot 2^{n+1}$

subtracting, we get

$-S_n = 3\cdot 2 + 2\cdot 2^2 + 2\cdot 2^3 + \ldots + 2\cdot 2^n - (2n+1)\cdot 2^{n+1}$

$= 3\cdot 2 + 2(2^2 + 2^3 + \ldots + 2^n) - (2n+1)\cdot 2^{n+1} = \text{etc}$

Now, simplify by yourself.

31 Go through options.

32 $t_n = n(2n+1)^2$

$= 4n^3 + 4n^2 + n$

$\therefore\quad S_n = \Sigma t_n = 4\Sigma n^3 + 4\Sigma n^2 + \Sigma n$

then put $n = 20$

33 $t_n = \dfrac{n^2(n+1)^2}{4n^2} = \dfrac{1}{4}(n^2 + 2n + 1)$

$\therefore\quad S_n = \Sigma t_n = \dfrac{1}{4}[\Sigma n^2 + 2\Sigma n + n]$

then put $n = 16$.

34 Let a, b, c and d be the required numbers, then a, b, c are in G.P. and b, c, d are in A.P.

a	b	c	d	
$\downarrow$	$\downarrow$	$\downarrow$	$\downarrow$	
a	b	$b+6$	$b+12$	(common difference = 6)
$\downarrow$	$\downarrow$	$\downarrow$	$\downarrow$	
$b+12$	b	$b+6$	$b+12$	$(\because\ a = d)$

Now, since a, b, c are in G.P.

$\therefore\quad \dfrac{c}{b} = \dfrac{b}{a}$

$\Rightarrow\quad \dfrac{b+6}{b} = \dfrac{b}{b+12}$

$\Rightarrow\quad (b+6)(b+12) = b^2$

$\Rightarrow\quad b = -4$

$\therefore\quad c = b + 6 = -4 + 6 = 2$

Alternatively Go through options.

35 Let a be the first term and r be the common ratio of the G.P. Then

$$S_\infty = a + ar + ar^2 + \ldots = 16 = \frac{a}{1-r}, |r| < 1$$

$\therefore\quad \dfrac{a}{1-r} = 16$ …(i)

and $a^2 + (ar)^2 + (ar^2)^2 + \ldots = 153\dfrac{3}{5}$

$\Rightarrow\quad a^2 + a^2r^2 + a^2r^4 + \ldots = \dfrac{768}{5}$

$\Rightarrow\quad \dfrac{a^2}{1-r^2} = \dfrac{768}{5}$ …(ii)

Dividing eq. (ii) by eq. (i), we get

$$\frac{\dfrac{a^2}{(1-r^2)}}{\dfrac{a}{(1-r)}} = \frac{\dfrac{768}{5}}{16}$$

$\Rightarrow\quad \dfrac{a}{1+r} = \dfrac{48}{5}$ …(iii)

Dividing eq. (i) by eq. (iii)

$$\frac{\dfrac{a}{(1-r)}}{\dfrac{a}{(1+r)}} = \frac{16}{\dfrac{48}{5}} \Rightarrow \frac{1+r}{1-r} = \frac{5}{3}$$

$\Rightarrow\quad \dfrac{1}{r} = 4$ (By componendo-dividendo rule)

$\Rightarrow\quad r = \dfrac{1}{4}$

$\therefore\quad a = 16 \times \left(1 - \dfrac{1}{4}\right)$ (from Eq. (i))

$a = 12$

$\therefore\quad T_4 = ar^3 = 12 \times \left(\dfrac{1}{4}\right)^3 = \dfrac{3}{16}$

36 $x = 1 + a + a^2 + a^3 + \ldots \infty$

$\therefore\quad x = \dfrac{1}{1-a}\quad \because |a| < 1$

Similarly, $y = \dfrac{1}{1-b}$

Let $S = 1 + ab + a^2b^2 + \ldots \infty$

$= 1 + ab + (ab)^2 + \ldots \infty$

$= \dfrac{1}{1-ab}$ $(\because\ |ab| < 1)$ …(i)

Now, go through option

$$\frac{xy}{x+y-1} = \frac{\dfrac{1}{1-a} \times \dfrac{1}{1-b}}{\dfrac{1}{1-a} + \dfrac{1}{1-b} - 1} = \frac{1}{1-ab}$$

Hence, $S = 1 + ab + a^2b^2$

$= \dfrac{1}{1-ab} = \dfrac{xy}{x+y-1}$

37 His first payment = ₹ 100

His second payment = ₹ $90 = \left(100 \times \dfrac{9}{10}\right)$

His third payment = ₹ 81 etc. $= \left(90 \times \dfrac{9}{10}\right)$

$\therefore$ The annual payments are 100, 90, 81, … which are in G.P. with common ratio $\dfrac{9}{10}$ (< 1)

Therefore the sum to infinity of this G.P.

$= 100 + 90 + 81 + \ldots \infty$

$$= \frac{100}{1 - \frac{9}{10}} = \frac{100}{\frac{1}{10}} = 1000$$

Hence the person can receive maximum amount of ₹ 1000.

38 $S_\infty = \frac{1}{4} - \frac{3}{16} + \frac{9}{64} - \frac{27}{256} + \ldots$

$$S_\infty = \frac{\frac{1}{4}}{1 - \left(-\frac{3}{4}\right)} = \frac{\frac{1}{4}}{\frac{7}{4}} \qquad \left(\because\ r = \frac{-\frac{3}{16}}{\frac{1}{4}}\right)$$

$$S_\infty = \frac{1}{7}$$

39 $$a + ar = \frac{5}{3} \quad \Rightarrow \quad a(1 + r) = \frac{5}{3} \qquad \ldots(i)$$

and $$\frac{a}{1 - r} = 3 \qquad \ldots(ii)$$

Dividing eq. (i) by eq. (ii), we get

$$(1 + r)(1 - r) = \frac{5}{9} \Rightarrow 1 - r^2 = \frac{5}{9}$$

$$\Rightarrow \qquad r^2 = \frac{4}{9}$$

$$\Rightarrow \qquad r = \pm\frac{2}{3}$$

If $r = \frac{2}{3}$, then $a = 1$ and if $r = -\frac{2}{3}$, then $a = 5$

40 Distance covered by ball just before it hits the ground for the first time = 96 ft.

In the first round (*i. e.* going up and returning to the earth) ball covers the distance $= \left(96 \times \frac{2}{3}\right) \times 2$

In the third round distance covered by ball

$$= 96 \times \left(\frac{2}{3}\right)^2 \times 2$$

In the fourth round distance covered by ball

$$= 96 \times \left(\frac{2}{3}\right)^3 \times 2 \text{ etc.}$$

NOTE In each round ball covers equal distance while going up and coming down to the earth).

Hence the required distance

$$= 96 + 2\left[96 \times \frac{2}{3} + 96 \times \frac{4}{9} + 96 \times \frac{8}{27} + \ldots\right]$$

$$= 96 + 96 \times 2\left[\frac{2}{3} + \frac{4}{9} + \frac{8}{27} + \ldots\right]$$

$$= 96 + 192\left(\frac{\frac{2}{3}}{1 - \frac{2}{3}}\right) = 96 + 192\left(\frac{\frac{2}{3}}{\frac{1}{3}}\right)$$

$$= 96 + 192 \times 2 = 480 \text{ ft}$$

Introductory Exercise 18.3

1 Let A, G, H be the Arithmetic mean, Geometric mean and Harmonic mean of a and b respectively.

Then, we have

$$A = \frac{a + b}{2}, \quad G = \sqrt{ab}, \quad H = \frac{2ab}{a + b}$$

$$\therefore \qquad \text{A} \cdot \text{H} \cdot = \frac{a + b}{2} \times \frac{2ab}{a + b} = ab = G^2$$

$$\text{Again } A - G = \frac{a + b}{2} - \sqrt{ab} = \frac{a + b - 2\sqrt{ab}}{2}$$

$$= (\sqrt{a})^2 + (\sqrt{b})^2 - 2\sqrt{ab} = \frac{(\sqrt{a} - \sqrt{b})^2}{2} \geq 0$$

$$\therefore \qquad A \geq G$$

Again since $\text{A} \cdot \text{H} \cdot = G^2 = G \times G$

$$\therefore \qquad H \leq G \qquad (\because\ A \geq G)$$

i. e. $\qquad G \geq H$

$$\therefore \qquad A \geq G \geq H$$

Alternatively Let $a = 6$ and $b = 24$

$$\therefore \qquad \text{A.M.} = \frac{6 + 24}{2} = 15$$

and $\qquad \text{G.M.} = \sqrt{6 \times 24} = 12$

and $\qquad \text{H.M.} = \frac{2 \times 6 \times 24}{6 + 24} = 9.6$

$$\therefore \qquad \text{A.M.} > \text{G.M.} > \text{H.M.}$$

Hence (c) is the correct option.

NOTE The equality depends upon values as

$a = 2$ and $b = 2$

then A.M. = 2 and G.M. = 2 and H.M. = 2

then A.M. = G.M. = H.M.

2 Let a, b, c, d, e are taken such that a, b, c are in A.P. and b, c, d are in G.P. and c, d, e are in H.P. then

$$a, b, c, d, e$$

$$2, 4, 6, 9, 18$$

$$\therefore \qquad a \cdot e = c^2$$

Hence choice (b) is correct

3 $$\frac{a + b}{2} = 10 \quad \Rightarrow \quad a + b = 20$$

$$\sqrt{a \cdot b} = 8 \quad \Rightarrow \quad ab = 64$$

$$\therefore \qquad a, b = 16, 4 \quad \text{or} \quad 4, 16$$

$$\therefore \qquad \text{H.M.} = \frac{2 \times 4 \times 16}{(4 + 16)} = 6.4$$

NOTE $\text{G.M.} = \sqrt{\text{A.M.} \times \text{H.M.}}$

Hint Choices (a) and (b) are clearly wrong since H.M. ≤ G.M. ≤ A.M.

Now you are left with choices (c) and (d) only.

☑ Level 01 Basic Level Exercise

1 $$S_n = \frac{a(1-r^n)}{1-r}; \qquad r < 1$$

$$S_n = \frac{4095}{1024} = \frac{3(1-r^n)}{1-\frac{1}{4}}$$

$$\Rightarrow \quad \frac{4095}{1024} = 4(1-r^n) \Rightarrow \frac{4095}{4096} = 1 - r^n$$

$$\Rightarrow \quad r^n = \frac{1}{4096} \Rightarrow r^n = \left(\frac{1}{4}\right)^6$$

$$\Rightarrow \quad \left(\frac{1}{4}\right)^n = \left(\frac{1}{4}\right)^6 \qquad \left(\because \ r = \frac{1}{4}\right)$$

$$\Rightarrow \quad n = 6$$

2 Since $a > l$, therefore $r < 1$

Now, since $S_n = \frac{a - lr}{1-r}$ if $r < 1$

$$\therefore \quad \frac{5187}{625} = \frac{5 - \frac{32}{625}r}{1-r}$$

$$(1-r)\frac{5187}{625} = 5 - \frac{32r}{625} \quad \Rightarrow \quad r = \frac{2}{5}$$

3 $$r = \frac{2\sqrt{2}}{2\sqrt{3}} = \frac{\sqrt{3}}{2\sqrt{2}} = \frac{\sqrt{2}}{\sqrt{3}} = \sqrt{\frac{2}{3}}$$

$$\therefore \quad S_\infty = \frac{a}{1-r}; \ |r| < 1$$

$$= \frac{2\sqrt{3}}{1-\sqrt{\frac{2}{3}}} = \frac{2\sqrt{3} \times \sqrt{3}}{\sqrt{3} - \sqrt{2}} = \frac{6}{\sqrt{3} - \sqrt{2}} = 6(\sqrt{3} + \sqrt{2})$$

4 (Sum of odd terms – sum of even terms) $= 72 - 63$

$$\Rightarrow \frac{\text{number of terms}}{2} \times \text{common difference} = 9$$

$$\Rightarrow \quad nd = 18 \qquad \ldots(i)$$

($n \rightarrow$ number of terms, $d \rightarrow$ common difference)

Again $\quad l - a = 16.5$

$$\Rightarrow \quad (n-1)d = 16.5 \qquad \ldots(ii)$$

$\therefore$ From eqs. (i) and (ii), we get

$$d = 1.5 \quad \therefore \quad n = 12$$

5 Go through option

$$\left\{\begin{matrix}\text{First Pocket} \\ 4, 7, 10\end{matrix}\right\} \left\{\begin{matrix}\text{Second Pocket} \\ 5, 7, 9\end{matrix}\right\}$$

6 $$a \cdot b \cdot c = a \cdot ar \cdot ar^2 = 216$$

$$\Rightarrow \quad b = ar = 6 \qquad \ldots(i)$$

and $\quad ab + bc + ac = a \cdot ar + ar \cdot ar^2 + a \cdot ar^2 = 126$

$$\Rightarrow \quad a^2r + a^2r^3 + a^2r^2 = 126$$

$$\Rightarrow \quad a^2r + a^2r^3 = 90 \qquad (\because \ ar = 6)$$

$$\Rightarrow \quad 6a + 36r = 90$$

$$\Rightarrow \quad a + 6r = 15 \qquad \ldots(ii)$$

From equation (i) and (ii), we get

$$\frac{6}{r} + 6r = 15$$

$$\Rightarrow \quad 6r^2 - 15r + 6 = 0$$

$$\Rightarrow \quad r = 2 \quad \text{or} \quad \frac{1}{2}$$

$\therefore$ $a, ar, ar^2 = 3, 6, 12$ or $12, 6, 3$

$$\therefore \quad a + b + c = 21$$

Alternatively Go through options

7 Let a, b, c, d be in A.P. then $\frac{ad}{bc} = \frac{9}{10}$

Also $\quad a + b + c + d = 36$

$$\Rightarrow \quad (a + d) = (b + c) = 18$$

Now, go through options.

8 Let a, b, c, d be four integers in A.P.

then $\quad a + d = b + c = 12$

Since $a \cdot b \cdot c \cdot d = 945$, it means one of the a, b, c and d has its unit digit 5.

$\therefore$ Therefore the obvious possibility is $b = 5$

So, if $b = 5$, then $c = 7$

$$\therefore \quad a = 3 \quad \text{and} \quad d = 9$$

$$\therefore \quad a \cdot b \cdot c \cdot d = 3 \times 5 \times 7 \times 9 = 945$$

Hence the values of a, b, c and d are correct.

Therefore $\quad a \times d = 3 \times 9 = 27$

Alternatively Option a is not suitable as

$30 = 1 \times 30$ ✗
$30 = 2 \times 15$ ✗
$30 = 3 \times 10$ ✗
$30 = 5 \times 6$ ✗

Since difference between a and d must be divisible by 3.
Option (c) is not suitable as

$35 = 1 \times 35$ ✗
$35 = 5 \times 7$ ✗

Since the difference between a and d is not divisible by 3.
Option (d) is also wrong as

$39 = 1 \times 39$ ✗
$= 3 \times 13$ ✗

Since the difference between a and d is not divisible by 3.
Choice (b) is correct as

$27 = 1 \times 27$ ✗
$27 = 3 \times 9$ ✓

If $\quad a = 3 \quad \text{and} \quad d = 9$

then $\quad b = 5 \quad \text{and} \quad c = 7$

$$\therefore \quad a \cdot b \cdot c \cdot d = 945$$

NOTE Choices (a) and (d) are wrong since 30 and 39 are not the factors of 945.

Alternatively Find the factors of 945 and then find the required values of b and c under the condition

$$a + b + c + d = 24$$

9 $T_{11} + T_{12} + T_{13} = 114$

$\Rightarrow \quad T_{12} = \dfrac{114}{3} = 38$

$\Rightarrow \quad a + 11d = 38 \quad \ldots(i)$

and $T_{21} + T_{22} + T_{23} = 204$

$\Rightarrow \quad T_{22} = 68$

$\Rightarrow \quad a + 21d = 68 \quad \ldots(ii)$

From eq. (i) and (ii)

$10d = 30 \quad \Rightarrow \quad d = 3$

$\therefore \quad a = 5$

$\therefore \quad T_1 + T_2 + T_3 = 5 + 8 + 11 = 24$

Alternatively $(T_1 + T_2 + T_3) + (T_{21} + T_{22} + T_{23})$

$= 2(T_{11} + T_{12} + T_{13})$

$\Rightarrow \quad (T_1 + T_2 + T_3) + 204 = 2 \times 114$

$\Rightarrow \quad T_1 + T_2 + T_3 = 24$

10 $a + ar + ar^2 + ar^3 + \ldots \infty = 4$

$\Rightarrow \quad \dfrac{a}{1-r} = 4$

or $\dfrac{a^3}{(1-r)^3} = 64 \quad \ldots(i)$

and $a^3 + (ar)^3 + (ar^2)^3 + (ar^3)^3 + \ldots \infty = 192$

$= \dfrac{a^3}{1-r^3} = 192 \quad \ldots(ii)$

From eqs. (i) and (ii)

$64(1-r)^3 = (1-r^3)192$

$\Rightarrow \quad 2r^3 + 3r^2 - 3r - 2 = 0$

$r = -\dfrac{1}{2}, 1, -2$

But $|r| < 1$

$\therefore r = -\dfrac{1}{2}$ is the only admissible value

$\therefore \quad \dfrac{a}{1-r} = 4 \quad \Rightarrow \quad \dfrac{a}{1-\left(-\frac{1}{2}\right)} = 4 \quad \Rightarrow \quad a = 6$

11 $\dfrac{18500 - 12000}{500} = 13$ years

He has to work minimim 13 years to reach the highest scale of 18500.

12 1, 4, 7, 10, 13, 16, 19, 22, 25, 28, 31, 34, 37, …, 187

3, 7, 11, 15, 19, 23, 27, 31, 35, 39, …, 187

The Common terms are 7, 19, 31, 43, … 187

Therefore number of such terms $= \left(\dfrac{187-7}{12}\right) + 1 = 16$

13 $3^{1/3} \cdot 9^{1/18} \cdot 27^{1/81} \ldots = 3^{1/3} \cdot 3^{1/9} \cdot 3^{1/27} \ldots$

$= 3^{1/3 + 1/9 + 1/27 + \ldots}$

$= 3^{\left(\frac{1/3}{1-1/3}\right)} = 3^{1/2} = \sqrt{3}$

14 $1 + 4 + 9 + 16 + \ldots + n^2$

$= 1^2 + 2^2 + 3^2 + 4^2 + \ldots + n^2 = \dfrac{n(n+1)(2n+1)}{6}$

15 Put $n = 2$ and 3 and then check for the correct choice

Sum of 2 terms = 11

and Sum of 3 terms = 46

at $n = 2$, $\dfrac{1}{6} \times 2(3)(11) = 11$

and at $n = 3$, $\dfrac{1}{6} \times 3 \times 4 \times 23 = 46$

Hence choice (c) is correct.

16 Let x, y, z be 1, 2, 4 respectively

$\therefore \quad a^1 = b^2 = c^4$

$\Rightarrow \quad 16^1 = 4^2 = 2^4$

$\Rightarrow \quad a = 16, \quad b = 4 \quad \text{and} \quad c = 2$

$\therefore \quad \log_4 16 = \log_2 4$

$\Rightarrow \quad 2 = 2$

Hence choice (a) is correct.

17 Since 913952088 is divisible by 7

Alternatively $a = 119$

$a + d = 119 + 7 = 126$

$a + 2d = 119 + 14 = 133$

$\therefore$ The numbers which are divisible by 7 are

119, 126, 133, …, 113113 …

$\therefore$ Number of terms $= \left(\dfrac{113113 - 119}{7}\right) + 1 = 16143$

$\therefore \quad S_{16143} = \left(\dfrac{119 + 113113}{2}\right) \times 16143$

$= 913952088$

Hint The unit digit will be 8 as $\left(\dfrac{9+3}{2}\right) \times 3$

$\Rightarrow \quad 6 \times 3 \Rightarrow 8$

Hence only choice (b) is appropriate.

18 Going through options

$S_{21} - S_{20} = T_{21}$

$\Rightarrow \quad [3(21)^2 + 5] - [3(20)^2 + 5] = 3 \times 441 - 3 \times 400$

$= 3(41) = 123$

Thus choice (c) is correct.

19 Let us consider choice (a)

then $b - a = 3 - 4 = -1$

$c - b = 2 - 3 = -1$

$a = 4$

Which are not in G.P., hence wrong.

Now, let us consider choice (c)

$b - a = 1$

$c - b = 1$

$a = 1$

Since $b - a, c - b, a$ (*i. e.* 1, 1, 1) are in G.P. hence correct.

20 $n = 1$, $S_n = \frac{1}{2}$

$n = 2$, $S_n = \frac{5}{4} = \left(\frac{1}{2} + \frac{3}{4}\right)$

$n = 3$, $S_n = \frac{17}{8} = \left(\frac{1}{2} + \frac{3}{4} + \frac{7}{8}\right)$

Choice (a) is wrong

Since at $n = 2$, $S_2 = 3 \neq \frac{5}{4}$

Choice (b) is also wrong

Since at $n = 2$, $S_2 = \frac{3}{4} \neq \frac{5}{4}$

Choice (c) is also wrong

Since at $n = 2$, $S_2 = 3 \neq \frac{5}{4}$

Choice (d) is correct

Since at $n = 1$, $S_1 = \frac{1}{2}$

at $n = 2$, $S_2 = \frac{5}{4}$

at $n = 3$, $S_3 = \frac{17}{18}$

21 The required numbers are 1001, 1005, 1009, …, 9997 and total number of terms in the above A.P. is 2250.

$$\therefore \quad S_{2250} = \frac{(1001 + 9997)}{2} \times 2250 = \frac{10998}{2} \times 2250$$

$$= 5499 \times 2250 = 12372750$$

Hint Choice (a) is the only suitable option since last two digits in the resultant value must be 50.

22 Let 3, 5, 7, 9, 11, 13, … are in A.P.
where 5, 7, 9 and 11 are 4 arithmetic means between 3 and 13.

Hence choice (b) is correct.

Since $\frac{4}{2}(3 + 13) = 5 + 7 + 9 + 11$

$$32 = 32$$

23 Let 1, 2, 4, 8, 16 are in G.P.
then 2, 4, 8 are 3 geometric means between 1 and 16
Hence choice (c) is correct.

Since $(1 \times 16)^{3/2} = 2 \times 4 \times 8$

$$64 = 64$$

24. $a_1 + a_5 + a_{10} + a_{15} + a_{20} + a_{24} = 225$

$$\Rightarrow a_1 + (a_1 + 4d) + (a_1 + 9d) + (a_1 + 14d) + (a_1 + 19d) + (a_1 + 23d) = 225$$

$$\Rightarrow \quad 6a_1 + 69d = 225 \quad \ldots(i)$$

Now, $a_1 + a_2 + a_3 + a_4 + \ldots + a_{23} + a_{24} = 24a_1 + 276d$

$$= 4(6a_1 + 69d)$$

$$= 4 \times 225 = 900$$

25. $1^2 - 2^2 + 3^2 - 4^2 + 5^2 - 6^2 + 7^2 - 8^2 + \ldots$

$$= (1 - 2)(1 + 2) + (3 - 4)(3 + 4) + (5 - 6)(5 + 6) + (7 + 8)(7 - 8) + \ldots$$

$$= -(1 + 2) - (3 + 4) - (5 + 6) \ldots$$

$$= -[(1 + 2) + (3 + 4) + (5 + 6) + \ldots]$$

$$= -[1 + 2 + 3 + 4 + 5 + 6 + \ldots] = -\left[\frac{n(n+1)}{2}\right]$$

Alternatively Go through options.

26. If $n = 1$, then $6 + 8 = 14$

If $n = 2$, then $66 + 88 = 154$

If $n = 3$, then $666 + 888 = 1554$

Now, go through options.

If you put $n = 1, 2, 3$ etc. in choice (c) you will find satisfactory results.

27. If $n = 1$, then sum of 1st group = 1

If $n = 2$, then sum of 2nd group = 35

If $n = 3$, then sum of 3rd group = 405

Now, going through options, we get choice (b) is correct

since at $n = 1$, $Sg_1 = 1$

at $n = 2$, $Sg_2 = 35$

at $n = 3$, $Sg_3 = 405$

28. Let the numbers be $a - d$, a, $a + d$

then $(a - d)^2$, a^2, $(a + d)^2$ are in G.P.

$$\therefore \quad a^4 = (a - d)^2(a + d)^2$$

$$\Rightarrow \quad d^4 - 2a^2d^2 = 0$$

$$\Rightarrow \quad d = 0, \pm\sqrt{2}a$$

Hence d has three values.

29. Since we know that when $a \cdot b \cdot c = k$ (any constant value) then the minimum value of $a + b + c$ is obtained when $a = b = c$

$$\therefore \quad b^3 = 4 = 2^2$$

$$\Rightarrow \quad b = 2^{2/3}$$

Alternatively Since a, b, c are in A.P.

Therefore $a = b - d$ and $c = b + d$

where d is the common difference.

Now, $abc = 4 \Rightarrow (b - d) \cdot b \cdot (b + d) = 4$

$$\Rightarrow \quad b(b^2 - d^2) = 4$$

But $b \cdot (b^2 - d^2) < b \cdot b^2 \quad (\because \ b^2 - d^2 < b^2)$

$$\therefore \quad b(b^2 - d^2) < b^3$$

$$4 < b^3$$

$$\Rightarrow \quad 2^2 < b^3$$

$$\Rightarrow \quad 2^{2/3} < b$$

Hence the minimum value of b is $2^{2/3}$.

30. Let the three numbers be $\frac{a}{r}$, a, ar. As the numbers form an increasing G.P.

Therefore $r > 1$

Also $\frac{a}{r}$, $2a$, ar are in A.P.

$$\therefore \quad 2(2a) = \frac{a}{r} + ar$$

$\Rightarrow \quad r^2 - 4r + 1 = 0$

$\Rightarrow \quad r = 2 \pm \sqrt{3}$

$\Rightarrow \quad r = 2 + \sqrt{3} \qquad (\because \ 2 - \sqrt{3} < 1)$

Hint If you go through options then options (a) and (d) are inadmissible.

Since $2 - \sqrt{3} < 1$

and $\sqrt{3} - 2 < 1$

Now you have only two probable choices consider three terms in G.P. with $r = 2 + \sqrt{3}$ or $r = 3 + \sqrt{2}$ and then satisfy the condition.

31. Best approach is to go through options. Choice (c) is correct.

Let $r = 4$, then a, b, c can be 1, 4, 16

$\therefore \quad 16 > 4 \times 4 - 3 \times 1$

$\Rightarrow \quad 16 > 13$

Let $r = -5$ then a, b, c can be 1, – 5, 25

$\therefore \quad 25 > -5 \times 4 - 1 \times 3$

$\Rightarrow \quad 25 > -23$

Let $r = 2$ then a, b, c can be 1, 2, 4

$\therefore \quad 4 > 4 \times 2 - 3 \times 1$

$\Rightarrow \quad 4 > 5,$ which is wrong.

Hence choice (a) is wrong and choice (c) is correct also the range of choice (b) is the subset of the range of choice (c).

Alternatively Let a, b, c be the first three consecutive terms of G.P. with common ratio r, then

$$b = ar \quad \text{and} \quad c = ar^2$$

Now, $c > 4b - 3a$

$\Rightarrow \quad ar^2 > 4ar - 3a$

$\Rightarrow \quad r^2 > 4r - 3$

$\Rightarrow \quad r^2 - 4r + 3 > 0$

$\Rightarrow \quad (r - 1)(r - 3) > 0$

$\Rightarrow \quad r < 1 \quad \text{or} \quad r > 3$

32. Let d be the common difference of the A.P.

Then $a_3 \cdot a_7 \cdot a_{11} = (22 - 4d) \cdot 22 \cdot (22 + 4d)$

$= 88(121 - 4d^2)$

Obviously, R.H.S. is greatest for $d = 0$

33 Given that A.M. = 2 G.M.

$\Rightarrow \quad \dfrac{a + b}{2} = 2\sqrt{ab}$

$\Rightarrow \quad a + b = 4\sqrt{ab}$

Now, let us consider option (c).

$\therefore \quad (2 + \sqrt{3}) + (2 - \sqrt{3}) = 4\sqrt{(2 + \sqrt{3})(2 - \sqrt{3})}$

$4 = 4 \cdot 1$

$4 = 4$

Hence option (c) is correct.

Alternatively $a + b = 4\sqrt{ab}$

$\Rightarrow \quad (a + b)^2 = 16ab$

$\Rightarrow \quad a^2 + b^2 + 2ab = 16ab$

$\Rightarrow \quad a^2 + b^2 = 14ab$

$\Rightarrow \quad \dfrac{a}{b} + \dfrac{b}{a} = 14$

$\Rightarrow \quad x + \dfrac{1}{x} = 14 \qquad \left(\because \dfrac{a}{b} = x\right)$

$\Rightarrow \quad x^2 - 14x + 1 = 0$

$\Rightarrow \quad x = \dfrac{14 \pm \sqrt{192}}{2}$

$\Rightarrow \quad x = 7 \pm 4\sqrt{3}$

$\Rightarrow \quad \dfrac{a}{b} = 7 + 4\sqrt{3} = (2)^2 + (\sqrt{3})^2 + 4\sqrt{3}$

$\dfrac{a}{b} = (2 + \sqrt{3})^2 = \dfrac{2 + \sqrt{3}}{2 - \sqrt{3}}$

Now $x = 7 - 4\sqrt{3}$

$\Rightarrow x = \dfrac{2 - \sqrt{3}}{2 + \sqrt{3}} \neq \dfrac{a}{b}$, since a should be greater than b.

Hence, $x \neq 7 - 4\sqrt{3}$

34 The two sequences are

17, 21, 25, 29, 33, 37, 41, …, 417

16, 21, 26, 31, 36, 41, …, 466

The common terms are

21, 41, 61, 81, … 381, 401

$\therefore$ Number of terms (which are common) = 20

35 $S_n = \dfrac{1}{\sqrt{1} + \sqrt{3}} + \dfrac{1}{\sqrt{3} + \sqrt{5}} + \ldots \dfrac{1}{\sqrt{2n - 1} + \sqrt{2n + 1}}$

$= \dfrac{1}{2}[(\sqrt{3} - \sqrt{1}) + (\sqrt{5} - \sqrt{3}) + (\sqrt{7} - \sqrt{5}) + \ldots$

$+ \ldots (\sqrt{2n + 1} - \sqrt{2n - 1})]$

$= \dfrac{1}{2}(\sqrt{2n + 1} - 1)$

Alternatively Substitute $n = 1, 2, 3$ etc. and check the correct answer.

36 Let a be the first term and d be the common difference of the given A.P. then

$$T_m = \frac{1}{n} \quad \Rightarrow \quad a + (m - 1)d = \frac{1}{n} \qquad \ldots(i)$$

$$T_n = \frac{1}{m} \quad \Rightarrow \quad a + (n - 1)d = \frac{1}{m} \qquad \ldots(ii)$$

Solving Eqs. (i) and (ii), we get

$$d = \frac{1}{mn} \quad \text{and} \quad a = \frac{1}{mn}$$

$\therefore \quad T_{mn} = a + (mn - 1)d$

$= \dfrac{1}{mn} + (mn - 1)\dfrac{1}{mn} = 1$

Alternatively Let $m = 2$ and $n = 4$, then

$$T_2 = \frac{1}{4} \quad \text{and} \quad T_4 = \frac{1}{2}$$

$\therefore \quad a + d = \dfrac{1}{4} \qquad \ldots(i)$

and $a + 3d = \dfrac{1}{2} \qquad \ldots(ii)$

$\Rightarrow \quad 2d = \frac{1}{4} \Rightarrow d = \frac{1}{8}$

$\therefore \quad a = \frac{1}{4} - \frac{1}{8} = \frac{1}{8}$ [from Eq. (i)]

$\therefore \quad T_{mn} = T_8 = a + 7d$

$= \frac{1}{8} + 7 \times \frac{1}{8} = 1$

Hence (c) is the correct.

37 Go through options

Let $n = 2$, then $S_n = 3 + 6 = 9$

$\therefore \quad S_n = 2(3) + 2^2 - 1 = 9$

at $n = 3$, $S_n = 19$

$\therefore \quad S_n = 3 \times 4 + 2^3 - 1 = 19$

Hence choice (b) is correct.

Alternatively $3 + 6 + 10 + 16 + \ldots$

$= (2 + 4 + 6 + 8 + \ldots) + (1 + 2 + 4 + 8 + \ldots)$

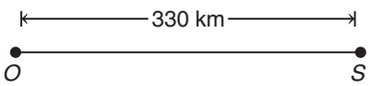
$= n(n + 1) + (2^n - 1)$

38 Total number of cells $= 2 + (2^2 + 2^3 + 2^4 + \ldots + 2^{12})$

$= 2^1 + 2^2 + 2^3 + \ldots + 2^{12}$

$= \frac{2(2^{12} - 1)}{2 - 1} = 8190$

39



Div. + Su. → Total

Ist day 30 + 20 → 50

2nd day 28 + 24 → 52

3rd day 26 + 28 → 54 and so on.

$\therefore \quad 50 + 52 + 54 + 56 + 58 + 60 = 330$

Hence required number of days = 6

40 Best way is to go through options

Let $n = 2$, then $S_n = S_2 = 1 + (1 + 2) = 4$

From option (b)

$S_2 = \frac{2 \times 3 \times 4}{6} = 4$

and for $n = 3$

$S_n = S_3 = 1 + (1 + 2) + (1 + 2 + 3) = 10$

$\therefore$ From choice (b), $S_3 = \frac{3 \times 4 \times 5}{6} = 10$

Hence choice (b) is correct.

Alternatively $T_n = \frac{n(n+1)}{2}$

$\therefore \quad S_n = \Sigma\left[\frac{n(n+1)}{2}\right] = \Sigma\left[\frac{n^2 + n}{2}\right] = \frac{1}{2}[\Sigma n^2 + \Sigma n]$

$= \frac{1}{2}\left[\frac{n(n+1)(2n+1)}{6} + \frac{n(n+1)}{2}\right]$

$= \frac{n(n+1)}{4}\left[\frac{2n+1}{3} + 1\right]$

$= \frac{n(n+1)}{4}\left[\frac{2n+4}{3}\right] = \frac{n(n+1)(n+2)}{6}$

41 $a = 2$ (since 3, 2, 1 are in A. P.)

$b = 3$ ($\therefore$ 2, 3, 6 are in H. P.) and $c = 6$

$\therefore \quad \left(\frac{1}{b} + \frac{1}{c} - \frac{1}{a}\right)\left(\frac{1}{c} + \frac{1}{a} - \frac{1}{b}\right) = \left(\frac{1}{3} + \frac{1}{6} - \frac{1}{2}\right)\left(\frac{1}{6} + \frac{1}{2} - \frac{1}{3}\right) = 0$

Check the option (a)

$\frac{3}{3^2} - \frac{2}{6} = 0$, which is satisfied

Again check the option (c)

$\frac{2}{bc} - \frac{1}{b^2} = \frac{2}{18} - \frac{1}{9} = 0$, which is also true.

Hence (d) is the most appropriate answer.

42 Go through options

$S_1 = 1 \cdot 3 \cdot 5 = 15$

and $S_2 = 1 \cdot 3 \cdot 5 + 3 \cdot 5 \cdot 7 = 120$ etc.

Now, put $n = 1$ in choice (b)

$1(2 + 8 + 7 - 2) = 15$

again put $n = 2$ in choice (b)

$2(16 + 32 + 14 - 2) = 120$

Hence choice (b) is correct.

NOTE For the certainity of the result you can check for $n = 3$ also.

Alternatively $T_n = (2n - 1)(2n + 1)(2n + 3)$

$= 8n^3 + 12n^2 - 2n - 3$

$\therefore \quad S_n = 8\Sigma n^3 + 12\Sigma n^2 - 2\Sigma n - 3n$

$= 8\left[\frac{n(n+1)}{2}\right]^2 + \frac{12(n)(n+1)(2n+1)}{6} - \frac{2(n)(n+1)}{2} - 3n$

$= n(2n^3 + 8n^2 + 7n - 2)$

43 $(1 - 2) + (3 - 4) + (5 - 6) + (7 - 8) + \ldots + (99 - 100)$

$= (-1) + (-1) + (-1) + (-1) + \ldots$ 50 times

$= -50$

44 The sum of an infinite G.P. $= \frac{x}{1 - r}$

$\therefore \quad \frac{x}{1 - r} = 5 \Rightarrow r = 1 - \frac{x}{5}$

$\because \quad |r| < 1 \Rightarrow \left|1 - \frac{x}{5}\right| < 1 \quad \Rightarrow 0 < x < 10$

Hence, choice (c) is the answer.

45 $1 \times 1 + 0 = 1$

$2 \times 2 + 1 = 5$

$3 \times 3 + 5 = 14$

$4 \times 4 + 14 = 30$

$5 \times 5 + 30 = 55$

$6 \times 6 + 55 = 91$

Hence, choice (a) is the answer.

46 Sum of the first 17 term $= 17 \times 7\frac{3}{17}$

Sum of the total 51 terms $= 51 \times 21\frac{9}{17}$

Sum of the last 34 terms $= 51 \times 21\frac{9}{17} - 17 \times 7\frac{3}{17}$

Therefore, the required ratio $= \dfrac{17 \times 7\frac{3}{17}}{51 \times 21\frac{9}{17} - 17 \times 7\frac{3}{17}}$

$$= \frac{17 \times \frac{122}{17}}{51 \times \frac{366}{17} - 17 \times \frac{122}{17}} = \frac{122}{3 \times 366 - 122}$$

$$= \frac{122}{122(3 \times 3 - 1)} = \frac{1}{8}$$

Hence, choice (b) is the correct one.

Hint Sum of n terms of an AP $= n \times$ mean of n terms

47 $n(n+1)(n+2)$

$$= n(n+1)(n+2)\frac{1}{4}[(n+3) - (n-1)]$$

$$= \frac{1}{4}[n(n+1)(n+2)(n+3) - (n-1)(n)(n+1)(n+2)]$$

Therefore, we have

$$3 \cdot 4 \cdot 5 = \frac{1}{4}[3 \cdot 4 \cdot 5 \cdot 6 - 2 \cdot 3 \cdot 4 \cdot 5]$$

$$4 \cdot 5 \cdot 6 = \frac{1}{4}[4 \cdot 5 \cdot 6 \cdot 7 - 3 \cdot 4 \cdot 5 \cdot 6]$$

… … … … … … … …

… … … … … … … …

$$28 \cdot 29 \cdot 30 = \frac{1}{4}[28 \cdot 29 \cdot 30 \cdot 31 - 27 \cdot 28 \cdot 29 \cdot 30]$$

Adding up all the terms we get,

$3 \cdot 4 \cdot 5 + 4 \cdot 5 \cdot 6 + 5 \cdot 6 \cdot 7 + \ldots 28 \cdot 29 \cdot 30$

$$= \frac{1}{4}[28 \cdot 29 \cdot 30 \cdot 31 - 2 \cdot 3 \cdot 4 \cdot 5] = 188760$$

Hence choice (b) is the correct one.

48 $p^{21} + p^{22} + p^{23} + \ldots + p^{399}$

$$= p^{21}(1 + p + p^2 + \ldots p^{378}) = p^{21}\left(\frac{p^{379} - 1}{p - 1}\right)$$

$$= (p^7)^3\left(\frac{[(p^7)^{54} \times p] - 1}{p - 1}\right) = (1)^3\left(\frac{(1 \times p) - 1}{p - 1}\right)$$

$$= 1 \times \left(\frac{p - 1}{p - 1}\right) = 1$$

Hence, choice (d) is the correct one.

49 Since $a > 0$ and $b \geq 9$. Therefore $a + b > 9$.

Similarly, since $a < 1$ and $b \leq 10$. Therefore $a + b < 11$.

Hence, choice (d) is the correct one.

☑ Level 02 Higher Level Exercise

1. Let us consider $d = 1$, then the A.P. is

$$1, 2, 3, 4, 5, 6, 7, 8$$

$\therefore$ $1 + 2 + 3 + 4 = 10$

and $5 + 6 + 7 + 8 = 26$

Again 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12

$\therefore$ $1 + 2 + 3 + 4 + 5 + 6 = 21$

and $7 + 8 + 9 + 10 + 11 + 12 = 57$

$\because$ $\dfrac{10}{26} \neq \dfrac{21}{57}$

hence $d \neq 1$

Now, consider $d = 2$, then the A.P. is

$$1, 3, 5, 7, 9, 11, 13, 15$$

$\therefore$ $1 + 3 + 5 + 7 = 16$

and $9 + 11 + 13 + 15 = 48$

Again 1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23

$\therefore$ $1 + 3 + 5 + 7 + 9 + 11 = 36$

and $13 + 15 + 17 + 19 + 21 + 23 = 108$

$\because$ $\dfrac{16}{48} = \dfrac{36}{108} \Rightarrow \dfrac{1}{3} = \dfrac{1}{3}$

Hence $d = 2$ is the correct answer.

Alternatively Let S_n denote the sum to n terms of the A.P. then,

$$\frac{S_n}{S_{2n} - S_n} = k \qquad \text{for every } n \geq 1$$

$$\Rightarrow \quad \frac{S_1}{S_2 - S_1} = \frac{S_2}{S_4 - S_2}$$

$$\Rightarrow \quad S_1 S_4 = S_2^2$$

$$\Rightarrow \quad a \cdot [2(2a + 3d)] = (2a + d)^2$$

$$\Rightarrow \quad 2ad = d^2$$

$$\Rightarrow \quad d = 2 \qquad (\because \ a = 1)$$

2 Number of divisors of 187 = 4

Number of divisors of 637 = 6

Number of divisors of 1001 = 8

Hence they are in A.P.

Hint To know more about how to find the number of divisors refer to chapter 1 "Fundamentals".

3 $S_1 = 1^2 = 1$

$S_2 = 1^2 + (1^2 + 3^2) = 11$

$S_3 = 1^2 + (1^2 + 3^2) + (1^2 + 3^2 + 5^2) = 46$

Now put $n = 1, 2, 3$ in choice (b) you will get

$$S_1 = \frac{1}{6} \times 1 \times 2 \times 3 = 1$$

$$S_2 = \frac{1}{6} \times 2(3)(11) = 11$$

$$S_3 = \frac{1}{6} \times 3(4)23 = 46$$

Hence choice (b) is correct.

Alternatively $t_r = 1^2 + 3^2 + 5^2 + \ldots + (2r-1)^2$

$$\therefore \quad = \sum_{k=1}^{r} (2k-1)^2 = \sum_{k=1}^{r} (4k^2 - 4k + 1)$$

$$= 4\left\{\frac{1}{6} r(r+1)(2r+1)\right\} - \frac{4}{2} r(r+1) + r$$

$$= \frac{1}{3}(4r^3 - r)$$

$$\therefore \quad S_n = \frac{4}{3} \sum_{r=1}^{n} r^3 - \frac{1}{3} \sum_{r=1}^{n} r$$

$$= \frac{4}{3} \cdot \frac{1}{4} n^2 (n+1)^2 - \frac{1}{3} \cdot \frac{1}{2} n(n+1)$$

$$= \frac{1}{6} n(n+1)(2n^2 + 2n - 1)$$

4 Since $|a| <$ and $|b| <$, therefore $|ab| = |a||b| < 1$

Also, $a(a+b) + a^2(a^2 + b^2) + a^3(a^3 + b^3) + \ldots$

$$= (a^2 + a^4 + a^6 + \ldots \infty) + (ab + a^2b^2 + a^3b^3 + \ldots \infty)$$

$$= \frac{a^2}{1-a^2} + \frac{ab}{1-ab}$$

5 Best way is to go through options by substituting the values of $n = 1, 2, 3, \ldots$

Alternatively $\frac{3}{1^2 \cdot 2^2} + \frac{5}{2^2 \cdot 3^2} + \frac{7}{3^2 \cdot 4^2} + \ldots$

$$= \left(1 - \frac{1}{2^2}\right) + \left(\frac{1}{2^2} - \frac{1}{3^2}\right) + \ldots + \left(\frac{1}{n^2} - \frac{1}{(n+1)^2}\right)$$

$$= 1 - \frac{1}{(n+1)^2} = \frac{n^2 + 2n}{(n+1)^2}$$

6 Best way is to go through options by substituting the values.

Sum of the terms of first row = 1

Sum of the terms of second row = 2 + 3 = 5

Sum of the terms of third row = 4 + 5 + 6 = 15 etc.

7 We have $\underbrace{1\,1\,1 \ldots 1}_{119 \text{ times}} = 10^{118} + 10^{117} + \ldots + 10^2 + 10^1 + 1$

$$= \frac{(10^{119} - 1)}{10 - 1} = \left(\frac{10^{119} - 1}{10^7 - 1}\right)\left(\frac{10^7 - 1}{10 - 1}\right)$$

$$= (10^{112} + 10^{105} + 10^{98} + \ldots 1)$$

$$(10^6 + 10^5 + \ldots 10 + 1)$$

Thus $\underbrace{1\,1\,1 \ldots 1}_{119 \text{ terms}}$ is not a prime number.

8 Since we know that the sum of the interior angles of a polygon of n sides is $(n-2)\pi$

$$\therefore \quad \frac{n}{2}[2(120) + (n-1)5] = (n-2)180 \Rightarrow n = 9, 16$$

But if $n = 16$, then the greatest angle will be 195° and other interior angles are 190°, 185°, 180°. But no interior angle of a polygon can be equal to 180°. Hence $n = 9$.

9 If $n = 1$, then $1 + 10^4 = 10001 = 73 \times 137$

$\therefore 10^4 + 1$ is a composite number.

10 $0.1\overline{23} = \frac{1}{10} + \frac{23}{10^3} + \frac{23}{10^5} + \frac{23}{10^7} + \ldots$

$$= \frac{1}{10} + \frac{\frac{23}{10^3}}{1 - \left(\frac{1}{10^2}\right)}$$

$$= \frac{1}{10} + \frac{23}{1000 - 10} = \frac{122}{990} = \frac{61}{495}$$

11

$$11 - 2 = 9 = 3^2$$

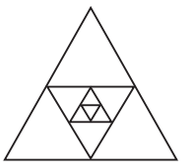
$$1111 - 22 = 1089 = 33^2$$

$$111111 - 222 = 110889 = 333^2$$

$$11111111 - 2222 = 11108889 = 3333^2 \text{ etc.}$$

12 Perimeter of the outer most triangle is 72 cm and perimeter of the second outer most triangle is 36 cm.

Similarly perimeter of the third outermost triangle is 18 cm.



$\therefore$ Sum of perimeters of all such triangles

$$= 72 + 36 + 18 + 9 + 4.5 + \ldots \infty \qquad \left(\because \ S_\infty = \frac{a}{1-r}\right)$$

$$= \frac{72}{1 - \frac{1}{2}} = \frac{72}{\frac{1}{2}} = 144 \text{ cm}$$

13 Go through options.

14 $\log a + \log \frac{a^3}{b} + \log \frac{a^5}{b^2} + \log \frac{a^7}{b^3} + \ldots + \log \frac{a^{2n-1}}{b^{n-1}}$

$$= \log a \times \frac{a^3}{b} \times \frac{a^5}{b^2} \times \frac{a^7}{b^3} \times \ldots \times \frac{a^{2n-1}}{b^{n-1}}$$

$$= \log \frac{a^{(1+3+5+7+\ldots+2n-1)}}{b^{(1+2+3+4+\ldots+n-1)}} = \log \frac{a^{n^2}}{b^{(n-1)n/2}}$$

$$= \log \left(\frac{a^{2n}}{b^{n-1}}\right)^{n/2}$$

15 ${}_{(0.2)}\log_{\sqrt{5}}\left(\frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \ldots\right) = {}_{(0.2)}\log_{\sqrt{5}}\left(\frac{1}{2}\right)$

$$= {}_{(5^{-1})}\log_{\sqrt{5}}\left(\frac{1}{2}\right)$$

$$= {}_{5}\log_{\sqrt{5}} 2 \qquad (\because \ m \log n = \log (n)^m)$$

$$= {}_{(\sqrt{5})^2}\log_{\sqrt{5}}(2)$$

$$= {}_{(\sqrt{5})}\log_{\sqrt{5}}(4) \qquad (\because \ {}_a\log_a b = b)$$

$$= 4$$

16 Since a, b, c are in H.P.

Therefore we can assume $a = 2$, $b = 3$, $c = 6$

$\therefore \quad \dfrac{b+a}{b-a} + \dfrac{b+c}{b-c} = \dfrac{5}{1} + \dfrac{9}{-3} = 2$

17 Let $r = \dfrac{1}{2}$, then $(a, b, c) = (4, 2, 1)$

$\therefore \quad (a, 2b, 3c) = (4, 4, 3)$ which are not in A.P.

Again if $r = \dfrac{1}{3}$ then

$$(a, b, c) = (9, 3, 1)$$

$\therefore \ (a, 2b, 3c) = (9, 6, 3)$ which are in A.P.

Hence choice (c) is correct.

18 Let $\quad S = \dfrac{5}{13} + \dfrac{55}{(13)^2} + \dfrac{555}{(13)^3} + \dfrac{5555}{(13)^4} + \ldots \infty$

$\therefore \quad \dfrac{S}{13} = \dfrac{5}{(13)^2} + \dfrac{55}{(13)^3} + \dfrac{555}{(13)^4} + \dfrac{5555}{(13)^5} + \ldots \infty$

$\therefore \quad \left(S - \dfrac{S}{13}\right) = \dfrac{5}{13} + \dfrac{50}{(13)^2} + \dfrac{500}{(13)^3} + \dfrac{5000}{(13)^4} + \ldots \infty$

$$S\left(1 - \frac{1}{13}\right) = \frac{5}{13} + \frac{5}{13}\left(\frac{10}{13}\right) + \frac{5}{13}\left(\frac{10}{13}\right)^2 + \frac{5}{13}\left(\frac{10}{13}\right)^3 + \ldots \infty$$

$$\frac{12}{13}S = \frac{5/13}{3/13} \qquad \left(\because \ S_\infty = \frac{a}{1-r}\right)$$

$$\frac{12}{13}S = \frac{5}{3} \quad \Rightarrow \quad S = \frac{65}{36}$$

19 Let $\quad S = \dfrac{1}{1\cdot 4} + \dfrac{1}{4\cdot 7} + \dfrac{1}{7\cdot 10} + \ldots \infty$

$$\Rightarrow \quad S = \frac{1}{3}\left[\frac{3}{1\cdot 4} + \frac{3}{4\cdot 7} + \frac{3}{7\cdot 10} + \ldots \infty\right]$$

$$\Rightarrow \quad S = \frac{1}{3}\left[\left(\frac{1}{1} - \frac{1}{4}\right) + \left(\frac{1}{4} - \frac{1}{7}\right) + \left(\frac{1}{7} - \frac{1}{10}\right) + \ldots \infty\right]$$

$$\Rightarrow \quad S = \frac{1}{3}[1] \quad \therefore \quad S = \frac{1}{3}$$

20. Let us add up one more number a_{n+1} to the given sequence such that $|a_{n+1}| = |a_n + 1|$.

Now, squaring all the numbers, we get

$$a_1^2 = 0$$
$$a_2^2 = a_1^2 + 2a_1 + 1$$
$$a_3^2 = a_2^2 + 2a_2 + 1$$
$$a_4^2 = a_3^2 + 2a_3 + 1$$
$$\ldots \ldots \ldots$$
$$\ldots \ldots \ldots$$
$$a_n^2 = a_{n-1}^2 + 2a_{n-1} + 1$$
$$a_{n+1}^2 = a_n^2 + 2a_n + 1$$

$\therefore \quad a_1^2 + a_2^2 + a_3^2 + \ldots + a_{n+1}^2 = a_1^2 + a_2^2 + \ldots + a_n^2 + 2(a_1 + a_2 + \ldots + a_n) + n$

$$\Rightarrow \quad 2(a_1 + a_2 + \ldots + a_n) = -n + a_{n+1}^2 \geq -n$$

$$\Rightarrow \quad \frac{a_1 + a_2 + \ldots + a_n}{n} \geq -\frac{1}{2}$$

21 Let a, b, c, d are the first consecutive terms in G.P.

Let us consider choice (a)

$\therefore \quad \dfrac{b+c}{2} = 5 \quad \Rightarrow \quad b + c = 10$

Now if $(b, c) = (1, 9)$, then a and d can not be found so that $a + b + c + d = 30$.

Similarly $(b, c) = (2, 8)$, $(3, 7)$, $(4, 6)$, $(5, 5)$ are also not suitable.

Again consider choice (b)

$\therefore \quad \dfrac{b+c}{2} = 6 \quad \Rightarrow \quad b + c = 12$

Now if $(b, c) = 4, 8$, then $a = 2$ and $d = 16$

$\therefore \quad a + b + c + d = 30$

Hence this can be the correct answer.

Further $a^2 + b^2 + c^2 + d^2 = 4 + 16 + 64 + 256 = 340$

Hence choice (b) is correct.

Alternatively Let a, ar, ar^2, ar^3 be the 4 consecutive terms of G.P. then

$\therefore \quad a + ar + ar^2 + ar^3 = 30 \qquad \ldots(i)$

and $\quad a^2 + a^2r^2 + a^2r^4 + a^2r^6 = 340 \qquad \ldots(ii)$

clearly $r \neq 1$

$[\because \ (a + ar + ar^2 + ar^3)^2 \neq 4(a^2 + a^2r^2 + a^2r^4 + a^2r^6)]$

$$\therefore \quad \frac{(1 + r + r^2 + r^3)^2}{(1 + r^2 + r^4 + r^6)} = \frac{(30)^2}{340} = \frac{45}{17}$$

$$\Rightarrow \quad \frac{\left[\dfrac{(r^4 - 1)}{(r - 1)}\right]^2}{\left(\dfrac{r^8 - 1}{r^2 - 1}\right)} = \frac{45}{17} \qquad (\because \ r \neq 1)$$

$$\Rightarrow \quad \frac{(r^4 - 1)^2}{(r - 1)^2} \cdot \frac{(r^2 - 1)}{(r^8 - 1)} = \frac{45}{17}$$

$$\Rightarrow \quad \frac{(r^4 - 1)(r^4 - 1)(r - 1)(r + 1)}{(r - 1)(r - 1)(r^4 - 1)(r^4 + 1)} = \frac{45}{17}$$

$$\Rightarrow \quad \frac{(r^4 - 1)}{(r - 1)} \cdot \frac{(r + 1)}{(r^4 + 1)} = \frac{45}{17}$$

$$\Rightarrow \quad (r^3 + r^2 + r - 1) \cdot \frac{(r + 1)}{(r^4 + 1)} = \frac{45}{17}$$

$$\Rightarrow 17r^4 + 34r^3 + 34r^2 + 34r + 17 = 45r^4 + 45$$

$$\Rightarrow \ 14r^4 - 17r^3 - 17r^2 - 17r + 14 = 0$$

Dividing by r^2, we get

$$14\left(r^2 + \frac{1}{r^2}\right) - 17\left(r + \frac{1}{r}\right) - (17) = 0$$

$$\Rightarrow \quad 14\left[\left(r+\frac{1}{r}\right)^2-2\right]-17\left(r+\frac{1}{r}\right)-17=0$$

$$\Rightarrow \quad 14y^2-17y-45=0$$

$$\Rightarrow \quad y=\frac{17\pm\sqrt{17^2+4\times14\times45}}{28}$$

$$\Rightarrow \quad y=\frac{17\pm\sqrt{2809}}{28}=\frac{17\pm53}{28}=\frac{5}{2},-\frac{9}{7}$$

$$\therefore \quad \left(r+\frac{1}{r}\right)=\frac{5}{2} \quad \Rightarrow \quad r=2,\frac{1}{2}$$

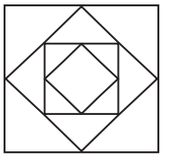
and $\left(r+\frac{1}{r}\right)=-\frac{9}{7}$ has no real roots.

$\therefore$ when $r=2$, $a=2$

and when $r=\frac{1}{2}$, $a=16$

Thus the required progression is 2, 4, 8, 16, 32, 64, … or 16, 8, 4, 2, 1, $\frac{1}{2}$, …

22 Side of the first square is 4 cm, side of the second square is $2\sqrt{2}$ cm and side of the third square is 2 cm and so on. *i. e.*, each side of first, second , third square …



$=4, 2\sqrt{2}, 2, \sqrt{2}, 1, \frac{1}{\sqrt{2}}, \ldots$

$\therefore$ Area of each of first, second, third square …

$$=16, 8, 4, 2, 1, \frac{1}{2}, \ldots$$

$\therefore$ Sum of the area of first, second, third square …

$$=16+8+4+2+\ldots=\frac{16}{1-\left(\frac{1}{2}\right)}=32\,\text{cm}^2$$

23 Best way consider some suitable values to check it physically.

Let A.P. be 2, 9.5, 17, 24.5, 32

and G.P. be 2, 4, 8, 16, 32

$\therefore \quad A_s=2+9.5+17+24.5+32=85$

and $\quad G_s=2+4+8+16+32=62$

Since $\quad A_s>G_s$

Hence option (a) is the correct.

NOTE For the fool proof testing you can consider some more values (*i.e.,* Progressions)

24 Consider any A.P. and G.P. as per the given conditions …, then

A.P. 2, 4, 6, 8, 10, 12, 14, …

G.P. 2, 4, 8, 16, 32, 64, …

Hence $a_i<g_i$ for $i>2$ and $i\in N$

NOTE You can consider some more examples and then you will find that only choice (b) is correct.

25 $\frac{1^1+2^1+3^1+4^1}{1+2+3+4}=1$

$\frac{1^3+2^3+3^3+4^3}{1+2+3+4}=\frac{100}{10}=10$ and so on.

26 Let the A.P. be 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, …

where $\quad p=1, \quad q=2, \quad r=4, \quad s=8$

$\therefore \quad p-q=-1$ and $q-r=-2$ and $r-s=-4$

Hence $(p-q)$, $(q-r)$ and $(r-s)$ are in G.P. with common ratio 2 and first term – 1.

27 $2^0+2^1+2^2+2^3+2^4+2^5=1+2+4+8+16+32=63$

28 $n=5$

The weight of each stone (in kg) is

1, 3, 9, 27, 81

1 kg = 1 kg
2 kg = 3 – 1 = 2 kg
3 kg = 3 kg
4 kg = (3 + 1) = 4 kg
5 kg = 9 – (3 + 1) = 5 kg
6 kg = (9 – 3) = 6 kg
7 kg = (9 + 1) – 3 = 7 kg
8 kg = (9 – 1) = 8 kg
9 kg = 9 kg
10 kg = (9 + 1) = 10 kg and so on.

Remember he is allowed to put the stones on either side of the balance.

29

$T_1=3^1-2$

$T_2=3^2-2$

$T_3=3^3-2$

$T_4=3^4-2$

30 Try with the options.

31 2^1 – 1 souls become ghost in 1 second

2^2 – 1 souls become ghost in 2 second

2^3 – 1 souls become ghost in 3 second

2^4 – 1 souls become ghost in 4 second

$\therefore$ $(2^{43200}-1)$ souls become ghost in 43200 seconds.

32 Assume some values of n and k and then verify the correct answer.

Alternatively At a particular moment there are x souls left.

Just 1 second before there are

$$2^1x+1=2^1x+2^1-1 \text{ souls}$$

Just 2 seconds before there are

$$2^2x+2+1=2^2x+2^2-1 \text{ souls}$$

Just 3 seconds before there are

$$2^3x + 2^2 + 2 + 1 = 2^3x + 2^3 - 1 \text{ souls}$$

Hence n seconds before there are $2^nx + 2^n - 1$ souls left.

33 Savings = Income – Expenditure

Savings on Ist day = 3 – 3 = 0

Savings on 2nd day = 6 – 5 = 1

Savings on 3rd day = 11 – 7 = 4

Savings on 4th day = 18 – 9 = 9

$\therefore$ Total savings

$$= 1240 = 0 + 1 + 4 + 9 + 16 + 25 + \ldots + 225$$

This will take 16 days.

34 Check through options.

Let us consider choice (a)

	E	M	L	T		
Lucknow (G.P.)	1	1	1	1	}	4
Kanpur (A.P.)	1	2	3	4	}	10

It is wrong since $M = E$

Again	E	M	L	T		
Lucknow (G.P.)	1	2	4	8	}	15
Kanpur (A.P.)	1	3	5	7	}	16

It is wrong since $15 \neq \frac{3}{2} \times 16$, also $2 \neq 3$

Again	E	M	L	T		
Lucknow (G.P.)	1	3	9	27	}	40
Kanpur (A.P.)	1	4	7	10	}	22

It is also wrong since $40 \neq \frac{3}{2} \times 22$, also $3 \neq 4$

Again	E	M	L	T		
Lucknow (G.P.)	2	4	8	16	}	30
Kanpur (A.P.)	2	4	6	8	}	20

It is correct since number of monkeys and number of elephants in both the places are equal respectively. Also total number of animals in zoological park is 50% more than that of Local zoo in Kanpur.

36 Go through options

Let $n = 4$, then

$$S_n = -1 + 1^2 - 2 + 2^2 = 2$$

form option (a) $\frac{4 \times 17}{3} = \frac{68}{3} \neq 2$

from option (b) $16 + 4 = 20 \neq 2$

from option (c) $\frac{4 \times 15}{3} = 20 \neq 2$

Hence choice (d) is correct.

37 Let $S = 1 + \frac{2}{3} + \frac{4}{9} + \frac{6}{27} + \frac{8}{81} + \frac{10}{243} + \ldots \infty$

$\therefore \quad 3(S) = 3 + 2 + \frac{4}{3} + \frac{6}{9} + \frac{8}{27} + \frac{10}{81} + \ldots \infty$

$\therefore \quad 2(S) = 4 + \frac{2}{3} + \frac{2}{9} + \frac{2}{27} + \frac{2}{81} + \ldots \infty$

$\therefore \quad 2(S) = 4 + 2\left(\frac{1}{3} + \frac{1}{9} + \frac{1}{27} + \frac{1}{81} + \ldots \infty\right)$

$\Rightarrow \quad 2(S) = 4 + 2\left[\frac{\frac{1}{3}}{1 - \left(\frac{1}{3}\right)}\right]$

$\Rightarrow \quad 2(S) = 4 + 1$

$\Rightarrow \quad 2(S) = 5 \ \therefore \ S = \frac{5}{2}$

38 $\log a + \log \frac{a^2}{b} + \log \frac{a^3}{b^2} + \log \frac{a^4}{b^3} + \ldots + \log \frac{a^n}{b^{n-1}}$

$$= \log\left(a \cdot \frac{a^2}{b} \cdot \frac{a^3}{b^2} \cdot \frac{a^4}{b^3} \cdots \frac{a^n}{b^{n-1}}\right)$$

$$= \log\left[\frac{a^{(1+2+3+4+\ldots+n)}}{b^{(1+2+3+4+\ldots+(n-1))}}\right]$$

$$= \log\left[\frac{a^{\frac{n(n+1)}{2}}}{b^{\frac{(n+1)n}{2}}}\right] = \log\left[\frac{a^{(n+1)}}{b^{(n-1)}}\right]^{n/2}$$

39 Go through options

Let 1, 2, 3, 4, 5, … be an A.P. then

$$\frac{1}{\sqrt{a_1} + \sqrt{a_2}} + \frac{1}{\sqrt{a_2} + \sqrt{a_3}} + \frac{1}{\sqrt{a_3} + \sqrt{a_4}} + \frac{1}{\sqrt{a_4} + \sqrt{a_5}}$$

$$= \frac{1}{\sqrt{1} + \sqrt{2}} + \frac{1}{\sqrt{2} + \sqrt{3}} + \frac{1}{\sqrt{3} + \sqrt{4}} + \frac{1}{\sqrt{4} + \sqrt{5}}$$

$$= -(\sqrt{1} - \sqrt{2}) - (\sqrt{2} - \sqrt{3}) - (\sqrt{3} - \sqrt{4}) - (\sqrt{4} - \sqrt{5})$$

$$= \sqrt{5} - \sqrt{1}$$

$$= \sqrt{5} - \sqrt{1} \times \frac{\sqrt{5} + \sqrt{1}}{\sqrt{5} + \sqrt{1}} = \frac{5 - 1}{\sqrt{5} + \sqrt{1}}$$

$$= \frac{4}{\sqrt{1} + \sqrt{5}} = \frac{n - 1}{\sqrt{a_1} + \sqrt{a_n}}$$

Alternatively $\frac{1}{\sqrt{a_1} + \sqrt{a_2}} + \frac{1}{\sqrt{a_2} + \sqrt{a_3}} + \frac{1}{\sqrt{a_3} + \sqrt{a_4}} + \ldots + \frac{1}{\sqrt{a_{n-1}} + \sqrt{a_n}}$

$$= \frac{\sqrt{a_2} - \sqrt{a_1}}{(\sqrt{a_2} + \sqrt{a_1})(\sqrt{a_2} - \sqrt{a_1})} + \frac{\sqrt{a_3} - \sqrt{a_2}}{(\sqrt{a_3} + \sqrt{a_2})(\sqrt{a_3} - \sqrt{a_2})} + \ldots + \frac{\sqrt{a_n} - \sqrt{a_{n-1}}}{(\sqrt{a_n} + \sqrt{a_{n-1}})(\sqrt{a_n} - \sqrt{a_{n-1}})}$$

$$= \frac{\sqrt{a_2} - \sqrt{a_1}}{a_2 - a_1} + \frac{\sqrt{a_3} - \sqrt{a_2}}{a_3 - a_2} + \ldots + \frac{\sqrt{a_n} - \sqrt{a_{n-1}}}{a_n - a_{n-1}}$$

$$= \frac{\sqrt{a_2} - \sqrt{a_1}}{d} + \frac{\sqrt{a_3} - \sqrt{a_2}}{d} + \ldots + \frac{\sqrt{a_n} - \sqrt{a_{n-1}}}{d}$$

$$= \frac{1}{d}[(\sqrt{a_2} - \sqrt{a_1}) + (\sqrt{a_3} - \sqrt{a_2}) + \ldots + (\sqrt{a_n} - \sqrt{a_{n-1}})]$$

$$= \frac{1}{d}[\sqrt{a_n} - \sqrt{a_1}] = \frac{a_n - a_1}{d(\sqrt{a_n} + \sqrt{a_1})} = \frac{n - 1}{\sqrt{a_n} + \sqrt{a_1}} = \frac{n - 1}{\sqrt{a_1} + \sqrt{a_n}}$$

40 Go through options. Remember if $\log a$, $\log b$, $\log c$ are in A.P., then a, b, c are in G.P.

$\therefore$ 2, $(2^x - 3)$ and $\left(\frac{17}{2} + 2^{x-1}\right)$ must be in G.P.

Let $x = 3$, then the value of $2^x - 3 = 5$

and $$\frac{17}{2} + 2^{x-1} = \frac{25}{2}$$

Since 2, 5, $\frac{25}{2}$ are in G.P.

Hence, the given terms of the sequence are in A.P.

41 Combining all of the three relations we get $x = y^{-1} = z^3$

$\therefore 1, \log_y x, \log_z y, -15 \log_x z$

$\Rightarrow 1, -1, -3, -5$, which are in A.P.

Hence, choice (d) is most appropriate.

42 Let $x = 1, y = 2, z = 4$

$\therefore$ $$a = 16, \quad b = 4, \quad c = 2 \qquad (\because\ a^x = b^y = c^z)$$

$\therefore$ $$\log_b a \cdot \log_b c = \log_4 16 \cdot \log_4 2$$

$$= (2 \log_4 4) \cdot \left(\frac{\log 2}{2 \log 2}\right)$$

$$= (2 \cdot 1)\left(\frac{1}{2}\right) = 1$$

43 Go through options.

Let us consider choice (b)

$$x = 1 - \log_2 5 = \log_2 2 - \log_2 5 = \log_2\left(\frac{2}{5}\right)$$

$\therefore \log_2(5 \cdot 2^x + 1), \log_4(2^{1-x} + 1), 1$

$$= \log_2(5 \cdot 2^{\log_2 2/5} + 1), \log_4(2^{1 - \log_2 2/5} + 1), 1$$

$$= \log_2\left(5 \times \frac{2}{5} + 1\right), \log_4\left(\frac{2}{2^{\log_2 2/5}} + 1\right), 1$$

$$= \log_2 3, \log_4\left(\frac{2}{2/5} + 1\right), 1$$

$$= \log_2 3, \log_4 6, 1 = \log_4 9, \log_4 6, \log_4 4$$

$\because$ 9, 6, 4 are in G.P.

Hence the assumed choice (b)is correct.

Hint If a, b, c are in G.P. then $\log a$, $\log b$, $\log c$ are in A.P.

44 Very similar to the previous problem.

45 Let $x = e$, $y = e^2$ and $z = e^3$, then

$$\frac{1}{1 + \ln e}, \frac{1}{1 + \ln e^2} + \frac{1}{1 + \ln e^3} = \frac{1}{1+1}, \frac{1}{1+2}, \frac{1}{1+3}$$

$$= \frac{1}{2}, \frac{1}{3}, \frac{1}{4} \text{ which are in H.P.}$$

46 Let d be the common difference of the A.P.

then $$a_{10} = 3$$

$\Rightarrow$ $$a_1 + 9d = 3$$

$\Rightarrow$ $$2 + 9d = 3$$

$\Rightarrow$ $$d = \frac{1}{9}$$

$\therefore$ $$a_4 = a_1 + 3d = 2 + \frac{1}{3} = \frac{7}{3}$$

Let D be the common difference of

$$\frac{1}{h_1}, \frac{1}{h_2}, \ldots, \frac{1}{h_{10}}$$

Then, $$h_{10} = 3$$

$\Rightarrow$ $$\frac{1}{h_{10}} = \frac{1}{3}$$

$\Rightarrow$ $$\frac{1}{h_1} + 9D = \frac{1}{3}$$

$\Rightarrow$ $$\frac{1}{2} + 9D = \frac{1}{3}$$

$\Rightarrow$ $$D = -\frac{1}{54}$$

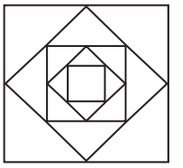
$\therefore$ $$\frac{1}{h_7} = \frac{1}{h_1} + 6D = \frac{1}{2} - \frac{1}{9} = \frac{7}{18}$$

$\Rightarrow$ $$h_7 = \frac{18}{7}$$

$\therefore$ $$a_4 h_7 = \frac{7}{3} \times \frac{18}{7} = 6$$

47 $$S_4 < 1 \text{ cm}^2$$

Therefore the side of square also be less than 1 cm.



$\therefore$ $$l_1 = 10, \quad l_2 = \frac{10}{\sqrt{2}},$$

$$l_3 = \frac{10}{2}, \quad l_4 = \frac{10}{2\sqrt{2}}$$

$$l_5 = \frac{10}{4}, \quad l_6 = \frac{10}{4\sqrt{2}},$$

$$l_7 = \frac{10}{8}, \quad l_8 = \frac{10}{8\sqrt{2}}$$

Hence $$l_8 = \frac{10}{8\sqrt{2}} < 1 \text{ cm}$$

$\therefore$ $$\text{area of } S_8 < 1 \text{ cm}^2$$

where $l_1, l_2, \ldots, l_{10}$ are the lengths of sides of different squares, from outwards to inwards.

48 $G_2 = \sqrt{A_1 H_1} = \sqrt{\frac{a+b}{2} \times \frac{2ab}{a+b}} = \sqrt{ab}$

Similarly, $G_3 = \sqrt{A_2 H_2}$

$$= \sqrt{\frac{A_1 + H_1}{2} \times \frac{2A_1 H_1}{A_1 + H_1}} = \sqrt{A_1 H_1} = \sqrt{ab}$$

$\therefore$ $$G_1 = G_2 = G_3 = \ldots$$

Hence, choice (c) is the correct one.

49 $A_1 = \frac{a+b}{2}, G_1 = \sqrt{ab}$ and $H_1 = \frac{2ab}{a+b}$

$A_n = \frac{A_{n-1} + H_{n-1}}{2}$;

$G_n = \sqrt{A_{n-1}H_{n-1}}$; $H_n = \dfrac{2A_{n-1}H_{n-1}}{A_{n-1} + H_{n-1}}$

Now, A_2 is A.M. of A_1 and H_1, but $A_1 > H_1$

$\Rightarrow \quad A_1 > A_2 > H_1$

Similarly, A_3 is A.M. of A_2 and H_2, but $A_2 > H_2$

$\Rightarrow \quad A_2 > A_3 > H_2$

$\therefore \quad A_1 > A_2 > A_3 > \ldots$

Hence, choice (a) is the correct one.

50 $H_2 = \dfrac{2A_1H_1}{A_1 + H_1}$

$\Rightarrow \quad \dfrac{1}{A_1} + \dfrac{1}{H_1} = 2\left(\dfrac{1}{H_2}\right)$

$\Rightarrow \quad \dfrac{1}{H_2}$ is the A.M. of $\dfrac{1}{A_1}$ and $\dfrac{1}{H_1}$, but $\dfrac{1}{A_1} < \dfrac{1}{H_1}$

$\Rightarrow \quad \dfrac{1}{A_1} < \dfrac{1}{H_2} < \dfrac{1}{H_1} \Rightarrow H_2 > H_1$

Similarly, $H_3 = \dfrac{2A_2H_2}{A_2 + H_2}$

$\Rightarrow \quad \dfrac{1}{A_2} + \dfrac{1}{H_2} = 2\left(\dfrac{1}{H_3}\right)$

$\Rightarrow \dfrac{1}{H_3}$ is the A.M. of $\dfrac{1}{A_2}$ and $\dfrac{1}{H_2}$, but $\dfrac{1}{A_2} < \dfrac{1}{H_2}$

$\Rightarrow \quad \dfrac{1}{A_2} < \dfrac{1}{H_3} < \dfrac{1}{H_2} \Rightarrow H_3 > H_2$

$\therefore \quad H_1 < H_2 < H_3 < \ldots$

Hence, choice (c) is the correct one.

51 $\dfrac{S_m}{S_n} = \dfrac{a_1 + a_2 + \ldots + a_{5n}}{a_1 + a_2 + \ldots + a_n} = \dfrac{\frac{5n}{2}[2 \times 3 + (5n-1)d]}{\frac{n}{2}[2 \times 3 + (n-1)d]}$

$\Rightarrow \dfrac{S_m}{S_n} = \dfrac{5(6 + 5nd - d)}{(6 + nd - d)}$

$\dfrac{S_m}{S_n}$ will be independent of n when $d = 6$.

Therefore $a_2 = a_1 + d = 3 + 6 = 9$

Hence, choice (b) is the answer.

52 Let α, β be the roots of the equation, then

$\alpha + \beta = \dfrac{4 + \sqrt{5}}{5 + \sqrt{2}}$ and $\alpha \cdot \beta = \dfrac{8 + 2\sqrt{5}}{5 + \sqrt{2}}$

Therefore HM of α, $\beta = \dfrac{2(\alpha \cdot \beta)}{\alpha + \beta} = 4$

Hence, choice (b) is the answer.

53 $a_{10} = a_1 + 9d$

$\Rightarrow \quad 3 = 2 + 9d$

$\Rightarrow \quad d = \dfrac{1}{9}$

$\Rightarrow \; a_4 = a_1 + 3d = 2 + \dfrac{1}{3} = \dfrac{7}{3}$

And since $h_1, h_2, \ldots, h_{10}$ are in H.P., then $\dfrac{1}{h_1}, \dfrac{1}{h_2}, \ldots, \dfrac{1}{h_{10}}$ are in A.P.

Therefore $\dfrac{1}{h_{10}} = \dfrac{1}{h_1} + 9D$

$\Rightarrow \quad D = \dfrac{-1}{54}$

So, $\dfrac{1}{h_7} = \dfrac{1}{h_1} + 6D$

$\Rightarrow \quad \dfrac{1}{h_7} = \dfrac{7}{18}$

Thus, $a_4h_7 = \dfrac{7}{3} \times \dfrac{18}{7} = 6$

Hence, choice (d) is the answer.

54 $a(n) = 1 + \dfrac{1}{2} + \dfrac{1}{3} + \dfrac{1}{4} + \ldots + \dfrac{1}{(2^n) - 1}$

$\Rightarrow \quad a(n) = 1 + \left(\dfrac{1}{2} + \dfrac{1}{3}\right) + \left(\dfrac{1}{4} + \ldots + \dfrac{1}{7}\right) + \left(\dfrac{1}{8} + \ldots + \dfrac{1}{15}\right) + \ldots + \left(\dfrac{1}{2^{n-1}} + \ldots + \dfrac{1}{2^n - 1}\right)$

$\Rightarrow \quad a(n) < 1 + \left(\dfrac{1}{2} + \dfrac{1}{2}\right) + \left(\dfrac{1}{4} + \ldots + \dfrac{1}{4}\right) + \left(\dfrac{1}{8} + \ldots + \dfrac{1}{8}\right) + \ldots + \left(\dfrac{1}{2^{n-1}} + \ldots + \dfrac{1}{2^{n-1}}\right)$

$\Rightarrow \quad a(n) < 1 + \left(\dfrac{2}{2}\right) + \left(\dfrac{4}{4}\right) + \left(\dfrac{8}{8}\right) + \ldots + \left(\dfrac{2^{n-1}}{2^{n-1}}\right)$

$\Rightarrow \quad a(n) < \underbrace{1 + 1 + 1 + \ldots + 1}_{n \text{ times}}$

$\Rightarrow \quad a(n) < n$

$\Rightarrow \quad a(100) < 100$

Again, $a(n) = 1 + \dfrac{1}{2} + \dfrac{1}{3} + \dfrac{1}{4} + \ldots + \dfrac{1}{(2^{n-1}) - 1} + \dfrac{1}{(2^n) - 1}$

$\Rightarrow \quad a(n) = 1 + \dfrac{1}{2} + \left(\dfrac{1}{3} + \dfrac{1}{4}\right) + \left(\dfrac{1}{5} + \ldots + \dfrac{1}{8}\right) + \ldots + \left(\dfrac{1}{(2^{n-1}) + 1} + \ldots + \dfrac{1}{2^n - 1} + \dfrac{1}{2^n}\right) - \dfrac{1}{2^n}$

$\Rightarrow a(n) > 1 + \dfrac{1}{2} + \left(\dfrac{1}{4} + \dfrac{1}{4}\right) + \left(\dfrac{1}{8} + \ldots + \dfrac{1}{8}\right) + \ldots + \left(\dfrac{1}{2^n} + \ldots + \dfrac{1}{2^n}\right) - \dfrac{1}{2^n}$

$\Rightarrow \quad a(n) > 1 + \underbrace{\dfrac{1}{2} + \dfrac{1}{2} + \dfrac{1}{2} + \ldots + \dfrac{1}{2}}_{n \text{ times}} - \dfrac{1}{2^n}$

$\Rightarrow \quad a(n) > 1 + \dfrac{n}{2} - \dfrac{1}{2^n}$

$\Rightarrow \quad a(200) > 1 + \dfrac{200}{2} - \dfrac{1}{2^{200}}$

$\Rightarrow \quad a(200) > 100 + \left(1 - \dfrac{1}{2^{200}}\right) > 100$

Hence, choice (b) is the answer.

55 $S = 1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \ldots + \frac{1}{2^{32}}$

$\Rightarrow S = 1 + \left[\left(\frac{1}{2}\right) + \left(\frac{1}{3} + \frac{1}{4}\right) + \left(\frac{1}{5} + \frac{1}{6} + \frac{1}{7} + \frac{1}{8}\right) + \left(\frac{1}{9} + \ldots + \frac{1}{16}\right) + \left(\frac{1}{17} + \frac{1}{18} + \ldots + \frac{1}{32}\right) + 32\,\text{sets}\right]$

$\Rightarrow S > 1 + \left[\left(\frac{1}{2}\right) + \left(\frac{1}{4} + \frac{1}{4}\right) + \left(\frac{1}{8} + \frac{1}{8} + \frac{1}{8} + \frac{1}{8}\right) + \left(\frac{1}{16} + \ldots + \frac{1}{16}\right) + \left(\frac{1}{32} + \frac{1}{32} + \ldots + \frac{1}{32}\right) + \ldots 32\,\text{sets}\right]$

$\Rightarrow S > 1 + \left[\left(\frac{1}{2}\right) + \left(\frac{1}{2}\right) + \left(\frac{1}{2}\right) + \left(\frac{1}{2}\right) + \left(\frac{1}{2}\right) + \ldots 32\,\text{sets}\right]$

$\Rightarrow S > 1 + \left(\frac{1}{2}\right) \times 32$

$\Rightarrow S > 1 + (16) \quad \Rightarrow S > 17$

Now, solve the same series for upper limit, as explained below.

$S = 1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \ldots + \frac{1}{2^{32}}$

$\Rightarrow S = \left[\left(\frac{1}{1}\right) + \left(\frac{1}{2} + \frac{1}{3}\right) + \left(\frac{1}{4} + \frac{1}{5} + \frac{1}{6} + \frac{1}{7}\right) + \left(\frac{1}{8} + \frac{1}{9} + \ldots \frac{1}{15}\right) + \left(\frac{1}{16} + \frac{1}{17} + \ldots + \frac{1}{31}\right) + 32 \ldots \text{sets}\right]$

$\Rightarrow S < \left[\left(\frac{1}{1}\right) + \left(\frac{1}{2} + \frac{1}{2}\right) + \left(\frac{1}{4} + \frac{1}{4} + \frac{1}{4} + \frac{1}{4}\right) + \left(\frac{1}{8} + \frac{1}{8} + \ldots \frac{1}{8}\right) + \left(\frac{1}{16} + \frac{1}{16} + \ldots + \frac{1}{16}\right) + \ldots 32\,\text{sets}\right]$

$\Rightarrow S < [1 + (1) + (1) + (1) + (1) + \ldots 32\text{sets}] + \frac{1}{2^{32}}$

$\Rightarrow S < (1) \times 32 + \frac{1}{2^{32}} \quad \Rightarrow S < 32 + \frac{1}{2^{32}}$

$\Rightarrow S < 32 + \left(\frac{1}{2}\right) \qquad \left(\because \frac{1}{2^{32}} < \frac{1}{2}\right)$

$\Rightarrow S < 32\frac{1}{2}$

Therefore, $17 < S < 32\frac{1}{2}$

Hence, choice (c) is correct.

Alternatively $\frac{1}{1} + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \ldots + \frac{1}{n} = \sum_{i-1}^{n} \frac{1}{i}$

$\because \quad \ln(n+1) \le \sum_{i=1}^{n} \frac{1}{i} \le \ln(n) + 1$

$\therefore \quad \ln(2^{32} + 1) \le \sum_{i=1}^{2^{32}} \frac{1}{i} \le \ln(2^{32}) + 1;$

$(\ln 2^{32} = 32 \ln 2 = 32 \times 0.693 = 22.18)$

$\Rightarrow \quad 22.18 \le \sum_{i=1}^{n} \frac{1}{i} \le 22.18 + 1$

$\Rightarrow \quad 22.18 \le \sum_{i=1}^{n} \frac{1}{i} \le 23.18$

$\Rightarrow \quad 22.18 < S < 23.18$

Hence, choice (c) is correct.

NOTE Whenever you see this problem in the exam, just find the value of natural log of that number.

56 As you know that AM ≥ GM, so $\frac{a^3p + b^3q}{2} \ge \sqrt{(a^3p)(b^3q)}$

$\Rightarrow \quad a^3p + b^3q \ge 2[(a^2b^3)(apq)]^{1/2}$

$\Rightarrow \quad a^3p + b^3q \ge 2[(a^2b^3)(9b)]^{1/2}$

$\Rightarrow \quad a^3p + b^3q \ge 2[9(a^2b^4)]^{1/2}$

$\Rightarrow \quad a^3p + b^3q \ge 6ab^2$

Hence, choice (a) is the correct one.

57 $a + b = 10 \Rightarrow b = (10 - a)$

And the total distance completed by them = $3a^2 + b^2$

$\Rightarrow \quad 3a^2 + (10 - a)^2$

$\Rightarrow \quad 4a^2 - 20a + 100 \quad \Rightarrow \quad (2a - 5)^2 + 75$

So, when $2a - 5 = 0$ or $a = \frac{5}{2}$, the above expression will have the minimum value. Thus the minimum distance covered by them is 75 km.

Hence choice (a) is the correct one.

58 Using the property, A.M. ≥ G.M., you will have

$\frac{a^{-5} + a^{-4} + a^{-3} + a^{-3} + a^{-3} + 1 + a^8 + a^{10}}{8} \ge 1$

$\Rightarrow \quad a^{-5} + a^{-4} + a^{-3} + a^{-3} + a^{-3} + 1 + a^8 + a^{10} \ge 8$

Hence, choice (a) is the correct answer.

Hint $\text{GM} = \sqrt[8]{a^{-5} \times a^{-4} \times a^{-3} \times a^{-3} \times a^{-3} \times 1 \times a^8 \times a^{10}}$

$= \sqrt[8]{a^0} = 1$

59 The best way is to substitute some numerals in place of variables (a, b, c) then test the validity against various given choices.

Let us consider $a = b = c = 1$, then $p = 8^7$. It shows that choices (a), (b) and (c) are wrong.

Hence, choice (d) is the answer.

Alternatively $(1 + a)(1 + b)(1 + c)$

$= 1 + a + b + ab + bc + ac + abc$

$\Rightarrow (1 + a)(1 + b)(1 + c) - 1$

$= a + b + c + ab + bc + ac + abc$

Now, using the property AM ≥ GM

$\Rightarrow \frac{(1 + a)(1 + b)(1 + c) - 1}{7} \ge (a \cdot b \cdot c \cdot ab \cdot bc \cdot ac \cdot abc)^{1/7}$

$\Rightarrow (1 + a)(1 + b)(1 + c) - 1 \ge 7(a^4b^4c^4)^{1/7}$

$\Rightarrow \quad (1 + a)(1 + b)(1 + c) \ge 7(a^4b^4c^4)^{1/7}$

$\Rightarrow \quad (1 + a)(1 + b)(1 + c)^7 \ge 7^7(a^4b^4c^4)$

60 Choice (c) is the correct one.

☑ Level 03 *Final Round*

1 Total number of bacterias after 10 seconds

$$= 3^{10} - 3^5 = 3^5(3^5 - 1)$$

since just after 10 seconds all the bacterias (*i. e.* 3^5) are dead after living for 5-5 seconds.

2 $S_{20} = 2^{66} - 2^{65} - 2^{64} - 2^{63} - 2^{62} - \ldots - 2^{47}$

$= 2^{65}(2-1) - 2^{64} - 2^{63} - \ldots - 2^{47}$

$= 2^{65} - 2^{64} - 2^{63} - \ldots - 2^{47}$

$= 2^{64}(2-1) - 2^{63} - \ldots - 2^{47}$

$= 2^{64} - 2^{63} - 2^{62} - \ldots - 2^{47}$

$= 2^{63}(2-1) - 2^{62} - \ldots - 2^{47}$

$= 2^{63} - 2^{62} - 2^{61} - \ldots - 2^{47}$

$\ldots \quad \ldots \quad \ldots$

$\ldots \quad \ldots \quad \ldots$

$= 2^{47}$

3 Since $S_{67} = 2^0 \qquad (\because\ S_n = 2^{67-n})$

$S_{66} = 2^1$

$S_{65} = 2^2$

$S_{64} = 2^3$

$S_{63} = 2^4$

$\ldots \quad \ldots \quad \ldots$

$\ldots \quad \ldots \quad \ldots$

$S_{34} = 2^{33}$ etc.

Now, $U_m = S_m + S_{m+1} + S_{m+2} + \ldots + S_{m+(m-1)}$

$\therefore \quad U_{34} = S_{34} + S_{35} + S_{36} + \ldots + S_{67}$

$\Rightarrow \quad U_{34} = 2^{33} + 2^{32} + 2^{31} + \ldots + 2^0$

$\Rightarrow \quad U_{34} = 1 + 2^1 + 2^2 + 2^3 + \ldots + 2^{32} + 2^{33}$

$\Rightarrow \quad U_{34} = (2^{33} - 1)$

4 Consider an A. P, then go through options

Let 1, 2, 3, 4, 5, 6 be an A.P. with 6 terms

i. e. $3n = 6, \quad 2n = 4 \quad$ and $\quad n = 2$

$\therefore \quad S_3 - S_2 - S_1$

$= (1 + 2 + \ldots 6) - (1 + 2 + 3 + 4) - (1 + 2)$

$= 21 - 10 - 3 = 8$

Choice (a) gives

$S_3 - S_2 - S_1 = 3a - 2n - d = 3 - 4 - 1$

$= -2$, hence wrong

Check the choice (d)

$S_3 - S_2 - S_1 = 2n^2 d = 8$

Hence it is correct.

Alternatively Since $S_3 - S_2 - S_1$ is independent of a (*i.e.,* first term).

Hence only choice (d) is correct.

5

$T_n = n$	$n + 3$	$n + 5$	$n + 7$	$n + 9$
$T_1 = 1$	4	6	8	10
$T_2 = 2$	5	7	9	11
$T_3 = 3$	6	8	10	12
$T_4 = 4$	7	9	11	13
$T_5 = 5$	8	10	12	14
$T_6 = 6$	9	11	13	15
$T_7 = 7$	10	12	14	16
$T_8 = 8$	11	13	15	17
$T_n = 9$	12	14	16	18

In general when $n = 4, 9, 13, 17, \ldots,$ 99 does not contain 5 or its multiple.

i. e. $n = 5k - 1$ where $k = 1, 2, 3, \ldots, 20$

Hence out of 99 sets 20 sets does not contain the 5 or its multiples.

Thus the required number of sets = 99 – 20 = 79

6 Let $S = \{\sqrt{1}\} + \{\sqrt{2}\} + \{\sqrt{3}\} + \{\sqrt{4}\} + \ldots + \{\sqrt{99}\} + \{\sqrt{100}\}$

$\Rightarrow \quad S = 1 + 2 + 2 + 2 + 3 + 3 + 3 + 3 + 3 + \ldots + 10$

$\Rightarrow \quad S = 1 + 3(2) + 5(3) + 7(4) + 9(5) + \ldots + 19(10)$

Since $\quad T_n = (2n-1)n = 2n^2 - n$

$\therefore \quad S_n = \Sigma(2n^2 - n) = 2\Sigma n^2 - \Sigma n$

$$= \frac{2n(n+1)(2n+1)}{6} - \frac{n(n+1)}{2}$$

$$= \frac{n(n+1)}{2}\left[\frac{2}{3}(2n+1) - 1\right]$$

$$= \frac{n(n+1)}{2}\left[\frac{4n+2-3}{3}\right]$$

$$= \frac{n(n+1)(4n-1)}{6}$$

$$\therefore \quad S_{10} = \frac{10 \times 11 \times 39}{6} = 715$$

7 Let $S = [\sqrt{1}] + [\sqrt{2}] + [\sqrt{3}] + \ldots + [\sqrt{323}]$

$\Rightarrow \quad S = 1 + 1 + 1 + 2 + 2 + 2 + 2 + 2 + \ldots + 17 + 17$

$\Rightarrow \quad S = 1(3) + 2(5) + 3(7) + 4(9) + \ldots + 17(35)$

$\because \quad T_n = n(2n+1)$

$\therefore \quad S_n = \Sigma\, n(2n+1) = 2\Sigma n^2 + \Sigma n$

$$= \frac{2 \cdot n(n+1)(2n+1)}{6} + \frac{n(n+1)}{2}$$

$$= \frac{n(n+1)}{2}\left[\frac{2}{3}(2n+1) + 1\right]$$

$$= \frac{n(n+1)}{2}\left[\frac{4n+5}{3}\right] = \frac{n(n+1)(4n+5)}{6}$$

$$\therefore \quad S = \frac{17 \times 18 \times 73}{6} = 3723$$

8 This can be done only by giving the number of coins as $2^0, 2^1, 2^2, 2^3, 2^4, \ldots$ etc.

So, the amounts are 1, 2, 4, 8, 16, 32, 37.

Hence (c) is the correct answer.

9 $(1 + 37) = (32 + 4 + 2)$

Hence, 3 people are required.

10 $(1 + 2 + 37) = (32 + 8)$

Hence 2 people are required.

12 1, 2, 4, 8, 16, 32, 64, 73

13 Since there are only 5 people left with their amount viz. 1, 4, 16, 64, 73, (excluding 2, 8, 32).

So total number of combinations are $2^5 - 1 = 31$

Hence option (c) is correct.

14 $$1 + 2 + 4 + 8 + 16 + 32 = 63$$
$$3(1 + 2 + 4 + 8 + 16 + 32) = 189$$
$$200 - 189 = 11$$

15 First of all choice (c) is ruled out since 'a' can not be zero.

Again choice (a) is ruled out because $|r| < 1$

Now let us check the option (b)

$$S_\infty = 3 + \left(-\frac{3}{2}\right) + \frac{9}{4} + \left(-\frac{27}{8}\right) + \ldots \infty$$

$$\therefore \quad S_\infty = \frac{3}{1 - \left(-\frac{1}{2}\right)} = \frac{3}{\frac{3}{2}} = 2$$

Again, $$27 - \frac{27}{8} + \frac{729}{64} - \ldots \infty$$

$$S_\infty = \frac{27}{1 - \left(-\frac{1}{8}\right)} = \frac{27}{\frac{9}{8}} = 24$$

Hence choice (b) is the appropriate choice.

Alternatively $S_1 = \dfrac{a}{1 - r} = 2$

$$S_2 = \frac{a^3}{1 - r^3} = 24$$

By solving these two equations, we get

$$a = 3, \quad r = -\frac{1}{2}$$

16 When you check option (a) it will be proved wrong. Again for convenience consider option (c) 2, 5, 8, 11, …

then first term of that G.P. = 3

and the common ratio of G.P. = 2

Hence G.P. = 3, 6, 12, 24, …

So $a_1 + a_2 = 9$, which is correct.

and S_n of A.P. $= \dfrac{10}{2}[2 \times 2 + 9 \times 3] = 155$

which is also correct. Hence choice (c) is correct.

Similarly choice (b) is also correct.

Hence choice (d) is most appropriate.

Alternatively $a, a + d, a + 2d, \ldots$ be an A.P. and $A, Ar, Ar^2, Ar^3 \ldots$ be a G.P.

then, $$\frac{n}{2}[2a + (n - 1)d] = 155$$

$$5[2a + 9d] = 155$$

$$2a + 9d = 31 \qquad \ldots(i)$$

Again $$A + Ar = 9$$

$$d + ad = 9 \qquad \ldots(ii)$$

Solving eqs. (i) and (ii) by substitution method,

$$a = 2, \frac{25}{2} \quad \text{and} \quad d = 3, \frac{2}{3}$$

Thus A.P. $\rightarrow$ 2, 5, 8,11, …

G.P. $\rightarrow$ 3, 6, 12, 24, …

or A.P. $\rightarrow \dfrac{25}{2}, \dfrac{79}{6}, \dfrac{83}{6}, \ldots$

G.P. $\rightarrow \dfrac{2}{3}, \dfrac{25}{3}, \dfrac{625}{6}, \ldots$

Thus choice (d) is correct.

17 $$\frac{a}{1 - r} = 162, \quad \frac{a(1 - r^n)}{1 - r} = 160$$

$$\therefore \quad 1 - r^n = \frac{80}{81} \quad \Rightarrow \quad r^n = \frac{1}{81}$$

Now, since $\dfrac{1}{r} \in Z$

$$\therefore \quad \frac{1}{r^n} = 81 \quad \Rightarrow \quad \frac{1}{r} = 3^{4/n}$$

$$\Rightarrow \therefore \quad n = 1, 2, 4$$

Here 1, 2, 4 are the factors of 4.

Hence

n	r	a
1	$\frac{1}{81}$	160
2	$\frac{1}{9}, -\frac{1}{9}$	144 and 180
4	$\frac{1}{3}, -\frac{1}{3}$	108 and 216

Hence option (d) is correct.

19 $$a_k = 2a_{k-1} - a_{k-2}$$

$\Rightarrow a_{k-2} + a_k = 2a_{k-1}$.

Therefore $a_1, a_2, a_3, \ldots, a_{11}$ are in AP.

Let's assume that the common difference of this AP is d, then

$$a_1 = 15, a_2 = 15 + d, a_3 = 15 + 2d, \ldots, a_{11} = 15 + 10d$$

$$\therefore \quad \frac{a_1^2 + a_2^2 + \ldots + a_{11}^2}{11} = 90$$

$$\Rightarrow \quad \frac{(15)^2 + (15 + d)^2 + \ldots + (15 + 10d)^2}{11} = 90$$

$$\Rightarrow \frac{[11(15)^2] + d^2[(1)^2 + (2)^2 + \ldots + (10)^2] + 2 \times 15d(1 + 2 + \ldots + 10)}{11} = 90$$

$\Rightarrow \quad 7d^2 + 30d + 27 = 0$

$\Rightarrow \quad d = -3 \text{ or } d = -\frac{9}{7}$

Since, $a_2 < \frac{27}{2}$, therefore $d = -3$

$\therefore \quad \frac{a_1 + a_2 + a_3 + \ldots + a_{11}}{11} = \frac{15 + 12 + 9 + \ldots + (-15)}{11} = 0$

Hence, choice (a) is the answer.

20 $V_r = \frac{r}{2}[2r + (r-1)(2r-1)] = \frac{1}{2}(2r^3 - r^2 + r)$

$\therefore \quad V_1 + V_2 + \ldots + V_n = \sum_{r=1}^{n} \frac{1}{2}(2r^3 - r^2 + r)$

$= \sum_{r=1}^{n} (r^3) - \frac{1}{2}\sum_{r=1}^{n} (r^2) + \frac{1}{2}\sum_{r=1}^{n} (r)$

$= \left(\frac{n(n+1)}{2}\right)^2 - \frac{1}{2}\left(\frac{n(n+1)(2n+1)}{6}\right) + \frac{1}{2}\left(\frac{n(n+1)}{2}\right)$

$= \frac{1}{12} n(n+1)(3n^2 + n + 2)$

Hence choice (b) is the answer.

21 $T_r = V_{r+1} - V_r - 2$

$\Rightarrow T_r = \left[\frac{1}{2}2\{(r+1)^3 - (r+1)^2 + (r+1) - 2 - \frac{1}{2}(2r^3 - r^2 + r) - 2\right]$

$\Rightarrow \quad T_r = 3r^2 + 2r + 1$

$\Rightarrow \quad T_r = (r+1)(3r-1)$

It implies that T_r is a composite number.

Hence, choice (d) is the answer.

22 $T_r = 3r^2 + 2r + 1$

And $\quad T_{r+1} = 3(r+1)^2 + 2(r+1) + 1 = 3r^2 + 8r + 4$

$\therefore \quad Q_r = T_{r+1} - T_r$

$\Rightarrow \quad Q_r = 6r + 5$

$\Rightarrow \quad Q_{r+1} = 6(r+1) + 5$

$\Rightarrow \quad Q_{r+1} - Q_r = 6$

Therefore, common difference = 6

Hence, choice (b) is the answer.

23 $a_n = \frac{3}{4} - \left(\frac{3}{4}\right)^2 + \left(\frac{3}{4}\right)^3 + \ldots + (-1)^{n-1}\left(\frac{3}{4}\right)^n$

$\Rightarrow \quad a_n = \frac{\frac{3}{4}\left[1 - \left(-\frac{3}{4}\right)^n\right]}{1 + \frac{3}{4}} = \frac{3}{7}\left[1 - \left(-\frac{3}{4}\right)^n\right]$

Now, since $b_n = 1 - a_n \Rightarrow b_n + a_n = 1$

But $b_n > a_n \Rightarrow b_n > \frac{1}{2}$ and $a_n < \frac{1}{2}$

$\therefore \quad \frac{3}{7}\left[1 - \left(-\frac{3}{4}\right)^n\right] < \frac{1}{2}$

$\Rightarrow \quad -\frac{1}{6} < \left(-\frac{3}{4}\right)^n$

It implies that the minimum natural number $n_0 = 6$

Hence, choice (d) is the answer.

24 Total runs = runs scored in (1st math match + 2nd match + … + nth match)

$\left(\frac{n+1}{4}\right)(2^{n+1} - n - 2) = \sum_{k=1}^{n} k \cdot 2^{n+1-k}$

$\Rightarrow \quad \left(\frac{n+1}{4}\right)(2^{n+1} - n - 2) = 2^{n+1}\sum_{k=1}^{n} \frac{k}{2^k}$

The best way to solve this problem is to go though the options.

Choice (d) : $n = 3$, then $\left(\frac{n+1}{4}\right)(2^{n+1} - n - 2) = 11$

And $2^{3+1}\sum_{k=1}^{3} \frac{k}{2^k} = 16\left(\frac{1}{2} + \frac{2}{4} + \frac{3}{8}\right) = 22$

Therefore, choice (d) is not valid.

Choice (c) : $n = 7$, then $\left(\frac{n+1}{4}\right)(2^{n+1} - n - 2) = 494$

And $2^{7+1}\sum_{k=1}^{7} k/2^k$

$= 256\left(\frac{1}{2} + \frac{2}{4} + \frac{3}{8} + \frac{4}{16} + \frac{5}{32} + \frac{6}{64} + \frac{7}{128}\right) = 494$

Therefore, choice (c) is valid.

Hence, choice (c) is the correct answer.

Alternatively $\left(\frac{n+1}{4}\right)(2^{n+1} - n - 2) = \sum_{k=1}^{n} k \cdot 2^{n+1-k}$

$\Rightarrow \quad \left(\frac{n+1}{4}\right)(2^{n+1} - n - 2) = 2^{n+1}\sum_{k=1}^{n} \frac{k}{2^k}$

$\Rightarrow \left(\frac{n+1}{4}\right)(2^{n+1} - n - 2)$

$= 2^{n+1}\left(\frac{1}{2^1} + \frac{2}{2^2} + \frac{3}{2^3} + \ldots + \frac{n}{2^n}\right)$

$\Rightarrow \quad \left(\frac{n+1}{4}\right)(2^{n+1} - n - 2) = 2^{n+1}\left[2\left(1 - \frac{1}{2^n} - \frac{n}{2^{n+1}}\right)\right]$

$\Rightarrow \quad \left(\frac{n+1}{4}\right)(2^{n+1} - n - 2) = 2(2^{n+1} - n - 2)$

$\Rightarrow \quad \left(\frac{n+1}{4}\right) = 2 \Rightarrow n = 7$

Hint The expression $\left(\frac{1}{2^1} + \frac{2}{2^2} + \frac{3}{2^3} + \ldots + \frac{n}{2^n}\right)$ is an Arithmetico-Geometric Progression.

Let us consider $P = \left(\frac{1}{2^1} + \frac{2}{2^2} + \frac{3}{2^3} + \ldots + \frac{n-1}{2^{n-1}} + \frac{n}{2^n}\right)$

Therefore $2P = \left(\frac{1}{2^0} + \frac{2}{2^1} + \frac{3}{2^2} + \ldots + \frac{n-1}{2^{n-2}} + \frac{n}{2^{n-1}}\right)$

$\Rightarrow 2P - P = \frac{1}{2^0} + \frac{1}{2^1} + \frac{1}{2^2} + \frac{1}{2^3} + \ldots + \frac{1}{2^{n-1}} - \frac{n}{2^n}$

$\Rightarrow P = \left(1 + \frac{1}{2} + \frac{1}{2^2} + \frac{1}{2^3} + \ldots + \frac{1}{2^{n-1}}\right) - \frac{n}{2^n}$

$\Rightarrow P = 2\left(1 - \frac{1}{2^n}\right) - \frac{n}{2^n}$

$\Rightarrow P = 2\left(1 - \frac{1}{2^n} - \frac{n}{2^{n+1}}\right)$

25 Since the length of each side of S_n equals the length of the diagonal of S_{n+1}. So the each side of S_{n+1} is $\frac{1}{\sqrt{2}}$ times that of S_n. Thus the area of S_{n+1} is half the area of S_n. So the answer can be obtained directly through finding the area of squares for $n = 1, 2, 3$, etc. Then, there is no need to calculate the side of different squares.

Choice	n	Side of S_n	Area of S_n
-	1	10	100
-	2	$10/\sqrt{2}$	100/2
-	3	10/2	100/4
-	4	$10/2\sqrt{2}$	100/8
-	5	…	100/16
-	6	…	100/32
(a)	7	…	100/64
(b)	8	…	100/128
(c)	9	…	100/256
(d)	10	$10/16\sqrt{2}$	100/512

Thus, you can see that at $n = 10$, the area of S_n is less than 0.5.

Hence choice (d) is the answer.

CHAPTER 19

Permutations & Combinations

It is one of the most logical chapters that you are considering for your test preparation, so it's a really good thing for those who are pretty uncomfortable with the traditional Maths-essentially, the colossal equations, intricate graphs and confusing formulae. Well, if you feel that all these things are intimidating and discouraging, then here is a *nirvana* (or relief) from all such nasty things. Now, what you need to do is just stop relying upon the formulae and try getting the answers using logic (or call it common sense). And, the biggest advantage of using the logic is that you would be able to develop a knack for replicating and expanding the scope of logic in innumerable situations and settings; while there are huge limitations in memorizing, recalling and applying the formulae in the twisted and unfamiliar situations, especially under pressure. Usually, it is easy for our minds to apply the same logic in different situations, but it is truly painstaking in relating the same formula for different situations. For example, dividing the 10 identical chocolates among 3 kids is same as the number of non-negative integral solutions of $a + b + c = 10$.

My only advice to you is that please stay open minded, logical and creative enough. If you struggle to get the answer, break the problem down into pieces or take a similar but small example in order to understand the underlying idea and its logic. In P&C (Permutation & Combination) the understanding of problem is more important than knowing its solution, because the challenge is to decode the thought process, the calculation part is too simple to be bothered about. Even if you don't know the formula/property you can get the required answer just by becoming a bit imaginative, inventive and ingenious. As a business manager or a leader of a team your job is to arrange the events, things and select the best people and resources, so why don't you start it right here and right now.

Therefore, being a very logical chapter it is one of the favorite chapters for the paper setters of competitive exams. In CAT, you can expect approx. 1-3 problems from this chapter in almost every session/slot. Other exams like XAT and IIFT too ask approx. 2-4 sums from this chapter.

Chapter Checklist

19.1 Counting

Fundamental principle of counting

(i) **Multiplication** : If one operation can be performed in 'm' ways and corresponding to each way of performing the first operation a second operation can be performed in 'n' ways, then the two operations together can be performed in $m \times n$ ways. If after two operations are performed in any one of the $m \times n$ ways a third operation can be performed in p ways, then the three operations together can be performed in $m \times n \times p$ ways and so on.

In general if there are n jobs (works/operations) $j_1, j_2, j_3, ..., j_n$ such that job j_i can be performed independently in m_i ways. $(i = 1, 2, 3, ..., n)$. Then the total number of ways in which all the jobs can be performed is $m_1 \times m_2 \times m_3 \times .....\times m_n$.

Here the different jobs/operations are mutually inclusive. It implies that all the jobs are being done in succession. In this case we use the word **'and'** to complete the all stages of operation and the meaning of **'and'** is multiplication.

***Exp.* 1)** A student has to select a letter from vowels and another letter from consonants, then in how many ways can he make this selection?

Solution Out of 5 vowels he can select one vowel (letter) in 5 ways and out of 21 consonants he can select one consonant (letter) in 21 ways. Thus a letter from the vowels and a letter from the consonants can be selected together in $5 \times 21 = 105$ ways.

(ii) Addition : If there are two jobs such that they can be performed independently in m and n ways respectively, then either of the two jobs can be performed in $(m + n)$ ways.

In general if there are various jobs which are mutually exclusive, then they can be performed in $m_1 + m_2 + m_3 + ... + m_n$ ways.

In this case we use the word **'or'** between various jobs and the meaning of **'or'** is addition.

***Exp.* 2)** A student has to select a letter either from vowels 'or' from consonants, then in how many ways can he make this selection?

Solution Out of 5 vowels he can select one letter in 5 ways.
Similarly he can select one letter from 26 consonants in 21 ways. Thus he can select one letter in 5 + 21 = 26 ways.

***Exp.* 3)** If a die is cast and then a coin is tossed, find the number of all possible outcomes.

Solution A die can fall in 6 different ways showing six different points 1, 2 , 3, 4, 5, 6, ... and a coin can fall in 2 different ways showing head (H) or tail (T).

$\therefore$ The number of all possible outcomes from a die and a coin $= 6 \times 2 = 12$

Hint (1, *H*), (1, *T*), (2, *H*), (2, *T*), (3, *H*), (3, *T*), (4, *H*), (4, *T*), (5, *H*), (5, *T*), (6, *H*), (6, *T*) *i.e.,* the total number of all possible outcomes is 12. *i.e.,* the total number of all possible outcomes is 12.

***Exp.* 4)** There are 6 trains running between Indore and Bhopal. In how many ways can a man go from Indore to Bhopal and return by a different train?

Solution A man can go from Indore to Bhopal in 6 ways by any one of the 6 trains available. Then he can return from Bhopal to Indore in 5 ways by the remaining 5 trains, since he cannot return by the same train by which he goes to Bhopal from Indore.
Thus the required number of ways = $6 \times 5 = 30$

***Exp.* 5)** In the previous question, if the person can return by any one of the 6 trains, then find the number of ways in which he can go from Indore to Bhopal and return from Bhopal to Indore.

Solution He can go from Indore to Bhopal in 6 ways and he can return from Bhopal to Indore in 6 ways also.

Hence the number of ways in which he can go from Indore to Bhopal and return from Bhopal to Indore $= 6 \times 6 = 36$ ways.

***Exp.* 6)** Four persons entered the lift cabin on the ground floor of a six floor office. Suppose each of them can leave the cabin independently at any floor beginning with the first. Find the total number of ways in which each of the four persons can leave the cabin at different floors.

Solution Suppose M_1, M_2, M_3 and M_4 are four persons. M_1 can leave at any of the 5 floors. So M_1 can leave the cabin in 5 ways. Now, M_2 can leave the cabin at any of remaining 4 floors. So M_2 can leave the cabin in 4 ways. Similarly M_3 and M_4 can leave the cabin in 3 ways and 2 ways respectively. Thus, the total number of ways in which each of the 4 persons can leave the cabin at different floors is $5 \times 4 \times 3 \times 2 = 120$.

***Exp.* 7)** In the above question if the 4 persons can leave the cabin at any one of the 5 floors, then find the number of ways in which this can be done.

Solution Since each of the four person can leave the cabin at any one of the 5 floors. Hence each one of M_1, M_2, M_3 and M_4 can leave the cabin in 5 ways.

Hence total number of ways in which each of the four persons can leave the cabin at any of the 5 floors is $5 \times 5 \times 5 \times 5 = 625$

***Exp.* 8)** In a MOCK CAT there are 3 sections viz, QA, English and D I containing 4, 6 and 11 questions respectively. In how many ways can a candidate select one question from each of the three sections?

Solution The candidate can select one question from Q A in 4 ways, one question from English in 6 ways and one

question from D I in 11 ways. Hence he can select one question from each of three sections in $4 \times 6 \times 11 = 264$ ways.

***Exp.* 9)** A tricolour flag is to be formed having three adjacent strips of three different colours choosen from six different colours. How many different coloured flags can be formed with different design in which all the three strips are always in horizontal position ?

Solution First strip can be coloured in 6 ways and second strip can be coloured in 5 ways and third strip can be coloured in 4 ways. Hence all the three strips can be coloured in $6 \times 5 \times 4 = 120$ ways.

Hence there can be 120 differently coloured flags.

***Exp.* 10)** In how many ways can a chairman and vice-chairman be elected from a committee of 8 members who are equally eligible for the post?

Solution The chairman can be elected in 8 ways, and the vice chairman can be elected in 7 ways from the remaining 7 members.

Hence the required number of ways $= 8 \times 7 = 56$ ways.

***Exp.* 11)** In how many ways can 5 prizes be given away to 7 boys when each boy is eligible for all the prizes?

Solution First prize can be given away to any one of 7 boys in 7 ways. Again second prize can be given away to any one of the 7 boys since each boy is eligible for all the prizes. Similarly third, fourth and fifth prize can also be given away in 7 ways.

Hence the required number of ways $= 7 \times 7 \times 7 \times 7 \times 7 = 7^5$

***Exp.* 12)** A test paper consists of 10 questions and each question has 4 choices. If each question is necessarily attempted, then find the number of ways of answering the test paper.

Solution Since each question can be answered in 4 ways.

So, the total number of ways of answering 10 questions $= 4 \times 4 \times 4 \times 4 \times 4$..10 times $= 4^{10}$.

***Exp.* 13)** A set of 6 questions contains true/false type questions. Maximum how many students can take the test if all the students answer differently from others and must attempt all the questions?

Solution A question can be answered in two ways *i.e.* either true or false. Hence all the 6 questions can be answered in $2 \times 2 \times 2 \times 2 \times 2 \times 2 = 2^6 = 64$ ways.

Thus there can be maximum 64 students.

***Exp.* 14)** In a test paper first section contains 5 question each with 4 choices and second section contains 4 questions each with 3 choices. In how many different ways can the paper be answered if all the questions are attempted?

Solution First section can be answered in $4 \times 4 \times 4 \times 4 \times 4 = 4^5$ ways

Second section can be answered in $3 \times 3 \times 3 \times 3 = 3^4$ ways.

Hence the whole test paper can be answered in $4^5 \times 3^4$ ways.

***Exp.* 15)** How many three letter words can be formed using only consonants but each only once?

Solution There are only 21 consonants in English alphabet. So, there are 21 ways of filling up the first place. Now, there are only 20 ways of filling up the second place and the third place can be filled up in 19 ways.

Hence, the required number of words $= 21 \times 20 \times 19 = 7980$

***Exp.* 16)** How many four digit numbers can be formed with the digits 3, 5, 7 and 9 only?

4	4	4	4
Th	*H*	*T*	*U*

A four digit number has 4 places *viz,* thousands, hundreds, tens and unit place. All the four places can be filled up in $4 \times 4 \times 4 \times 4 = 256$ ways since repetition of digits is not restricted.

***Exp.* 17)** How many 3 digit number can be formed whose unit digit is always zero and repetition of digits is not allowed?

Solution

9	8	1

$\Rightarrow 9 \times 8 \times 1 = 72$

Since zero is fixed for the unit digit place. So only 9 digits are available for the hundreds place. Now only 8 digits are available for the tens place since out of 10 digits (*i.e.,* 0, 1, 2, 3, ..., 9) two digits at two places have been used. Therefore required possible numbers $= 9 \times 8 \times 1 = 72$.

***Exp.* 18)** How many numbers can be formed with digits 2, 4, 6, 8 without repetition?

Solution Case 1. There are 4 numbers of 1 digit.

Case 2.

4	3

$\Rightarrow 4 \times 3 = 12$

There are 12 numbers of 2 digits.

Case 3.

4	3	2

$\Rightarrow 4 \times 3 \times 2 = 24$

There are 24 numbers of 3 digits.

Case 4.

4	3	2	1

$\Rightarrow 4 \times 3 \times 2 \times 1 = 24$

There are 24 numbers of 4 digits.

Hence total required numbers $= 4 + 12 + 24 + 24 = 64$

NOTE No any number of 5, 6, 7, ... digits can be formed since we have only four digits and repetition of digits is not allowed.

***Exp.* 19)** How many four digit numbers can be formed using 5 only once but 5 must be used in all such numbers?

Solution Case 1.

8	9	9	1

$\Rightarrow 8 \times 9 \times 9 \times 1 = 648$

When 5 is fixed at unit place, then there are only 8 digits available for thousands place (*i.e.,* except to 0 and 5).

Again hundreds and tens places can be filled by any one of digits from 0 to 9 except 5.

Case 2. | 8 | 9 | 1 | 9 | $\Rightarrow 8\times9\times1\times9=648$

When 5 is fixed at tens, place then there are only 8 digits available for thousands place and 9 digits are available for each of the hundreds and unit places.

Case 3. | 8 | 1 | 9 | 9 | $\Rightarrow 8\times1\times9\times9=648$

Here 5 is fixed at hundreds place.

Case 4. | 1 | 9 | 9 | 9 | $\Rightarrow 9\times9\times9=729$

Here 5 is fixed at thousands place and each of the hundreds, tens and unit place can be filled up in 9 ways each.

Therefore, the total required numbers of ways

$$= 648 + 648 + 648 + 729 = 2673$$

***Exp.* 20)** How many four digit numbers can be formed with the digits 0, 2, 3, 5, 8, 9 if

(i) repetition of digits is allowed?

(ii) repetition of digits is not allowed?

Solution (i) | 5 | 6 | 6 | 6 | $\Rightarrow 5\times6\times6\times6=1080$

Since at thousands place zero can not be placed.

(ii) | 5 | 5 | 4 | 3 | $\Rightarrow 5\times5\times4\times3=300$

Since at thousands place zero cannot be placed so only 5 digits are available and there are only 5 remaining digits available for hundreds place and 4 digits for tens place and 3 digits for unit place.

19.2 **Permutations**

Out of the given set of finite number of things, you take all or some of them and arrange in distinct possible ways, then each such arrangement is called the permutation. In Permutation, order of the things is very important.

Permutation means selection and arrangement both, while Combination means only selection.

- A permutation is said to be a Linear Permutation if the objects are arranged in a line. A linear permutation is simply called as a permutation.
- A permutation is said to be a Circular Permutation if the objects are arranged in the form of a circle.
- The number of (linear) permutations that can be formed by taking r things at a time from a set of n distinct things is denoted by ${}^nP_r$ or $P(n, r)$, for every $1 \le r \le n$.

$$^nP_r = n(n-1)(n-2)(n-3)\ldots(n-r+1) = \frac{n!}{(n-r)!}$$

Thus the permutations of three letters (say) a, b, c taken two at a time are

$$ab, ba, bc, cb, ac, ca$$

Therefore the number of permutations of three different things taken two at a time is

$$^3P_2 = \frac{3!}{(3-2)!} = 6$$

Similarly, the permutations of the set of four letters S, W, A, G number of taken two at a time is

$$SW, WS, SA, AS, SG, GS, WA, AW, WG, GW, AG, GA$$

Therefore, the number of permutations of three different things taken two at a time is

$$^4P_2 = \frac{4!}{(4-2)!} = 12$$

NOTE $n! = 1.2.3.4\ldots(n-1).n$

$(n-r)! = 1.2.3.4\ldots(n-r-2)(n-r-1)(n-r)$

$0! = 1 = 1!$

Permutations of n Different Things

1. Number of permutations of n different things taken all at a time $= {}^nP_n = n!$
2. Number of permutations of n different things taken r at a time $= {}^nP_r = \frac{n!}{(n-r)!}$
3. Number of permutations of n different things taken at most r at a time $= {}^nP_1 + {}^nP_2 + {}^nP_3 + \ldots + {}^nP_r$
4. Number of permutations of n different things taken at least r at a time $= {}^nP_r + {}^nP_{r+1} + {}^nP_{r+2} + \ldots + {}^nP_n$
5. Number of permutations of n different things taken r at a time, when one particular thing always occurs $= r\cdot({}^{n-1}P_{r-1})$
6. Number of permutations of n different things taken r at a time, when one particular thing never occurs $= {}^{n-1}P_r$
7. Number of permutations of n different things taken r at a time, when k particular things, always occur $= ({}^rP_k)({}^{n-k}P_{r-k})$
8. Number of permutations of n different things taken r at a time, when k particular things never occur $= {}^{n-k}P_r$
9. Number of permutations of n different things, taken all at a time, when m specified things always come together $= m!(n-m+1)!$
10. Number of permutations of n different things, taken all at a time, when m specified things never come together $= n! - [m!(n-m+1)!]$

Introductory Exercise 19.1

1. Find the value of ${}^{9}P_{3}$.
(a) 504 (b) 309 (c) 405 (d) 600

2. Find the value of n, if ${}^{n}P_{5} = 20\ {}^{n}P_{3}$.
(a) 5 (b) 8 (c) 6 (d) 4

3. If ${}^{56}P_{r+6} : {}^{54}P_{r+3} = 30800 : 1$, find r.
(a) 14 (b) 20
(c) 41 (d) 21

4. How many different numbers of 3 digits can be formed with the digits 1, 2, 4, 5, 7, 8 ; none of the digits being repeated in any of the numbers so formed?
(a) 120 (b) 1200
(c) 180 (d) 270

5. How many even numbers less than 10,000 can be formed with the digits 3, 5, 7,8, 9 without any repetition?
(a) 32 (b) 16 (c) 44 (d) 41

6. How many numbers with different digits each greater than 4000 can be formed from the digits 0, 2, 5, 7, 8 ?
(a) 160 (b) 168 (c) 320 (d) 270

7. How many numbers greater than 5000 can be formed with the digits, 3, 5, 7, 8, 9 no digit being repeated?
(a) 216 (b) 126 (c) 512 (d) 252

8. How many 6-digit telephone numbers can be constructed with the digits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9 if each number starts with 35 and no digit appears more than once?
(a) 1600 (b) 1680 (c) 900000 (d) 9000

9. How many 6-digit numbers can be formed with the digits 1, 2, 4, 5, 6, 7 (no digit being repeated) which are divisible by 5?
(a) 555 (b) 156
(c) 120 (d) none of these

10. Find the sum of all the four digit numbers which are formed by the digits 1, 2, 5, 6.
(a) 933510 (b) 93324 (c) 65120 (d) 8400

11. How many even numbers greater than 300 can be formed with the digits 1, 2, 3, 4, 5, such that no digit being repeated in any such number?
(a) 111 (b) 600
(c) 900 (d) none of these

12. How many numbers, each lying between 100 and 1000, can be formed with the digits 0, 2, 3, 4, 5, such that no digit being repeated?
(a) 24 (b) 48 (c) 72 (d) 96

Directions (for Q. Nos. 13 to 22) **:** *Answer these questions based on the following information.*
After completing his MBA, Zafar shifted to a new flat where he bought a new bookshelf and a set of 7 novels. The names of these novels, in the chronological order, are A, B, C, D, E, F and G.

13. Find the number of ways in which he can arrange all the 7 novels in his bookshelf.
(a) 5040 (b) 4050 (c) 1 (d) 7

14. If he wants to keep exactly 4 novels in his bookshelf, find the number of ways in which he can arrange 4 novels.
(a) 420 (b) 24 (c) 28 (d) 840

15. If he wants to keep at most 4 novels in his bookshelf, find the number of ways in which he can arrange the novels.
(a) 1100 (b) 1099 (c) 999 (d) 10

16. If he wants to keep at least 4 novels in his bookshelf, find the number of ways in which he can arrange the novels.
(a) 13440 (b) 1440 (c) 12440 (d) 840

17. If he always wants to keep the first novel of the series in his bookshelf, find the number of ways in which he can arrange total 4 novels in his bookshelf.
(a) 120 (b) 480 (c) 720 (d) 24

18. If he never wants to keep the last novel of the series in his bookshelf, find the number of ways in which he can arrange total 4 novels in his bookshelf.
(a) 360 (b) 256 (c) 240 (d) 666

19. If he always wants to keep the first two novels of the series (*A*, *B*) in his bookshelf, find the number of ways in which he can arrange total 4 novels.
(a) 345 (b) 210 (c) 240 (d) 360

20. If he never wants to keep the last two novels of the series (*F* , *G*) in his bookshelf, find the number of ways in which he can arrange 4 novels.
(a) 360 (b) 240 (c) 256 (d) 120

21. He wants to keep the novels in his bookshelf such that the first two novels of the series are always kept together, find the number of ways in which he can arrange all the novels.
(a) 120 (b) 2440
(c) 720 (d) 1440

22. He wants to keep the novels in his bookshelf such that the last two novels of the series are never kept together, find the number of ways in which he can arrange all the novels.
(a) 3600 (b) 2500
(c) 1440 (d) 2880

Directions (for Q. Nos. 23 to 40) **:** *Answer these questions independently of each other.*

23. Find the number of ways in which the letters of the word RAINBOW can be arranged.
(a) 5040 (b) 4050 (c) 3040 (d) 8040

24. In the different arrangements of the word RAINBOW, how many words begin with *R*?
(a) 720 (b) 360 (c) 1440 (d) 480

25. In the different arrangements of the word RAINBOW, how many words begin with *R* and end with *W*?
(a) 120 (b) 240 (c) 180 (d) 360

26. In the different arrangements of the word RAINBOW, how many words are there in which *R* and *W* are at the end positions?
(a) 120 (b) 180 (c) 210 (d) 240

27. In the different arrangements of the word RAINBOW, how many words are there in which first and last letters are vowels?
(a) 360 (b) 720 (c) 1440 (d) 2880

28. In the different arrangements of the word RAINBOW, how many words are there in which *R* and *W* are together?
(a) 720 (b) 360 (c) 540 (d) 1440

29. In the different arrangements of the word RAINBOW, how many words are there in which *R* and *W* are never together?
(a) 3600 (b) 2400 (c) 1774 (d) 1440

30. In the different arrangements of the word RAINBOW, how many words are there in which vowels are never together?
(a) 720 (b) 1440 (c) 360 (d) 3660

31. In the different arrangements of the word RAINBOW, how many words are there in which *A* is always before *I* and *I* is always before *O* ?
(a) 840 (b) 420 (c) 720 (d) 630

32. In the different arrangements of the word RAINBOW, how many words are there in which vowels are always before the consonants?
(a) 72 (b) 144 (c) 96 (d) 124

33. In the different arrangements of the word RAINBOW, how many words are there in which no two consonants are together?
(a) 441 (b) 420 (c) 360 (d) 144

34. In the different arrangements of the word RAINBOW, how many words are there in which vowels may occupy only even positions?
(a) 567 (b) 144 (c) 576 (d) 625

35. In the different arrangements of the word RAINBOW, how many words are there in which vowels occupy odd positions?
(a) 676 (b) 625 (c) 343 (d) 576

36. In the different arrangements of the word RAINBOW, how many words are there in which exactly two vowels always remain together?
(a) 2880 (b) 1440 (c) 3200 (d) 1600

37. If all the words formed by the letters of the word RAINBOW are arranged in a dictionary form, what is the position of the word RAINBOW in that dictionary?
(a) 3136 (b) 3631 (c) 3361 (d) 1363

38. In how many ways can the letters of the word STRANGE be arranged so that the vowels appear at the odd places?
(a) 720 (b) 1092 (c) 1440 (d) 1772

39. In how many ways can the letters of the word MOBILE be arranged so that the consonants always occupy the odd places?
(a) 18 (b) 36
(c) 54 (d) 72

40. In how many ways can the letters of the word *MOBILE* be arranged so that at least two consonants remain together?
(a) 2880 (b) 3200
(c) 576 (d) 1600

Directions (for Q. Nos. 41 to 47) **:** *Answer these questions independently of each other.*

41. 5 men and 4 women are to be seated for a dinner, in a row, such that no two persons of the same sex sit together. Find the number of ways in which this arrangement can be done.
(a) 2880 (b) 20
(c) 86400 (d) $9! - 2(5! \times 4!)$

42. 5 men and 4 women are to be seated for a dinner, in a row, such that no two men sit together. Find the number of ways in which this arrangement can be done.
(a) 1440 (b) 2880 (c) 1720 (d) 720

43. 5 men and 4 women are to be seated for a dinner, in a row, such that no two women sit together. Find the number of ways in which this arrangement can be done.
(a) 43200 (b) 2880
(c) 7200 (d) 21600

44. 5 men and 4 women are to be seated for a dinner, in a row, such that all the women do not sit together. Find the number of ways in which this arrangement can be done.
(a) 345600 (b) 348800 (c) 347200 (d) 216006

45. 5 men and 4 women are to be seated for a dinner, in a row, such that women occupy the even places. Find the number of ways in which this arrangement can be done.
(a) 2880 (b) 1440 (c) 720 (d) 2020

46. 6 men and 3 women are to be seated for a dinner, in a row, such that no two women sit together. Find the number of ways in which this arrangement can be done.
(a) 121500 (b) 151200 (c) 112500 (d) $6! \times 120$

47. 4 men and 4 women are to be seated for a dinner, in a row, such that men and women sit alternately. Find the number of ways in which this arrangement can be done.
(a) 1152 (b) 1252
(c) 576 (d) 40320

Directions (for Q. Nos. 48 to 52) **:** *Answer these questions independently of each other.*

48. In how many ways can 12 soldiers stand in a queue?
(a) 11! (b) 12!
(c) 12! - 1 (d) 1

49. In how many ways can 12 soldiers stand in two queues such that each queue has 6 soldiers?
(a) ${}^{12}P_6 \times {}^{12}P_6 \times 2!$ (b) ${}^{12}P_6 \times {}^{6}P_6$
(c) $6! \times 6! \times 2!$ (d) ${}^{12}P_6 \times 6! \times 2!$

50. In how many ways can 12 soldiers stand in three queues such that each queue has same number of soldiers?
(a) ${}^{12}P_4 \times {}^{8}P_4 \times {}^{4}P_4$ (b) ${}^{12}P_4 \times 3!$
(c) ${}^{12}P_4 \times {}^{12}P_4 \times {}^{12}P_4 \times 3!$ (d) ${}^{12}P_4 \times {}^{8}P_4 \times {}^{4}P_4 \times 3!$

51. In how many ways can 12 soldiers stand in three queues such that one queue has 3 soldiers, another queue has 4 soldiers and so the remaining row has 5 soldiers?
(a) ${}^{12}P_5 \times {}^{7}P_4 \times {}^{3}P_3$ (b) ${}^{12}P_3 \times {}^{9}P_4 \times {}^{5}P_5$
(c) ${}^{12}P_3 \times {}^{9}P_4 \times {}^{5}P_5 \times 3!$ (d) ${}^{12}P_3 \times {}^{12}P_4 \times 12P_5 \times 3!$

52. In how many ways can 12 soldiers stand in a queue such that no other soldier stands between three particular soldiers?
(a) 21772800 (b) 22778800
(c) 21278800 (d) 362880

Directions (for Q. Nos. 53 to 55) **:** *Answer these questions independently of each other.*

53. Find the number of ways in which 12 different books can be arranged on a shelf so that 2 particular books shall not be together.
(a) 399168000 (b) 299168000
(c) 199168000 (d) 369088000

54. Find the number of ways in which 12 different books can be arranged on a shelf so that all the 3 particular books shall not be together.
(a) $126 \times 10!$ (b) $1320 \times 9!$
(c) 387892 (d) 39916800

55. Find the number of ways in which 12 different books can be arranged on a shelf so that none of the 3 particular books shall be together.
(a) $126 \times 9!$ (b) $1320 \times 9!$
(c) $720 \times 10!$ (d) 261273600

56. There are 3 distinct books on Physics, 4 distinct books on Chemistry and 5 distinct books on Biology. In how many ways can these books be placed on a shelf if the books on the same subject are to be together?
(a) 103680 (b) 17280
(c) $\frac{12!}{3!}$ (d) 60

Directions (for Q. Nos. 57 to 60) **:** *Answer these questions independently of each other.*

57. How many different signals can be given using any number of flags from 6 flags of different colours?
(a) 1240 (b) 1956
(c) 3976 (d) 1976

58. How many different signals can be given using 3 coloured flag from 6 flags of different colours?
(a) 120 (b) 60 (c) 18 (d) 20

59. 10 students took a test and each one got the distinct score. In how many ways can three distinct prizes be given?
(a) 270 (b) 360
(c) 720 (d) 540

60. There are 10 stations on Konkan Railway Line that connects Mumbai and Mangalore at the two ends of it. How many different kinds of tickets of second class must be printed in order to make a passenger buy a ticket so that he can travel from one station to any other station?
(a) 90 (b) 45
(c) 135 (d) 100

61. In how many ways three different rings can be worn in four fingers such that at most one ring in any finger can be worn?
(a) 24 (b) 12
(c) 36 (d) 120

19.3 Permutations of *n* Things Not All Different

1. Number of permutations of n things taken all at a time when p of them are all alike and the rest are all different $= \frac{n!}{p!}$
2. Number of permutations of n things taken all at a time when p things are alike of one kind, q things are alike of other kind, r things are alike of another kind and rest all, if any, are different from p, q, r, then the number of permutations of n things $= \frac{n!}{p!\,q!\,r!}$
3. Number of permutations of n things taken all at a time when p_1 things are alike of one kind, p_2 things are alike of second kind, p_3 things are alike of third kind, … p_r things are alike of r^{th} kind, and rest all, if any, are different from $p_1, p_2, p_3, \ldots, p_r$, then the number of permutations of n things $= \frac{n!}{p_1!\,p_2!\,p_3!\ldots p_r!}$

Introductory Exercise 19.2

1. In how many ways can the letters of the word REPEAT be arranged ?
(a) 2240 (b) 232230 (c) 360 (d) 235760

2. In how many ways can the letters of the word TAMANNA be arranged?
(a) 120 (b) 420
(c) 840 (d) none of these

3. In how many ways can the letters of the word RECUPERATE be arranged?
(a) 234000 (b) 123000 (c) 232300 (d) 302400

4. In how many ways can the letters of the word ASSASSINATION be arranged?
(a) 181800 (b) 818100 (c) 108108 (d) 10810800

5. In the above question (number 4) find the number of arrangements of four different letters of the word in a row?
(a) 360 (b) 180
(c) 540 (d) none of these

6. How many arrangements can be made out of the letters of the word COMMITTEE, taken all at a time, such that the four vowels do not come together?
(a) 216 (b) 45360 (c) 1260 (d) 43200

7. How many arrangements can be made out of the letters of the word COMMITTEE, taken all at a time, such that none of the four vowels come together?
(a) 5400 (b) 360 (c) 2160 (d) 14400

8. In how many ways can the letters of the word DUMDUMDIGADIGA be arranged?
(a) 180 (b) 90
(c) 270 (d) none of these

9. How many different words can be formed with the letters of the word NAINITAL such that each of the word begin with *L* and end with *T* ?
(a) 90 (b) 80
(c) 88 (d) 82

10. How many words can be made from the word MATHEMATICS in which vowels are together?
(a) 12960 (b) 120960
(c) 15400 (d) none of (a), (b), (c)

11. How many words can be made from the word IMPORTANT in which both *T* do not come together?
(a) 141120 (b) 112244
(c) 113113 (d) 888222

12. How many words can be made from the word TING TING TRING in which vowels occupy even positions?
(a) 336000 (b) 85360
(c) 113600 (d) none of these

13. If the different permutations of the word PRODIGIOUS are listed as in a dictionary, then what is the rank of the word PRODIGIOUS?
(a) 200966 (b) 609902
(c) 12500 (d) 24800

14. If all the letters of the word SEQUESTERED be arranged as in a dictionary, what is 50^{th} word?
(a) DEEEEQURSTS (b) RUQDESTESEE
(c) ESSTREEUQDE (d) DQUESTREEES

15. How many 7 digit numbers can be formed using the digits 1, 2, 0, 2, 4, 2, 4?
(a) 120 (b) 360 (c) 240 (d) 424

16. How many 6 digit numbers can be formed out of the digits of the number 113113?
(a) 15 (b) 180 (c) 888 (d) 222

17. How many 6 digit numbers can be formed out of the number 567724, which are even?
(a) 360 (b) 480
(c) 180 (d) 220

18. How many numbers greater than a million can be formed with the digits 5, 5, 2, 2, 1, 7, 0?
(a) 980 (b) 1080
(c) 920 (d) 1200

19. How many different words can be formed with the letters of the word REGURGITATE so that the two *T*'s are always together?
(a) 453600 (b) 543600 (c) 183600 (d) 5040

20. The number of ways in which the letters of the word SUMPTUOS can be arranged so that the two *U*'s do not come together is :
(a) 5040 (b) 7560
(c) 38920 (d) none of (a), (b), (c)

21. In how many ways the letters of the word AFLATOON be arranged if the consonants and vowels must occupy alternate places?
(a) 144 (b) 143 (c) 288 (d) 248

22. In how many ways can the letters of the word SOOTHSAYER be arranged so that the two *S*'s and two *O*'s come together?
(a) 23400 (b) 302050 (c) 12340 (d) 40320

23. There are three copies of each of 4 different books. In how many ways can they be arranged on a shelf?
(a) 369600 (b) 366900 (c) 396600 (d) 306609

24. There are 3 red, 4 green and 5 pink marbles in a bag. They are drawn one by one and arranged in a row. Assuming that all the 12 marbles are drawn, determine the number of different arrangements.
(a) 22770 (b) 27720 (c) 22077 (d) 27270

25. There are 12 umbrellas placed in a row. Out of these, 3 identical umbrellas are of red colour, 4 identical umbrellas are of pink colour and 5 identical umbrellas are of white colour. In how many ways can these 12 umbrellas be arranged so that at least one umbrella is separated from the umbrellas of the same colour?
(a) 27714 (b) 27720 (c) $\frac{12!}{3!4!5!} \times 3!$ (d) 37216

Permutations Where Repetitions are Allowed

1. Number of permutations of n different things taken exactly r at a time, when each may be repeated any number of times in each arrangement $= n^r$

2. Number of permutations of n different things taken at most r at a time, when each may be repeated any number of times in each arrangement
$$= n + n^2 + n^3 + \ldots + n^r = \frac{n(n^r - 1)}{n - 1}$$

3. Number of permutations of n different things taken at least r at a time, when each may be repeated any number of times in each arrangement
$$= n^r + n^{r+1} + n^{r+2} + \ldots + n^n$$
$$= \frac{n^r (n^{(n-r+1)} - 1)}{n - 1}$$

Introductory *Exercise 19.3*

1. How many numbers of 5 digits can be formed with the digits 0, 2, 3, 4 and 5 if the digits may repeat?
(a) 2500 (b) 250 (c) 120 (d) 2400

2. How many numbers each lying between 9 and 1000 can be formed with the digits 0, 1, 2, 3, 7, 8 (numbers can be repeated) ?
(a) 30 (b) 120 (c) 210 (d) 90

3. How many five-figures numbers can be formed with the digits 1, 2, 3, 4, 5 given that an even digit may not occupy an even place if the digits may be repeated?
(a) 1125 (b) 5210 (c) 1152 (d) 2120

4. How many of the numbers from 1000 to 9999 (both inclusive) do not have four different digits?
(a) 4446 (b) 4664 (c) 4464 (d) 6444

5. Find the number of three digit numbers (repetitions allowed) such that atleast one of the digits is 9.
(a) 252 (b) 648
(c) 468 (d) 864

6. How many natural numbers not exceeding 4321 can be formed with the digits 1, 2, 3, 4 if repetition is allowed?
(a) 123 (b) 113 (c) 222 (d) 313

7. In how many ways 4 rings of different types can be worn in 3 fingers?
(a) 49 (b) 12 (c) 24 (d) 81

8. In how many ways can 5 prizes be given away to 4 boys, when each boy is eligible for all the prizes?
(a) 1024 (b) 20 (c) 625 (d) 540

9. In how many ways can n balls be randomly distributed in n cells?
(a) $n!$ (b) n^n (c) $n(n-1)$ (d) 2^n

10. In the above question, what will be the number of ways if it is specified that each cell is to be occupied?
(a) $n!$ (b) n^n (c) n^3 (d) 2^n

11. In how many ways can 5 letters be posted in 4 letter boxes?
(a) 512 (b) 1024 (c) 625 (d) 20

19.4 **Circular Permutations**

1. Number of circular permutations of n different things taken all at a time $= (n-1)!$
2. Number of circular permutations of n different things taken all at a time in one direction (either clock-wise or anti-clock-wise) $= \frac{(n-1)!}{2}$
3. Number of circular permutations of n different things taken r at a time $= \frac{{}^{n}P_{r}}{r}$
4. Number of circular permutations of n different things taken r at a time in one direction (either clock-wise or anti-clock-wise) $= \frac{{}^{n}p_{r}}{2r}$

Introductory *Exercise 19.4*

1. In how many ways can 6 boys form a ring?
(a) 120 (b) 720
(c) 119 (d) none of (a), (b), (c)

2. In how many ways can 6 boys be arranged at a round table so that 2 particular boys may be together?
(a) 24 (b) 48 (c) 360 (d) 60

3. In how many ways can 6 beads be strung into a necklace?
(a) 60 (b) 360 (c) 720 (d) 120

4. In how many ways can 5 men and 2 ladies be arranged at a round table if two ladies are never together?
(a) 5040 (b) 480 (c) 240 (d) 720

5. 9 persons were invited for a business meeting by Ambani, where the host be seated at a circular table. How many different arrangements are possible if two invitees *viz.,* Sahara and Mahindra be seated on either side of the host Ambani?
(a) 10080 (b) 10800 (c) 9200 (d) 4600

6. In a G-20 meeting there were total 20 people representing their own country. All the representative sat around a circular table. Find the number of ways in which we can arrange them around a circular table so that there is exactly one person between two representatives namely Manmohan and Musharraf.
(a) $2 \times (17!)$ (b) $2 \times (18!)$
(c) $(3!) \times (18!)$ (d) $(17!)$

7. 6 men and 6 women are to be seated at a circular table such that no two women are adjacent, then the number of arrangements is :
(a) 86400 (b) 46800 (c) 12! (d) $\frac{1}{2}(12!)$

8. There are 3 boys and 4 girls, seated around a circular table so that no two boys are together. Find the number of ways in which this can be done.
(a) 36 (b) 120 (c) 144 (d) 132

9. 7 sisters dine at a round table. They dine together till each of them dine with different neighbours *i.e.,* they do not like to dine with same neighbours in any two arrangements. In a year how many days they dine together?
(a) 180 (b) 504 (c) 720 (d) 360

10. Find the number of ways in which 10 different flowers can be strung to form a garland so that 3 particular flowers are always together.
(a) 30240 (b) 30420
(c) 23400 (d) None of (a), (b), (c)

11. 3 male and 3 female singers sat around a circular table. Alka is a female singer did not sat adjacent to a male singer and Sonu is a male singer did not sat adjacent to a female singer. In how many ways this could be done?
(a) 4 (b) 6 (c) 9 (d) 10

12. Three couples book a table for six people at a restaurant that has only circular tables. If no husband sits opposite his wife, in how many ways can three couples be arranged to sit around the table?
(a) 64 (b) 117 (c) 96 (d) 56

13. Twelve students are called for the group discussion of which no two students have the same rank. They sit in a circle for the group discussion in such a way that the students sitting just next to either side of any student should have either higher rank or lower rank. Find the number of ways in which they can be arranged.
(a) 14400 (b) 28560 (c) 86400 (d) 72000

14. In a single-occupancy co-ed hostel, consisting of 20 rooms, exactly 10 guys and 10 girls are allowed to stay in. Each one of them stays in a separate room. The hostel is designed in a circular form such that the door of a room opens opposite the door of another room. In how many ways can the rooms be allocated to them so that whenever a guy looks either side of his door there is always a girl next door?
(a) $2! \times (10!)^2$ (b) $20! - 19!$
(c) $9! \times 10!$ (d) $2! \times \frac{19!}{9! \times 10!}$

19.5 Combinations

A selection that can be formed by taking some or all of a finite set of things (or objects) is called a Combination.

Let *A, B, C* be three letters, then we can combine any two of them in the following ways:

$$AB,\ BC,\ CA$$

Similarly, if *A, B, C, D* are four letters, then we can combine any two of them in the following ways:

$$AB,\ AC,\ AD,\ BC,\ BD,\ CD$$

Similarly, we can combine any three of *A, B, C* and *D* as following: *ABC, ABD, ACD, BCD*

The number of combinations of n dissimilar things taken r at a time is denoted by ${}^nC_r$ or $C\ (n, r)$ or $\binom{n}{r}$

${}^nC_r = \dfrac{n!}{r!\,(n-r)!}$; Whereas C denotes the combination and $r \le n$

NOTE In the combination order of the letters (or things/people) does not matter. That means *AB* and *BA* are same. Similarly, *ABC, ACB, BAC, BCA, CAB, CBA* are same, as order does not matter.

Essential Properties

1. ${}^nC_r = \dfrac{{}^nP_r}{r!}$
2. ${}^nC_o = {}^nC_n = 1$
3. ${}^nC_r = {}^nC_{n-r}\ (0 \le r \le n)$
4. ${}^nC_x = {}^nC_y \Leftrightarrow x + y = n$ or $x = y;\ (x,\ y \in W)$
5. ${}^nC_{r-1} + {}^nC_r = {}^{n+1}C_r$
6. If n is even, the greatest value of ${}^nC_r = {}^nC_m$ where $m = n/2$
7. If n is odd, the greatest value of ${}^nC_r = {}^nC_m$ where $m = \dfrac{(n-1)}{2}$ or $m = \dfrac{(n+1)}{2}$
8. ${}^rC_r + {}^{r+1}C_r + {}^{r+2}C_r + \ldots + {}^nC_r = {}^{n+1}C_{r+1};\ r \le n$
9. ${}^nC_0 + {}^nC_1 + {}^nC_2 + {}^nC_3 + \ldots + {}^nC_n = 2^n$
10. ${}^nC_1 + {}^nC_2 + {}^nC_3 + \ldots + {}^nC_n = 2^n - 1$
11. ${}^nC_0 + {}^nC_2 + {}^nC_4 + \ldots = 2^{n-1}$
12. ${}^nC_1 + {}^nC_3 + {}^nC_5 + \ldots = 2^{n-1}$

Combination of n Different Things

1. Number of combination of n different things taken r at a time, when x particular things always occur $= {}^{n-x}C_{r-x}$
2. Number of combination of n different things taken r at a time, when x particular things never occur $= {}^{n-x}C_r$
3. Number of combination of n different things taken r at a time, when x particular things always occur and y particular things never occur $= {}^{n-x-y}C_{r-x}$
4. Number of combination of n different things taken r at a time, when x particular things are not together in any selection $= {}^{n-x}C_{r-x}$
5. Number of ways of selections of zero or more things from a group of n distinct things
   $= {}^nC_0 + {}^nC_1 + {}^nC_2 + {}^nC_3 + \ldots + {}^nC_n = 2^n$
6. Number of ways of selections of one or more things from a group of n distinct things
   $= {}^nC_1 + {}^nC_2 + {}^nC_3 + \ldots + {}^nC_n = 2^n - 1\ (\because {}^nC_0 = 1)$

Introductory Exercise 19.5

1. Find the vlaue of ${}^8C_3$.
(a) 56 (b) 8! (c) 65 (d) 3^8

2. Find the value of ${}^{10}C_5$.
(a) 525 (b) 126 (c) 252 (d) 50

3. If ${}^{13}C_x = {}^{13}C_y$ and $x \ne y$, what is the value of $x + y$?
(a) 6 (b) 7 (c) 13 (d) 26

4. ${}^{17}C_r = {}^{17}C_{r+3}$. Find the value of r.
(a) 17 (b) 6 (c) 7 (d) 13

5. ${}^7P_3 = n.{}^7C_3$, find the value of n.
(a) 4 (b) 8 (c) 6 (d) 9

6. If $C\ (2n, 3) : C\ (n, 2) = 12 : 1$, find n.
(a) 3 (b) 5 (c) 6 (d) 4

7. What is the least possible value of n if :
$${}^{n-1}C_3 + {}^{n-1}C_4 > {}^nC_3$$
(a) 6 (b) 8 (c) 7 (d) 12

8. If ${}^nC_x = 56$ and ${}^nP_x = 336$, find n and x.
(a) 7, 3 (b) 8, 4 (c) 8, 3 (d) 9, 6

9. What is the value of x when ${}^{11}C_x$ is maximum ?
(a) 7 (b) 6
(c) 5 (d) both (b) and (c)

10. What is the maximum value of ${}^{12}C_x$ for any natural number x ?
(a) 6 (b) 7 (c) 8 (d) 4

11. For what value of x, ${}^{14}C_x$ is maximum?
(a) 5 (b) 6 (c) 7 (d) 8

12. How many different committees of 5 members may be formed from 6 gentlemen and 4 ladies?
(a) 181 (b) 357 (c) 603 (d) 252

13. In a test paper there are total 10 questions. In how many different ways can you choose 6 questions to answer?
(a) 210 (b) 540
(c) 336 (d) none of these

14. In the above question (no. 13) if the question number 1 is compulsory in how many ways can you choose to answer 6 questions in all?
(a) 53 (b) 63 (c) 126 (d) 210

15. Droupdi has 5 friends. In how many ways can she invite one or more of them to a dinner?
(a) 31 (b) 5^5 (c) 13 (d) 2^5

16. In how many ways can a committee of 6 members be formed from 7 men and 6 ladies consisting of 4 men and 2 ladies?
(a) 252 (b) 525 (c) 625 (d) 256

17. A committee of 5 persons is to be formed from a group of 6 gentlemen and 4 ladies. In how many ways can this be done if the committee is to be included atleast one lady?
(a) 123 (b) 113
(c) 246 (d) 945

18. A committee of 7 persons is to be chosen from 13 persons of whom 6 are Americans and 7 are Indians. In how many ways can the selection be made so as to retain a majority of Indians?
(a) 945 (b) 1057
(c) 923 (d) 1056

19. In how many ways can a committee of 4 men and 3 women be appointed from 6 men and 8 women?
(a) 480 (b) 408
(c) 420 (d) 840

20. In the previous question (no. 19) what will be the number of committees in which Miss *A* refuses to serve if Mr. *B* is a member?
(a) 210 (b) 420
(c) 630 (d) none of these

21. In how many ways 7 members forming a committee out of 11 be selected so that 3 particular members must be included?
(a) 60 (b) 130 (c) 80 (d) 70

22. In the previous question (no. 21) how many committees can be formed if 3 particular members must not be included?
(a) 6 (b) 8 (c) 10 (d) 61

23. A committee of 3 experts is to be selected out of a panel of 7 persons, three of them are engineers, three of them are managers and one is both engineer and manager. In how many ways can the committee be selected if it must have at least an engineer and a manager?
(a) 33 (b) 22 (c) 11 (d) 66

24. A committee of 5 persons is to be formed out of 6 gents and 4 ladies. In how many ways this can be done, when at most two ladies are included?
(a) 186 (b) 168 (c) 136 (d) 169

25. In an election, a voter may vote for any number of candidates not greater than the number to be chosen. There are 7 candidates and 4 members are to be chosen. In how many ways can a person vote?
(a) 89 (b) 98 (c) 79 (d) 101

26. At an election there are 5 candidates and 3 members are to be elected and a voter is entitled to vote for any number to be elected. In how many ways a voter can a vote?
(a) 25 (b) 5^3 (c) 3^5 (d) 15

27. A question has two parts, part *A* and part *B*, each containing 8 questions. If the students has to choose 6 from part *A* and 5 questions from part *B*, in how many ways can he choose the questions?
(a) 1268 (b) 1788 (c) 1024 (d) 1568

28. An examinee is required to answer six questions out of twelve questions which are divided into two groups each containing six questions and he is not permitted to answer more than four questions from any group. In how many ways can he answer six questions?
(a) 750 (b) 850 (c) 580 (d) 570

29. An examination paper consists of 12 questions divided into two parts, part *A* and part *B*. Part *A* contains 7 questions and part *B* contains 5 questions. A candidate is required to attempt 8 questions, selecting atleast 3 from each part. In how many ways can he select the questions?
(a) 240 (b) 60 (c) 420 (d) 480

30. In MOCK CAT Quantitative Aptitude Section was divided into 3 groups of 5, 5 and 4 questions respectively. A candidate is required to answer 6 questions taking at least two questions from each of the first two groups and atleast one question from the third group. In how many ways can he make up his choice?
(a) 1200 (b) 1400 (c) 1284 (d) 1560

31. Mr. Daruwala has 18 acquaintances of whom 13 are relatives. In how many ways he may invite 10 guests so that 8 of whom are relatives?
(a) 12870 (b) 22022
(c) 20222 (d) 12780

32. If there are 11 players in a cricket team, all of whom shake hands with each other, how many shake hands take place in the team?
(a) 36 (b) 55
(c) 66 (d) none of these

33. Amitabh has a list of 24 friends. He wishes to invite some of them in such a manner that he can enjoy maximum number of parties, but in each party the number of friends (*i.e.,* invitees) be same and each party must have different set of persons. Then how many parties can Amitabh enjoy?
(a) 2704156 (b) 357600
(c) 235763 (d) 270156

34. An ice-cream parlour offers only family packs of ice-creams with 11 different flavours. If each member of a family loves different flavours, then maximum how many such families can purchase the ice-cream if each family contains equal number of persons?
(a) 246 (b) 462
(c) 123 (d) ${}^{11}C_2$

35. In the previous question (no. 34) what is the maximum possible number of member in a family?
(a) 4 (b) 5
(c) 6 (d) 8

36. In a meeting everyone had shaken hands with everyone else, it was found that 66 handshakes were exchanged. How many members were present in the meeting?
(a) 10 (b) 14 (c) 12 (d) 8

37. In how many ways can a cricket team of eleven players be chosen out of a batch of 16 players if a particular player is always chosen?
(a) 2002 (b) 3003 (c) 1003 (d) 7603

38. In the previous question (no. 37) if a particular player is never chosen, then the number of ways in which a cricket team of eleven players can be chosen is :
(a) 2365 (b) 2359 (c) 1365 (d) 1056

39. A cricket team of 11 players is to be formed from 16 players including 4 bowlers and 2 wicket keepers. In how many different ways can a team be formed so that the team has atleast 3 bowlers and atleast one wicket keeper?
(a) 2472 (b) 2274 (c) 2427 (d) 1236

40. A cricket team of 11 players is to be formed from 20 players including 6 bowlers and 3 wicket keepers. In how many different ways can a team be formed so that the team contain exactly 2 wicket keepers and atleast 4 bowlers?
(a) 22725 (b) 27225
(c) 22275 (d) none of (a), (b), (c)

41. A team of 11 cricketers containing 1 wicket keeper, 2 bowlers, 3 all rounders and 5 batsmen, is to be formed from a group of 25 cricketers containing 2 wicket keepers, 8 bowlers, 5 all rounders and 10 batsmen?
(a) 141120 (b) 111240
(c) 101240 (d) none of (a), (b), (c)

42. Out of 3 books on Economics, 4 books on Corporate Strategy and 5 books on Philosophy, how many collection consists of exactly one book on each subject?
(a) 40 (b) 36 (c) 60 (d) 120

43. In the previous question (no. 42) what is the number of different collections of books if atleast one book on each subject is taken?
(a) 2365 (b) 3255 (c) 4224 (d) 1236

44. A box contains 7 red, 6 white and 4 blue balls. How many selection of three balls can be made so that all three are red balls?
(a) 35 (b) 70 (c) 42 (d) 17

45. In the previous question (no. 44) if the red coloured ball is not taken, then the number of selections is :
(a) 30 (b) 120
(c) 60 (d) none of (a), (b), (c)

46. In the question (no. 44), if there is one ball of each colour, then the number of selections is :
(a) 148 (b) 124 (c) 168 (d) 186

47. An urn contains 5 different red and 6 different green balls. In how many ways can 6 balls be selected so that there are atleast two balls of each colour?
(a) 425 (b) 245 (c) 125 (d) 625

48. Find the number of different words that can be formed from 15 consonants and 5 vowels by taking 2 consonants and 4 vowels in each word.
(a) 625 (b) 630 (c) 525 (d) 615

49. Find the number of ways of selecting 4 letters from the word EXAMINATION.
(a) 136 (b) 126 (c) 252 (d) 525

50. How many words can be formed by using 4 letters at a time out of the letters of the word MATHEMATICS?
(a) 2445 (b) 2454
(c) 1243 (d) 1454

51. In how many ways can 3 ladies and 3 gentlemen be seated at a round table, so that any two and only two of ladies sit together?
(a) 72 (b) 36 (c) 24 (d) 144

52. Eighteen guests have to be seated half on each side of a long table. Four particular guests desire to sit on one particular side and three others on other side. Determine the number of ways in which the sitting, arrangements can be made.
(a) 18! (b) $462 \times (9!)^2$
(c) $(9!)^2$ (d) $7! \times (9!)^2$

53. Find the value of ${}^{10}C_1 + {}^{10}C_2 + {}^{10}C_3 + \ldots + {}^{10}C_{10}$.
(a) 100 (b) 10^2 (c) 2^{10} (d) $2^{10} - 1$

54. Find the value of ${}^{10}C_2 + {}^{10}C_3 + \ldots + {}^{10}C_{10}$.
(a) 100 (b) $10^2 - 10$ (c) $2^{10} - 11$ (d) $2^{10} - 2$

55. Find the value of ${}^{10}C_1 + {}^{10}C_2 + {}^{10}C_3 + \ldots + {}^{10}C_9$.
(a) 100 (b) $10^2 - 10$ (c) $10^2 - 11$ (d) $2(2^9 - 1)$

56. Find the value of ${}^{10}C_0 + {}^{10}C_2 + {}^{10}C_4 + \ldots$.
(a) ∞ (b) 2^9 (c) $2^{10} - 1$ (d) $4^9 - 1$

57. Find the value of $[({}^{10}C_1 + {}^{10}C_3 + {}^{10}C_5 + \ldots)$
$\times ({}^{20}C_1 + {}^{20}C_3 + {}^{20}C_5 + \ldots) \times ({}^{30}C_1 + {}^{30}C_3 + {}^{30}C_5 + \ldots)$
$\times \ldots \times ({}^{100}C_1 + {}^{100}C_3 + {}^{100}C_5 + \ldots.)]$
(a) 540 (b) 55^2 (c) 2^{540} (d) $2^{55} - 1$

58. Larry has a long weekend off for 4 days that starts from Thursday and lasts till Sunday. She wants to attend some spiritual enrichment sessions that are held every day for four hours. In how many ways can she attend one or more sessions during this long weekend?
(a) 15 (b) 16 (c) 4 (d) $4 \times {}^4C_1$

59. Madhulika is planning to join International School for languages, which imparts the professional courses on numerous languages under various programs. Program 1 offers 1 language, program 2 offers 2 languages, program 3 offers 3 languages, and so on. No two programs offer any common language. One can choose any number of languages from a certain program, but all the languages must be chosen from any one program only. Currently, there are total 10 programs on offer with the program 10 offering exactly 10 languages. Madhulika is willing to enroll for exactly 4 languages, find the number of ways in which she can study any 4 languages.
(a) 462 (b) 210 (c) 40 (d) ${}^{10}C_1 \times {}^{49}C_4$

60. Paratha Inc. is a chain of food joints, which specializes in various kinds of parathas – the Indian dish, usually stuffed with various kinds of vegetables cooked and smashed. It has total 210 different parathas in its menu. The menu is designed in such a way that n^{th} pack contains n parathas. Also, no two packs contain common parathas. However, you can choose any r parathas from any pack ($r \le n$), but not from different packs, for any particular order.
The parathas can be ordered online only through home delivery service, and only one order in a day is accepted from a particular customer. Shivesh Raina — my foodie friend— wants to order 3 different parathas. Then, on a particular day, how many different sets of parathas can he choose from?
(a) 5985 (b) 1140 (c) 5040 (d) ${}^{20}C_1 \times {}^{206}C_3$

Directions (for Q. Nos. 61 and 62) **:** *Answer these questions based on the following information.*
To win the Mathematics Olympiad you can choose any one module from 40 different modules. The number of problems in each module is same as the number of module, i.e., n^{th} module has n problems. The module 1 has the toughest problem and so the module 40 has the easiest problems.

61. Nilekani, an aspirant, attempts only 2 problems from a particular module. The number of ways in which he can attempt 2 distinct problems is
(a) 10850 (b) 10660 (c) 50425 (d) ${}^{20}C_1 \times {}^{206}C_3$

62. Narainmurthi, another aspirant, attempts exactly 38 problems from a particular module. The number of ways in which he can attempt 38 distinct problems is
(a) 2460 (b) 1640 (c) 820 (d) 40^{38}

Directions (for Q. Nos. 63 to 66) **:** *Answer these questions based on the following information.*
This week Cinemax, a multi screen cinema, is showing 4 new movies. Shahid Chopra and Priyanka Kapoor, the movie freak couple, who never watch movies individually or separately, can watch as many movies as possible if they get good reviews, else they may not go for any movie if the movies are not entertaining enough.

63. Find the total number of ways in which they can watch any number of new movies this week, irrespective of the order of the movie?
(i) ${}^4C_0 + {}^4C_1 + {}^4C_2 + {}^4C_3 + {}^4C_4$
(ii) 2^4 (iii) 4^2 (iv) 4
(a) Only (i) (b) Only (ii) and (iii)
(c) Either (i) or (iv) (d) (i), (ii) and (iii)

64. If his girlfriend Priyanka insists on watching at least one new movie this week, irrespective of the order of the movie, then the number of ways in which they can watch the movies is
(i) ${}^4C_1 + {}^4C_2 + {}^4C_3 + {}^4C_4$ (ii) $2^4 - 1$
(iii) 3 (iv) $2^4 - {}^4C_0$
(a) Only (iii) (b) Only (iv)
(c) All, except (iii) (d) Only (i) and (ii)

65. If his ex-girlfriend Kareena Gandhi also joins the couple and now all of them want to watch at least 2 movies, irrespective of the order of the movie, then the number of ways in which they can watch the movies is

(i) ${}^4C_2 + {}^4C_3 + {}^4C_4$ (ii) $2^4 - 5$

(iii) 2 (iv) $2^4 - {}^4C_0 - {}^4C_1$

(a) Only (iii)
(b) Only (iv)
(c) All, except (iii)
(d) Only (i) and (ii)

66. If Shahid and Priyanka realize, before they start watching any movie, that they have to do a long due shopping and so they decide not to watch more than 3 movies this week, then the number of ways, irrespective of the order of the movie, in which they can watch the movies is

(i) ${}^4C_0 + {}^4C_1 + {}^4C_2 + {}^4C_3$

(ii) $2^4 - 1$

(iii) $2^4 - {}^4C_4$

(iv) 6

(a) Only (iii) (b) Only (iv)
(c) Except (i) only (d) Only (i), (ii) and (iii)

Directions (for Q. Nos. 67 to 70) **:** *Answer these questions based on the following information.*

Amirbhai Moviewala, regarded for his perfection, is a very fastidious actor as far selection of the scripts is concerned. This year he has been offered as many as 100 scripts to read before he confirms to act in any movie which would be based on these scripts only. Facing the problem of plenty and hectic shooting schedule this year, he may not go through some or all of the scripts. Also, he is not looking for any other assignment in whatsoever media or role-small screen, commercials, reality shows, cameo role etc.

67. Find the number of ways in which he can read these scripts, irrespective of their order.

(a) 100 (b) 101
(c) 2^{100} (d) $2^{100} - 1$

68. If he decides not to read more than 50 scripts, then the number of ways in which he can read these scripts, irrespective of their order, is

(a) 2^{50} (b) $2^{50} - 1$
(c) $2^{100} - 2^{50} - 1$ (d) $\frac{1}{2}(2^{100} + {}^{100}C_{50})$

69. If he decides to read at least 2 but not more than 98 scripts, then the number of ways in which he can read these scripts, irrespective of their order, is

(a) 97 (b) 2^{97}
(c) $2^{100} - 202$ (d) $2^{100} - 2^{98} - 2$

70. If he decides to read at least 50 scripts this year, then the number of ways in which he can read these scripts, irrespective of their order, is

(a) $\frac{1}{2}(2^{100} - {}^{100}C_{50})$ (b) 2^{49}

(c) $2^{100} - 2^{51}$ (d) $2^{99} + \frac{1}{2}({}^{100}C_{50})$

71. A coaching institute imparts training in 10 different subjects. It wants to develop various modules in such a way that each module has equal number of subjects and no two modules have all the same subjects. Find the number of subjects in each module when maximum number of modules can be developed.

(a) 5 (b) 4 (c) 8 (d) 6

72. A sweet shop sells 9 varieties of sweets. The shopkeeper wants to pick not more than one piece of any variety of sweets to make the assortment of sweets. He then packs equal number of pieces in each box from variety of sweets in order to have maximum number of distinct assortments. How many varieties of sweets should he pack in a box so that each box contains distinct assortment of sweets?

(a) 3 (b) 4
(c) 5 (d) both (b) and (c)

Directions (for Q. Nos. 73 and 74) **:** *Answer these questions based on the following information.*

A team of 8 software engineers works on a project, for an American client, in Bengaluru, India. Every team member wants to go to the client's site in USA, as many times as it's possible for them. However, as per the company's policy every member will visit the site same number of times in a year. Each team member has to travel in groups of the same size each time the team goes to client's site. Not all members can be same in any two groups visiting the client's site in a year.

73. Maximum how many different groups can be formed?

(a) 4 (b) 16 (c) 70 (d) 32

74. Maximum how many times a team member can go to the client's site in a year?

(a) 32 (b) 35 (c) 49 (d) 7

Directions (for Q. Nos. 75 to 79) **:** *Answer these questions based on the following information.*

Shashi Huzoor – a prolific writer – is very vocal and straightforward in his views. He loves to opine through twitter, a website that allows anybody to tweet (or publish digitally) a message containing not more than 140 characters including the number of blank spaces.

But, it's not possible to tweet a blank message. Recently he got mired in a nasty tweet. Since then he has a superstition that if he tweets a post that uses odd number of alphanumeric characters, from the set of 26 alphabets and 10 numerals, it brings misfortune and a lot of trouble for him. So he prefers to use only even number of alphanumeric characters in all his tweets. That is to write a post on twitter he may select either 2 characters or 4 characters or 6 characters, and so on, from the set {a, b, c, ..., z, 0, 1, 2, ..., 9} to write a tweet. Repetition of any character does not matter to him; that is total number of characters in a tweet can be either odd or even.

75. Find the number of ways in which he can select the characters to tweet for his ardent followers.
(a) 36 (b) 2^{36} (c) $4^{36}-1$ (d) $2^{35}-1$

76. Sunanda Khushker, his beautiful wife, loves his everything but his superstition with the usage of odd number of characters. This invokes her to insist him to write a tweet using nothing but an odd number of characters. Succumbed to his wife's love and insistence he decides to tweet a post using odd number of characters only. Find the number of ways in which he can select the characters for tweeting.
(a) $2^{35}+1$ (b) 2^{36} (c) $4^{18}-1$ (d) 2^{35}

77. If he selects even number of characters from alphabets and even number of characters from numerals, separately, then the number of ways in which he can select the characters for tweeting.
(a) $2^{35}+1$ (b) $2^{34}-1$
(c) $4^{36}-1$ (d) $2^{35}-1$

78. Seeing his dilemma, one of his fans tweeted back that Mr. Shashi should not be bogged down and further advises him that if he just selects an odd number of characters from alphabets and odd number of characters from numerals, separately, no trouble will occur to him. Then the number of ways in which he can select the characters for tweeting.
(a) $2^{35}+1$ (b) 2^{34}
(c) $2^{35}-2$ (d) $2^{35}-1$

79. Mr. Shashi is also a globetrotter. Once on board he meets a numerologist, who tells him not to worry as even if he selects an odd number of characters from alphabets and an odd number of characters from numerals, separately, but if he selects overall an even number of characters from the set of 36 alphanumerical characters, all sorts of problems will be vanished. Then the number of ways in which he can select the characters for tweeting is
(a) $2^{35}+1$ (b) $2^{35}-1$
(c) $2^{35}-2$ (d) 2^{34}

Combination of n Identical Things

1. Number of ways of selections of r things from a group of n identical things = 1.
2. Number of ways of selections of at most r things from a group of n identical things = $r+1$
3. Number of ways of selections of at least r things from a group of n identical things = $(n-r)+1$
4. Number of ways of selections of at least one thing from a group of n identical things = n
5. Number of ways of selections of zero or more things from a group of n identical things = $n+1$

Combination of n Things Not All Different

Number of ways of selection of some or all the things from a group of distinct subgroups:

1. Number of ways of selection of zero or more things out of $(p+q+r+\ldots)$ things, of which p are alike of one kind, q are alike of second kind, r are alike of third kind, and so on $=[(p+1)(q+1)(r+1)\ldots]$
2. Number of ways of selection of at least one thing out of $(p+q+r+\ldots)$ things, of which p are alike of one kind, q are alike of second kind, r are alike of third kind, and so on $=[(p+1)(q+1)(r+1)\ldots]-1$
3. Number of ways of selection of zero or more things from p identical things of one kind, q identical things of second kind, r identical things of third kind, and from remaining n things which are all different $=[(p+1)(q+1)(r+1)2^n]$
4. Number of ways of selection of at least one thing from p identical things of one kind, q identical things of second kind, r identical things of third kind, and from remaining n things which are all different $=[\{(p+1)(q+1)(r+1)2^n\}-1]$
5. The number of ways of choosing k objects, from p objects of one kind, q objects of second kind, and so on, is the coefficient of x^k in the expansion $(1+x+x^2+\ldots+x^p)(1+x+x^2+\ldots+x^q)\ldots$
6. The number of ways of choosing k objects from p objects of one kind, q objects of second kind, and so on, such that one object of each kind must be included is the coefficient of x^k in the expansion $(x+x^2+\ldots.+x^{p)}(x+x^2+\ldots+x^{q)}\ldots$
7. The number of ways in which r things can be selected from a group of n things of which p are identical is
$$\sum_{0}^{r} {}^{n-p}C_r;\ \text{if } r \le p$$
8. The number of ways in which r things can be selected from a group of n things of which p are identical is
$$\sum_{r=p}^{r} {}^{n-p}C_r;\ \text{if } r > p$$

Introductory Exercise 19.6

Directions (for Q. Nos. 1 and 2) **:** *Answer these questions based on the following information.*
A set contains 9 letters such that
$S = \{A, A, B, B, B, C, C, C, C\}$.

1. Find the number of ways of selection of 4 letters.
(a) 7 (b) 11 (c) 15 (d) 18

2. Find the number of ways of selection of 4 letters such that each of A, B, C must be there.
(a) 3 (b) 4 (c) 5 (d) 6

Directions (for Q. Nos. 3 to 10) **:** *Answer these questions based on the following information.*
At DLF mall Gurugram, there is a store that sells premium T-shirts. At this store there is a shelf that has exactly 10 red tees (or T-shirts) of same colour, size and style; and I am interested in buying tees from this shelf only.

3. Find the number of ways of selecting 1 tee.
(a) 0 (b) 1 (c) 2 (d) 10

4. Find the number of ways of selecting at least 1 tee.
(a) 0 (b) 1 (c) 2 (d) 10

5. Find the number of ways of selecting at most 1 tee.
(a) 0 (b) 1 (c) 2 (d) 10

6. Find the number of ways of selecting 4 tees.
(a) 0 (b) 1 (c) 2 (d) 10

7. Find the number of ways of selecting at least 4 tees.
(a) 4 (b) 1
(c) 2 (d) none of these

8. Find the number of ways of selecting at most 4 tees.
(a) 5 (b) 1 (c) 4 (d) 10

9. Find the number of ways of selecting any number of tees.
(a) 0 (b) 1 (c) 2 (d) 11

10. Find the number of ways of selecting 10 tees.
(a) 0 (b) 1 (c) 2 (d) 10

Directions (for Q. Nos. 11 to 25) : *Answer these questions based on the following information.*
There are 2 white candles, 3 red candles, 4 green candles and 3 yellow candles in a brand new packet. All the candles are uniform in shape and size, except their colour, as told above.

11. Find the number of ways of selecting any number of candles.
(a) 2^{12} (b) 240
(c) 72 (d) 13

12. Find the number of ways of selecting at least one candle.
(a) $2^{22} - 1$ (b) 239 (c) 72 (d) 12

13. Find the number of ways of selecting one candle of each colour.
(a) 10 (b) 11 (c) 2 (d) 1

14. Find the number of ways of selecting at least one candle of each colour.
(a) 0 (b) 72 (c) 2 (d) 10

15. Find the number of ways of selecting 2 candles of each colour.
(a) 0 (b) 1 (c) 2 (d) 10

16. Find the number of ways of selecting at least 2 candles of each colour.
(a) 12 (b) 2 (c) 10 (d) 11

17. Find the number of candles of selecting at most 2 candles of each colour.
(a) 0 (b) 16 (c) 18 (d) 81

18. Find the number of ways of selecting 2 candles.
(a) 0 (b) 1 (c) 2 (d) 10

19. Find the number of ways of selecting 1 white, 2 red, 3 green and 2 yellow candles.
(a) 0 (b) 1 (c) 2 (d) 10

20. Find the number of ways of selecting all the candles of each colour.
(a) 0 (b) 1 (c) 2 (d) 10

21. Find the number of ways of selecting 4 candles.
(a) 0 (b) 29 (c) 2 (d) 10

22. Find the number of ways of selecting 6 candles.
(a) 0 (b) 36 (c) 40 (d) 72

23. Find the number of ways of selecting at least 6 candles.
(a) 0 (b) 140 (c) 72 (d) 120

24. Find the number of ways of selecting at most 6 candles.
(a) 7 (b) 72 (c) 120 (d) 140

25. Find the number of ways of selecting 6 candles, such that there must be at least one candle of each colour.
(a) 9 (b) 10 (c) 11 (d) 100

Directions (for Q. Nos. 26 to 34) **:** *Answer these questions based on the following information.*
An electronic goods store has 3 boxes of pendrives. The capacity of each pendrive is n GB, where $n \in N$.
The first box has 3 identical pendrives, each of 4 GB storage capacity; second box has 4 identical pen-drives, each of 2 GB storage capacity; and third box has 5 pendrives, each of varying or distinct storage capacities other than 2 GB and 4 GB. All the pendrives are of the same make, colour and design.

26. Find the number of ways of selecting any number of pen drives.
(a) 120 (b) 600 (c) 520 (d) 640

27. Find the number of ways of selecting at least one pendrive.
(a) 639 (b) 119 (c) 519 (d) 384

28. Find the number of ways of selecting at most 1 pendrive.
(a) 9 (b) 8 (c) 0 (d) 1

29. Find the number of ways of selecting 1 pendrive from each box.
(a) 5 (b) 3 (c) 60 (d) 50

30. Find the number of ways of selecting 3 pendrives.
(a) 49 (b) 36 (c) 64 (d) 220

31. Find the number of ways of selecting 3 distinct pendrives.
(a) 10 (b) 36 (c) 35 (d) 3

32. Find the number of ways of selecting 2 pen-drives of 4 GB, 3 pendrives of 2 GB and 4 pen-drives of different storage capacities other than 2 GB and 4 GB.
(a) 5 (b) 10
(c) 24 (d) 25

33. Find the number of ways of selecting at most 2 pendrives from the first box, at most 3 pendrives from the second box and at most 4 pendrives from the third box.
(a) 372 (b) 72
(c) 36 (d) 488

34. Find the number of ways of selecting any 2 identical pendrives.
(a) 0 (b) 1 (c) 2 (d) 4

35. Find the number of ways of selecting any 2 distinct pendrives.
(a) 19 (b) 20 (c) 21 (d) 66

Directions (for Q. Nos. 36 and 37) **:** *Answer these questions based on the following information.*
A shop has 10 mobile recharge coupons of Vodafone. Out of which 4 are identical of same value and remaining each coupon is of distinct value.

36. Find the number of ways of selecting 7 coupons.
(a) 3 (b) 21 (c) 42 (d) 22

37. Find the number of ways of selecting 3 coupons.
(a) 6 (b) 21 (c) 22 (d) 42

Combination of Contiguous Things

(A) *Linear Combination*

I. Number of selections of k consecutive things out of n things in a row $= (n-k+1)$

II. Number of selection of k things out of n things in a row, such that no two of the selected objects are next to each other $= {}^{n-k+1}C_k$

(B) *Circular Combination*

Number of selections of k consecutive things out of n things in a circle $= \begin{cases} n, & \text{when } k < n \\ 1, & \text{when } k = n \end{cases}$

Introductory Exercise 19.7

Directions (for Q. Nos. 1 to 3) **:** *Answer these questions based on the following information.*
Last Diwali Chhota Bheem got 10 distinct coloured candles placed in a row. Then he asked his friend to lit 3 candles.

1. Find the number of ways of selection of candles so that all the 3 candles are consecutive.
(a) 19 (b) 20 (c) 8 (d) 66

2. Find the number of ways of selection of candles so that all the 3 candles are not consecutive.
(a) 112 (b) 120
(c) 132 (d) 66

3. Find the number of ways of selection of candles so that at least 2 candles are consecutive.
(a) 66 (b) 33
(c) 17 (d) 64

Directions (for Q. Nos. 4 to 13) **:** *Answer these questions independently of each other.*

4. In an amphitheater there are 10 distinguishable seats placed in a row. A family of five wants to sit together, while rest of the attendees can sit anywhere without any restriction. In how many ways can 5 seats be selected so that this family can sit together?
(a) 4 (b) 5 (c) 6 (d) ${}^{10}C_5$

5. A rectangular field of 100×10 is plotted into 10 square plots of 10×10. Happy Housing is a first customer who wants to buy 4 contiguous square plots to develop a society for women who are victims of domestic violence. In how many ways can he select 4 such plots that are all adjacent to each other?
(a) 7 (b) 6
(c) 5 (d) 40

6. Anna Hazare – a social activist who became world famous after his crusade against corruption – wants to sit on a fast for 4 days back-to-back in the next week. Sitting on fast is usually indicative of protest in a democratic system to let the government/authority know the differing, rising and unheard opinion of its stakeholders.

Find the number of selection of days in which he can sit on fast for 4 consecutive days.

(a) 4 (b) 5 (c) 6 (d) 2

7. Divya, who just got married, is allowed to work from home. The only restriction is that in every calendar year she has to work in the office for exactly 4 months but she cannot work in the office for any two consecutive months. In a particular calendar year, in how many different ways can she choose to work from her office?

(a) 369 (b) 156
(c) 126 (d) 123

8. At a very small railway station in Rajasthan, out of eight terrorists four terrorists enter into four distinct bogies of a passenger train that has total ten bogies, so that they could place the bombs in the train. However, no two terrorists enter in the contiguous bogies that are directly connected to each other. In how many ways can these terrorists board the train?

(a) 58800 (b) 54200
(c) 14700 (d) 2450

9. Four teams – A, B, C and D, are attending a meet. They are made to sit in the 21 chairs placed beside one another in a row. The number of members in these teams are 2, 3, 5 and 6, respectively. However, no two members of different teams sit in the adjacent chairs and all the members of each team must sit together in the adjacent seats. In how many ways can they sit in these chairs?

(a) 3036800 (b) 373248000
(c) 61036800 (d) 125646000

10. On the very auspicious day of Karva Chauth, six couples of my college decide to book the whole mini-theater, however they prefer to sit on the top row only, which has twenty seats. They sit in such a manner that the couple sits in any two adjacent chairs but there must be at least one seat vacant between any two couples. All the seats of top row are fixed in such a way that there is no gap between any two seats. Find the number of ways of sitting in the seats of top row.

(a) 4456200 (b) 519300
(c) 697480 (d) 3870720

11. There are twelve security guards made to stand around a circular football stadium. Any six guards, who are adjacent to each other, need a replacement. In how many ways can these guards be selected for replacement?

(a) 36 (b) 18 (c) 2 (d) 12

12. Five friends were dining at a plush restaurant sitting at a round dining table. During their dinner a wine glass fell off the table and wine was, of course, spilled on the two guys sitting next to each other. Find the number of ways in which any two chairs can be selected on which these two persons are sitting next to each other, provided each chair is distinguishable.

(a) 2 (b) 10 (c) 4 (d) 5

13. A group of ten friends went to Lonavala in the late night. After reaching there all of them were almost nonplussed to realize that there is a nip in the air. Luckily there was a hut that had a bone-fire for sale. All of them paid money for tea and bone-fire and then sat around the fire. But it wasn't too late when four adjacent chairs caught the fire, which went unnoticed until one of the guys felt the burning sensation. Find the number of ways in which these four chairs can be selected, provided each chair is distinguishable.

(a) 2 (b) 10 (c) 4 (d) 5

Directions (for Q. Nos. 14 and 15) **:** *Answer these questions based on the following information.*
All the triangles are formed from the 10-sided polygon by connecting all the vertices mutually.

14. Find the number of triangles so that at least one side of the triangle coincides with the side of the polygon.

(a) 120 (b) 70 (c) 80 (d) 66

15. Find the number of triangles so that none of the sides of the triangle coincides with the side of the polygon.

(a) 20 (b) 80 (c) 64 (d) 50

16. Sunburn is one of the biggest New Year carnivals of Goa. The party happens inside the restricted circular premises, which has exactly 10 gates. The event managers want 3 entrance gates and 7 exit gates for the heck of safety and security concerns. However, they want that none of the 3 entrances should be adjacent to each other. Each of the gates have a designated number, as in gate number 1, 2, ..., 10. In how many ways can 3 gates be selected from the 10 gates in order to have the entrance facility?

(a) 150 (b) 50 (c) 60 (d) 160

17. Out of the following six statements how many statements are INCORRECT?

(i) Number of ways of arranging 6 different red chairs and 4 different blue chairs in a row such that the chairs of the same color are always together = $(6! \times 4!) \times 2!$

(ii) Number of ways of arranging 6 different red chairs and 4 different blue chairs in a row such that all the red chairs are together = $5! \times 6!$

(iii) Number of ways of arranging 6 different red chairs and 4 different blue chairs in a row such that no two blue chairs are together = ${}^7C_4 \times 4! \times 6!$

(iv) Number of ways of arranging 5 different red chairs and 5 different blue chairs in a row such that no two adjacent chairs are of the same color $= 2 \times (5!)^2$

(v) Number of ways of arranging 6 identical red chairs and 4 identical blue chairs in a row such that no two blue chairs are together = ${}^7C_4$

(vi) Number of ways of arranging 6 identical red chairs and 4 different blue chairs in a row such that no two blue chairs are together = $4! \times {}^7C_4$

(a) 0 (b) 1 (c) 2 (d) 4

18. Suchirupa is a fitness conscious woman. She joined a club in her neighbourhood that offers seven fitness activities to choose from. However, on a particular day only one activity is supposed to be done by any of the members of this club. If Suchirupa does not do the same activity on any two consecutive days, in how many ways can she choose to work out the next week?

(a) 42×5^5

(b) $7 \times 6^3 \times 5^3$

(c) $7 \times (6)^6$

(d) 56

19. Deepika has two best friends, Yuvraj and Siddhartha. Everyday, she practices badminton with one of them, but she practices at least once a week with Siddhartha. If she practices badminton with Siddhartha more than once in a week she must practice with him on consecutive days only. She practices it only once in a day. In how many ways can she practice the badminton with her friends?

(a) 206 (b) 28

(c) 49 (d) 48

19.6 Distribution/Division of Distinct Things Among Individuals/Groups

1. Number of ways in which $(m+n)$ different things can be divided into two unequal groups containing m and n things, if the order of the group is not important $= {}^{m+n}C_m \times {}^nC_n = \dfrac{(m+n)!}{m!\,n!}$

2. Number of ways in which $(m+n)$ different things can be divided into two unequal groups containing m and n things, if the order of the group is important $= \dfrac{(m+n)!}{m!\,n!} \times 2!$

3. The number of ways in which $(m+n+p)$ different things can be divided into three different groups containing m, n and p things respectively, if the order of the group is not important $= {}^{m+n+p}C_m \times {}^{n+p}C_n \times {}^pC_p = \dfrac{(m+n+p)!}{m!\,n!\,p!}$

4. The number of ways in which $(m+n+p)$ different things can be divided into three different groups containing m, n and p things respectively, if the order of the group is important $= \dfrac{(m+n+p)!}{m!\,n!\,p!} \times 3!$

5. The number of ways in which mn different items can be divided equally into m groups, each containing n objects when the order of the group is not important $= \left[\dfrac{(mn)!}{(n!)^m}\right]\dfrac{1}{m!}$

6. The number of ways in which mn different items can be divided equally into m groups, each containing n objects when the order of the groups is important $= \left[\dfrac{(mn)!}{(n!)^m}\right]$

7. The number of ways of dividing $2n$ different things into three groups of n each when the order of groups is not important $= \dfrac{(2n)!}{(n!)^2}\dfrac{1}{2!}$; the division by 2! indicates that since 2 groups have equal number of things, so the two groups are indistinguishable.

8. The number of ways of dividing $3n$ different things into three groups of n each when the order of groups is important $= \left[\dfrac{(2n)!}{(n!)^2}\right]$

9. The number of ways of dividing $3n$ different things into three groups of n each when the order of groups is not important $= \frac{(3n)!}{(n!)^3}\frac{1}{3!}$; the division by 3! indicates that since 3 groups have equal number of things, so the three groups are indistinguishable.
10. The number of ways of dividing $3n$ different things into three groups of n each when the order of groups is important $= \left[\frac{(3n)!}{(n!)^3}\right]$
11. The number of ways in which n distinct things can be distributed to r different persons $= r^n$

NOTE Usually the phrase 'distribution' indicates that the things are given out (or doled out) to different people and so the order becomes important. As, normally, people are distinct so it becomes essential to distinguish that who receives what.

The phrase 'division' usually suggests that the different things are just clubbed in different sets or groups. They may be kept in identical boxes or their receivers are identical, and therefore they are naturally indistinguishable. That's why no rearranging or ordering matters.

However, authors/paper-setters normally use both the phrases interchangeably. So, it is your responsibility to figure it out whether order is important or not; and that can be done on the basis of the situation and language of the problem.

Exp. 1) Find the number of ways of dividing 4 distinct articles between 2 groups.

Solution Let a, b, c and d be the four distinct articles to be divided in two groups.

Then you have the following groups.

i	–	*a, b, c, d*
ii	*a*	*b, c, d*
iii	*b*	*a, c, d*
iv	*c*	*a, b, d*
v	*d*	*a, b, c*
vi	*a, b*	*c, d*
vii	*a, c*	*b, d*
viii	*a, d*	*b, c*

Therefore, total number of ways in which 4 distinct articles can be divided in 2 groups is 8.

Alternatively

Case I (4, 0) Number of ways = ${}^4C_4 \times {}^0C_0 = 1 \times 1 = 1$

Case II (3, 1) Number of ways = ${}^4C_3 \times {}^1C_1 = 4 \times 1 = 4$

Case III (2, 2) Number of ways

$$= {}^4C_2 \times {}^2C_2 \times \frac{1}{2} = 6 \times 1 \times \frac{1}{2} = 3$$

Therefore, total number of ways in which 4 distinct articles can be divided in 2 groups =1 + 4 + 3 = 8.

Exp. 2) Find the number of ways of distributing the 4 distinct articles between 2 girls.

Solution Let a, b, c and d be the four distinct articles to be distributed in two girls.

Then you have the following distribution.

	Girl 1	**Girl 2**
i	–	*a, b, c, d*
ii	*a*	*b, c, d*
iii	*b*	*a, c, d*
iv	*c*	*a,b, d*
v	*d*	*a, b, c*
vi	*a, b*	*c, d*
vii	*a, c*	*b, d*
viii	*a,d*	*b, c*
ix	*b, c*	*a, d*
x	*b, d*	*a, c*
xi	*c, d*	*a, b*
xii	*a, b, c*	*d*
xiii	*a, b, d*	*c*
xiv	*a, c, d*	*b*
xv	*b, c, d*	*a*
xvi	*a, b, c, d*	–

Since each girl is distinct, so the number of ways in which the 2 groups can be arranged is 2! ways.

Therefore the number of ways of distribution of 4 distinct articles between 2 distinct girls = $2! \times 8 = 16$

Alternatively

Case I (4, 0) Number of ways = ${}^4C_4 \times {}^0C_0 \times 2 = 1 \times 2 = 2$

Case II (3, 1) Number of ways = ${}^4C_3 \times {}^1C_1 = 4 \times 1 \times 2 = 8$

Case III (2, 2) Number of ways

$$= {}^4C_2 \times {}^2C_2 \times \frac{1}{2} \times 2 = 6 \times 1 \times \frac{1}{2} \times 2 = 6$$

Therefore, total number of ways in which 4 distinct articles can be divided in 2 groups =2 + 8 + 6 = 16.

Exp. 3) Find the number of ways of distributing 4 distinct articles between 2 groups, such that one group has 1 article and another one has 3 articles.

Solution Let a, b, c and d be the four distinct articles to be divided in two groups, such that one group has 1 article and another one has 3 articles. Then you have the following groups.

i	a	b, c, d
ii	b	a, c, d
iii	c	a, b, d
iv	d	a, b, c

Therefore, total number of ways in which 4 distinct articles can be divided in 2 groups such that one group has 1 article and another one has 3 articles is 4.

Alternatively Number of ways in which 4 distinct articles can be divided in 2 groups such that one group has 1 article and another one has 3 articles

$$= {}^4C_1 \times {}^3C_3 = \frac{4!}{1!3!} = 4$$

Exp. 4) Find the number of ways of dividing 4 distinct articles between 2 girls, such that one girl gets 1 article and another girl gets 3 articles.

Solution Let *a, b, c* and *d* be the four distinct articles to be distributed in two girls, such that one girl gets 1 article and another girl gets 3 articles.

Then you have the following distribution.

	Girl 1	Girl 2
i	*a*	*b, c, d*
ii	*b*	*a, c, d*
iii	*c*	*a, b, d*
iv	*d*	*a, b, c*
v	*a, b, c*	*d*
vi	*a, b, d*	*c*
vii	*a, c, d*	*b*
viii	*b, c, d*	*a*

Since each girl is distinct, so the number of ways in which the 2 groups can be arranged in 2! ways.

Therefore the number of ways of distribution of 4 distinct articles equally among 2 distinct girls = $2! \times 4 = 8$

Alternatively: Number of ways in which 4 distinct articles can be divided in 2 groups such that one group has 1 article and another one has 3 articles

$$= {}^4C_1 \times {}^3C_3 = \frac{4!}{1!3!} = 4$$

Now these 2 groups of articles can be arranged among themselves in 2! ways.

Therefore the number of ways of distribution of 4 distinct articles among 2 distinct girls = $2! \times 4 = 8$

Exp. 5) Find the number of ways of distributing 4 distinct articles between 2 groups, equally.

Solution Let *a, b, c* and *d* be the four distinct articles to be divided in two groups, equally.

Then you have the following groups.

i	*a, b,*	*c, d*
ii	*a, c*	*b, d*
iii	*a, d*	*b, c*

Therefore, total number of ways in which 4 distinct articles can be divided equally in 2 groups is 3.

Alternatively Number of ways in which 4 distinct articles can be divided equally in 2 groups

$$= {}^4C_2 \times {}^2C_2 = \frac{4!}{2!2!} = 6$$

But since both the groups have equal number of articles, so the two groups become identical. Therefore, the actual number of ways of division of articles

$$= ({}^4C_2 \times {}^2C_2) \times \frac{1}{2!} = \left[\frac{4!}{2!2!}\right] \times \frac{1}{2!} = 3$$

Exp. 6) Find the number of ways of dividing 4 distinct articles between 2 girls, equally.

Solution Let *a, b, c* and *d* be the four distinct articles to be distributed in two girls, equally.

Then you have the following distribution.

	Girl 1	Girl 2
i	a, b	c, d
ii	a, c	b, d
iii	a, d	b, c
iv	b, c	a, d
v	b, d	a, c
vi	c, d	a, b

Since each girl is distinct, so the number of ways in which the 2 groups can be arranged in 2! ways.

Therefore the number of ways of distribution of 4 distinct articles equally among 2 distinct girls = $2! \times 3 = 6$

Alternatively Number of ways in which 4 distinct articles can be divided equally in 2 groups

$$= {}^4C_2 \times {}^2C_2 = \frac{4!}{2!2!} = 6$$

But since both the 2 groups have equal number of articles, so the two groups become identical. Therefore, the actual number of ways of division of articles

$$= ({}^4C_2 \times {}^2C_2) \times \frac{1}{2!} = \left(\frac{4!}{2!2!}\right) \times \frac{1}{2!} = 3$$

However, the 2 girls are distinct so the required number of distribution of articles

$$= ({}^4C_2 \times {}^2C_2) \times \frac{1}{2!} \times 2! = \left(\frac{4!}{2!2!}\right) \times \frac{1}{2!} \times 2! = 6$$

19.7 Distribution/Division of Identical Objects Among Individuals/Groups

1. The number of ways of dividing n identical items among r persons (where, $0 \le r \le n$), each one of whom can receive any number (0, 1, 2,..., n) of items $= {}^{n+r-1}C_{r-1}$

   Example : Divide 16 identical balls among 3 kids, in such a way that any kid can get any number of balls is ${}^{16+3-1}C_{3-1} = {}^{18}C_2$

2. The number of ways of dividing n identical items among r persons (where, $0 \le r \le n$), each one of whom must receive at least one item $= {}^{n-1}C_{r-1}$

Example : Divide 16 identical balls among 3 kids, in such a way that each kid must get at least 1 ball is

$$^{16-1}C_{3-1} = {}^{15}C_2$$

3. The number of ways in which n identical items can be divided into r groups so that no group contains less than m items and more than k items (where $m < k$) is coefficient of x^n in the expansion of

$$(x^m + x^{m+1} + \ldots + x^k)^r,$$

for every $m \le x_i \le k$

Example : Divide 16 identical balls among 3 kids, so that each kid gets at least 2 balls but not more than 7 balls is coefficient of x^{16} in the expansion of

$$(x^2 + x^3 + x^4 + x^5 + x^6 + x^7)^3$$

4. The number of ways in which n identical items can be divided into r groups such that the group x_i contains minimum a_i and maximum b_i items (where $a_i \le b_i$) is coefficient of x^n in

$$(x^{a_1} + x^{a_1+1} + \ldots + x^{b_1})(x^{a_2} + x^{a_2+1} + \ldots + x^{b_2}) \ldots (x^{a_r} + x^{a_r+1} + \ldots + x^{b_r})$$

Example : Divide 16 identical balls among 3 kids, such that first kid cannot have less than 3 and more than 5 balls, second kid cannot have less than 2 and more than 8 balls, and the third kid cannot have less than 4 and more than 7 balls is coefficient of x^{16} in

$$(x^3 + x^4 + x^5)(x^2 + x^3 + x^4 + x^5 + x^6 + x^7 + x^8)(x^4 + x^5 + x^6 + x^7)$$

19.8 Algebraic Properties

A. For a natural number n, the given equation is $x_1 + x_2 + x_3 + \ldots + x_r = n$

1. If $x_i \ge 0$, the number of integral solutions is $^{n+r-1}C_{r-1}$
2. If $x_i \ge 1$, the number of integral solutions is $^{n-1}C_{r-1}$
3. If $m \le x_i \le k$, the number integral solutions is coefficient of x^n in the expansion of $(x^m + x^{m+1} + \ldots + x^k)^r$
4. If $a_1 \le x_1 \le b_1, a_2 \le x_2 \le b_2, \ldots, a_r \le x_r \le b_r$ the number of integral solutions is coefficient of x^n in $(x^{a_1} + x^{a_1+1} + \ldots + x^{b_1})(x^{a_2} + x^{a_2+1} + \ldots + x^{b_2}) \ldots (x^{a_r} + x^{a_r+1} + \ldots + x^{b_r})$

B. For a natural number n, if the given inequation is $x_1 + x_2 + x_3 + \ldots + x_r \le n$.
Then, add a dummy variable x_{r+1} in the given equation, so that inequality can be converted into equality before finding the number of solutions.

5. If $x_i \ge 0$, the number of integral solutions to $x_1 + x_2 + x_3 + \ldots + x_r \le n$ is same as the number of integral solutions of $x_1 + x_2 + x_3 + \ldots + x_r + x_{r+1} = n$. Thus the required number of integral solutions is $^{n+r}C_r$.

   Example : If $x_i \ge 0$, the given inequation $x_1 + x_2 + x_3 + \ldots \le n$ can be expressed as $x_1 + x_2 + x_3 + x_4 = n$

so the required number of integral solutions is $^{n+3}C_3$.

C. For a natural number n, number of solutions of $|x_1| + |x_2| + \ldots + |x_m| = n$.

6. The total number of integral solutions of $|a| + |b| = n$ is $4n$
7. The total number of integral solutions of $|a| + |b| + |c| = n$ is $4n^2 + 2$
8. The total number of integral solutions of $|a| + |b| + |c| + |d| = n$ is $\left(\frac{8n}{3}\right)(n^2 + 2)$

D. For a natural number n, number of terms of binomial and multinomial expressions.

9. Total number of terms in $(x + y)^n = n + 1$
10. Total number of terms in

$$(a_1 + a_2 + \ldots a_n)^m = {}^{m+n-1}C_{n-1}$$

11. Total number of terms in $(1 + x + x^2 + \ldots x^n)^m$ is $(m.n) + 1$

NOTE $1 + x + x^2 + \ldots + x^n = \frac{x^{n+1} - 1}{x - 1}$

Exp. 1) Suppose you have 4 identical chocolates in your pocket. In how many ways can you distribute the four identical chocolates between the two kids (or children)?

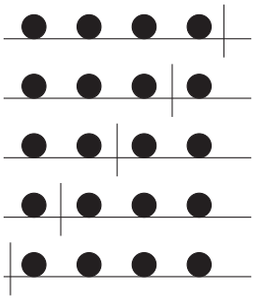
Solution In the following you can see that there are total 5 ways of distributing the 4 chocolates between 2 kids.

	Number of Chocolates					
First Kid	4	3	2	1	0	
Second Kid	0	1	2	3	4	

NOTE Here chocolates are identical and kids are distinct. So, we focus on kids, as they are distinguishable, but not on the chocolates.

Alternatively Look at the other way of understanding the same problem. In this illustration there are 5 distinct possibilities of distributing the 4 chocolates between 2 kids.

The number of chocolates on the left side of the bar (vertical line) is given to the first kid and the number of chocolates on the right side of the bar is given to the second kid. Thus, you can see that the number of ways of distributing the 4 chocolates is same as the number of ways of arranging 4 circles and 1 bar in a row.



And, you already know how to arrange the 5 objects in a row, which can be simply done in 5! ways. But since all the 4 circles are identical, so the actual number of ways in which 5 objects can be arranged is $5!/4! = 5$ ways.

NOTE As we need only one wall or partition to divide any physical object into two parts, so we need only one bar to divide any number of circles into 2 parts.

Alternatively Now look at the other way of understanding the same problem.

Find the number of non-negative integral solutions of

$$a + b = 4$$

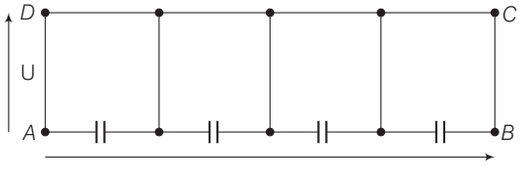
Therefore, we have (a, b)

$$= (4, 0), (3, 1), (2, 2), (1, 3), (0, 4).$$

Thus you can see that there are total 5 solutions to the above equation.

Alternatively Now look at the other problem, which works with the same logic as the original problem does.

Find the number of distinct shortest paths from A to C in the following diagram, which is a rectangular grid of 4 horizontal steps and 1 upward step.



In order to reach C from A you have to take any 4 horizontal steps and any 1 upward step in anyone of the 5 following orders.

HHHH**U**
HHH**U**H
HH**U**HH
H**U**HHH
UHHHH

Thus you can see that there are total 5 shortest ways of reaching C from A.

Mathematically, the answer is similar to arranging 5 objects (steps) in a row such that 4 of them are identical. That is $5!/4! = 5$

So, essentially, what you are doing is nothing but distributing the total 5 steps in 2 different directions. Thus you can use the same logic in various kinds of problems.

***Exp.* 2)** Find the number of ways in which you can distribute all the 12 identical chocolates among the 3 kids.

Solution This problem is like dividing 12 circles by 2 bars (vertical lines). Now, the number of ways of arranging 12 circles and 2 bars $= \frac{(12+2)!}{12! \times 2!} = \frac{14!}{12! \times 2!} = 91$

Therefore, the number of ways in which 12 identical chocolates can be divided among 3 kids is 91.

Hint The equivalent algebraic equation would be $a + b + c = 12$, such that $a, b, c \geq 0$.

NOTE You must be wondering that since the two kids are distinct, then why I have considered them identical. The reason is that the order of kids does not matter at all, as the kids are equivalent to the bars and the role of bars is just to separate the circles. So whenever the order is not important, things (or persons) may act as if they are identical.

***Exp.* 3)** Find the number of ways in which you can distribute all the 12 identical chocolates among the 5 kids.

Solution As you have to distribute the chocolates among 5 kids that means you need to have 4 bars to make 5 divisions among 12 circles.

Thus the answer to this problem is same as finding the number of ways in which 16 objects (12 circles + 4 bars) can be arranged in a row, out of which 12 objects (circles) are identical and 4 other objects (bars) are also identical.

That is the number of ways of arrangements of 12 circles and 4 bars in a row $= \frac{12+4)!}{12! \times 4!} = \frac{16!}{12! \times 4!} = 1820$

Therefore, the number of ways in which 12 identical chocolates can be divided among 5 kids is 1820.

Hint The equivalent algebraic equation would be $a + b + c + d + e = 12$, such that $a, b, c, d, e \geq 0$

***Exp.* 4)** Find the number of ways in which you can distribute all the 12 identical chocolates among the 3 kids, such that each of them must get at least one chocolate.

Solution To simplify the solution what you need to do is distribute 1 chocolate to each of the 3 kids. Since chocolates are identical, so it does not matter who gets which chocolate.

Now you have just 9 chocolates left to distribute among

3 kids, in the second round. But the best part is that now you are totally free to give any number of chocolates, out of 9 chocolates, to any of the 3 kids. That means even if you give 0 chocolate to a particular kid, it won't violate the basic restriction, as each kid has already received 1 chocolate in the first round.

Then the modified problem is like distributing 9 identical chocolates among 3 kids, without any specific restriction.

And, this is equivalent to arranging the 9 circles and 2 bars, such that all the 9 circles are identical and the 2 bars are identical.

That is the number of ways of arrangements of 9 circles and 2 bars $= \frac{(9+2)!}{9! \times 2!} = \frac{11!}{9! \times !2!} = 55$

Therefore, the number of ways in which 12 identical chocolates can be divided among 3 kids, such that each kid must get at least 1 chocolate is 55.

Hint The equivalent algebraic equation would be $a + b + c = 12$, such that $a, b, c \geq 1$. or $a + b + c = 9$, such that $a, b, c \geq 0$

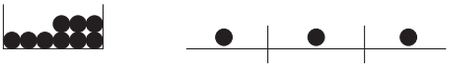
NOTE Whenever you see the lower limits imposed on the problem, you must give away the minimum required number of items to the deserving persons in the first round, then remaining number of items can be given away (or distributed) without any restriction. So, our objective is to deal with the restrictions, first. Then it becomes a very flexible problem to deal with.

Alternatively The given problem can be stated as

$$a + b + c = 12\,;\, a, b, c \geq 1$$

Before the distribution of chocolates :

After distributing minimum 1 chocolate to each of the 3 kids :



Now, you can see that only 9 chocolates are remaining to be distributed among the 3 kids.

And, the best thing is that you are totally free to give any number of chocolates to anyone. As in, you can give all the 9 chocolates to one kid and no chocolates to the other 2 kids or you can give equal number of chocolates to each of them. And, that you can do in 55 ways, as explained below.

After ensuring that each kid must get 1 chocolate, the distribution problem transforms to

$$a + b + c = 9;\, a, b, c \geq 0$$

And, the number of solutions to this equation

$$= \frac{(9+2)!}{9! \times 2!} = \frac{11!}{9! \times 2!} = 55$$

NOTE Once you have ensured that each kid is getting the minimum requisite number of items, you are completely free to distribute the items using the very basic logic of distribution.

Exp. 5) Find the number of ways in which you can distribute all the 12 identical chocolates among the 3 kids, such that each of them must get at least two chocolates.

Solution To simplify the solution what you need to do is give 2 chocolates to each of the 3 kids. Since chocolates are identical, so it does not matter who gets which chocolates.

Now you have just 6 chocolates left to be distributed among 3 kids, in the second round.

But the best part is that now you are totally free to give any number of chocolates, out of 6 chocolates, to any of the 3 kids. That means even if you give 0 chocolate to a particular kid, it won't violate the basic restriction, as each kid has already received 2 chocolates, in the first round.

Then the modified problem is like distributing 6 identical chocolates among 3 kids, without any specific restriction.

And, this is equivalent to arranging the 6 circles and 2 bars, such that all the 6 circles are identical and the 2 bars are identical.

That is the number of ways of arrangements of 6 circles and 2 bars $= \frac{(6+2)!}{6! \times 2!} = \frac{8!}{6! \times 2!} = 28$

Therefore, the number of ways in which 12 identical chocolates can be divided among 3 kids, such that each kid must get at least 2 chocolates is 28.

Hint The equivalent algebraic equation would be $a + b + c = 12$ such that $a, b, c \geq 2$ or $a + b + c = 6$, such that $a, b, c \geq 0$

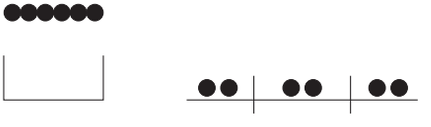
NOTE Whenever you see the lower limits imposed in the problem, you must give away the minimum required number of items to the deserving persons in the first round, then remaining number of items can be given away (or distributed) without any restriction. So, our objective is to do away with (or get rid of) the restrictions, first. Then it becomes a very flexible problem to deal with.

Alternatively The given problem can be stated as

$$a + b + c = 12\,;\, a, b, c \geq 2$$

Before the distribution of chocolates:

After distributing the minimum 2 chocolates to each of the 3 kids:



Now, you can see that only 6 chocolates are remaining to be distributed among the 3 kids. And, the best thing is that you are totally free to give any number of chocolates to anyone. As in, you can give all the 6 chocolates to one kid and no chocolates to the other 2 kids or you can give equal number of chocolates to each of them. And, that you can do in 28 ways, as explained on next page.

After ensuring that each kid must get 1 chocolate, the distribution problem transforms to

$$a+b+c=6;\ a,\ b,\ c\geq 0$$

And, the number of solutions to this equation

$$=\frac{(6+2)!}{6!\times 2!}=\frac{8!}{6!\times 2!}=28$$

NOTE Once you have ensured that each kid is getting the minimum requisite number of items, you are completely free to distribute the items using the very basic logic of distribution.

***Exp.* 6)** Find the number of ways in which you can distribute all the 12 identical chocolates among the 3 kids, such that each of them must get at least three chocolates.

Solution Total number of identical chocolates = 12

In the first round total number of chocolates given to the 3 kids = $3\times 3=9$

Number of chocolates remaining to be distributed without any restriction = $12-9=3$

Now this will be equivalent to arranging 5 objects (3 circles + 2 bars) in a row such that all the 3 circles are identical and all the 2 bars are also identical.

Thus the number of ways of arrangements of 3 circles and 2 bars $=\frac{(3+2)!}{3!\times 2!}=\frac{5!}{3!\times 2!}=10$

Therefore, the number of ways in which 12 identical chocolates can be divided among 3 kids, such that each kid must get at least 3 chocolates is 10.

Hint The equivalent algebraic equation would be $a+b+c=12$, such that $a, b, c\geq 3$ or $a+b+c=3$, such that $a, b, c\geq 0$

NOTE Whenever you see the lower limits imposed in the problem, you must give away the minimum required number of items to the deserving persons in the first round, then remaining number of items can be given away (or distributed) without any restriction. So our objective is to do away with (or get rid of) the restrictions, first. Then, it becomes a very flexible problem to deal with.

***Exp.* 7)** Find the number of ways in which you can distribute all the 12 identical chocolates among the 3 kids, such that each of them must get at least four chocolates.

Solution Total number of identical chocolates = 12

In the first round total number of chocolates given to the 3 kids = $3\times 4=12$

Number of chocolates remaining to be distributed without any restriction = $12-12=0$

Now there are no any chocolate left to be distributed.

Thus, there is only 1 way to distribute the 12 identical chocolates among 3 kids such that each of them must get at least 4 chocolates. And that can be expressed as following.

(4, 4, 4)

Hint The equivalent algebraic equation would be $a+b+c=12$, such that $a, b, c\geq 4$.

***Exm.* 8)** Find the number of ways in which you can distribute all the 12 identical chocolates among the 3 kids, such that each of them must get at least five chocolates.

Solution Total number of identical chocolates = 12

In the first round total number of chocolates to be given to the 3 kids $=3\times 5=15$

Since there are fewer chocolates available than the required number of chocolates, so there is no way to distribute the given chocolates.

Thus the required number of ways = 0.

Hint The equivalent algebraic equation would be $a+b+c=12$, such that $a, b, c\geq 5$.

***Exp.* 9)** Find the number of ways in which you can distribute 12 identical chocolates among the 3 kids, such that one kid gets at least 1 chocolate, another kid gets at least 2 chocolates and the third kid gets at least 3 chocolates.

Solution Total number of identical chocolates = 12

In the first round total number of chocolates given to the 3 kids = 1+2+3 = 6

Number of chocolates remaining to be distributed without any restriction = $12-6=6$

Now, this will be equivalent to arranging 8 objects (6 circles + 2 bars) in a row such that all the 6 circles are identical and all the 2 bars are also identical.

That is the number of ways of arrangements of 6 circles and 2 bars $=\frac{8!}{6!\times 2!}=28.$

Therefore, the number of ways in which 12 identical chocolates can be divided among 3 kids, such that one kid gets at least 1 chocolate, another kid gets at least 2 chocolates and the third kid gets at least 3 chocolates.

Hint The equivalent algebraic equation would be $a+b+c=12$, such that $a\geq 1, b\geq 2, c\geq 3$ or $a+b+c=6$, such that $a, b, c\geq 0$

NOTE Whenever you see the lower limits imposed in the problem, you must give away the minimum required number of items to the deserving persons in the first round, then remaining number of items can be given away (or distributed) without any restriction. So our objective is to do away with (or get rid of) the restrictions, first. Then it becomes a very flexible problem to deal with.

***Exp.* 10)** Find the number of ways in which you can distribute 12 identical chocolates among 3 kids, such that there is one particular kid who gets the chocolates in the multiples of 3 only.

Solution The equivalent algebraic equation would be

$$3x+y+z=12$$

For $x=0$, we have $y+z=12$ and the number of solutions

$$=\frac{13!}{12!\times 1!}=13$$

For $x = 1$, we have $y + z = 9$ and the number of solutions

$$= \frac{10!}{9! \times 1!} = 10$$

For $x = 2$, we have $y + z = 6$ and the number of solutions

$$= \frac{7!}{6! \times 1!} = 7$$

For $x = 3$, we have $y + z = 3$ and the number of solutions

$$= \frac{4!}{3! \times 1!} = 4$$

For $x = 4$, we have $y + z = 0$ and the number of solutions

$$= \frac{1!}{0! \times 1!} = 1$$

Therefore, total number of solutions

$$= 1 + 4 + 7 + 10 + 13 = \frac{(1+13)}{2} \times 3 = 35$$

***Exp.* 11)** Find the number of ways in which you can distribute 12 chocolates among 3 kids, such that there is one particular kid who gets the chocolates in the multiples of 3 only and no kid gets less than 1 chocolate.

Solution Since, $x, y, z \geq 1$ and x gets chocolates in multiple of 3, we must give 3 chocolates to x and 1 chocolate to each of y and z. Now, we are free to give the remaining 7 chocolates without any restriction.

The equivalent algebraic equation would be $3x + y + z = 7$

For $x = 0$, we have $y + z = 7$ and the number of solutions

$$= \frac{8!}{7! \times 1!} = 8$$

For $x = 1$, we have $y + z = 4$ and the number of solutions

$$= \frac{5!}{4! \times 1!} = 5$$

For $x = 2$, we have $y + z = 1$ and the number of solutions

$$= \frac{2!}{1! \times 1!} = 2$$

Therefore, total number of solutions $= 2 + 5 + 8 = 15$

***Exp.* 12)** Find the number of ways in which you can distribute 12 chocolates among 3 kids, such that exactly two kids get the same number of chocolates.

Solution Let the three kids get x, y and z number of chocolates. Since two kids get same number of chocolates, so we can assume $x = y$, Then we have,

$$x + y + z = 12$$

$$\Rightarrow \quad 2x + z = 12$$

$$\Rightarrow \quad x = \frac{12 - z}{2}$$

$\Rightarrow \{y, z\} \equiv \{0, 12\}, \{1, 10\}, \{2, 8\}, \{3, 6\}, \{5, 2\}, \{6, 0\}$

$\Rightarrow \{x, y, z\} \equiv \{0, 0, 12\}, \{1, 1, 10\}, \{2, 2, 8\}, \{3, 3, 6\}, \{5, 5, 2\}, \{6, 6, 0\}$

Thus there are 6 distinct pairs of $\{x, z\}$, such that $x = y \neq z$

Now, each such triplet $\{x, y, z\}$ can be arranged in 3 ways $\left(= \frac{3!}{2!}\right)$.

Therefore total number of non-negative integral solutions $= 6 \times 3 = 18$

$\{0, 0, 12\}, \{1, 1, 10\}, \{2, 2, 8\}, \{3, 3, 6\}, \{5, 5, 2\}, \{6, 6, 0\}$

$\{0, 12, 0\}, \{1, 10, 1\}, \{2, 8, 2\}, \{3, 6, 3\}, \{5, 2, 5\}, \{6, 0, 6\}$

$\{12, 0, 0\}, \{10, 1, 1\}, \{8, 2, 2\}, \{6, 3, 3\}, \{2, 5, 5\}, \{0, 6, 6\}$

So the number of ways in which 12 identical chocolates can be distributed among 3 kids such that exactly 2 kids get the same number of chocolates = 18.

***Exp.* 13)** Find the number of ways in which you can distribute 12 chocolates among 3 kids, such that no two kids get the equal number of chocolates.

Solution Total number of ways in which 12 chocolates can be distributed among 3 kids, without any restriction

$$= \frac{(12 + 2)!}{12! \times 2!} = 91$$

But, this distribution involves those cases too, in which 2 or all the 3 kids get same number of chocolates.

Case I : When all 3 kids get the same number of chocolates.

$$x = y = z$$

$$\Rightarrow \quad \text{1 way only}$$

Case II : When any 2 kids get same number of chocolates.

$$x + y + z = 12$$

$$\Rightarrow \quad 2x + z = 12$$

$$\Rightarrow \quad \text{18 ways}$$

Case III: When none of the kids get same number of chocolates.

$$x < y < z, y < z < x, \ z < x < y,$$
$$x < z < y, y < x < z, z < y < x$$

Let α denotes the number of ways when each of the kids get the same number of chocolates, β denotes the number of ways when exactly two kids get the same number of chocolates and γ denotes the number of ways when none of the kids get same number of chocolates. Therefore,

$$\alpha + \beta + \gamma = 91$$

$$\Rightarrow \quad 1 + 18 + 6(k) = 91$$

$$\Rightarrow \quad 6k = 72 = \gamma$$

Therefore number of ways in which 12 identical chocolates can be distributed among 3 kids in such a way that no two kids get same number of chocolates = 72

Alternatively There are 4 possible cases when each of the three kids gets distinct number of chocolates.

Case I: $\{0, 1, 11\}, \{0, 2, 10\}, \{0, 3, 9\}, \{0, 4, 8\}, \{0, 5, 7\} \rightarrow 5$

Case II: $\{1, 2, 9\}, \{1, 3, 8\}, \{1, 4, 7\}, \{1, 5, 6\} \rightarrow 4$

Case III: $\{2, 3, 7\}, \{2, 4, 6\} \rightarrow 2$

Case IV: $\{3, 4, 5\} \rightarrow 1$

Total 12 (=5+4+2+1) triplets. Each such triplet can be arranged in 3! = 6 ways. Therefore there are total 72 ways to express $a + b + c = 12$, such that a, b and c are distinct.

Thus, the number of ways in which 12 identical chocolates can be distributed among 3 kids such that no two kids get the same number of chocolates = 72.

***Exp.* 14)** Find the number of ways in which you can distribute 12 chocolates among 3 kids, such that all the three kids get distinct number of chocolates.

Solution It is the same problem as previous one, which is stated in different words.

Hence, the answer is 72.

***Exp.* 15)** Find the number of ways in which you can distribute 12 chocolates among 3 kids. – Archimedes, Bernoulli and Carl Gauss, such that Archimedes gets more than Bernoulli and Bernoulli gets more than Carl Gauss.

Solution Total number of ways in which 12 chocolates can be distributed among 3 kids, without any restriction

$$= \frac{(12+2)!}{12! \times 2!} = 91$$

Now, we know that there are 13 different relations between the number of chocolates that 3 persons can receive.

Case I: When all 3 kids get the same number of chocolates.

$$a = b = c$$

$\Rightarrow$ 1 way only

Case II: When any 2 kids get same number of chocolates.

$$a + b + c = 12$$

$\Rightarrow$ $2a + c = 12$

$\Rightarrow$ 18 ways

Case III: When none of the kids get same number of chocolates.

$$a > b > c,\ b > c > a,\ c > a > b,$$
$$a > c > b,\ b > a > c,\ c > b > a$$

Let α denotes the number of ways when each of the kids get the same number of chocolates, β denotes the number of ways when exactly two kids get the same number of chocolates and γ denotes the number of ways when none of the kids get same number of chocolates. Therefore,

$$\alpha + \beta + \gamma = 91$$

$\Rightarrow$ $1 + 18 + 6(k) = 91$

$\Rightarrow$ $6k = 72 \Rightarrow k = 12$

So, out of 6 relations, as suggested in Case III, only 1 relation is in our favour (a > b > c).

Therefore, the required number of ways in which 12 identical chocolates can be distributed among A, B and $C = 72 \times \frac{1}{6} = 12$

Alternatively If $a + b + c = n;\ a > b > c \geq 0$, the number of solutions $= \left\lfloor \frac{n^2 + 6}{12} \right\rfloor$

We have, $a + b + c = 12;\ a > b$

Therefore, the required number of ways

$$= \left\lfloor \frac{12^2 + 6}{12} \right\rfloor = \left\lfloor \frac{150}{12} \right\rfloor = \lfloor 12.5 \rfloor = 12$$

***Exp.* 16)** Find the number of ways in which you can distribute 12 chocolates among 3 kids, such that each kid gets the odd number of chocolates.

Solution odd + odd + odd = odd

Since 12 is not an odd number, so we cannot distribute odd number of chocolates to each of the three kids.

The required number of ways = 0.

***Exp.* 17)** Find the number of ways in which you can distribute 12 chocolates among 3 kids, such that each kid gets the even number of chocolates.

Solution Even + Even + Even = Even. Therefore it is possible to distribute even number of chocolates, as shown below.

$\{0, 0, 12\}, \{0, 2, 10\}, \{0, 4, 8\}, \{0, 6, 6\} \rightarrow 3+6+6+3 = 18$ ways

$\{2, 2, 8\}, \{2, 4, 6\} \rightarrow 3+6 = 9$ ways

$\{4, 4, 4\} \rightarrow 1$ way

Total number of ways in which this can be done

$= 18 + 9 + 1 = 28$ ways

***Exp.* 18)** Find the number of ways in which you can distribute all the 12 chocolates among 3 kids, such that at least one of them must get more than 6 chocolates.

Solution In order to ensure that at least one of them must get more than 6 chocolates you have to find the number of ways in which one or more than one kid gets more than 6 chocolates using the inclusion-exclusion principle, as explained below.

(i) Finding the number of ways in which any one kid gets more than 6 chocolates.

So, first of all keep aside 7 chocolates and distribute the remaining 5 chocolates among 3 kids.

Now, the number of ways in which you can distribute 5 identical chocolates among 3 kids without restriction

$$= \frac{(5+2)!}{(5! \times 2!)} = \frac{7!}{5! \times 2!} = 21$$

Now, you can give away the 7 chocolates, which you had kept aside, to any one of the 3 kids in ${}^3C_1 = 3$ ways.

Therefore, the number of ways in which you can distribute 12 identical chocolates among 3 kids such that any one = of the 3 kids must get more than 6 chocolates $= 3 \times 21 = 63$

(ii) Finding the number of ways in which any two kids get more than 6 chocolates.

So, for that you have to keep aside 14 (=7+7) chocolates. But, you have only 12 chocolates, so you cannot distribute 12 chocolates among 3 kids in such a way that at least 2 kids get more than 6 chocolates.

That is, the number of ways in which you can distribute 12 identical chocolates among 3 kids such that any 2 kids must get more than 6 chocolates = 0.

(iii) Finding the number of ways in which all three kids get more than 6 chocolates.

So, for that you have to keep aside 21 (=7+7+7) chocolates. But, you have only 12 chocolates, so you cannot distribute 12 chocolates among 3 kids in such a way that all the 3 kids get more than 6 chocolates.

That is, the number of ways in which you can distribute 12 identical chocolates among 3 kids such that all the 3 kids must get more than 6 chocolates = 0.

Now using Inclusion-Exclusion principle, you can find the number of ways in which you can distribute 12 identical chocolates among 3 kids such that at least one of them must get more than 4 chocolates = 63 – 0 + 0 = 63.

Hint $^3C_1\left[\frac{(5+2)!}{5!\times 2!}\right] - {}^3C_2(0) + {}^3C_3(0) = 63$

***Exp.* 19)** Find the number of ways in which you can distribute all the 12 chocolates among 3 kids, such that at least one of them must get more than 4 chocolates.

Solution In order to ensure that at least one of them must get more than 4 chocolates you have to find the number of ways in which one or more than one kid gets more than 4 chocolates using the inclusion-exclusion principle, as explained below.

(i) Finding the number of ways in which any one kid gets more than 4 chocolates.

So, first of all keep aside 5 chocolates and distribute the remaining 7 chocolates among 3 kids.

Now, the number of ways in which you can distribute 7 identical chocolates among 3 kids without restriction

$$= \frac{(7+2)!}{7!\times 2!} = \frac{9!}{7!\times 2!} = 36$$

Now, you can give away the 5 chocolates, which you had kept aside, to any one of the 3 kids in $^3C_1 = 3$ ways.

Therefore, the number of ways in which you can distribute 12 identical chocolates among 3 kids such that any one of the 3 kids must get more than 4 chocolates $= 3 \times 36 = 108$

(ii) Finding the number of ways in which any two kids get more than 4 chocolates.

So, first of all keep aside 10 (=5+5) chocolates and distribute the remaining 2 chocolates among 3 kids.

Now, the number of ways in which you can distribute 2 identical chocolates among 3 kids without restriction

$$= \frac{(2+2)!}{2!\times 2!} = \frac{4!}{2!\times 2!} = 6$$

Now you have 2 identical packets of chocolates with you, such that each packet has 5 chocolates in it.

Now, you can give away the 2 identical packets of chocolates, which you had kept aside, to any 2 of the 3 kids in $^3C_2 = 3$ ways.

Therefore, the number of ways in which you can distribute 12 identical chocolates among 3 kids such that any two of the 3 kids must get more than 4 chocolates $= 3 \times 6 = 18$.

(iii) Finding the number of ways in which all three kids get more than 4 chocolates.

So, for that you have to keep aside 15 (=5+5+5) chocolates. But, you have only 12 chocolates, so you cannot distribute 12 chocolates among 3 kids in such a way that all the 3 kids get more than 4 chocolates. That is, the number of ways in which you can distribute 12 identical chocolates among 3 kids such that all the 3 kids must get more than 4 chocolates = 0.

Now using Inclusion-Exclusion principle, you can find the number of ways in which you can distribute 12 identical chocolates among 3 kids such that at least one of them must get more than 4 chocolates $= 108 - 18 + 0 = 90$.

Hint $^3C_1\left(\frac{(7+2)!}{7!\times 2!}\right) - {}^3C_2\left(\frac{(2+2)!}{2!\times 2!}\right) + {}^3C_3(0) = 90$

Alternatively Total number of ways in which you can distribute 12 identical chocolates among 3 kids without any restriction $= \frac{(12+2)!}{12!\times 2!} = \frac{14!}{12!\times 2!} = 91$

And, the number of ways in which you can distribute not more than 4 chocolates to any of the 3 kids = 1

Therefore, the number of ways in which you can distribute 12 identical chocolates among 3 kids such that at least one of them must get more than 4 chocolates $= 91 - 1 = 90$.

Hint There is only one way in which none of the 3 kids gets more that 4 chocolates, which is (4, 4, 4). In all other 90 combinations at least one kid must get more than 4 chocolates.

***Exp.* 20)** Find the number of ways in which you can distribute all the 12 chocolates among 3 kids, such that at least one of them must get more than 2 chocolates.

Solution In order to ensure that at least one of them must get more than 2 chocolates you have to find the number of ways in which one or more than one kid gets more than 2 chocolates using the inclusion-exclusion principle, as explained below.

(i) Finding the number of ways in which any one kid gets more than 2 chocolates.

So, first of all keep aside 3 chocolates and distribute the remaining 9 chocolates among 3 kids.

Now, the number of ways in which you can distribute 9 identical chocolates among 3 kids without restriction

$$= \frac{(9+2)!}{91\times 2!} = \frac{11!}{9!\times 2!} = 55$$

Now, you can give away the 3 chocolates, which you had kept aside, to any one of the 3 kids in $^3C_1 = 3$ ways.

Therefore, the number of ways in which you can distribute 12 identical chocolates among 3 kids such that any one of the 3 kids must get more than 2 chocolates $= 3 \times 55 = 165$.

(ii) Finding the number of ways in which any two kids get more than 2 chocolates.

So, first of all keep aside 6 (=3+3) chocolates and distribute the remaining 6 chocolates among 3 kids.

Now, the number of ways in which you can distribute 6 identical chocolates among 3 kids without restriction

$$= \frac{(6+2)!}{6!\times 2!} = \frac{8!}{6!\times 2!} = 28$$

Now you have 2 identical packets of chocolates with you, such that each packet has 3 chocolates in it.

Now, you can give away the 2 packets of chocolates, which you had kept aside, to any 2 of the 3 kids in ${}^3C_2 = 3$ ways.

Therefore, the number of ways in which you can distribute 12 identical chocolates among 3 kids such that any two of the 3 kids must get more than 2 chocolates $= 3 \times 28 = 84$.

(iii) Finding the number of ways in which all three kids get more than 2 chocolates.

So, for that you have to keep aside 9 (= 3+3+3) chocolates and distribute the remaining 3 chocolates among 3 kids.

Now, the number of ways in which you can distribute 3 identical chocolates among 3 kids without restriction $= \frac{(3+2)!}{3! \times 2!} = \frac{5!}{3! \times 2!} = 10$

Now you have 3 identical packets of chocolates with you, such that each packet has 3 chocolates in it.

Now, you can give away the 3 packets of chocolates, which you had kept aside, to the 3 kids in ${}^3C_3 = 1$ way.

Therefore, the number of ways in which you can distribute 12 identical chocolates among 3 kids such that at least two of the 3 kids must get more than 2 chocolates $= 1 \times 10 = 10$.

Now using Inclusion-Exclusion principle, you can find the number of ways in which you can distribute 12 identical chocolates among 3 kids such that at least one of them must get more than 2 chocolates $= 165 - 84 + 10 = 91$

Hint ${}^3C_1\left(\frac{(9+2)!}{9! \times 2!}\right) - {}^3C_2\left(\frac{(6+2)!}{6! \times 2!}\right) + {}^3C_3\left(\frac{(3+2)!}{3! \times 2!}\right) = 91$

Alternatively Total number of ways in which you can distribute 12 identical chocolates among 3 kids without any restriction $= \frac{(12+2)!}{12! \times 2!} = \frac{14!}{12! \times 2!} = 91$

And, the number of ways in which you can distribute not more than 2 chocolates to any of the 3 kids = 0

Therefore, the number of ways in which you can distribute 12 identical chocolates among 3 kids such that at least one of them must get more than 4 chocolates $= 91 - 0 = 91$

***Exp.* 21)** Find the number of ways in which you can distribute all the 12 chocolates among 3 kids, such that none of them gets more than 6 chocolates.

Solution In order to ensure that at least one kid must get more than 6 chocolates, keep aside 7 chocolates and later on give it to any of the 3 kids. Now, you have just 5 chocolates to be distributed among 3 kids, which you can distribute in any manner because when you give 7 chocolates to any one of the 3 kids he will certainly have more than 6 chocolates.

Therefore, the number of ways in which you can distribute 5 identical chocolates, without any restriction $= \frac{(5+2)!}{5! \times 2!} = \frac{7!}{5! \times 2!} = 21$

Now you can give away the remaining 7 chocolates, which you had kept aside, to any one of the 3 kids in 3 ways.

Therefore, the number of ways in which you can distribute 12 identical chocolates among 3 kids such that any one of the 3 kids must get more than 6 chocolates $= 12 \times 3 = 63$.

Number of ways in which you can distribute 12 identical chocolates among 3 kids such that any 2 kids get more than 6 chocolates = 0. Similarly, the number of ways in which you can distribute 12 identical chocolates among 3 kids such that all 3 kids get more than 6 chocolates = 0.

Now using Inclusion-Exclusion principle, you can find the number of ways in which you can distribute 12 identical chocolates among 3 kids such that at least one of them must get more than 4 chocolates $= 63 - 0 + 0 = 63$.

Thus, the number of ways in which you can distribute 12 identical chocolates among 3 kids such that none of the 3 kids get more than 6 chocolates $= 91 - 63 = 28$

Alternatively There are following 3 cases: when the highest value is 6, when the highest value is 5 and when the highest value is 4.

$\{6, 6, 0\}$, $\{6, 5, 1\}$, $\{6, 4, 2\}$, $\{6, 3, 3\}$

$\rightarrow 3 + 6 + 6 + 3 = 18$ ways

$\{5, 5, 2\}$, $\{5, 4, 3\} \rightarrow 3+6 = 9$ ways $\{4, 4, 4\} \rightarrow 1$ way

Therefore, we can distribute 12 chocolates among 3 kids such that no kid gets more than 6 chocolates in 28 ways (=18+9+1).

***Exp.* 22)** Find the number of ways in which you can distribute all the 12 chocolates among the 3 kids, such that none of them gets less than 1 chocolate and more than 6 chocolates.

Solution The problem suggests that each kid has to get at least 1, but at most 6 chocolates.

In order to ensure that no any kid gets more than 6 chocolates subtract the number of ways in which at least one kid must get more than 6 chocolates from the total number of ways.

How to calculate the total number of ways in which each kid gets at least 1 chocolate: In order to ensure that each kid must get at least 1 chocolate keep aside 3 chocolates and distribute the remaining 9 chocolates without any other constraint. The number of ways in which it can be done is $\frac{(9+2)!}{9! \times 2!} = \frac{11!}{9! \times 2!} = 55$

However, the remaining 3 chocolates can be given in such a way that each kid gets exactly 1 chocolate. This distribution can be done in 1 way. Therefore, the number of ways in which 12 chocolates can be distributed among 3 kids such that each kid must get at least 1 chocolate $= 55 \times 1 = 55$.

How to calculate the total number of ways in which at least one kid must get more than 6 chocolates and none of them gets less than 1 chocolate:

(i) As you know that if you want to ensure that each kid must get at least 1 chocolate then you actually have only 9 chocolates to be distributed.

Now you have to ensure that any one kid must get more than 6 chocolates, so keep aside 6 chocolates. Then you have only 3 chocolates out of the 9 chocolates to be distributed among 3 kids.

Therefore, the number of ways in which 3 chocolates can be distributed among 3 kids $= \frac{(3+2)!}{3! \times 2!} = \frac{5!}{3! \times 2!} = 10$

Now, you can give away 3 chocolates, which you had kept aside, to any one of the 3 kids in ${}^3C_1 = 3$ ways.

Therefore, the number of ways in which you can distribute 12 identical chocolates among 3 kids such that any one of the 3 kids must get more than 6 chocolates and none of them gets less than 1 chocolate $= 3 \times 10 = 30$

(ii) Number of ways in which you can distribute 12 identical chocolates among 3 kids such that any 2 kids get more than 6 chocolates and none of them gets less than 1 chocolate = 0.

(iii) Similarly, the number of ways in which you can distribute 12 identical chocolates among 3 kids such that all 3 kids get more than 6 chocolates and none of them gets less than 1 chocolate = 0.

Now using Inclusion-Exclusion principle, you can find the number of ways in which you can distribute 12 identical chocolates among 3 kids such that at least one of them must get more than 1 chocolate $= 30 - 0 + 0 = 30$.

Thus, the number of ways in which you can distribute 12 identical chocolates among 3 kids such that none of them gets less than 1 chocolate and more than 6 chocolates $= 55 - 30 = 25$

Alternatively Let A, B and C be three kids. Then,

$$a + b + c = 12, \text{ such that } a, b, c \geq 1$$

$$\Rightarrow \quad a + b + c = 9, \text{ such that } a, b, c \geq 0$$

The number of solutions to the above equation

$$= \frac{(9+2)!}{9! \times 2!} = \frac{11!}{9! \times 2!} = 55$$

Now, $a + b + c = 12$, such that $a, b, c \geq 1$

$\Rightarrow \quad a + b + c = 9$, such that $a, b, c \geq 0$

$\Rightarrow \quad a + b + c = 3$, such that $a, b, c \geq 0$ and any one of $a, b, c \geq 6$

The number of solution to the above equation

$$= {}^3C_1 \left(\frac{(3+2)!}{3! \times 2!} \right)$$

$$= 3 \times \left(\frac{5!}{3! \times 2!} \right) = 30$$

Thus, the number of solutions of $a + b + c = 12$, such that $a, b, c \geq 1$ and one of $a, b, c \geq 6$ is $55 - 30 = 25$.

NOTE You cannot give more than 6 chocolates to any 2 or 3 kids.

Alternatively There are following 3 cases: when the highest value is 6, when the highest value is 5 and when the highest value is 4.

$$\{6,5,1\}, \{6,4,2\}, \{6,3,3\} \rightarrow 6 + 6 + 3 = 15 \text{ ways}$$

$$\{5,5,2\}, \{5,4,3\} \rightarrow 3 + 6 = 9 \text{ ways}$$

$$\{4, 4, 4\} \rightarrow 1 \text{ way}$$

Therefore, we can distribute 12 chocolates among 3 kids such that no kid gets less than 1 chocolate or more than 6 chocolates in 25 ways $(= 15 + 9 + 1)$

***Exp.* 23)** Find the number of ways in which you can distribute at most 12 chocolates among 3 kids.

Solution First of all you must understand that the maximum number of chocolates that you can distribute is 12. It implies that out of the 12 chocolates it is not necessary that you distribute all the chocolates. If you distribute all the chocolates then the kids will receive the maximum number of 12 chocolates, but if you retain some chocolates with yourself, then the kids will receive less than 12 chocolates.

It implies that greater the number of chocolates you retain with yourself, lesser the number of chocolates you will distribute among the 3 kids. That means if you distribute X chocolates among 3 kids and retain Y chocolates with yourself, then

$$X + Y = 12$$

Now, let the number of chocolates received by first kid, second kid and third kid be a, b and c, the appropriate relation would be

$$a + b + c \leq 12 \quad \text{or} \quad a + b + c + Y = 12$$

Now, the above equation is equivalent to the problem of distributing 12 identical chocolates among 4 kids. This, in turn, is equivalent to the problem of arranging the 15 objects (12 circles + 3 bars) in a row, out of which 12 circles are identical and 3 bars are also identical. That is the number of ways of arrangements of 12 circles and 3 bars $= \frac{15!}{12! \times 3!} = 455$

Therefore, the number of ways in which at most 12 identical chocolates can be divided among 3 kids is 455.

Alternatively This solution is indeed not the smartest one, but it gives you a glimpse of what you can do to understand it how it works actually when you are not able to solve the problem smartly and quickly.

Case I: $a + b + c = 12$ The number of solutions

$$= \frac{14!}{12! \times 2!} = {}^{14}C_2$$

Case II: $a + b + c = 11$ The number of solutions

$$= \frac{13!}{11! \times 2!} = {}^{13}C_2$$

Case III: $a+b+c=10$ The number of solutions

$$=\frac{12!}{10!\times 2!}={}^{12}C_2$$

Case XII: $a+b+c=10$ The number of solutions

$$=\frac{3!}{1!\times 2!}={}^{3}C_2$$

Case XIII: $a+b+c=0$ The number of solutions

$$=\frac{2!}{0!\times 2!}={}^{2}C_2$$

Therefore, total number of solutions

$$={}^{2}C_2+{}^{3}C_2+\ldots+{}^{12}C_2+{}^{13}C_2+{}^{14}C_2$$

$$={}^{14+1}C_{2+1}={}^{15}C_3=\frac{15!}{12!\times 3!}=455$$

Hint ${}^{r}C_r+{}^{r+1}C_r+{}^{r+2}C_r+\ldots+{}^{n}C_r={}^{n+1}C_{r+1}; r\le n$. Otherwise,

$$\frac{2!}{0!\times 2!}+\frac{3!}{1!\times 2!}+\frac{4!}{2!\times 2!}+\ldots+\frac{14!}{12!\times 2!}=1+3+6+\ldots+91$$

$$=\frac{13\times 14\times 15}{6}=455$$

Hint Since $1+3+6+\ldots+\frac{n(n+1)}{2}=\frac{n(n+1)(n+2)}{6}$

***Exp.* 24)** Find the number of ways in which you can distribute at least 6 and at most 12 chocolates among 3 kids.

Solution First of all you must understand that the number of chocolates that you can distribute is maximum 12 and minimum 6. That means if you distribute X chocolates among the 3 kids and retain Y chocolates with yourself, then

$$X+Y=12$$

Now, let the number of chocolates received by first kid, second kid and third kid be a, b and c, then the appropriate relation is

$$a+b+c+Y=12$$

Now, the above equation is equivalent to the problem of distributing 12 identical chocolates among 4 kids. This, in turn, is equivalent to the problem of arranging 15 objects (12 circles + 3 bars) in a row, out of which 12 circles are identical and 3 bars are also identical.

That is the number of ways of arrangements of 12 circles and 3 bars $=\frac{15!}{12!\times 3!}=455$

Therefore, the number of ways in which at most 12 identical chocolates can be divided among 3 kids is 455.

Now, assume that instead of 12 chocolates you have just 5 chocolates. And, you can distribute at most 5 chocolates to the 3 kids. That means if you distribute P chocolates among the 3 kids and retain Q chocolates with yourself, then

$$P+Q=5$$

Now, let the number of chocolates received by first kid, second kid and third kid be a, b and c, then the appropriate relation is, $a+b+c+Q=5$

Now, the above equation is equivalent to the problem of distributing 5 identical chocolates among 4 kids.

This, in turn, is equivalent to the problem of arranging the 8 objects (5 identical circles + 3 identical bars) in a row.

That is the number of ways of arrangements of 5 circles and 3 bars $=\frac{8!}{5!\times 3!}=56$

Therefore, the number of ways in which at most 5 identical chocolates can be distributed among 3 kids is 56.

Therefore, the number of ways in which you can distribute not less than 6 but not more than 12 identical chocolates among 3 kids = number of ways in which you can distribute at most 12 identical chocolates among 3 kids– number of ways in which you can distribute at most 5 identical chocolates among 3 kids = 455 – 56 = 399

Hint Number of non negative integral solutions of $6\le a+b+c\le 12$ = Number of non negative integral solutions of $a+b+c\le 12$ – Number of non negative integral solutions of $a+b+c\le 5$

$$=({}^{2}C_2+{}^{3}C_2+\ldots.+{}^{14}C_2)-({}^{2}C_2+{}^{3}C_2+\ldots+{}^{7}C_2)$$

$$=({}^{15}C_3)-({}^{8}C_3)=455-56=399$$

Alternatively This solution is indeed not the smartest one, but it gives you a glimpse of what you can do in exam when you are not able to solve the problem smartly and quickly.

Case I : $a+b+c=12$. The number of solutions

$$=\frac{14!}{12!\times 2!}={}^{14}C_2$$

Case II : $a+b+c=11$. The number of solutions

$$=\frac{13!}{11!\times 2!}={}^{13}C_2$$

Case III : $a+b+c=10$. The number of solutions

$$=\frac{12!}{10!\times 2!}={}^{12}C_2$$

Case IV : $a+b+c=9$. The number of solutions

$$=\frac{11!}{9!\times 2!}={}^{11}C_2$$

Case V : $a+b+c=8$. The number of solutions

$$=\frac{10!}{8!\times 2!}={}^{10}C_2$$

Case VI : $a+b+c=7$. The number of solutions

$$=\frac{9!}{7!\times 2!}={}^{9}C_2$$

Case VII : $a+b+c=6$. The number of solutions

$$=\frac{8!}{6!\times 2!}={}^{8}C_2$$

Therefore, the required number of solutions

$$=({}^{8}C_2+{}^{9}C_2+\ldots+{}^{14}C_2)$$

$$=28+36+45+55+66+78+91=399$$

NOTE Now, you must have observed that the previous solution is more logical and this one is more mechanical (or manual). But, this solution is helping you to visualize that what the actual logic behind the previous solution is. For smaller values alternative solution may appear to be easy one, but for greater values the previous solution is faster.

***Exp.* 25)** You have 2 dice and you throw them simultaneously. Find the number of ways in which the total sum you get in any throw is not less than 5 and not more than 10.

Solution Even though the two dice are identical, still for the heck of our convenience we call them A and B

That is, $5 \le a + b \le 10$, such that, $(a, b) = 1, 2, 3, 4, 5, 6$

Then, $3 \le a + b \le 8$, such that, $(a, b) = 0, 1, 2, 3, 4, 5, 6$

Now, we can find the required number of ways as shown below.

$$a + b = 3, \text{ Number of ways} = \frac{4!}{3! \times 1!} = 4$$

$$a + b = 4, \text{ Number of ways} = \frac{5!}{4! \times 1!} = 5$$

$$a + b = 5, \text{ Number of ways} = \frac{6!}{5! \times 1!} = 6$$

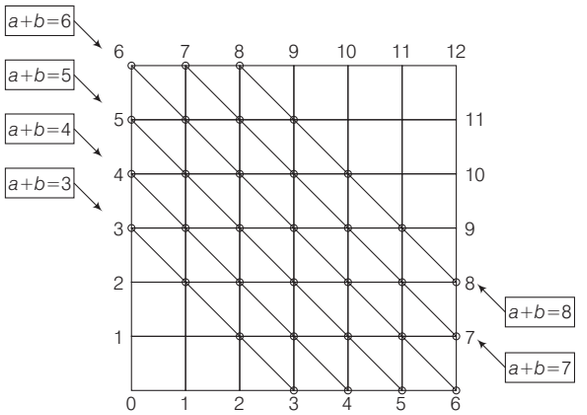
$$a + b = 6, \text{ Number of ways} = \frac{7!}{6! \times 1!} = 7$$

$$a + b = 7, \text{ Number of ways} = \frac{8!}{7! \times 1!} - 2 = 6$$

$$a + b = 8, \text{ Number of ways} = \frac{9!}{8! \times 1!} - 4 = 5$$

To get the above values you can use the following approach.

Draw a 6×6 grid, as a die has only 6 numbers (1, 2, …, 6) on it.



Now, you can find the number of ways by looking at the number of intersections on corresponding diagonals. As, $a + b = 3$ has 4 intersections, so it has 4 solutions. Similarly, $a + b = 6$ has 7 intersections, so it has 7 solutions. But, since 6 is the highest number that a die has, so after it reaches 6 it starts to decrease in the same manner as it increases before 6.

Thus the total number of ways $= 4 + 5 + 6 + 7 + 6 + 5 = 33$

***Exp.* 26)** You have 3 dice and you throw them simultaneously. Find the number of ways in which the total sum that you get in any throw is not less than 5 and not more than 15.

Solution Even though the three dice are identical, still for the heck of our convenience we call them A, B and C

Then, $5 \le a + b + c \le 15$, such that $(a, b, c) = 1, 2, 3, 4, 5, 6$

That is, $2 \le a + b + c \le 12$, such that $(a, b, c) = 0, 1, 2, 3, 4, 5, 6$

Now, we can find the required number of ways as shown below.

Case I : $a + b + c = 2$, Number of ways $= \frac{4!}{2! \times 2!} = 6$

Case II : $a + b + c = 3$, Number of ways $= \frac{5!}{3! \times 2!} = 10$

Case III : $a + b + c = 4$, Number of ways $= \frac{6!}{4! \times 2} = 15$

Case IV : $a + b + c = 5$, Number of ways $= \frac{7!}{5! \times 2!} = 21$

Case V : $a + b + c = 6$, Number of ways $= \frac{8!}{6! \times 2!} = 28$

Case VI : $a + b + c = 7$, Number of ways $= \frac{9!}{7! \times 2!} - 3 = 33$

Case VII : $a + b + c = 8$, Number of ways $= \frac{10!}{8! \times 2!} - 9 = 36$

Case VIII : $a + b + c = 9$, Number of ways $= \frac{11!}{9! \times 2!} - 18 = 37$

Case IX : $a + b + c = 10$, Number of ways $= \frac{12!}{10! \times 2!} - 30 = 36$

Case X : $a + b + c = 11$, Number of ways $= \frac{13!}{11! \times 2!} - 45 = 33$

Case XI : $a + b + c = 12$, number of ways $= \frac{14!}{12! \times 2!} - 63 = 28$

Thus the total number of ways

$$= 6 + 10 + 15 + 21 + 2(28 + 33 + 36) + 37 = 283$$

Hint From Case VI to Case XI, you see that I have subtracted some values. For example, in case VI, there are 3 ways/ arrangements (7, 0, 0), (0, 7, 0), (0, 0, 7) which do not satisfy the given criteria, as you cannot use any value greater than 6. That's why they have been discarded from the maximum possible number of ways/ solutions.

Similarly, in case VII, there are 9 solutions (8, 0, 0), (0, 8, 0), (0, 0, 8), (7, 1, 0), (7, 0, 1), (1, 0, 7), (1, 7, 0), (0, 1, 7), (0, 7, 1) which do not satisfy, as you cannot use any value greater than 6.

The same process is being followed for other cases too.

***Exp.* 27)** Find the number of integral solutions of $|x| + |y| = 12$.

Solution It can be solved simply, by putting the minimum and maximum possible values.

x	y	Number of Solutions
0	± 12	2
± 1	± 11	4
± 2	± 10	4
……	……	……
± 10	± 2	4
± 11	± 1	4
± 12	0	2

Total number of solutions $= 2 + 11(4) + 2 = 48$.

Alternatively Since $|\pm k| = k$, it means each k accepts 2 non-zero values. But since 0 is a neutral number in the sense that it has no effect of positive or negative sign, so we have to consider it separately.

Case I : When none of x and y is 0.

$$x + y = 12;\ x,\ y \geq 1 \Rightarrow \qquad x + y = 10;\ x,\ y \geq 0$$

Therefore, the number of solutions of the equation

$$x + y = 10;\ x,\ y \geq 0 \text{ is } \frac{11!}{10! \times 1!} = 11$$

And, the number of solutions of the equation $|x| + |y| = 10$; $x,\ y \geq 0$ is $11 \times (2 \times 2) = 44$

Case II : When one of x and y is 0

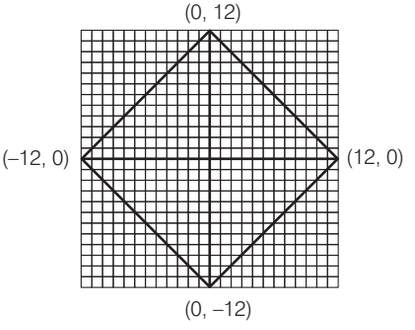
That is $(x, y) \equiv (0,12), (0, -12), (12, 0), (-12, 0)$. So it has 4 solutions. Thus, the total number of required solutions of $|x| + |y| = 10; x,\ y \geq 0$ is $44 + 4 = 48$

NOTE There are 44 solutions which have no zeros and 4 solutions have exactly one zero.

Alternatively Look at the following coordinate graph.

The graph is drawn such that $-12 \leq x \leq 12$ and $-12 \leq y \leq 12$.

The number of solutions is equal to the number of intersections of the diagonals. As, there are 48 intersection points. So the number of solutions of $|x| + |y| = 12$ is 48.



***Exp.* 28)** Find the integral solutions of $|x| + |y| \leq 12$.

Solution The number of integral solutions of $|x| + |y| \leq 12$ will be the sum of the number of integral solutions of

$$(|x| + |y| = 0) + (|x| + |y| = 1) + (|x| + |y| = 2) + \ldots + (|x| + |y| = 12)$$
$$= 1 + 4 + 8 + \ldots + 48$$
$$= 1 + 4\,(1 + 2 + 3 + \ldots + 12) = 313$$

***Exp.* 29)** Find the integral solutions of $|x| + |y| + |z| = 12$.

Solution The total number of integral solutions of $|x| + |y| + |z| = n$ is $4n^2 + 2$. So the number of integral solutions of the given equation is $4(12^2) + 2 = 578$

Alternatively The given problem can be solved in the following way.

Case I : When none of the x, y and z is zero, then the number of solutions of

$$x + y + z = 12 = {}^{11}C_2 = 55$$

But, since each of $|x|, |y|$ and $|z|$ takes 2 non zero values – one positive and one negative, so we will have 8 different ways $(2 \times 2 \times 2)$ to represent the 55 solutions.

Therefore, the number of solutions of $|x| + |y| + |z| = 12$ is $8 \times 55 = 440$

Case II : When exactly one of the x, y and z is zero, the number of solutions of

$$x + y + z = 12 = {}^{11}C_1 = 11$$

But, when $x = 0, |y| + |z|$ will have 4 different ways (2×2) to represent the 11 solutions

Similarly, when $y = 0, |x| + |y|$ will have 4 different ways to represent the 11 solutions

Similarly, when $z = 0, |x| + |y|$ will have 4 different ways to represent the 11 solutions

Therefore, the number of solutions of

$$|z| + |y| + |z| = 12 \text{ is } 12 \times 11 = 132$$

Case III : When exactly 2 of x, y and z are zero.

Then the number of solutions of $x + y + z = 12$ is 3.

But, since there are two ways to express a non-zero value $(+ / -)$, so the total number of solutions of $|x| + |y| + |z| = 12$ is $2 \times 3 = 6$

Thus, by adding the number of solutions of case I, II and III, we get the total number of solutions, which is $440 + 132 + 6 = 578$.

***Exp.* 30)** How many 3 digit numbers are there in which sum of all the three digits is 12?

Solution $a + b + c = 12;\ a \geq 1,\ b \geq 0,\ c \geq 0$

$\Rightarrow \quad a + b + c = 11;\ a \geq 1,\ b \geq 0,\ c \geq 0$

Therefore the required number of solutions

$$= {}^{11+3-1}C_{3-1} = {}^{13}C_2 = 78$$

Alternatively: Total number of solutions of

$$a + b + c = 12;$$
$$(a \geq 0,\ b \geq 0,\ c \geq 0) \text{ is } {}^{14}C_2 = 91$$

Number of solutions of $a + b + c = 12$, when

$$a = 0,\ b \geq 0,\ c \geq 0 \text{ is } {}^{13}C_1 = 13$$

Therefore the required number of solutions

$$a + b + c = 12, \text{ when}$$
$$a \geq 1,\ b \geq 0,\ c \geq 0 \text{ is } 78\ (= 91 - 13).$$

Alternatively $a + b + c = 12$, such that $a \geq 1, b \geq 0, c \geq 0$

For $a = 1, b + c = 11 \Rightarrow$ The number of solutions $= {}^{12}C_1 = 12$

For $a = 2, b + c = 10 \Rightarrow$ The number of solutions $= {}^{11}C_1 = 11$

For $a=3,\ b+c=9 \Rightarrow$ The number of solutions= ${}^{10}C_1 = 10$

……

For $a=12,\ b+c=0 \Rightarrow$ The number of solutions $= {}^{1}C_1 = 1$

Therefore, he required answer is

$$78(=12+11+10+\ldots+3+2+1).$$

NOTE Since, ${}^{r}C_r + {}^{r+1}C_r + {}^{r+2}C_r + \ldots + {}^{n}C_r = {}^{n+1}C_{r+1};\ r \le n,$

Therefore ${}^{1}C_1 + {}^{2}C_1 + {}^{3}C_1 + \ldots + {}^{12}C_1 = {}^{13}C_2 = 78$

***Exp.* 31)** How many 3 digit number are there in which sum of all the three digits is not more than 12?

Solution $a+b+c \le 12$, such that $a \ge 1,\ b \ge 0,\ c \ge 0$.

For $a+b+c=1$, the number of solutions is ${}^{2}C_2 = 1$

For $a+b+c=2$, the number of solutions is ${}^{3}C_2 = 3$

For $a+b+c=3$, the number of solutions is ${}^{4}C_2 = 6$

… … …

For $a+b+c=12$, the number of solutions is

$${}^{13}C_2 = 78$$

Therefore the required number

$$= 1 + 3 + 6 + \ldots + 78$$
$$= 364$$

Hint $1 + (1+2) + (1+2+3) + \ldots + (1+2+3+\ldots.n)$

$$= \left(\frac{n(n+1)(n+2)}{6}\right)$$

***Exp.* 32)** Find the number of terms in $(x+y)^n$

Solution $(x+y)^n = {}^{n}C_0(x^n) + {}^{n}C_1(x^{n-1}y) + {}^{n}C_2(x^{n-2}y^2) + \ldots + C_{n-1}(xy^{n-1}) + {}^{n}C_n(y^n)$

(a) There are $n+1$ terms in the expansion of $(x+y)^n$

(b) In each term sum of the indices of x and y is equal to n.

***Exp.* 33)** Find the total number of terms in the expansion of $(a+b+c)^2$.

Solution Look at the following expansions. These expansions show how the different terms are formed. However, the coefficients of these terms may not be correct as our emphasis is on finding the number of terms only.

$$(a+b)^2 = a^0b^2 + a^1b^1 + a^2b^0$$
$$(a+b)^3 = a^0b^3 + a^1b^2 + a^2b^1 + a^0b^3$$
$$(a+b)^4 = a^0b^4 + a^1b^3 + a^2b^2 + a^3b^1 + a^4b^0$$
$$(a+b+c)^2 = a^0b^0c^2 + a^0b^1c^1 + a^0b^2c^0 + a^1b^0c^1 + a^1b^1c^0 + a^2b^0c^2$$

So looking at the various terms of the expansion of above polynomials we can conclude that the number of terms in any polynomial expansion is like distributing n identical items among m distinct persons. And thus we get the following formula.

$$(a_1 + a_2 + \ldots + a_n)^m = {}^{m+n-1}C_{n-1}$$

***Exp.* 34)** Find the total number of terms in $(1+x+x^2)^3$.

Solution
$$(1+x)^2 = 1 + x^2 + 2x$$
$$(1+x)^3 = 1 + 3x + 3x^2 + x^3$$
$$(1+x)^4 = 1 + 4x + 6x^2 + 4x^3 + x^4$$
$$(1+x+x^2)^2 = 1 + 2x + 3x^2 + 2x^3 + x^4$$
$$(1+x+x^2)^3 = 1 + 3x + 6x^2 + 7x^3 + 6x^4 + 3x^5 + x^6$$

This shows that total number of terms in

$$(1 + x + x^2 + \ldots.x^n)^m = (m.n) + 1$$

***Exp.* 35)** What is the coefficient of $a^2b^3c^5$ in $(x+y+z)^{10}$?

Solution By Multinomial Theorem, it is $\dfrac{10!}{2!3!5!}$

Introductory Exercise 19.8

Directions (for Q. Nos. 1 to 12) : *Answer these questions based on the following information.*

A film library at FTII (Film and Television Institute of India) Pune has 12 distinct CDs on French cinema.

1. Find the number of ways in which these CDs can be divided into two groups such that one group has 8 CDs and another one has 4 CDs.
(a) 594 (b) 495 (c) 945 (d) 32

2. Find the number of ways in which these CDs can be gifted to two French students who had recently visited FTII from France such that one student has 8 CDs and another one has 4 CDs.
(a) 990 (b) 900 (c) 945 (d) 1188

3. Find the number of ways in which these CDs can be divided into three groups of 6 CDs, 4CDs and 2 CDs.
(a) 12680 (b) 18360
(c) 13860 (d) $\dfrac{12!}{6!+4!+2!}$

4. Find the number of ways in which these CDs can be gifted to three French students who had recently visited FTII from France such that one student has 6 CDs, second student has 4 CDs and the third one has 2 CDs.
(a) 31860 (b) 82160
(c) 13860 (d) 83160

5. Find the number of ways in which these CDs can be divided equally into two groups.
(a) 1024 (b) 492 (c) 462 (d) 924

6. Find the number of ways in which these CDs can be distributed to two French students equally.
(a) 594 (b) 990 (c) 984 (d) 924

7. Find the number of ways in which these CDs can be divided equally into three groups.
(a) 34560 (b) 34650 (c) 7575 (d) 5775

8. Find the number of ways in which these CDs can be distributed among three French students equally.
(a) 34650 (b) 272100
(c) 43650 (d) 207900

9. Find the number of ways in which these CDs can be distributed to 6 French students equally.
(a) $\frac{12!}{(2!)^6}$ (b) $\frac{12!}{(6!)^2} \times 6!$
(c) $\frac{12!}{6! \times 2!} \times 6!$ (d) 32000084

10. Find the number of ways in which these CDs can be distributed to 6 French students such that anyone may have any number of CDs.
(a) 6^{12} (b) 12^6 (c) $\frac{12!}{6!}$ (d) $(6!)^{12}$

11. Find the number of ways in which these CDs can be distributed to 4 French students such that each one must have at least two CDs.
(a) 3450650 (b) 7050120
(c) 504090 (d) 6900520

12. Find the number of ways in which these CDs can be distributed to 4 French students such that no one has more than three CDs.
(a) $\frac{12!}{64}$ (b) $\frac{12!}{(3!)^4} \times 4!$
(c) $\frac{12!}{1296}$ (d) 360960

Directions (for Q. Nos. 13 to 20) **:** *Answer the questions based on the following information. Once Ruskin Bond meets 4 kids on his way to Dehradun. While chatting with them he decides to distribute all the 12 identical chocolates among these kids.*

13. Find the number of ways of distributing 12 chocolates among 4 kids such that each of them can receive any number of chocolates.
(a) 455 (b) 272 (c) 575 (d) 34650

14. Find the number of ways of distributing 12 chocolates among 4 kids such that each of them must receive at least one chocolate.
(a) 365 (b) 1 (c) 8! (d) 165

15. Find the number of ways of distributing 12 chocolates among 4 kids such that each of them must receive at least two chocolates.
(a) 35 (b) 1 (c) 8 (d) 65

16. Find the number of ways of distributing 12 chocolates among 4 kids such that each of them must receive at least three chocolates.
(a) 36 (b) 1 (c) 3 (d) 16

17. Find the number of ways of distributing 12 chocolates among 4 kids such that no kid receives less than 2 chocolates and more than 4 chocolates.
(a) 38 (b) 19 (c) 16 (d) 32

18. Find the number of ways of distributing 12 chocolates among 4 kids such that these kids get 1, 2, 4, and 5 chocolates.
(a) 25 (b) 24 (c) 52 (d) 64

19. Find the number of ways of distributing 12 chocolates among 4 kids such that taller the kid fewer the chocolates he gets. However, these kids get 1, 2, 4, and 5 chocolates as per their heights, assuming no two kids are of the same height.
(a) 25 (b) 24
(c) 52 (d) 1

20. Find the number of ways of distributing 12 chocolates among 4 kids equally.
(a) 4 (b) 4^4
(c) $\frac{12!}{4!}$ (d) 1

Directions (for Q. No. 21 to 30) **:** *Answer the following questions independently of each other.*

21. Find the total number of non-negative integral solutions of $a + b + c = 30$.
(a) 306 (b) 406 (c) 396 (d) 496

22. Find the total number of positive integral solutions of $a + b + c = 30$.
(a) 405 (b) 406 (c) 303 (d) 496

23. Find the total number of even positive integral solutions of $a + b + c = 30$.
(a) 128 (b) 72 (c) 91 (d) 104

24. Find the total number of odd positive integral solutions of $a + b + c = 30$.
(a) 30 (b) 42 (c) 1 (d) 0

25. Find the total number of positive integral solutions of $a + b + c = 30$ such that a, b and c are distinct.
(a) 366 (b) 256 (c) 178 (d) 398

26. Find the total number of non-negative integral solutions of $a + b + c = 30$ such that $a < b < c$.
(a) 63 (b) 85 (c) 105 (d) 75

27. Find the total number of non-negative integral solutions of $a + b + c = 30$ such that $a \le b$.
(a) 231 (b) 225 (c) 256 (d) 132

28. Find the total number of positive integral solutions of $3a + 2b + c = 30$.
(a) 33 (b) 21 (c) 61 (d) 67

29. Find the total number of ways of selecting the 30 roses from the truckload of red, pink and yellow roses.
(a) 496 (b) 30! (c) 30^3 (d) 3^{30}

30. Find the total number of ways of selecting the 30 roses from truckload of red, pink and yellow roses, such that in each selection there are roses of all the three colours.
(a) 404 (b) 24 (c) 406 (d) 303

Directions (for Q. Nos. 31 to 38) **:** *Answer the questions based on the following information. There are four numbers a, b, c, d such that $a + b + c + d = 12$.*

31. Find the number of non-negative integral solutions of the equation.
(a) 25 (b) 244 (c) 255 (d) 425

32. Find the number of positive integral solutions of the equation.
(a) 125 (b) 165 (c) 143 (d) 156

33. Find the number of integral solutions of the equation, such that $2 \le a, b, c, d \le 4$.
(a) 19 (b) 24 (c) 52 (d) 34

34. Find the number of integral solutions of the equation, such that $a, b, c, d \ge 2$.
(a) 35 (b) 24 (c) 52 (d) 34

35. Find the number of integral solutions of the equation, such that $a > 0, b > 1, c > 2, d > 3$.
(a) 10 (b) 12 (c) 34 (d) 24

36. Find the number of integral solutions of the equation, such that $a > -4, b > -3, c > -2, d > -1$.
(a) 1330 (b) 1331 (c) 1690 (d) 340

37. Find the number of integral solutions of the equation, such that $1 \le (a, b) \le 4, c = 6, d = 0$.
(a) 18 (b) 9 (c) 5 (d) 4

38. Find the number of integral solutions of the equation, such that $-2 \le (a, b, c, d) \le 19$.
(a) 1991 (b) 1771 (c) 2552 (d) 434

Directions (for Q. No. 39 to 40) **:** *Answer the questions based on the following information. There are four numbers a, b, c, d such that $a + b + c + d = -12$.*

39. Find the number of integral solutions of the equation, such that $(a, b, c, d) < 0$.
(a) 195 (b) –165 (c) 92 (d) 165

40. Find the number of integral solutions of the equation, such that $(a, b, c, d) \le 0$.
(a) 256 (b) –256 (c) 425 (d) –425

Directions (for Q. Nos. 41 to 44) **:** *Answer the questions based on the following information. There are three integers a, b, c such that $a + b + c = p$.*

41. If $p = 8$ and $0 \le (a, b, c) \le 4$, find the number of solutions of the given equation.
(a) 15 (b) 24 (c) 12 (d) 30

42. If $p = 8$ and $0 \le (a, b, c) \le 3$, find the number of solutions of the given equation.
(a) 6 (b) 12
(c) 3 (d) 21

43. If $p = 8$ and $0 \le (a, b, c) \le 2$, find the number of solutions of the given equation.
(a) 7 (b) 6
(c) 5 (d) none of these

44. If $p = 8$ and $0 \le (a, b, c) \le 1$, find the number of solutions of the given equation.
(a) 2 (b) 4
(c) 6 (d) 0

Directions (for Q. Nos. 45 to 47) **:** *Answer the questions based on the following information.*
There are four integers a, b, c, d such that $a + b + c + d = p$

45. If $p = 30$ and $0 \le (a, b, c) \le 15$, find the number of solutions of the given equation.
(a) 2736 (b) 2456
(c) 5226 (d) 3436

46. If $p = 30$ and $0 \le (a, b, c) \le 10$, find the number of solutions of the given equation.
(a) 285 (b) 286
(c) 528 (d) 304

47. If $p = 30$ and $0 \le (a, b, c) \le 8$, find the number of solutions of the given equation.
(a) 25 (b) 10 (c) 0 (d) 30

Directions (for Q. Nos. 48 to 59) **:** *Answer the questions based on the following information. Hirawala is a uber rich guy who lives in a swanky place, called Hiranandini, in Mumbai. He has 15 diamond rings and 5 daughters.*

48. If the rings are distinct, find the number of ways of distributing these rings among his 5 daughters such that no any two daughters get equal number of rings but each daughter gets at least one ring and at most 5 rings.
(a) $^{15}C_5$ (b) $\frac{15!}{1!2!3!4!5!} \times 5$
(c) $\frac{15!}{1!2!3!4!5!}$ (d) $\frac{15!}{1!2!3!4!}$

49. If the rings are distinct, find the number of ways of distributing these rings among his 5 daughters such that elder the daughter fewer the rings she gets. Thus the youngest daughter gets 5 rings and the eldest daughter gets just 1 ring. No any two daughters are of the same age.
(a) $\frac{15!}{1!2!3!4!5!}\times 5!$ (b) $\frac{15!}{1!2!3!4!5!}$
(c) $\frac{15!}{({}^{15}C_5)\,5!}$ (d) $\frac{15!}{1!2!3!4!5!}\times 5$

50. If the rings are distinct, find the number of ways of distributing these rings among his 5 daughters such that elder the daughter fewer the rings she gets. The youngest daughter gets 5 rings and the eldest daughter gets just 1 ring. There are no twins among his daughters.
(a) $\frac{15!}{3!5!}\times\frac{7}{144}$ (b) $\frac{15!}{1!2!3!4!5!}\times 3!$
(c) 15^5 (d) $\frac{15!}{3!5!}\times\frac{8}{121}$

51. If the rings are distinct, find the number of ways of distributing these rings among his 5 daughters such that none of the daughters gets less than 2 rings and more than 4 rings.
(a) $\frac{15!}{2!2!3!4!4!}$ (b) $\frac{15!}{2!3!3!3!4!}$
(c) $({}^{15}C_5)\times 5!$ (d) none of these

52. If the rings are distinct, find the number of ways of distributing these rings among his 5 daughters equally.
(a) 1 (b) $\frac{15!}{(3!)^5}\times 5!$ (c) $\frac{15!}{(3!)^5}$ (d) ${}^{15}C_5$

53. If the rings are distinct, find the number of ways of distributing these rings among his 5 daughters such that a daughter may get zero or all the rings.
(a) 75 (b) 1
(c) 15^5 (d) 5^{15}

54. If the rings are identical, find the number of ways of distributing these rings among his 5 daughters such that no daughters get equal number of rings but each daughter gets at least one ring and at most 5 rings.
(a) 120 (b) 75 (c) 12 (d) 34

55. If the rings are identical, find the number of ways of distributing these rings among his 5 daughters such that elder the daughter fewer the rings she gets. Thus the youngest daughter gets 5 rings and the eldest daughter gets only 1 ring. No any two daughters are of the same age.
(a) 1 (b) 5 (c) 15 (d) 3

56. If the rings are identical, find the number of ways of distributing these rings among his 5 daughters such that elder the daughter fewer the rings she gets. The youngest daughter gets 5 rings and the eldest daughter gets 1 ring only. There are no twins among his daughters.
(a) 3 (b) 2 (c) 1 (d) 6

57. If the rings are identical, find the number of ways of distributing these rings among his 5 daughters such that none of the daughters gets less than 2 rings and more than 4 rings.
(a) 51 (b) 15 (c) 52 (d) 25

58. If the rings are identical, find the number of ways of distributing these rings among his 5 daughters equally.
(a) 5 (b) 1 (c) 10 (d) 25

59. If the rings are identical, find the number of ways of distributing these rings among his 5 daughters such that a daughter may get zero or all the rings.
(a) 38 (b) 76 (c) 3876 (d) 34

Directions (for Q. Nos. 60 to 63) **:** *Solve the following problems independently of each other.*
Rollmall is a fast food outlet, which delivers the veg and non-veg rolls in its vicinity. Bawarchi is an employee, who is assigned to pack the rolls in the boxes for delivery. He has 5 rolls in hand to pack in the 3 boxes so that none of the boxes remains empty.

60. Find the number of ways of packing the rolls, if each role and each box both are distinct.
(a) 150 (b) 50 (c) 60 (d) 90

61. Find the number of ways of packing the rolls, if each roll is identical but each box is distinct.
(a) 3 (b) 5 (c) 6 (d) 4

62. Find the number of ways of packing the rolls, if each roll is distinct but all the boxes are identical.
(a) 120 (b) 24 (c) 25 (d) 40

63. Find the number of ways of packing the rolls, if all the rolls and all the boxes are identical.
(a) 3 (b) 0 (c) 1 (d) 2

Directions (for Q. Nos. 64 to 70) **:** *Answer the following questions independently of each other.*

64. In how many ways can 12 identical bouquets be kept in 3 identical crates?
(a) 20 (b) 16 (c) 19 (d) 25

65. In how many ways can 12 identical bouquets be kept in 3 distinct crates?
(a) 19 (b) 91 (c) 81 (d) 61

66. In how many ways can 12 identical bouquets be kept in 3 distinct crates so that no box remains empty?
(a) 36 (b) 55 (c) 66 (d) 91

67. In how many ways can 12 identical bouquets be kept in 3 distinct crates so that at least 2 bouquets must be there in each bouquet?
(a) 28 (b) 24 (c) 42 (d) 36

68. In how many ways can 12 identical bouquets be kept in 3 distinct crates so that the smallest box has at least 2 bouquets, the largest box has at least 4 bouquets and the third one has at least 3 bouquets?
(a) 10 (b) 20 (c) 21 (d) 32

69. In how many ways can 12 identical bouquets be kept in 3 distinct crates so that no two boxes have the same number of bouquets?
(a) 36 (b) 32 (c) 72 (d) 64

70. In how many ways can 12 identical bouquets be kept in 3 distinct crates so that each box has the same number of bouquets?
(a) 36 (b) 1 (c) 2 (d) 12

Directions (for Q. No. 71-73) : *Answer the following questions independently of each other.*

71. In how many ways can 4 balls be selected from the box that contains 10 balls of distinct colours?
(a) 360 (b) 320 (c) 90 (d) 210

72. In how many ways can 4 balls be selected from the box that contains balls of 10 distinct colours, in which there are thousands of balls of each colour?
(a) 124 (b) 210
(c) 715 (d) 640

73. In how many ways can 10 cookies be selected from a bakery that sells the cookies of 4 distinct types, such that there must be at least one cookie of each type?
(a) 12
(b) 21
(c) 84
(d) none of the above

19.9 **Re-arrangement or Derangement**

Rearrangement of objects such that none of the objects occupies its original place.

(i) The number of ways in which exactly r letters can be placed in wrongly addressed envelopes when n letters are placed in n addressed envelopes

$$= {}^{n}P_{r}\left[1-\frac{1}{1!}+\frac{1}{2!}-\frac{1}{3!}+....+(-1)^{r}\frac{1}{r!}\right]$$

(ii) The number of ways in which n different letters can be placed in their n addressed envelopes so that all the letters are in the wrong envelopes

$$= n!\left[1-\frac{1}{1!}+\frac{1}{2!}-\frac{1}{3!}+...+(-1)^{n}\frac{1}{n!}\right]$$

Introductory *Exercise 19.9*

Directions (for Q. Nos. 1 to 4) : *Answer the following questions independently of each other.*

1. Find the number of ways in which all the 6 different letters are placed in 6 addressed envelops so that all the letters are in the wrong envelops.
(a) 265 (b) 365 (c) 252 (d) 356

2. Find the number of ways of placing 6 letters in 6 envelopes which have different addresses in such a way that only two letters are correctly placed and 4 letters are not in the right envelops.
(a) 235 (b) 135 (c) 152 (d) 325

3. Find the number of ways of placing 6 letters in 6 envelopes, which have different addresses in such a way that at least two letters are correctly placed in the right envelops.
(a) 191 (b) 171 (c) 362 (d) 121

4. For every distinct natural number $a, b, c, d, e, f < 7$, a number $N = (a-1)(b-2)(c-3)(d-4)(e-5)(f-6)$ is an integer. Find the number of distinct sets $\{a, b, c, d, e, f\}$ for which N is a non-zero integer.
(a) 365 (b) 256
(c) 265 (d) none of these

19.10 **Number Properties**

If a natural number N can be expressed in the canonical form as $N = a^p b^q c^r \ldots$, whereas $a, b, c, \ldots$ are distinct prime numbers. Then

(i) Total number of factors of a composite number $= (p+1)(q+1)(r+1)\ldots$

(ii) Sum of factors of a composite number

$$= \frac{(a^{p+1}-1)}{(a)-1} \times \frac{(b^{q+1}-1)}{(b-1)} \times \frac{(c^{r+1}-1)}{(c-1)} \times \ldots$$

(iii) Product of factors of a composite number $= N^{1/2}$ (total number of factors of N)

(iv) Total number of odd factors of a composite number $= (p+1)(q+1)(r+1)$; where each of $p, q, r \ldots$ must be odd prime number only. That means if $N = 2^k a^p b^q c^r \ldots$., then eliminate 2^k from the factors of N to obtain number of odd factors of N.

(v) Total number of even factors of a composite number = Total number of factors of N − total number of odd factors.

(vi) Total number of co-primes to N, which are less than

$$N = N\left(1-\frac{1}{a}\right)\left(1-\frac{1}{b}\right)\left(1-\frac{1}{c}\right)\ldots$$

(vii) Sum of all the co-primes of N which are less than $N = \frac{N}{2} \times$ Number of co-primes to N which are less than N.

(viii) Total number of ways in which N can be written as a product of two co-primes $= 2^{n-1}$; where n is the number of distinct prime factors of N.

(ix) Total number of ways in which N can be expressed as a product of two factors

$$= \frac{\text{Total number of factors of } N}{2}$$

(a) If N has odd number of factors (i.e. when N is a perfect square), the number of ways in which N can be expressed as a product of two 'distinct' factors

$$= \frac{(\text{Total number of factors of } N)-1}{2}$$

(b) If N has odd number of factors (i.e. when N is a perfect square), the number of ways in which N can be expressed as a product of two factors, including the 'similar' factors

$$= \frac{(\text{Total number of factors of } N)+1}{2}$$

(x) Total number of ordered pairs (x, y) such that LCM of x and y is a composite number $= (2p+1)(2q+1)(2r+1)\ldots$

***Exp.* 1)** Find the number of factors 72.

Solution Let us consider $N = 72$, which can be expressed as $72 = 2^3 \times 3^2$. Now, there are total 12 factors of 72; namely 1, 2, 3, 4, 6, 8, 9, 12, 18, 24, 36, 72. Let's see how it happens.

$$1 = 2^0 3^0,\ 2 = 2^1 3^0,\ 3 = 2^0 3^1,$$
$$4 = 2^2 3^0,\ 6 = 2^1 3^1,\ 8 = 2^3 3^0,$$
$$9 = 2^0 3^2,\ 12 = 2^2 3^1,\ 18 = 2^1 3^2,$$
$$24 = 2^3 3^1,\ 36 = 2^2 3^2,\ 72 = 2^3 3^2$$

Thus you can see that all the factors of 72 are due to only two prime numbers namely 2 and 3. What's happening here is that we are taking all the possible combinations of 2^j and 3^k. Where $j = 0, 1, 2, 3$ and $k = 0, 1, 2$. In other words we can select prime number 2 in four ways (as 2^0, 2^1, 2^2, 2^3) and prime number 3 in three ways (as 3^0, 3^1, 3^2) to get the factors of 72.

It implies that $72 = 2^3 \times 3^2$ has $(3+1)(2+1)$ factors $= 12$ factors.

Thus it can be concluded that $N = a^p \times b^q \times c^r \times \ldots$. has $(p+1)(q+1)(r+1)\ldots$ factors.

NOTE When N is a perfect square total number of distinct factors would be odd and when N is a non perfect square total number of distinct factors would be even.

***Exp.* 2)** Find the sum of the factors of 72.

Solution Let us consider $N = 72$, which can be expressed as $72 = 2^3 \times 3^2$. Now, there are total 12 factors of 72.

$$(2^0 3^0),(2^0 3^1),(2^0 3^2),\ (2^1 3^0),(2^1 3^1),(2^1 3^2),$$
$$(2^2 3^0),(2^2 3^1),(2^2 3^2),(2^3 3^0),(2^3 3^1),(2^3 3^2)$$

Therefore sum of these factors

$$= (2^0 3^0) + (2^0 3^1) + (2^0 3^2),\ (2^1 3^0) + (2^1 3^1) + (2^1 3^2)$$
$$+ (2^2 3^0) + (2^2 3^1) + (2^2 3^2) + (2^3 3^0) + (2^3 3^1) + (2^3 3^2)$$
$$= (2^0 + 2^1 + 2^2 + 2^3)(3^0 + 3^1 + 3^2)$$
$$= \frac{(2^{3+1}-1)}{2-1} \times \frac{(3^2-1)}{3-1}$$

Thus we can conclude that sum of all the factors of

$$N = \frac{(a^{p+1}-1)}{(a-1)} \times \frac{(b^{q+1}-1)}{(b-1)} \times \frac{c^{r+1}-1}{(c-1)} \times \ldots.$$

***Exp.* 3)** Find the product of all the factors of 72.

Solution Let us consider $N = 72$, which can be expressed as $72 = 2^3 \times 3^2$

Now, there are total 12 factors of 72; namely 1, 2, 3, 4, 6, 8, 9, 12, 18, 24, 36, 72.

We can write these factors in pairs like

$72 = 1 \times 72,\ 72 = 2 \times 36,$

$72 = 3 \times 24,\ 72 = 4 \times 18,$

$72 = 6 \times 12,\ 72 = 8 \times 9$

Therefore, product of all the factors

$= 72 \times 72 \times 72 \times 72 \times 72 \times 72 = 72^6$

It implies that product of all the factors of

$N = (N)^{\text{half of the total number of factor}}$

NOTE When N is a perfect square, the number of factors would be odd. In that case express N as $(\sqrt{N})^2$ so the product of all the factors of $N = (\sqrt{N})^{\text{total number of factors}}$

***Exp.* 4)** Find the total number of odd factors of 72.

Solution Let us consider $N = 72$, which can be expressed as $72 = 2^3 \times 3^2$

Now, there are total 12 factors of 72.

$(2^0 3^0), (2^0 3^1), (2^0 3^2), (2^1 3^0), (2^1 3^1), (2^1 3^2),$

$(2^2 3^0), (2^2 3^1), (2^2 3^2), (2^3 3^0), (2^3 3^1), (2^3 3^2)$

But if we remove those factors which involve any positive power of 2, that is 2^1, 2^2, 2^3, we will have those factors only which are odd. Thus there are 3 odd factors in 72 namely 1, 3 and 9.

So we can conclude that if $N = 2^k a^p b^q c^r \ldots$; where $a, b, c \ldots$ are odd prime numbers, then the number of odd factors will be obtained by disregarding (or ignoring) the even prime number. Therefore in this case total number of odd factors of $N = (p+1)(q+1)(r+1)\ldots..$

***Exp.* 5)** Find the total number of even factors of 72.

Solution Let us consider $N = 72$, which can be expressed as $72 = 2^3 \times 3^2$

Now, there are total 12 factors of 72; namely 1, 2, 3, 4, 6, 8, 9, 12, 18, 24, 36, 72. Simply if we subtract the odd factors from total factors, we will have only even factors.

Thus number of even factors = total number of factors – total odd factors

Thus you can see 72 has 3 odd factors and 9 even factors.

***Exp.* 6)** Find the total number of co-primes to 72, which are less than 72.

Solution Let us consider $N = 72$, which can be expressed as $72 = 2^3 \times 3^2$

Now, there are total 12 factors of 72; namely 1, 2, 3, 4, 6, 8, 9, 12, 18, 24, 36, 72. You know that since 2 is a prime factor of 72, so all the multiples of 2 (i.e., 2, 4, 6, 8, …, 72) will be factors of 72. Simply there are $72/2 = 36$ such numbers. Again since 3 is a factor of 72, so all the multiples of 3 (i.e., 3, 6, 6, 9, ..., 72) will be factors of 72. Simply there are $72/3 = 24$ such numbers.

It is also very clear that if any number less than or equal to 72 is multiple of either 2 or 3 cannot be co-prime to 72. So in order to get co-prime numbers of 72 which are less than 72, we will simply ignore those numbers which are multiple of 2 or 3 but less than or equal to 72.

Number of multiples of $2 = \frac{72}{2} = 36$, so the number of numbers which are not the multiple of

$$2 = 72 - \frac{72}{2} = 72\left(1 - \frac{1}{2}\right)$$

Number of multiples of $3 = \frac{72}{3} = 24$, so the number of numbers which are not the multiple of

$$3 = 72 - \frac{72}{3} = 72\left(1 - \frac{1}{3}\right)$$

Therefore, number of numbers which are neither the multiple of 2 nor of 3

$$= 72\left(1 - \frac{1}{2}\right)\left(1 - \frac{1}{3}\right)$$

It implies that the number of co-primes of 72 which are less than $72 = 72\left(1 - \frac{1}{2}\right)\left(1 - \frac{1}{3}\right) = 24$

Therefore number of co-primes to N, which is less than

$$N = N\left(1 - \frac{1}{a}\right)\left(1 - \frac{1}{b}\right)\left(1 - \frac{1}{c}\right) \ldots.$$

***Exp.* 7)** Find the sum of all the co-primes of 72, which are less than 72.

Solution Let us consider $N = 24$, which can be expressed as $24 = 2^2 \times 3$

Therefore number of co-primes to 24, which are less than

$$24 = 24\left(1 - \frac{1}{2}\right)\left(1 - \frac{1}{3}\right) = 8$$

Thus there are total 8 co-prime factors of 24; namely 1, 5, 7, 11, 13, 17, 19, 23. Now you can see the conjugate pairs of co-prime factors which are (1, 23), (5, 19), (7,17), (11, 13).

It shows that sum of both the terms in each parenthesis is 24.

Thus the sum of all the co-prime factors of 24, not exceeding $24 = 24 \times 4$

It implies that the sum of all the co-primes of N which are less than $N = \frac{N}{2} \times$ Number of co-primes to N which are less than N.

***Exp.* 8)** Find the total number of ways in which 6, 30, 210 and 60 can be written as a product of two co-primes.

Solution Let us consider $N = 6$, which can be expressed as $6 = 2 \times 3$.

Now, there are total 4 factors of 6; namely 1, 2, 3, 6.

Then 6 can be expressed as product of two co-prime factors in two ways: 1×6 and 2×3,

Again consider $N = 30$, which can be expressed as $30 = 2 \times 3 \times 5$

Now, there are total 8 factors of 30; namely 1, 2, 3, 5, 6, 10, 15, 30.

Then 30 can be expressed as product of two co-prime factors in four ways: 1×30, 2×15, 3×10 and 5×6.

Similarly, if we consider $N = 210$, which can be expressed as $210 = 2 \times 3 \times 5 \times 7$

Now, there are total 16 factors of 210; namely 1, 2, 3, 5, 6, 7, 10, 14, 15, 21, 30, 35, 42, 70, 105, 210.

Then 210 can be expressed as product of two co-prime factors in eight ways:

$$1 \times 210,\ 2 \times 105,\ 3 \times 70,\ 5 \times 42,$$
$$6 \times 35,\ 7 \times 30,\ 10 \times 21 \text{ and } 14 \times 15.$$

Once again, if we consider $N = 60$, which can be expressed as $60 = 2^2 \times 3 \times 5$. Now, there are total 12 factors of 60; namely 1, 2, 3, 4, 5, 6, 7, 10, 12, 15, 20, 30, 60. Then there will be 6 pairs: $1 \times 60,\ 2 \times 30,\ 3 \times 20,\ 4 \times 15,\ 5 \times 12$ and 6×10. But 2×30 and 6×10 are not valid.

Then 60 can be expressed as product of two co-prime factors in four ways: $1 \times 60,\ 3 \times 20,\ 4 \times 15$ and 5×12.

Let $N = a^p \times b^q \times c^r \times \ldots$ and $N = L \times R$, where L and R are co-prime (or relatively prime) numbers.

Then a^p can be placed in two ways either at the place of L or R. Similarly b^q can be placed in two ways either at the place of L or R. Similarly c^r can be placed in two ways either at the place of L or R. And so on...

Therefore if there are n factors of N, the number of ways in which N can be expressed as product of two co-prime factors $= \underbrace{2 \times 2 \times 2 \times \ldots \times 2}_{n \text{ times}} = 2^n$

But since L and R are interchangeable, so the number of ways in which N can be expressed as product of two factors $= \dfrac{2^n}{2} = 2^{n-1}$

***Exp.* 9)** Find the total number of ways in which 72 and 36 can be expressed as a product of two factors.

Solution Let us consider $N = 72$, which can be expressed as $72 = 2^3 \times 3^2$.

Now, there are total 12 factors of 72; namely 1, 2, 3, 4, 6, 8, 9, 12, 18, 24, 36, 72. Now you see that

$$72 = (1 \times 72),\ 72 = (2 \times 36),$$
$$72 = (3 \times 24),\ 72 = (4 \times 18),$$
$$72 = (6 \times 12)$$

It implies that total number of ways in which N can be expressed as a product of two factor

$$= \frac{\text{Total number of factors of } N}{2}$$

Let us consider $N = 36$, which can be expressed as $36 = 2^2 \times 3^2$

Now, there are total 9 factors of 36; namely 1, 2, 3, 4, 6, 9, 12, 18, 36.

Now you see that

$$36 = (1 \times 36);\ 36 = (2 \times 18)$$
$$36 = (3 \times 12);\ 36 = (4 \times 9)$$
$$36 = (6 \times 6)$$

Thus 36 can be expressed as a product of two distinct factors $= \dfrac{(9-1)}{2} = 4$

And 36 can be expressed as a product of two factors including the product of similar factors $= \dfrac{(9+1)}{2} = 5$

Therefore it implies that, when N is a perfect square number

(a) The total number of ways in which N can be expressed as a product of two 'distinct' factors

$$= \frac{(\text{Total number of factors of } N) - 1}{2}$$

(b) The total number of ways in which N can be expressed as a product of two factors, including the 'similar' factors

$$\text{factor} = \frac{(\text{Total number of factors of } N) + 1}{2}$$

***Exp.* 10)** Find the total number of ordered pairs (x, y) such that LCM of x and y is 72.

Solution Let us consider 72 is the LCM of two numbers x and y

$72 = 2^2 \times 3^2$

Then the possible pairs can be determined as follows.

The various ways to distribute 2^3 to (x, y) are

$$(2^3, 1),\ (2^3, 2),\ (2^3, 2^2),$$

$(2^3, 2^3),\ (2^2, 2^3),\ (2, 2^3),\ (1, 2^3)$. Thus it can be distributed in $2 \times 3 + 1 = 7$ ways.

Similarly, 3^2 can be distributed to (x, y) in $2 \times 2 + 1 = 5$ ways.

Therefore the total number of ways $= 7 \times 5 = 35$

These pairs are as follows:

(72, 1), (72, 3), (72, 9), (24, 9), (8, 9),
(72, 2), (72, 6), (72, 18), (24, 18), (8, 18)
(72, 4), (72, 12), (72, 36), (24, 36), (8, 36)
(72, 8), (72, 24), (72, 72), (24, 72), (8, 72)
(36, 8), (36, 24), (36, 72), (12, 72), (4, 72)
(18, 8), (18, 24), (18, 72), (6, 72), (2, 72)
(9, 8), (9, 24), (9, 72), (3, 72), (1, 72)

Thus the total number of ordered pairs (x, y) such that LCM of x and y is $72 = (2 \times 3 + 1)(2 \times 2 + 1) = 35$

Thus the total number of ordered pairs (x, y) such that LCM of x and y is a composite number $= (2p + 1)(2q + 1)(2r + 1)$.

19.11. Geometrical Properties

(i) In a plane if there are *n* points of which no three are collinear, then

(a) The number of straight lines that can be formed by joining them $= {}^nC_2$

(b) The number of triangles that can be formed by joining them $= {}^nC_3$

(c) The number of quadrilaterals that can be formed by joining them $= {}^nC_4$

(d) The number of polygons with k sides that can be formed by joining them $= {}^nC_k$

(e) The number of diagonals in a polygon of n sides $= {}^nC_2 - n$

(ii) In a plane if there are n points out of which m points are collinear, then

(a) The number of straight lines that can be formed by joining them $= {}^nC_2 - {}^mC_2 + 1$

(b) The number of triangles that can be formed by joining them $= {}^nC_3 - {}^mC_3$

(c) The number of polygons with k sides that can be formed by joining them $= {}^nC_k - {}^mC_k$

(iii) If n points are given on the circumference of the circle, then

(a) The number of straight lines that can be formed by joining them $= {}^nC_2$

(b) The number of triangles that can be formed by joining them $= {}^nC_3$

(c) The number of quadrilaterals that can be formed by joining them $= {}^nC_4$

(d) The number of polygons with k sides that can be formed by joining them $= {}^nC_k$

(e) The number of diagonals in a polygon of n-sides $= {}^nC_2 - n$

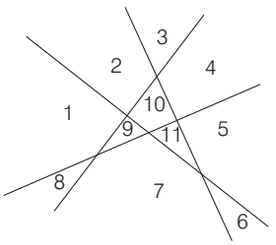
(iv) The number of regions in which a line/plane/space/sphere can be divided by n points/lines/circles/ellipses

Division by	Division of	Maximum Number of Parts / Regions
n Points	Line (1-Dimensional)	$\sum_{k=0}^{1} {}^nC_k = {}^nC_0 + {}^nC_1$
n Lines	Plane (2-Dimensional)	$\sum_{k=0}^{2} {}^nC_k = {}^nC_0 + {}^nC_1 + {}^nC_2$
n Planes	Solid (3-Dimensional)	$\sum_{k=0}^{3} {}^nC_k = {}^nC_0 + {}^nC_1 + {}^nC_2 + {}^nC_3$
n Hyper Planes	Space (4-Dimensional)	$\sum_{k=0}^{4} {}^nC_k = {}^nC_0 + {}^nC_1 + {}^nC_2 + {}^nC_3 + {}^nC_4$

(a) If n straight lines are drawn in the plane such that no two lines are parallel and no three lines are concurrent, then the maximum number of parts/regions into which these lines divide the plane is

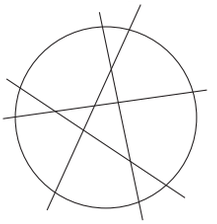
$${}^nC_0 + {}^nC_1 + {}^nC_2 = \frac{n(n+1)}{2} + 1$$

$$= \frac{n^2 + n + 2}{2}$$

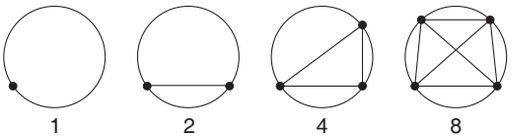


(b) If n straight lines are intersecting a circle such that no two lines are parallel and no three lines are concurrent, the maximum number of parts/regions into which these lines divide the circle is

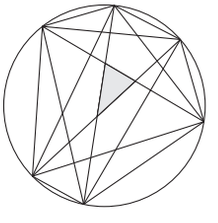
$${}^nC_0 + {}^nC_1 + {}^nC_2 = \frac{n(n+1)}{2} + 1 = \frac{n^2 + n + 2}{2}$$



(c) If n points lie on the circumference of a circle and are connected by straight lines intersecting the circle such that no three lines are concurrent (that is no three lines ever pass through the same point), then the maximum number of parts/regions into which these lines divide the circle is ${}^nC_0 + {}^nC_2 + {}^nC_4$. The first few values are: 1, 2, 4, 8, 16, 31, 57, 99, 163, 256,



(d) If n points are given on the circumference of a circle and the chords determined by them are drawn. If no three chords have a common point, number of triangles all of whose vertices lie inside the circle $= {}^nC_6 = \frac{n!}{6!(n-6)!}$



Every set of six points on the circumference of the circle can be paired in one and only one way such that the three lines joining pairs will form an admissible triangle.

Conversely, every admissible triangle has sides leading to six points on the circumference. Hence the number of admissible triangles is

$= {}^nC_6 = \dfrac{n!}{6!(n-6)!}$

(e) If n circles are drawn in the plane such that no two of them are tangent, none of them lies entirely within or outside of another one and no three of them are concurrent, the maximum number of parts/regions into which these circles divide the plane is $n(n-1)+2$

(f) If n ellipses are drawn in the plane such that no two of them are tangent, none of them lies entirely within or outside of another one and no three of them are concurrent, the maximum number of parts/regions into which these ellipses divide the plane is $2n(n-1)+2$

(g) If there are n overlapping triangles, the maximum number of regions into which these triangles divide the plane is $3n^2 - 3n + 2$

(h) If n planes are drawn in the space such that no four planes intersect at a single point and the intersection of any three planes are non-parallel lines and no two planes are parallel, the maximum number of spacial regions into which these planes divide the space is

$${}^nC_0 + {}^nC_1 + {}^nC_2 + {}^nC_3 = \frac{n^3 + 5n + 6}{6}$$

(i) The maximum number of regions into which a 3-dimensional cube/sphere/cylinder can be partitioned by exactly n planes is

$${}^nC_0 + {}^nC_1 + {}^nC_2 + {}^nC_3 = \frac{n^3 + 5n + 6}{6}$$

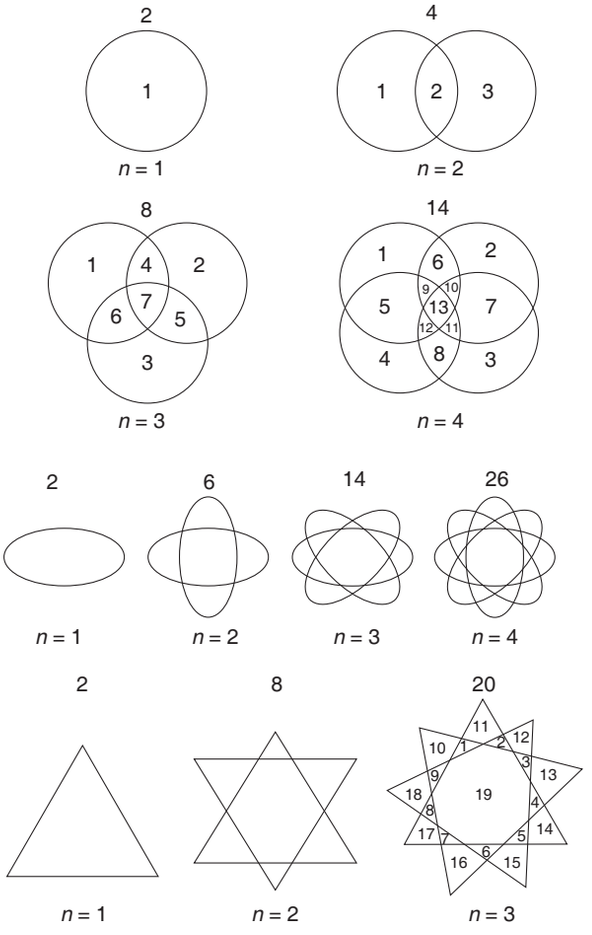
(j) A great circle is a circle drawn on a sphere is known as an 'equator'. That is, its center is also the centre of the sphere. There are n great circles on a sphere such that no three of which meet at any point, the number of regions into which these great circles divide the sphere is $n^2 - n + 2$

(k) If n circles are intersecting each other, maximum number of points of intersection

$= 2 \times ({}^nC_2) = {}^nP_2 = n(n-1)$

(l) If n points in the plane are connected by straight lines in all the possible ways, and of these no two are coincident or parallel and no three of them are concurrent except at the given points, the number of points of intersection other than the given points of the lines so formed is

$\frac{1}{8} \times \frac{n!}{(n-4)!}$



(v) Bounded and unbounded Regions

Since every new line added on the plane increases the number of unbounded regions by 2, so by using this logic we can determine the number of unbounded and bounded regions. As n th line creates n new regions and that of the n new regions introduced, $n-2$ of them must be new bounded regions. And the maximum number of bounded regions is the difference of total number of regions and unbounded regions.

Refer to the following table.

Number of lines n	Total regions	Total new regions added by nth line	Total unbounded regions	New unbounded regions added by nth line	Total bounded regions	Now bounded regions added by nth line
1	2	1	2	(1)	0	(0)
2	4	2	4	2	0	0
3	7	3	6	2	1	1
4	11	4	8	2	3	2
5	16	5	10	2	6	3
6	22	6	12	2	10	4
.....	.....	.....	.....	.....	.....	.....
.....	.....	.....	.....	.....	.....	.....
n	$\frac{n^2+n+2}{n}$	n	$2n$	2	$\frac{n^2-3n+2}{2}$	$n-2$

NOTE The figures, as shown in the table above, written in parentheses () indicate the exception to the pattern.

- Total number of regions may vary depending on the way each line is drawn. In order to have maximum number of regions no two lines should be parallel and no three lines should pass through any intersecting point.
- In the above table, the second column by default talks about MAXIMUM number of total regions.
- Total number of unbound regions varies as per NUMBER of lines drawn only, not on the WAY the lines are drawn on the plane.
- Total number of BOUNDED regions may vary depending on the way each line is drawn. In order to have maximum number of regions no two lines should be parallel and no three lines should pass through any intersecting point.
- In the above table, the sixth column by default talks about MAXIMUM number of total bounded regions.
- Each new line drawn on the plane increases minimum 1 new bounded region and maximum $n-2$ bounded regions.
- Minimum number of bounded regions given by each nth line is $n-2$.

(vi) Number of Squares/Rectangles/Quadrilaterals

(a) Total number of squares in a square having n columns and n rows

$$=1^2+2^2+3^2+....+n^2=\Sigma n^2=\frac{n(n+1)(2n+1)}{6}$$

(b) Total number of rectangles in a square having n columns and n rows

$$=1^3+2^3+3^3+....+n^3=\Sigma n^2=\left(\frac{n(n+1)}{2}\right)^2$$

(c) Total number of squares in a rectangle having m columns and n rows

$$=m\cdot n+(m-1)(n-1)+(m-2)(n-2)+\ldots+0$$

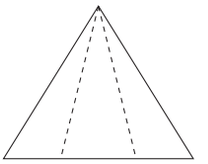
(d) Total number of rectangles in a rectangle having m columns and n rows

$$=(1+2+3+\ldots+m)(1+2+3+\ldots+n)$$

(e) Total number of quadrilaterals if m parallel lines intersect other n parallel lines $= {}^mC_2 \times {}^n C_2$

(vii) Number of Triangles in any Triangle

If you draw m lines from a vertex, these new lines will divide the side of the original triangle in $m+1$ units (or parts).



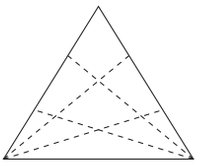
(a) When lines are drawn from only one vertex

If a side of a triangle is divided into n units, the total number of triangles $= \frac{n(n+1)}{2}$

NOTE In the above diagram, there are 6 triangles.

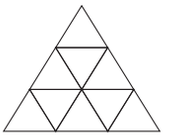
(b) When lines are drawn from any two vertices

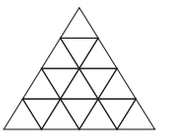
If each side of a triangle is divided into n units, the total number of triangles $= n^3$



NOTE In the above diagram, there are 27 triangles.

(c) When the original triangle is an equilateral triangle and lines are drawn parallel to the sides of original triangle, as shown in the following figures.





If each side of a triangle is divided into n units –

A. Total number of triangles

$$=\left[\frac{n(n+2)(2n+1)}{8}\right]$$

Or, total number of triangles

$$=\frac{(-1)^n+4n^3+10n^2+4n-1}{16}$$

Or, total number of triangles

$$\begin{cases}\frac{n(n+2)(2n+1)}{8}, \text{when } n \text{ is even}\\ \frac{[n(n+2)(2n+1)-1]}{8}, \text{when } n \text{ is odd}\end{cases}$$

B. Total number of triangles pointing upward

$$=\frac{n(n+1)(n+2)}{6}$$

C. Total number of triangles pointing downward

$$=\left[\frac{n(n+2)(2n-1)}{24}\right]$$

Or, total no. of triangles pointing downward

$$=\begin{cases}\frac{1}{24}(n)(n+2)(2n-1), \text{when } n \text{ is even}\\ \frac{1}{24}(n^2-1)(2n+3), \text{when } n \text{ is odd}\end{cases}$$

NOTE

- In the above diagram, figure (i) has 13 triangles and figure (ii) has 27 triangles.
- In the above diagram, figure (i) has 10 upward pointing triangles and figure (ii) has 20 upward pointing triangles.
- In the above diagram, figure (i) has 3 downward pointing triangles and figure (ii) has 7 downward pointing triangles.

Let n be the number of units in each side of the original triangle and k be the number of units in each side of the triangle that can be formed out of the given triangle.

The following table gives the number of triangles for different values of n and k for Upward pointing triangles.

n	k										Total Triangles
	1	2	3	4	5	6	7	8	9	10	
1	1										1
2	3	1									4
3	6	3	1								10
4	10	6	3	1							20
5	15	10	6	3	1						35
6	21	15	10	6	3	1					56
7	28	21	15	10	6	3	1				84
8	36	28	21	15	10	6	3	1			120
9	45	36	28	21	15	10	6	3	1		165
10	55	45	36	28	21	15	10	6	3	1	220
.....	.....	.....	.....	.....	.....	.....	.....	.....	.....	.....	.....

The following table gives the number of triangles for different values of n and k for Downward pointing triangles.

n	k										Total Triangles
	1	2	3	4	5	6	7	8	9	10	
1											0
2	1										1
3	3										3
4	6	1									7
5	10	3									13
6	15	6	1								22
7	21	10	3								34
8	28	15	6	1							50
9	36	21	10	3							70
10	45	28	15	6	1						95
.....	.....	.....	.....	.....	.....	.....	.....	.....	.....	.....	.....

(viii) Number of Triangles, Diagonals and Intersections in a Regular Polygon

A. Number of triangles formed by the vertices of a regular polygon of n sides .

(a) Number of triangles formed by joining the 3 vertices of n - sided polygon

$$N = {}^nC_3 = \frac{n(n-1)(n-2)}{6}; \forall\, n \geq 3$$

(b) Number of triangles having one side common with that of the polygon $N_1 = n(n-4); \forall\, n \geq 3$

(c) Number of triangles having two sides common with that of the polygon $N_2 = n;\ \forall\, n \geq 3$

(d) Number of triangles so that at least one side of the triangle coincides with the side of the polygon

$$= (N_1 + N_2) = n(n-3)$$

(e) Number of triangles having no side common with that of the polygon

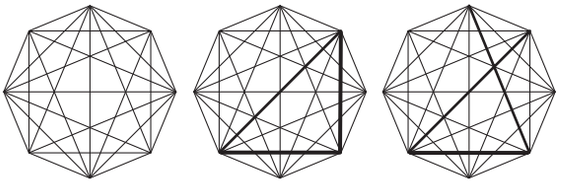
$$N_0 = N - (N_1 + N_2) = \frac{n(n-4)(n-5)}{6}; \forall\, n \geq 6$$

B. Number of triangles formed by intersecting diagonals of a regular polygon of n - sides.

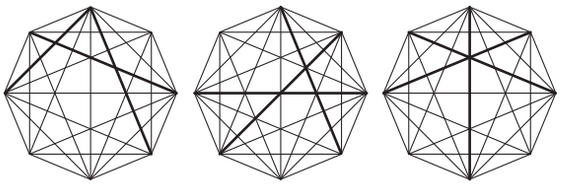
Let us assume $N(d_k)$ indicates the number of triangles with k number of diagonal endpoints

Number of sides in a polygon	Number of Triangles				
n	$N(d_3)$	$N(d_4)$	$N(d_5)$	$N(d_6)$	Total
3	1				1
4	4	4			8
5	10	20	5		35
6	20	60	30		110
7	35	140	105	7	287
8	56	280	280	16	632
9	84	504	630	84	1302
10	120	840	1260	180	2400

Let us consider an example of a regular octagon (8-sided polygon), as shown below. By connecting all the vertices it produces ${}^8C_2 = 28$ lines and $20\,(=28-8)$ diagonals.



A Regular Octagon 3 Diagonal Endpoints 4 Diagonal Endpoints



5 Diagonal Endpoints 6 Diagonal Endpoints 6 Diagonal Endpoints with False Triangle

Number of triangles with 3 Diagonal Endpoints $= {}^nC_3$

Number of triangles with 4 Diagonal Endpoints $= 4({}^nC_4)$

Number of triangles with 5 Diagonal Endpoints $= 5({}^nC_5)$

Number of triangles with 6 Diagonal Endpoints

$$= {}^nC_6 - [a_3(n)({}^3C_3) + a_4(n)({}^4C_3) + a_5(n)({}^5C_3) + a_6(n)({}^6C_3) + a_7(n)({}^7C_3) + \delta_2(n)({}^{n/2}C_3)]$$

Therefore, the number of triangles generated by intersecting diagonals of an n-sided regular polygon is

$${}^nC_3 + 4({}^nC_4) + 5({}^nC_5) + {}^nC_6 - [a_3(n)({}^3C_3) + a_4(n)({}^4C_3) + a_5(n)({}^5C_3) + a_6(n)({}^6C_3) + a_7(n)({}^7C_3) + \delta_2(n)({}^{n/2}C_3)]$$

For example, if we consider an 8-sided regular polygon, the total number of triangles

$$= {}^8C_3 + 4({}^8C_4) + 5({}^8C_5) + {}^8C_6 - [8(1) + 0({}^4C_3) + 0({}^5C_3) + 0({}^6C_3) + 0({}^7C_3) + 1({}^4C_3)]$$

$$= 56 + 280 + 280 + 28 - (8+4)$$

$$= 56 + 280 + 280 + 16 = 632$$

Hint The expression $a_3(n)({}^3C_3) + a_4(n)({}^4C_3) + a_5(n)({}^5C_3) + a_6(n)({}^6C_3) + a_7(n)({}^7C_3) + \delta_2(n)({}^{n/2}C_3)$ indicates the number of false triangles. It happens when more than two diagonals intersect at any point inside the regular polygon.

I. Here $a_m(n)$ denotes the number of intersection (interior) points other than the centre when m diagonals intersect each other.

II. Here ${}^kC_3$ denotes the number of false triangles corresponding to a common point created by the intersection of k line segments for every $k > 2$.

III. Here $\delta_2(n)$ denotes the contribution of the centre-point for even value of n. When n is odd, there is no centre point inside the regular polygon.

Therefore, $\delta_2(n) = \begin{cases} 0, & \text{if } n \text{ is odd} \\ 1, & \text{otherwise} \end{cases}$

NOTE By observation, the number of diagonals m is 2, 3, 4, 5, 6 or 7. In particular, it is impossible to have 8 or more diagonals of a regular n-gon meeting at a point other than the centre.

The maximum number of diagonals of a regular n-gon ($n > 4$) that meet at a point other than the center is $m = 2$, if n is odd or n is 6

$m = 3$, if n is even but not divisible by 6,
$m = 4$, if n is 12
$m = 5$, if n is divisible by 6 but not 30, and,
$m = 7$, if n is divisible by 30.

The number of intersection points formed inside a regular n-gon by its diagonals.

n	m	$a_m(n)$ [Intersection Points Other Than Centre]						Centre Point	Total Intersection Points	
		$a_2(n)$	$a_3(n)$	$a_4(n)$	$a_5(n)$	$a_6(n)$	$a_7(n)$		Without Centre	With Centre
5	2	5							5	5
6	2	12						1	12	13
7	2	35							35	35
8	3	40	8					1	48	49
9	2	126							126	126
10	3	140	20					1	160	161
11	2	330							330	330
12	4	228	60	12				1	300	301
...	...	...							...	...
15	2	1365							1365	1365
...	...	...							...	...
18	5	1512	216	54	54			1	1836	1837
...	...	...							...	...
30	7	13800	2250	420	180	120	30	1	16800	16801

For a generic polygon, maximum number of intersection points formed inside a regular n-gon by its diagonals is ${}^nC_4$, because every four vertices would act as the end points of a unique pair of intersecting diagonals. But it can be less, because in a regular n-gon it may happen that three or more diagonals meet at an interior point, and then some of the ${}^nC_4$ intersection points will coincide.

Also, as we know that no three diagonals meet when n is odd, it implies that for odd n the number of intersection points

$$a_m(n) = {}^nC_4.$$

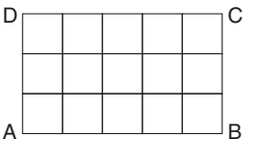
Here ${}^kC_3$ denotes the number of false triangles corresponding to a common point created by the intersection of k line segments for every $k > 2$.

Since, $k > 2$, it implies that this term $a_2(n)({}^nC_3)$ makes no sense, as you cannot select 3 things out of 2 things, and that's why it has been discarded from the formula.

Here $\delta_2(n)$ denotes the contribution of the centre-point for even value of n. Therefore, $\delta_2(n) = \begin{cases} 0, & \text{if } n \text{ is odd} \\ 1, & \text{otherwise} \end{cases}$.

Paths and Grids When m horizontal lines intersect the n vertical lines then a grid or network is formed.

In the following figure, a grid of 3×5 dimensions is shown, in which there are 4 horizontal lines and 6 vertical lines intersect each other. Using these lines as roads you can go from one corner to another one.



In mathematics, we are usually interested in determining the shortest paths and maximum number of paths available from one point to another one.

Suppose you have to go from A to C using the shortest paths, without backtracking, then how many shortest paths are there between A and C?

If you look closely, then you will realize that while going from A to C you can move in only 2 directions – either rightward or upward. In other words, to reach from A to C, you have to use the combination of rightward and upward moves.

As you see in the diagram there are 5 RIGHT steps (between A and B) and 3 UP steps (between B and C). So it's obvious that to reach from A to C, you have to take total $8(=5+3)$ steps. Now, it's your choice how you choose these steps. Suppose if you want to go from A to C, then you can choose your paths as given below.

RRRRRUUU or *RRRRURUU* or *RRRRUURU* or … or *UUURRRRR*. It implies that you have to find out that in how many ways you can select 5 RIGHT steps and 3 UP steps out of total 8 step. And this can be done in

$${}^8C_5 \times {}^{8-5}C_3 = {}^8C_5 \times {}^3C_3 = \frac{8!}{5! \times 3!} \text{ ways}$$

In a sense, it shows that in how many ways you can arrange your 8 steps. Since out of 8 steps 5 steps are identical (RIGHTWARD) and 3 steps are identical (UPWARD).

$$\frac{8!}{5! \times 3!}$$

So all the 8 steps can be arranged in $8!(5! \times 3!)$ ways.

In general, if there is a grid of m horizontal lines and n vertical lines, there will be $(m-1)$ steps in the horizontal direction and $(n-1)$ steps in the vertical direction, thus the total number of steps will be $(m-1)+(n-1) = (m+n)-2$.

Therefore, the total number of shortest paths that can be taken to reach from one corner to the opposite corner $= {}^{(m+n-2)}C_{m-1} \times {}^{n-1}C_{n-1} = \frac{(m+n-2)!}{(m-1)!(n-1!)}$.

Introductory Exercise 19.10

Directions (for Q. Nos. 1 and 2) **:** *Answer these questions based on the following information.*
There are four non-collinear points on a plane.

1. Find the maximum number of straight lines formed by joining the four points.
(a) 3 (b) 2 (c) 1 (d) 6

2. Find the maximum number of triangles formed by joining the four points.
(a) 4 (b) 2 (c) 1 (d) 6

Directions (for Q. Nos. 3 to 6) **:** *Answer these questions based on the following information.*
There are ten points on a plane, such that no three of them are collinear.

3. Find the maximum number of straight lines formed by joining the ten points.
(a) 90 (b) 30 (c) 45 (d) 20

4. Find the maximum number of triangles formed by joining the ten points.
(a) 100 (b) 120 (c) 90 (d) 60

5. Find the maximum number of hexagons formed by joining the ten points.
(a) 210 (b) 120 (c) 240 (d) 66

6. Find the maximum number of diagonals in a decagon formed by joining the ten points.
(a) 30 (b) 45 (c) 35 (d) 20

Directions (for Q. Nos. 7 to 10) **:** *Answer these questions based on the following information.*
There are fifteen points on the circumference of a circle.

7. Find the maximum number of straight lines formed by joining the fifteen points.
(a) 105 (b) 210 (c) 15 (d) 60

8. Find the maximum number of triangles formed by joining the fifteen points.
(a) 555 (b) 455 (c) 660 (d) 560
(e) 525

9. Find the maximum number of quadrilaterals formed by joining the fifteen points.
(a) 365 (b) 1035
(c) 1155 (d) 1365

10. Find the maximum number of octagons formed by joining the fifteen points.
(a) 6543 (b) 2345
(c) 7275 (d) 6435

Directions (for Q. Nos. 11 to 14) **:** *Answer these questions based on the following information.*
There are twelve points on a plane, out of which four are collinear points.

11. Find the maximum number of straight lines formed by joining the twelve points.
(a) 33 (b) 60 (c) 62 (d) 61

12. Find the maximum number of triangles formed by joining the twelve points.
(a) 215 (b) 216 (c) 220 (d) 196

13. Find the maximum number of quadrilaterals formed by joining the twelve points.
(a) 495 (b) 491 (c) 494 (d) 400

14. Find the maximum number of hexagons formed by joining the twelve points.
(a) 900 (b) 924 (c) 906 (d) 609

Directions (for Q. Nos. 15 to 18) **:** *Answer these questions based on the following information.*
There are n points on a plane, out of which m are collinear points, such that $m < n$

15. Find the maximum number of straight lines formed by joining them.
(a) ${}^{n-m}C_2 + 1$ (b) ${}^{n}C_2 - {}^{m}C_2 - 1$
(c) ${}^{n-m}C_2 - 1$ (d) ${}^{n}C_2 - {}^{m}C_2 + 1$

16. Find the maximum number of triangles formed by joining them.
(a) $n! - m!$ (b) ${}^{m}C_3 - {}^{n}C_3$
(c) ${}^{n-m}C_3 - {}^{m}C_3$ (d) ${}^{n}C_3 - {}^{m}C_3$

17. Find the maximum number of quadrilaterals formed by joining them.
(a) ${}^{m}C_4 - {}^{n}C_4$ (b) ${}^{n}C_4 + {}^{m}C_4$
(c) ${}^{n}C_4 - {}^{m}C_4$ (d) ${}^{n}C_4 - {}^{m}C_4 + 1$

18. Find the maximum number of hexagons formed by joining them.
(a) ${}^{n}C_6 - {}^{m}C_6$ (b) ${}^{n}C_6 - {}^{m}C_6 + 6$
(c) ${}^{n}C_6 + {}^{m}C_6$ (d) ${}^{n}C_6 + {}^{m}C_6 - 6$

Directions (for Q. Nos. 19 to 22) **:** *Solve the following problems independently of each other.*

19. Find the number of diagonals in a heptagon.
(a) 14 (b) 21 (c) 12 (d) 16

20. Find the number of diagonals in the n-sided polygon.
(a) ${}^{n}C_2 - n$ (b) ${}^{n}C_2$
(c) ${}^{n}C_2 + n$ (d) $\frac{n(n-3)}{2}$

21. A polygon has 54 diagonals. Find the number of its sides.
(a) 18 (b) 12
(c) 14 (d) 9

22. Find the value of m, if there are maximum 28 triangles formed by joining total 9 points on a plane, out of which m points are collinear.
(a) 3 (b) 4
(c) 1 (d) 8

Directions (for Q. Nos. 23 and 24) **:** *Answer these questions based on the following information.*
Two parallel lines each have a number of distinct points marked on them. On one line there are two points P and Q. On the other line there are eight points.

23. Find the maximum number of different triangles which could be formed having three of the ten points as their vertices.
(a) 3 (b) 2 (c) 64 (d) 6

24. Find the maximum number of triangles which must have P as their vertex.
(a) 3 (b) 2 (c) 36 (d) 6

Directions (for Q. Nos. 25 to 27) **:** *Solve the following problems independently of each other.*

25. If 20 straight lines be drawn in a plane such that no two of them being parallel and no three of them being concurrent, maximum how many points of intersection will there be?
(a) 95 (b) 380
(c) 400 (d) 190

26. If m parallel lines in a plane are intersected by a family of n parallel lines, find the maximum number of parallelograms thus formed.
(a) m^n (b) $(m + 1)(n + 1)$
(c) $\frac{(m - n)}{n!}$ (d) $\frac{mn(m - 1)(n - 1)}{4}$

27. In a plane there are 37 straight lines, of which 13 pass through the point A and 11 pass through the point B. Besides, no three lines pass through one point, no line passes through both the points A and B, and no two lines are parallel. Find the maximum number of points of intersection of the straight lines.
(a) 535 (b) 525 (c) 235 (d) 355

Directions (for Q. Nos. 28 to 31) **:** *Answer these questions independently of each other.*

28. If 6 straight lines be drawn in a plane such that no two of them being parallel and no three of them being concurrent, the maximum number of regions into which this plane will be divided
(a) 30 (b) 22 (c) 18 (d) 15

29. If a plane is divided into 22 distinct regions, find the minimum number of coplanar lines which divide this plane in such a way that neither two lines are parallel nor any three lines are concurrent.
(a) 3 (b) 4 (c) 8 (d) 6

30. The maximum number of disjoint regions that can be formed in the plane by n simple closed curves which pair-wise meet in at most two points is
(a) $n^3 - n + 2$ (b) $n^2 - n + 1$
(c) $n^2 - n + 2$ (d) $n(n - 1)$

31. If there are 6 points on the circumference of the circular sheet, find the maximum possible number of triangular regions that can be cut out of the circular sheet such that none of the vertices of these triangles are the points of the circumference.
(a) 3 (b) 2 (c) 1 (d) 15

Directions (for Q. Nos. 32 to 35) **:** *Answer these questions based on the following information.*
Once, Amey and his friends decided to celebrate their success after they secured their admissions into various IIMs (Indian Institutes of Management). They ordered a thin crust cheese pizza from Pizza Hut and they told Pizza Hut to deliver it without cutting into pieces. The pizza was large enough to satiate their cravings. Once they receive the pizza, they were so excited that they didn't mind cutting the pizza into any shape and size. However, while cutting the pizza they cut it from edge to edge, that is they started from any point on the circumference and didn't lift the knife until it reaches another point on the circumference. It's like they cut it along various chords of a circle.

32. At most, how many pieces would they get if they made 8 cuts in this pizza?
(a) 37 (b) 32 (c) 58 (d) 36

33. If they wanted to have 20 pieces of this pizza, minimum how many cuts would be required?
(a) 4 (b) 5 (c) 10 (d) 6

34. Amey had just made 7 cuts making maximum possible number of pieces such that everyone present there could have had one piece each. But before anybody could have picked up a piece of it few more friends arrived at the party. Thus to serve the new guests at his party, he made one more cut keeping in mind that each new guest would get exactly one piece of pizza. What's the maximum number of new guests (friends) that showed up at the party?
(a) 8 (b) 7 (c) 9 (d) 6

35. If Amey marked 6 points on the circumference of the pizza and then the pizza was cut into pieces such that all the cuts were straight and must passed through these points on the circumference, at most how many pieces they would have got out of this pizza?
(a) 99 (b) 69 (c) 66 (d) 25

Directions (for Q. Nos. 36 to 38) **:** *Answer these questions based on the following information.*

Actually few of his friends love cheese so much so that they don't want to eat the pieces which have less cheese on it as they find it tasteless. For them, size of the piece does not matter as long as it has cheese uniformly spread on it. The problem is that there is no cheese spread on the edge (or circumference) of the pizza in order to avoid any untoward incident of the cheese falling on the clothes while eating. A piece of pizza that contains some part of circumference (or edge) has less or no cheese spread on it is called as Edger and another piece of pizza that is from the middle part of pizza which has proper cheese spread on it is called as Cheeser.

36. If there are 15 such guys and girls who don't eat the Edger and each such person must get a Cheeser one to eat, minimum how many cuts are required to get the desired pieces?
(a) 6 (b) 7 (c) 8 (d) 9

37. If there are 25 such guys and girls who don't want to eat Edger one and if only 8 cuttings are made to cut this pizza, minimum how many such persons have to compromise with an Edger piece of pizza?
(a) 0 (b) 1 (c) 2 (d) 4

38. Minimum how many cuts are required if they need more number of Cheeser than that of Edger pieces?
(a) 3 (b) 6 (c) 9 (d) 7

Directions (for Q. Nos. 39 and 40) **:** *Answer these questions based on the following information.*

A Venn diagram has two circles, which cuts the plane into 4 regions and another Venn diagram has 3 circles, which cuts the plane into 8 regions.

39. Find the maximum possible number of regions on a plane that can be created by a Venn diagram with 6 circles.
(a) 28 (b) 32 (c) 16 (d) 36

40. If you have ovals instead of circles, find the maximum possible number of regions on a plane that can be created by a Venn diagram with 5 ovals.
(a) 34 (b) 42 (c) 18 (d) 26

Directions (for Q. Nos. 41 and 42) **:** *Answer these questions based on the following information.*

In a class of origami, in Japan, my teacher Yamamotoyama gave me a circular paper, a knife and a scissors. She asked me to cut the paper in order to make triangles out of the circular sheet. She laid down some rules which were mandatory to follow for every origami student.

(i) *A sheet of paper has n points marked on its circumference.*

(ii) *One must cut through the marked points only.*

(iii) *Any cut must last from one marked point to another marked point.*

(iv) *One has to cut the paper as many times as the number of chords are possible with n points on the circumference of a circle.*

(v) *One cannot displace the pieces until all the possible cuts are made.*

41. Find the maximum possible number of triangles which do not have any of its vertices out of the n marked points.
(a) 0 (b) 3 (c) ${}^{n}C_{3}$ (d) ${}^{n}C_{6}$

42. If $n = 6$, find the maximum possible number of triangles that can be cut out of the circular sheet such that none of the vertices of these triangles are the points of the circumference.
(a) 3 (b) 6
(c) 1 (d) 2

Directions (for Q. Nos. 43 and 44) **:** *Answer these two questions based on the following information.*

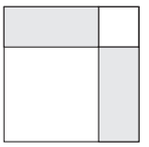
Khayamati is not just a foodie and extravagant but also a party animal. On her birthday her friends got an elephant size cake that was supposed to be distributed among all her friends. The cake was cylindrical in shape. To cut this cake they got a very large knife which was able to cross through the whole cake from any direction or angle. That is a single cut would be enough to make two pieces of the whole cake. By the way, they made n cuts to the cake from any arbitrary direction they could make. It was notable that until all the n cuts were done no one removed even a single piece.

43. If $n = 6$, find the maximum possible number of pieces that can be sliced out of that cake.
(a) 32 (b) 62 (c) 42 (d) 22

44. After cutting the cake if they got total 300 pieces, find the minimum possible number of cuts required.
(a) 13 (b) 17
(c) 11 (d) 12

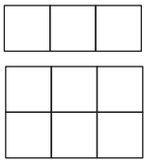
Directions (for Q. Nos. 45 to 60) **:** *Solve these problems independently of each other.*

45. Find the total number of squares and total number of rectangles, respectively, in the given figure. The main figure itself is a square.



(a) 2 and 4 (b) 2 and 2
(c) 3 and 4 (d) 3 and 9

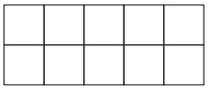
46. Find the total number of squares and total number of rectangles in the following figure. The main figure itself is a square.



(a) 10 and 6 (b) 10 and 16
(c) 14 and 36 (d) 14 and 22

47. Find the total number of squares and total number of rectangles in the following figure.

The smallest unit (or cell) in this figure is a square.



(a) 10 and 20 (b) 10 and 16
(c) 14 and 45 (d) 14 and 35

48. Find the total number of squares in a square having 10 rows and 10 columns.
(a) 385 (b) 360 (c) 100 (d) 275

49. Find the total number of rectangles in a square having 10 rows and 10 columns.
(a) 3225 (b) 1625 (c) 1044 (d) 3025

50. Find the total number of squares in a rectangle having 8 rows and 15 columns.
(a) 345 (b) 456 (c) 567 (d) 606

51. Find the total number of rectangles in a square having 8 rows and 15 columns.
(a) 4321 (b) 6320 (c) 4320 (d) 3456

52. Find the total number of quadrilaterals in a square having 10 rows and 10 columns.
(a) 3025 (b) 7744 (c) 2401 (d) 2601

53. Find the total number of quadrilaterals in a rectangle having 8 rows and 15 columns.
(a) 4321 (b) 4320 (c) 1234 (d) 5440

54. Find the total number of quadrilaterals when 8 parallel lines intersect another set of 15 parallel lines.
(a) 3636 (b) 2940 (c) 1990 (d) 3654

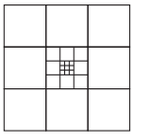
55. Find the total number of rectangles when 8 vertical lines intersect 15 horizontal lines such that all the vertical lines are parallel and equidistant to each other, and all the horizontal lines are also parallel and equidistant to each other.
(a) 3996 (b) 6040 (c) 2940 (d) 6734

56. Find the total number of squares when 8 vertical lines intersect 15 horizontal lines such that all the vertical lines are parallel and equidistant to each other, and all the horizontal lines are also parallel and equidistant to each other.
(a) 336 (b) 456 (c) 1096 (d) 376

57. How many total squares are there in a standard chess board (or check board)?
(a) 65 (b) 204 (c) 256 (d) 206

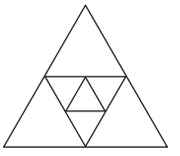
58. How many total rectangles are there in a standard chess board (or check board)?
(a) 1296 (b) 512 (c) 0 (d) 2025

59. Find the total number of squares in the following diagram, where the main figure (i.e., the largest one) itself is a square.



(a) 42 (b) 62 (c) 27 (d) 40

60. Find the total number of triangles in the given diagram.



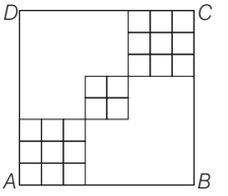
(a) 3 (b) 27 (c) 9 (d) 8

Directions (for Q. Nos. 61 to 66) **:** *Solve the following problems independently of each other.*

61. Find the total number of the shortest routes from one corner to its opposite corner in the given diagram.

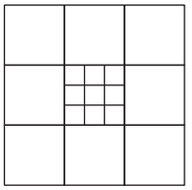
(a) 10 (b) 15 (c) 6 (d) 9

62. Find the total number of the shortest routes from *A* to *C* in the given diagram.



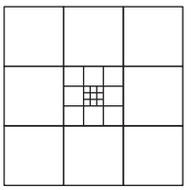
(a) 4200 (b) 2402 (c) 2400 (d) 4800

63. Find the total number of the shortest routes from one corner to its opposite corner in the following diagram.



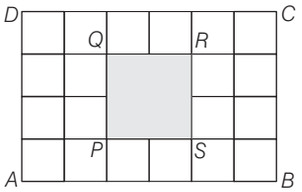
(a) 42 (b) 84 (c) 92 (d) 40

64. Find the total number of the shortest routes from one corner to its opposite corner in the following diagram.



(a) 800 (b) 400 (c) 388 (d) 380

65. Find the total number of the shortest paths from *A* to *C* in the following diagram.

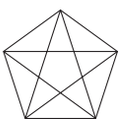


In this diagram, *PQRS* is a military area so one cannot enter inside the premises.

However, one may go along *PQ*, *QR*, *PS* and *SR*.

(a) 100 (b) 110
(c) 168 (d) 204

66. Find the total number of triangles in a pentagon when all its vertices are joined with each other.



(a) 10 (b) 35 (c) 25 (d) 20

Directions (for Q. Nos. 67 to 70) **:** *Solve the following problems based on the following information.*

An industrial corridor is laid out along the Special Economic Zone (SEZ), which is in the shape of a regular polygon. Every vertex of the SEZ has exactly one manufacturing plant.

A particular road connects any two plants. No single road connects directly more than two plants. Engineers have laid down all the possible roads connecting all the plants with each other. Each road is designed to offer the shortest distance between any two plants.

Also, engineers have laid down all the possible rail-loops. Each loop connects any three plants. Every loop is designed along the shortest possible distance between any two plants connected through that loop.

Wherever any two or more than two roads intersect inside the SEZ (polygon), exactly one warehouse is to be built there.

Wherever any three or more than three roads intersect inside the SEZ (polygon), exactly one government office is to be built there.

Wherever any five or more than five roads intersect inside the SEZ (polygon), exactly one airport is to be built there.

67. Maximum how many rail-loops are there if the SEZ has 16 plants?

(a) 480 (b) 256
(c) 560 (d) none of these

68. Maximum how many warehouses are there if the SEZ has 25 plants?

(a) 7220 (b) 12650
(c) 14400 (d) none of these

69. Maximum how many government offices are there if the SEZ has 49 plants?

(a) 0
(b) 7
(c) 50
(d) none of the above

70. Maximum how many airports are there if the SEZ has 32 plants?

(a) 56 (b) 108
(c) 8648 (d) none of these

CAT-Test

Questions Helping you bell the CAT

LEVEL 01 > BASIC LEVEL EXERCISE

1 A letter lock consists of 4 rings, each ring contains 9 non-zero digits. This lock can be opened by setting a 4 digit code with the proper combination of each of the 4 rings. Maximum how many codes can be formed to open the lock?
(a) 4^9 (b) ${}^9P_4$
(c) 9^4 (d) none of these

2 In the previous question, if the lock opens in only one arrangement of 4 digits, how many unsuccessful attempts are possible in which lock cannot be opened?
(a) $4^9 - 1$ (b) $9^4 - 1$
(c) ${}^9C_4$ (d) none of these

Directions (for Q. Nos. 3 to 7) **:** *Answer these questions based on the following information.*
A group consists of four straight couples. That means each couple is having a male and a female.

3 In how many ways could they be arranged in a straight line such that the men and the women occupy alternate positions?
(a) 1152 (b) 1278
(c) 1296 (d) none of these

4 In how many ways can they be arranged in a straight line such that no two men were sitting together?
(a) 1242 (b) 1440 (c) 3880 (d) 2880

5 In how many ways can they be seated such that each husband sits with his own wife?
(a) 384 (b) 275
(c) 184 (d) none of these

6 In how many ways can they be seated around a circular table such that the men and women occupy the alternate positions?
(a) 288 (b) 144 (c) 72 (d) 720

7 In how many ways can they be seated on the single bench such that all the men sit together and all the women sit together?
(a) 1512 (b) 1296
(c) 1152 (d) none of these

8 How many different words can be made using the letters of the word 'HALLUCINATION' if all consonants are together?
(a) 129780 (b) 1587600
(c) 35600 (d) none of these

9 If all vowels occupy odd places, how many words can be formed from the letters of the word HALLUCINATION?
(a) 129650 (b) 1587600
(c) 78500 (d) none of these

10 In how many ways can the letters of the word SUCCESSFUL be arranged?
(a) 1215700 (b) 1251600
(c) 151200 (d) none of these

11 If all S'_s come together, then in how many ways the letters of the word SUCCESSFUL be arranged?
(a) 10080 (b) 40080
(c) 2378 (d) none of these

12 If all C's occur together and all U'_s also occur together, then how many arrangements are possible of the word SUCCESSFUL?
(a) 5745 (b) 2760 (c) 6720 (d) 5432

13 What is the sum of all the 4 digit numbers which can be formed with the digits 1, 2, 3, 4 without repetition?
(a) 15560 (b) 87660 (c) 45600 (d) 66660

14 What is the sum of all 5 digit numbers which can be formed with the digits 0, 1, 2, 3, 4 without repetition?
(a) 2599980 (b) 235500 (c) 923580 (d) 765432

15 Which one of the following polygon has as many diagonals as the number of sides in it?
(a) 4 (b) 6 (c) 5 (d) 7

16 In how many ways can the letters of the word PROPORTION be arranged by taking 4 letters at a time?
(a) 123 (b) 758 (c) 658 (d) 578

17 In the previous question (no. 16) how many words can be formed without changing the relative positions of the vowels and consonants?
(a) 217 (b) 720 (c) 920 (d) 1040

18 There are 16 executives including two brothers, Lehman and Mckinsey. In how many ways can they be arranged around the circular table if the two brothers cannot be seated together?
(a) $(14!)\cdot 13$ (b) ${}^{14}P_3$
(c) $\frac{14!}{3!}$ (d) none of these

19 In the previous question how many arrangements are possible if there is exactly one executive between these two brothers?
(a) $(14!)^2$ (b) $(14!)$
(c) $2\cdot(14!)$ (d) none of these

20 In how many different ways can 6 different balls be distributed to 4 different boxes, when each box can hold any number of ball?
(a) 2048 (b) 1296
(c) $(24)^2$ (d) 4096

21 In how many different ways can 6 identical balls be distributed to 4 different boxes, when each box can have any number of balls?
(a) 12 (b) 18 (c) 84 (d) 88

22 If $a + b + c = 21$, what is the total number of non-negative integral solutions?
(a) 123 (b) 253 (c) 321 (d) 231

23 If $a + b + c = 21$ what is the total number of positive integral solutions?
(a) 109 (b) 190 (c) 901 (d) 910

24 What is the total number of ways of selecting atleast one object from 2 sets of 12 different objects, each set contains 6 objects?
(a) 4096 (b) 4095
(c) 2048 (d) none of these

25 What is the total number of ways of selecting atleast one object from 2 different sets, each set containing 6 identical objects?
(a) 24 (b) 48 (c) 76 (d) 96

26 What is the total number of ways of selecting atleast one item from each of the two sets containing 6 different items each?
(a) 2856 (b) 3969
(c) 480 (d) none of these

27 What is the total number of ways of selecting atleast one item from each of the two sets containing 6 identical items each?
(a) 16 (b) 36 (c) 32 (d) 18

28 A girl has to climb 12 steps. She climbs in either a single step or 2 steps simultaneously. In how many ways can she do it?
(a) 233 (b) 223 (c) 322 (d) 232

29 In how many ways can 8 identical apples be divided among 3 sisters?
(a) 25 (b) 65 (c) 45 (d) 24

30 In how many ways can 100 soldiers be divided into 4 squads of 10, 20, 30, 40 respectively?
(a) 1700 (b) 18!
(c) 190 (d) none of these

31 What is the total number of 4 digit numbers that can be formed using the digits 0, 1, 2, 3, 4, 5 without repetition, such that the number is divisible by 9?
(a) 36 (b) 28
(c) 15 (d) 18

32 How many 5 digit numbers contain exactly two 7's in them?
(a) 4268 (b) 6804 (c) 2340 (d) 1269

33 In how many ways can 15 billiard balls be arranged in a row if 3 are red, 4 are white and 8 are black?
(a) 12 (b) 18
(c) 96 (d) none of these

34 Seven delegates are to address a meeting. If a particular speaker is to speak before another particular speaker, find the number of ways in which this can be arranged.
(a) 1220 (b) 2520 (c) 3250 (d) 7826

35 How many 7 digit telephone numbers can be formed from the digits 0, 1, 2, …, 9, where each telephone number begins with digit 2?
(a) 10^6 (b) 6^{10} (c) 10! (d) ${}^{10}P_6$

36 A man has 4 sons. There are 6 proposals of marriage for his sons. In how many ways can they select a proposal for their marriages, such that none of them marry with more than one girl?
(a) 180 (b) 270
(c) 360 (d) none of these

37 In how many ways can 4 books be selected out of 16 books on different subjects?
(a) 1208 (b) 1820
(c) 1296 (d) 1860

38 In how many ways can 4 books be arranged out of 16 books on different subjects?
(a) 34650 (b) 43680
(c) 43890 (d) none of these

39 In how many ways can 16 books on different subjects be divided equally into 4 groups?
(a) $\frac{16!}{(4!)}$ (b) $4! \times (16!)$
(c) $\frac{16!}{(4!)^5}$ (d) none of these

40 In a badminton tournament each player played one game with all the other players. How many players participated in the tournament if they played 105 games in all?
(a) 35 (b) 12
(c) 15 (d) none of these

41 There are 9 subjects in eighth standard but there are only 6 periods in a day. In how many ways can the time table be formed?
(a) 60480 (b) 23460
(c) 56780 (d) 61280

42 How many 6 digit numbers can be formed using the digit 2 two times and the digit 4 four times?
(a) 16 (b) 15
(c) 18 (d) 24

43 There are 4 different monitors and 6 different mother boards. How many different arrangements can be made to purchase a monitor and a motherboard?
(a) 12 (b) 24
(c) 18 (d) 6^4

44 The number of five digit numbers having atleast one of their digits repeated is :
(a) 900 (b) 1000
(c) 62784 (d) none of these

45 Four dice are rolled. The number of possible outcomes in which atleast one die shows 4 is :
(a) 671 (b) 168
(c) 176 (d) none of these

46 The number of signals that can be generated by using 5 differently coloured flags, when any number of them may be hoisted at a time is :
(a) 235 (b) 253
(c) 325 (d) none of these

47 If the letters of the word VERMA are arranged in all possible ways and these words are written out as in a dictionary, then the rank of the word VERMA is :
(a) 108 (b) 117
(c) 810 (d) 180

48 How many 5 digit numbers divisible by 3 can be formed using the digits 0, 1, 2, 3, 4 and 5, without repetition?
(a) 108 (b) 216 (c) 810 (d) 180

49 In how many ways can a mixed double game can be arranged from amongst 8 married couples if no husband and wife play in the same game?
(a) 840 (b) 240
(c) 480 (d) none of these

50 If n objects are arranged in a row, then the number of ways of selecting three of these objects so that no two of them are next to each other is :
(a) ${}^{n}C_3$ (b) ${}^{n-2}C_3$
(c) ${}^{n}C_2$ (d) none of these

51 The number of times the digit 8 will be written when listing the integers from 1 to 1000 is :
(a) 100 (b) 200 (c) 300 (d) 400

52 Five balls of different colours are to be placed in three boxes of different sizes. Each box can hold all five balls. The number of ways in which we can place the balls in the boxes so that no box remains empty is :
(a) 30 (b) 150 (c) 600 (d) 900

53 The number of squares on a chessboard is :
(a) 102 (b) 108 (c) 216 (d) 204

54 A train going from Lucknow to Mumbai stops at 7 intermediate stations. Five persons enter the train during the journey with five different tickets of the same class. How many different set of tickets they could have had ?
(a) 98280 (b) 2898
(c) 7325 (d) none of these

55 In how many ways can a committee of 4 women and 5 men be chosen from 9 women and 7 men, if Mr. *A* refuses to serve on the committee if Ms. *B* is a member?
(a) 1608 (b) 1860
(c) 1680 (d) 1806

Directions (for Q. Nos. 56 to 63) **:** *There are 5 different caps c_1, c_2, c_3, c_4 and c_5 and 5 different boxes B_1, B_2, B_3, B_4 and B_5. The capacity of each box is sufficient to accomodate all the 5 caps.*

56 If any box can have any number of caps, in how many ways can all the caps be distributed?
(a) 3125 (b) 1235 (c) 2358 (d) 1248

57 In how many arrangements does B_1 have cap C_1?
(a) 5! (b) 5^4
(c) ${}^{5}P_4$ (d) none of these

58 If all the caps are of different colours and each box can have only one cap, in how many ways can you arrange the caps among the 5 boxes?
(a) 120 (b) 180
(c) 360 (d) none of these

59 If atleast one cap has to be distributed and the caps have to be arranged such that any box can have a maximum of one cap only, in how many ways can you arrange the caps among 5 boxes?
(a) 1 (b) 16
(c) 1545 (d) none of these

60 If all the caps are identical, in how many ways can the caps be arranged in the different boxes such that no box is empty?
(a) 1 (b) 2 (c) 6 (d) 8

61 If C_1 and C_5 are similar in all aspects, in how many ways can you arrange the caps in such a way that all the boxes have one cap?
(a) 70 (b) 60 (c) 75 (d) 80

62 If B_3 can have only C_1 or C_5, in how many ways can you arrange the caps such that all boxes have one cap?
(a) 480 (b) 420 (c) 48 (d) 88

63 If B_1 and B_5 have the caps C_1 and C_5 among themselves, in how many ways can you arrange the caps among the 5 boxes ?
(a) 400 (b) 485 (c) 500 (d) 365

64 Romeo and Juliet write love-letters to none but to each other. In a given period of time, Romeo writes 4 letters and Juliet writes 2 letters. During this period, at any given point of time Romeo writes greater than or equal to the number of letters written by Juliet. Find the number of ways of writing love-letters to each other.
(a) 10 (b) 8 (c) 6 (d) 9

65 Malvika wants to colour a cubical box from outside. In how many ways can she colour it if she wants to colour each face of the box with either blue or pink colour?
(a) 6 (b) 12 (c) 10 (d) 18

66 A gym opens twice a day – morning and evening. But, I don't work out twice a day. I attend it only 4 times a week. In how many ways can I attend the gym in a week?
(a) 560 (b) 350
(c) 280 (d) none of these

67 An n-digit number is a positive number with exactly n-digits. Nine hundred distinct n-digit numbers are to be formed using only the three digits 2, 5 and 7. The smallest value of n for which this is possible is
(a) 6 (b) 7 (c) 8 (d) 9

68 Which of the following is not a possible number of regions into which three straight lines, of infinite extent, divide a plane?
(a) 4 (b) 5 (c) 6 (d) 7

69 If you travel between Mumbai and Pune, you have to go through a 10 km long tunnel. Lately there has been a surge in the incidents of loot and plunder and many passengers have been harassed and injured inside the tunnel. Considering the enormity of the law and order problem, highway police decided to establish 4 security posts in order to ensure the safety of life and luggage of commuters. The minimum distance between any two posts is 1 km. Each security post must be n km ($n = 0, 1, 2, 3\ldots$) apart from entry/exit of the tunnel and none of them will be outside the tunnel. Find the number of ways of selecting the spots for upcoming security posts.
(a) 330 (b) 110 (c) 66 (d) 120

70 A rectangle with sides $(2m - 1)$ and $(2n - 1)$ is divided into squares of unit length by drawing parallel lines as shown in the diagram, then the number of rectangles possible with odd side lengths is
(a) $(m + n + 1)^2$ (b) $4^{(m+n-1)}$
(c) m^2n^2 (d) $mn(m + 1)(n +)$

71 A black ant has to go from the origin to a point (6, 4) on the Cartesian plane, using the coordinate axes. However, it avoids crossing the point (4, 1), as a red ant is sitting there. Find the total number of shortest paths that it can go along.
(a) 150 (b) 160 (c) 190 (d) 240

72 The number of seven digit integers, with sum of digits equal to 10 and formed by using the digits 1, 2, and 3 only, is
(a) 55 (b) 66 (c) 77 (d) 88

73 Find the maximum possible number of regions created by 6 overlapping triangles.
(a) 36 (b) 63 (c) 92 (d) 96

74 Find the total number of three digit numbers, which have their digits in increasing order, as in, for a three digit number abc, there must be $a < b < c$.
(a) 84 (b) 67 (c) 97 (d) 79

75 There are three straight lines dividing the circle into maximum possible number of regions. If three additional lines are drawn, what is the maximum possible number of additional regions that can be formed in the circle?
(a) 6 (b) 9
(c) 14 (d) none of these

76 Spiritual Guru H. E. Dalai Lama is on a world tour to speak on peace and compassion. His itinerary mentions only four continents – Asia, Africa, Europe and America – for this visit. What is the minimum number of countries he should visit to ensure that at least 21 Asian or at least 16 African or at least 11 European or at least 6 American countries must be visited?
(a) 24 (b) 51 (c) 54 (d) 57

77 Arya, Bran, Cersei, Daenerys, Petyr and Tyrion are seated in six chairs placed in a row. Maximum how many seating arrangements are possible if Arya must sit next to Bran, but Petyr cannot sit next to Tyrion?
(a) 98 (b) 196 (c) 144 (d) 256

78 How many 6 digit telephone numbers can be formed if each number starts with 91 and sum of the digits is equal to 16?
(a) 210 (b) 336 (c) 168 (d) 84

79 Jwala Gutta and P. V. Sindhu play a one-day series. They stop playing matches as soon as one of them wins 3 matches and in this series no match is drawn. In how many ways can this series be won?
(a) 20 (b) 24 (c) 12 (d) 6

80 Let there be a random number n such that the product of its digits is 6. How many values of n are there, if n lies between 10^9 and 10^{10}?
(a) 10 (b) 60 (c) 90 (d) 100

81 Sarvesh wants to prepare a bouquet with roses, lilies, orchids and carnations, so he walked into a large garden of flowers. In how many ways can he prepare a bouquet of 15 flowers such that he selects at least 1 rose, 2 lilies, 3 orchids and 4 carnations for his bouquet?
(a) 24 (b) 120 (c) 56 (d) 112

LEVEL 02 > HIGHER LEVEL EXERCISE

1 In how many ways can the following prizes be given away to a class of 30 students, first and second in Mathematics, first and second in Physics, first in Chemistry and first in English?
(a) $\frac{30!}{4!}$
(b) $(30)^4 \times (29)^2$
(c) $(30)^3 - 1$
(d) $(30)^4 \times (29)^4$

2 If P_r stands for ${}^rP_r$, then the value of
$1 + 1.P_1 + 2.P_2 + 3.P_3 + \ldots + n.P_n$ is :
(a) $\frac{(n-1)!}{2}$ (b) $\frac{(n+1)!}{2}$
(c) $2(n-1)!$ (d) $(n+1)!$

3 In an examination hall there are four rows of chairs. Each row has 6 chairs one behind the other. There are two classes sitting for the examination with 12 students in each class. It is desired that in each row, all students belong to the same class and that no two adjacent rows are alloted to the same class. In how many ways can these 24 students be seated?
(a) $2(12!)^2$ (b) $3! \times (12!)^2$
(c) $(6!)^2$ (d) none of these

4 How many 3 digit even numbers are there such that if 3 is one of the digits then 9 is the next digit?
(a) 365 (b) 536
(c) 210 (d) 156

5 A number plate of a vehicle has always a fixed code UP–32 for Lucknow city followed by the number of particular vehicle which is in two parts. First part is occupied by 2 English alphabets and second part is occupied by 4 digit numbers (0001, 0002, … 9999). If the latest registration number of vehicle is $\begin{Bmatrix}\text{UP} - 32\\ \text{SK} - 0123\end{Bmatrix}$, find the number of vehicles registered before this vehicle number in Lucknow.
(a) 2449744 (b) 4779644
(c) 4669235 (d) 9235888222

6 How many 4 digit numbers divisible by 4 can be formed without using the digits 0, 6, 7, 8, 9 if the repetition of digits is not allowed?
(a) 67 (b) 68
(c) 24 (d) 48

7 In how many ways three girls and nine boys can be seated in two vans, each having numbered seats, 3 in the front and 4 at the back?
(a) ${}^{14}C_{12}$ (b) 9^4
(c) ${}^{14}P_{12}$ (d) none of these

8 In the previous question, how many seating arrangements are possible if 3 girls sit together in a back row on adjacent seats?
(a) $(3!)^2$ (b) 6!
(c) 5! (d) none of these

9 In how many ways 5 plus (+) signs and 5 minus (–) signs be arranged in a row so that no two minus signs are together?
(a) 6 (b) 7 (c) 8 (d) 10

10 In how many ways can 11 identical books on English and 9 identical books on Maths be placed in a row on a shelf so that two books on Maths may not be together?
(a) 110 (b) 220 (c) 330 (d) 440

11 Find the total number of factors of 1680.
(a) 40 (b) 50 (c) 60 (d) 30

12 $\sum_{k=m}^{n} {}^kC_r$ equals :
(a) ${}^{n+1}C_{r-1}$ (b) ${}^{n+1}C_{r+1} - {}^mC_r$
(c) ${}^{n+1}C_{r+1} - {}^mC_{r+1}$ (d) ${}^{n+1}C_{r+1} + {}^mC_{r+1}$

13 In a certain test there are n questions. In this test 2^{n-k} students gave wrong answers to atleast k questions, where $k = 1, 2, 3, \ldots, n$. If the total number of wrong answers given is 2047, then n is equal to :
(a) 10 (b) 11 (c) 12 (d) 13

14 The number of triangles whose vertices are at the vertices of an octagon but none of the sides of such triangles are taken from the sides of the octagon.
(a) 8 (b) 15
(c) 16 (d) none of these

15 The number of ways in which we can select 5 numbers from the set of numbers {1, 2, 3, …, 25} such that none of the selections includes four consecutive numbers is :
(a) 53109 (b) 13350
(c) 10035 (d) none of these

16 The number of integral solutions for the equation $a + b + c + d = 12$, where $(a, b, c, d) \geq -1$ is :
(a) ${}^{19}C_3$ (b) ${}^{18}C_4$
(c) ${}^{20}C_4$ (d) none of these

17 If $n = {}^kC_2$, the value of ${}^nC_2$ is :
(a) $2({}^{k+2}C_4)$ (b) $(n-2)!$ (c) $(k-2)!$ (d) $3({}^{k+3}C_4)$

18 The number of positive integral solutions of $abc = 42$ is :
(a) 17 (b) 27 (c) 21 (d) $3! \times 42$

19 There are three piles of identical red, green and blue balls and each pile contains atleast 10 balls. The number of ways of selecting 10 balls if twice as many red balls as green balls are to be selected is :
(a) 1 (b) 2 (c) 4 (d) 6

20 Between Shirdee and Khandala, there are 10 intermediate stations. The number of ways in which a train can be made to stop at 4 of these stations so that no two of these halting stations are consecutive is :
(a) 35 (b) 70 (c) 105 (d) 10

21 The number of ways in which an examiner can assign 30 marks to 8 questions, giving not less than 2 marks to any question is :
(a) 11 (b) ${}^{21}C_7$ (c) 18 (d) 235

22 The exponent of 3 in 33! is :
(a) 15 (b) 2
(c) 11 (d) none of these

23 The total number of natural numbers of 6 digits that can be formed with digits 1, 2, 3, 4, if all the digits are to appear in the same number atleast once, is :
(a) 740 (b) 1830
(c) 1560 (d) none of these

24 The total number of seven digit numbers, the sum of whose digits is even are :
(a) 250000 (b) 4500000
(c) 35×10^5 (d) none of these

25 The number of ways in which 4 pictures can be hung from 6 picture nails on the wall is :
(a) 4^6 (b) ${}^4P_6$ (c) ${}^6P_4$ (d) 6^4

26 The total number of ways of selecting 6 coins out of 10 one rupee coins, 6 fifty paise coins and 8 twenty paise coins is :
(a) 28 (b) 14 (c) 13 (d) 19

27 Nargis has 8 children and she takes 3 at a time to children's park as often as she can without taking the same 3 children together more than once. The number of times she will go to the park is :
(a) 56 (b) 14 (c) 28 (d) 76

28 In the previous problem (no. 27), the number of times each child will go to the park is:
(a) 14 (b) 8
(c) 21 (d) none of these

29 The sides *AB, BC, CA* of a triangle *ABC* have 3, 4 and 5 interior points respectively on them. The total number of triangles that can be constructed by using these points as vertices is :
(a) 105 (b) 307 (c) 420 (d) 205

30 The number of all the possible selections which a student can make for answering one or more questions out of 10 given questions in a paper, when each question has an alternative is :
(a) 1345 (b) 23560 (c) 541340 (d) 59048

31 The number of ways in which a team of eleven players can be selected from 22 players including 2 of them and excluding 4 of them is :
(a) ${}^{15}C_{10}$ (b) ${}^{16}C_{10}$
(c) ${}^{16}C_9$ (d) none of these

32 There are 10 lamps in a hall. Each one of them can be switched on independently. The number of ways in which the hall can be illuminated is :
(a) 1022 (b) 1023
(c) 1024 (d) none of these

33 How many 10 digits numbers can be formed by using the digits 2 and 3?
(a) 2^{10} (b) 10^2
(c) 10! (d) none of these

34 How many subsets containing at most n elements from the set of $(2n + 1)$ elements can be selected?
(a) 2^n (b) 2^{n-1}
(c) 2^{n+1} (d) 2^{2n}

35 The sum of the divisors of $2^3 \cdot 3^4 \cdot 5^2$ is :
(a) 15625 (b) 1234
(c) 56265 (d) 56789

36 The number of ways of selecting 10 balls out of an unlimited number of white, red, blue and green balls is :
(a) 268 (b) 286 (c) 246 (d) 468

37 If 10 objects are arranged in a row, then the number of ways of selecting three of these objects so that no two of them are next to each other is :
(a) 56 (b) 65 (c) 28 (d) 13

38 The number of non-negative integral solutions of $x_1 + x_2 + x_3 + x_4 \le n$ (where n is a positive integer) is :
(a) ${}^{n+3}C_3$ (b) ${}^{n+2}C_3$ (c) ${}^{n+4}C_4$ (d) ${}^{n+4}C_3$

39 The total number of permutations of $(n > 1)$ different things taken not more than r at a time, when each thing may be repeated any number of times is :
(a) $\dfrac{n^r - 1}{(n-1)}$ (b) $r^n - 1$
(c) $\dfrac{n(n^r - 1)}{(n-1)}$ (d) none of these

40 Number of rectangles on a chessboard is :
(a) 1008 (b) 1296 (c) 1124 (d) 1600

41 Ten persons, amongst whom *A, B* and *C* are to speak at a function. The number of ways in which it can be done if *A* wants to speak before *B* and *B* wants to speak before *C* is :
(a) $\dfrac{10!}{6}$ (b) $\dfrac{9!}{6}$
(c) ${}^9C_6$ (d) none of these

42 The number of natural numbers which are smaller than $2 \cdot 10^8$ and which can be written by means of the digits 1 and 2 is :
(a) 678 (b) 786 (c) 766 (d) 677

43 Tweleve persons are arranged in a row. The number of ways of selecting four persons so that no two persons sitting next to each other are selected is :
(a) 124 (b) 136
(c) 126 (d) none of these

44 The number of n-bit (digits 0 and 1) strings having exactly k zeros with no two zeros consecutive is, where $2k < n$.
(a) ${}^{n+1-k}C_k$ (b) ${}^{n+k}C_k$
(c) ${}^{n-k}C_k$ (d) ${}^{n-1}C_k$

45 A question paper has two parts–Part A and Part B. Part A contains 5 questions and part B has 4. Each question in part A has an alternative. A student has to attempt atleast one question from each part. Find the number of ways in which the student can attempt the question paper.
(a) 3360 (b) 1258 (c) 3850 (d) 3630

46 How many different vehicle licence plates can be made if the licences contain 2 letters of the English alphabet followed by a three digit number if repetitions are allowed?
(a) 54320 (b) 67534 (c) 23456 (d) 675324

47 In the previous question (no. 46), how many different plates can be formed if the repetitions are not allowed?
(a) 468000 (b) 13000
(c) 15680 (d) none of these

48 $2m$ people are arranged along two sides of a long table with m chairs each side. r men wish to sit on one particular side and s on the other. In how many ways can they be seated? ($r, s \le m$)
(a) ${}^{48}C_r$ (b) 68 m
(c) $\dfrac{(2m+r)!}{r!\,s!}$ (d) none of these

49 Management city has m parallel roads running East-West and n parallel roads running North-South. How many shortest possible routes are possible to go from one corner of the city to its diagonally opposite corner?
(a) ${}^{m+n}C_{m-1}$ (b) ${}^{m+n}C_n$
(c) ${}^{(m+n-2)}C_{(m-1)}$ (d) none of these

50 Priyanka has 11 different toys and Supriya has 8 different toys. Find the number of ways in which they can exchange their toys so that each keeps her initial number of toys.
(a) ${}^{19}C_{11}$ (b) ${}^{18}C_{10}$ (c) ${}^{20}C_{11}$ (d) ${}^{19}C_{11} - 1$

51 The sum of the numbers of the n^{th} term of the series $(1) + (1+2) + (1+2+3) + (1+2+3+4) + \ldots$ $(1+2+3+\ldots n)$:
(a) ${}^{n+1}C_3$ (b) ${}^{n+1}C_2$ (c) ${}^{n}C_2$ (d) ${}^{n+2}C_3$

52 Two packs of 52 playing cards are shuffled together. Find the number of ways in which a man can be dealt 26 cards so that he does not get two cards of the same suit and same denomination.
(a) ${}^{52}C_{26} \times 2^{26}$ (b) $\dfrac{52!}{(2!)^{26}}$
(c) 2^{26} (d) none of these

53 In how many ways we can select four cards of different suits and different values from a deck of 52 cards?
(a) 10! (b) $\dfrac{13!}{10!}$
(c) $\dfrac{13!}{9!}$ (d) none of these

54 How many 5 digit numbers can be formed having the digits 0 three times and 3 two times?
(a) 4 (b) 6 (c) 8 (d) 10

55 How many different four digit numbers can be formed with the digits 1, 2, 3, 4, 5, 6, 7, 8 and 9 such that the digit 5 appears exactly once?
(a) 1024 (b) 2048
(c) 4096 (d) none of these

56 How many different four digit numbers can be formed using digits 1, 2, 3, 4, 5, 6, 7, 8, 9 without repetition such that the digit 5 appears exactly once?
(a) 1243 (b) 1234 (c) 1344 (d) 1355

57 How many different eight digit numbers can be formed using only four digits 1, 2, 3, 4 such that the digit 2 occurs twice?
(a) 20412 (b) 12042
(c) 25065 (d) none of these

58 In how many ways can 8 distinct things be divided among three people such that any one can receive any number of things?
(a) 1556 (b) 6561 (c) ${}^{8}C_2$ (d) ${}^{7}C_2$

59 There are 6 numbered chairs placed around a circular table. 3 boys and 3 girls want to sit on them such that neither of two boys nor two girls sit adjacent to each other. How many such arrangements are possible?
(a) 36 (b) 58
(c) 72 (d) none of these

60 In how many ways one black and one white rook can be placed on a chessboard so that they are never in an attacking position?
(a) 1234 (b) 3136 (c) 9516 (d) 1024

61 There are 9 pairs of white shoes and 6 pairs of black shoes contained in a box. We are allowed to draw only one shoe at a time. Minimum how many shoes are required to be drawn out to get one pair of white shoes?
(a) 11 (b) 22 (c) 33 (d) 15

62 In the previous question, minimum how many shoes must be drawn out to get at least 1 pair of either black or white shoes?
(a) 15 (b) 18 (c) 16 (d) 22

63 There are four different coloured balls and four boxes of the same colour as that of each ball is. Find the number of ways in which exactly one ball can be put in a box so that the colour of the box and that of ball is distinct.
(a) 16 (b) 10
(c) ${}^{4}C_2$ (d) none of these

64 In the previous question (no. 63) find the number of ways in which only two balls can be put in the correct boxes *i.e.,* the colour of box and the colour of contained ball be same.
(a) 3 (b) 6
(c) 9 (d) none of these

65 Find the number of digits required to write down the number of pages in a 300 pages book.
(a) 792 (b) 279
(c) 729 (d) none of these

66 Find the number of numbers that can be formed using all the digits 1, 2, 3, 4, 3, 2, 1 only once so that the odd digits occupy odd places only.
(a) 9 (b) 16 (c) 18 (d) 27

Directions (for Q. Nos. 67 to 74) **:** *There are 5 different boxes and 7 different balls. All the 7 balls are to be distributed in the 5 boxes placed in a row so that any box can receive any number of balls.*

67 In how many ways can these balls be distributed into these boxes?
(a) 5^7 (b) 7^5 (c) ${}^7C_5$ (d) ${}^7P_5$

68 In how many ways can these balls be distributed so that no box is empty?
(a) 7! (b) 16800
(c) 1775 (d) none of these

69 Suppose all the balls are identical, then in how many ways can all these balls be distributed into these boxes?
(a) 110 (b) 220 (c) 330 (d) 440

70 Suppose all the balls and all the boxes are also identical. Then in how many ways can all these balls be distributed into these boxes?
(a) 12 (b) 13 (c) 16 (d) 255

71 In the previous question (no. 70) in how many ways can all these balls be distributed into these boxes so that no box remains empty and no two consecutive boxes have the same number of balls?
(a) 1 (b) 4
(c) 12 (d) none of these

72 In how many ways can these balls be distributed so that box 2 and box 4 contain only 1 and 2 balls respectively?
(a) 5522 (b) 8505
(c) 2305 (d) none of these

73 In how many ways can these balls be distributed into these boxes if ball 2 can be put into either box 2 or box 4?
(a) 12360 (b) 31250 (c) 13490 (d) 31526

74 In how many ways can these balls be distributed such that no box is empty and ball 2 and ball 4 cannot be put in the same box?
(a) 1200 (b) 15000
(c) 3800 (d) none of these

Directions (for Q. Nos. 75 to 82) **:** *There are 3 pots and 4 coins. All these coins are to be distributed into these pots where any pot can contain any number of coins.*

75 In how many ways these coins can be distributed if all the coins and all the pots are different?
(a) 3^4 (b) 4^3 (c) ${}^3P_4$ (d) ${}^4P_3$

76 In how many ways these coins can be distributed if all the coins and all the pots are identical?
(a) 4 (b) 6 (c) 8 (d) 1

77 In how many ways all these coins can be distributed if all coins are identical but all pots are different?
(a) 15 (b) 16 (c) 17 (d) 81

78 In how many ways all these coins can be distributed if all coins are different but all pots are identical?
(a) 14 (b) 21
(c) 27 (d) none of these

79 In how many ways all these coins can be distributed such that no pot is empty if all coins are different but all pots are identical?
(a) 16 (b) 6 (c) 42 (d) 21

80 In how many ways all these coins can be distributed such that no pot is empty if all coins are identical but all pots are different?
(a) 6 (b) 3 (c) 9 (d) 27

81 In how many ways all these coins can be distributed if all coins are identical and two pots are also identical?
(a) 1 (b) 10 (c) 9 (d) 11

82 In how many ways all these coins can be distributed if out of 4 coins 2 coins are identical and all pots are different?
(a) 45 (b) 27
(c) 54 (d) none of these

83 Once Munnabhai gets admitted to a psychiatric hospital. In his room, there are two bulbs connected to two different switches, independently. One night, while accompanying him, his best buddy Circuit notices that there is, initially, no light in the room, but whenever a mosquito bites him he switches on the light and then immediately switches it off. Throughout the night, Munnabhai presses the switch (on/off) six times. Finally when Munnabhai stops playing around with the switches, Circuit notices that there is no light in the room. In how many ways Munnabhai ends up having no light in his room by pressing the given switches on or off exactly six times?
(a) 3 (b) 4 (c) 6 (d) 8

84 Mr. Been, who is getting older and senile, is standing on a crossroad totally confused about his directions. He can move in any of the four directions – North, South, East or West. He takes some steps and then comes back to the same point at the crossroad. In how many ways can he end up being at the same point where he is initially standing by taking total 8 steps?
(a) 4900 (b) 6400 (c) 360 (d) 238

85 Indian Democratic Alliance (IDA) is a coalition of three distinct regional parties. IDA decides to contest on 100 seats for the upcoming parliamentary elections. IDA wants to share these seats in such a way that no any ally gets the same number of seats to contest and no two allies contest for the same seat. Also each of the allies must get at least 1 seat to contest. Find the number of ways of allocating the number of seats for the three constituents of the IDA?

(a) 4704 (b) 4851 (c) 4884 (d) 3667

86 Bill Gates personally announced that he would be building 49 toilets in 3 select Indian villages A, B and C, as part of the pilot project. In how many ways these toilets can be built in 3 villages such that village A gets more toilets than that of village B and village B gets more toilets than that of village C?

(a) 98 (b) 196
(c) 188 (d) none of these

87 H2O is a chain of salons, employing one hair stylist at each salon. It has got centralized system in place to provide appointments through phone calls for all its 6 salons located in different areas in Pune. A family of four seeking the appointment for all its members for the hair cut. On a particular day, in how many ways the salons can give the appointments to them?

(a) 3024 (b) 2524 (c) 3384 (d) 3084

88 A natural number N is such that $10^{10} < N < 10^{12}$ and the sum of its digits is 3. Find the total number of values of N.

(a) 121 (b) 111 (c) 222 (d) 144

89 A spiritual organization, working for the world peace, has inducted 32 young volunteers none of whom knew each other before joining this organization. During the induction program they interacted with each other. Next day it was observed that most of the volunteers became friends on the Facebook, but one-fifth of the girls denied becoming Facebook friend with one-third of the boys. Considering the natural Facebook friendship among some of the volunteers, the head of the organization asked them to visit the various regions of the world and spread the message of the world peace. She told them that a region would have to be visited by exactly 2 volunteers who are the Facebook friends and no any such pair would have to visit more than one region. Which is the possible number of regions that these volunteers could have visited?

(a) 525 (b) 496 (c) 421 (d) 487

90 Find the total number of non-negative integers less than 1000 for which the sum of the digits is 10.

(a) 63 (b) 66 (c) 67 (d) 56

Directions (for Q. Nos. 91 and 92) **:** *Hirabhai after marrying Hiraben settled in Hiranandini, Mumbai. He has 15 diamond rings and 5 daughters. Among his 5 daughters, he has only one daughter who is not twins.*

91 If the rings are distinct, find the number of ways of distributing these rings among his 5 daughters such that elder the daughter fewer the rings she gets. However none of them gets less than 1 and more than 5.

(a) $\frac{15!}{3! \times (5!)^2}$ (b) $\frac{15!}{(2!)^5 \times (5!)^2}$

(c) $\frac{15!}{(2!)^2 \times (3!)^2 \times 5!}$ (d) none of these

92 If the rings are identical, find the number of ways of distributing these rings among his 5 daughters such that elder the daughter fewer the rings she gets. However none of them gets less than 1 and more than 5.

(a) 180 (b) 150 (c) 75 (d) 6

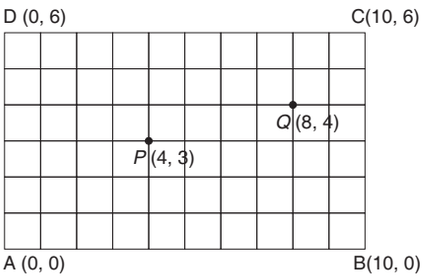
93 Find the number of positive integral solutions of the equation $x_1x_2x_3x_4 = 462$.

(a) 128 (b) 1024 (c) 256 (d) 64

94 Find the number of integral solutions of the equation $x_1x_2x_3x_4 = 462$.

(a) 2048 (b) 256 (c) 24 (d) 1024

95 Rumour has it that Runnbeer, an alpha male, who easily gets to date the hometown hotties at the drop of his hat. Of late, he has been very promiscuous and ditched his two girls, who stay in the same city at two distinct locations Powai (P) and Qababchowk (Q).



Today, Runnbeer has got a new date and so he wants to take his date from her apartment at Arthur road (A) to a restaurant at Churchgate (C). However, he does not want to go through the places P and Q as his deserted girls, Priyankhan and Qatrinah, stay at these two places only. Find the total number of the shortest paths that he can follow to reach C from A, considering the roadmap given in the diagram.

(a) 3298 (b) 6058 (c) 3880 (d) 3148

96 Sixty delegates from three different countries participated in a recent Disaster Management Conclave. Each such country is divided into four states and each such state is further divided into five cities. Each delegate was representing a different city. In that conclave any two delegates shook hands with each other exactly two times. However, if any two delegates are from the same country they shook hands five times and if any two delegates are from the same state they shook their hands nine times. What was the total number of handshakes amongst the delegates?

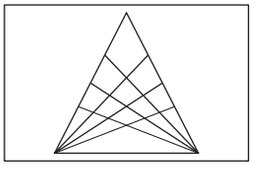
(a) 1200 (b) 5730 (c) 7370 (d) 3540

97 DHL is a leading logistics company in India. In order to optimize its resources it has virtually divided the whole market region into four zones and each zone is again divided into five blocks. There are two dedicated trucks of DHL carrying the goods between any two blocks within each zone. Also there are three dedicated trucks carrying the goods between any two blocks of different zones. Exactly, how many trucks of DHL are engaged in the stated market?
(a) 72 (b) 660 (c) 530 (d) 484

98 There are 6 red and 4 green points on the circumference of a circle. How many convex polygons can be formed such that all the vertices of the polygon must be from these ten points only and having at least one green vertex?
(a) 1226 (b) 530 (c) 730 (d) 926

99 If m and n are relatively prime and $mn = 10!$, find the number of all rational numbers $\frac{m}{n}$ such that $0 < \frac{m}{n} < 1$.
(a) 8 (b) 15
(c) 30 (d) 21

100 How many distinct triangles are there in this figure?



(a) 32 (b) 66
(c) 48 (d) 64

101 Sarvesh Verma has 3 mobile wallets – *PayPal, PayTM* and *PayU* – installed in his smartphone. Initially, he has only ₹ 100 in *PayPal* wallet and other two wallets have nothing. He can transfer his money from one wallet to any other wallet without any transaction charges or any incentives. One day, he performs seven online transactions, and in every transaction he empties his one wallet completely into another wallet. After seven transactions he has ₹ 100 in *PayPal* wallet. During this procedure neither he pays any amount to nor receives any amount from any third party by any means. In how many different ways can he make these transactions?
(a) 14 (b) 21 (c) 42 (d) 49

102 Kamlesh, the sulochan boy, has 100 identical matchsticks. How many distinct rectangles can he form using at most 100 matchsticks?
(a) 1225 (b) 625
(c) 25 (d) none of these

103 Two teams – Anadi and Khiladi – are playing a cricket match. Anadi requires 12 runs in the last 3 balls to win the match. Any team can score 0 to 6 runs, except 5 runs, from a particular ball. In how many different ways Team Anadi can score 12 runs without any no-ball and wide-ball in the last 3 balls?
(a) 11 (b) 12
(c) 13 (d) none of these

104 Each employee in our office at Lamamia must wear a shirt, a tie and a pair of pants to dress up oneself. Thus, any employee in our office can wear exactly 105 distinct combinations with the help of different colours. No two employees have equal number of quantities of all the three things individually. That is no two employees have x shirts, y ties and z pairs of pants. No two employees have the same colours of their clothes. Maximum how many employees are there in our office?
(a) 24 (b) 27 (c) 35 (d) 105

105 How many 8 digit numbers can be formed with the digits 1, 2, 3, 4, 5, 6, 7, 8 such that no digit repeats and none of the patterns 12, 34, 56, or 78 appears in any arrangement?
(a) 24096 (b) 24024
(c) 16296 (d) none of these

LEVEL 03 > Final Round

1 Maximum number of points of intersection of 6 circles, is
(a) 30 (b) 28
(c) 15 (d) none of these

2 Maximum number of points of intersection of 6 straight lines is :
(a) 30 (b) 15
(c) 28 (d) none of these

3 Maximum number of points into which 3 circles and 3 lines intersect is :
(a) 21 (b) 9 (c) 27 (d) 3!

4 Eight identical coins are arranged in a row. The total number of ways in which the number of heads is equal to the number of tails, is :
(a) 35 (b) 15 (c) 140 (d) 70

5 Two straight lines intersect at a point O. Points $A_1, A_2, A_3, A_4, A_5, \ldots, A_m$ are taken on one line and points $B_1, B_2, B_3, \ldots, B_n$ on the other. If the point O is not included, the number of triangles that can be drawn using these points as vertices, is :
(a) ${}^nC_2 + {}^mC_2$ (b) ${}^{2n}C_2$
(c) ${}^{m+n}C_2$ (d) none of these

6 How many different nine digit numbers can be formed from the number 22 33 55 888 by rearranging its digits so that the odd digits occupy even positions?
(a) 60 (b) 75
(c) 88 (d) 77

7 The straight lines l_1, l_2, l_3 are parallel and lie in the same plane. A total number of m points on l_1, n points on l_2, k points on l_3 are used to produce the triangles, the maximum number of triangles formed with vertices at these points are :
(a) ${}^mC_3 \times {}^nC_3 \times {}^kC_3$
(b) ${}^{(m+n+k)}C_3 - ({}^mC_3 + {}^nC_3 + {}^kC_3)$
(c) ${}^{(m+n+k)}C_3$
(d) none of the above

8 Given that n is the odd, the number of ways in which three numbers in AP can be selected from 1, 2, 3, 4, …, n is :
(a) $\frac{(n-1)^2}{4}$ (b) n^2 (c) n^3 (d) $(n-2)^2$

9 Eight straight lines are drawn in the plane such that no two lines are parallel and no three lines are concurrent. The number of parts into which these lines divide the plane, is :
(a) 73 (b) 37 (c) 17 (d) 72

10 Number of divisors of the form $4n + 2\,(n \geq 0)$ of the integer 240 is :
(a) 6 (b) 4 (c) 3 (d) 12

11 The number of rectangles excluding squares from a rectangle of size of 12×8 is :
(a) 1234 (b) 625
(c) 2460 (d) 256

12 Two lines intersect at O. Points $A_1, A_2, \ldots, A_n$ are taken on one of them and $B_1, B_2, \ldots, B_n$ on the other the number of triangles that can be drawn with the help of these $(2n + 1)$ points is :
(a) n (b) n^2 (c) n^3 (d) n^4

13 The number of ways in which 9 identical balls can be placed in three identical boxes is :
(a) 12 (b) 6 (c) 9 (d) $\frac{9!}{3!}$

14 The number of ways in which 30 coins of one rupee each be given to six persons so that none of them receives less than 4 rupees is :
(a) 246 (b) 462
(c) $\frac{30!}{6!}$ (d) none of these

15 Find the number of circles that can be drawn out of 10 points, of which 7 points are collinear is :
(a) 35 (b) 85
(c) 70 (d) 124

16 The number of natural numbers of two or more than two digits in which digits from left to right are in increasing order is :
(a) 205 (b) 520
(c) 502 (d) none of these

17 In how many ways a cricketer can make a century with fours and sixes only?
(a) 6 (b) 9
(c) 8 (d) 10

18 The number of permutations of the letters of the word LUMINARY such that neither the pattern LURY nor MINA occurs is :
(a) 46800 (b) 24600
(c) 40086 (d) none of these

19 10 students are to be seated in two rows equally for the MOCK CAT in a room. There are two sets of papers, code A and code B. Each of the two rows can have only one set of paper but different that from the other row. In how many ways these students can be arranged?
(a) 2775600 (b) 1200560
(c) 125600 (d) 7257600

20 Aman Verma and Mini Mathur jointly host a TV programme in which one particular day n guests attend their show. In that show, each guest shakes hands with every other guest and each guest shakes hands with each of the hosts. If there happens to be total 65 handshakes, find the number of guests who attend the show.
(a) 13 (b) 14
(c) 10 (d) 9

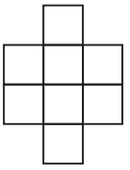
21 The number of ways in which an examiner can assign 50 marks to 10 questions giving not less than 3 marks to any question is :
(a) ${}^{29}C_9$ (b) ${}^{47}C_3$
(c) ${}^{52}C_2$ (d) ${}^{40}C_{10}$

22 For $x \in R$, let $[x]$ denote the largest integer less than or equal to x, then the value of
$E = \left[\frac{1}{3}\right] + \left[\frac{1}{3} + \frac{1}{100}\right] + \left[\frac{1}{3} + \frac{2}{100}\right] + \ldots + \left[\frac{1}{3} + \frac{99}{100}\right]$ is :
(a) 22 (b) 66
(c) 33 (d) none of these

23 The number of positive integers from 1 to 10^6 (both inclusive) which are neither perfect squares, nor cubes, nor perfect fourth powers is :
(a) 918990 (b) 998911
(c) 998910 (d) none of these

24 Kumar's family consists of a grandfather, 'm' sons and daughters and '$2n$' grand children. They are to be seated in a row for dinner. The grandchildren wish to occupy the n seats at each end and the grandfather refuses to have a grandchild on either side of him. In how many ways can the Kumar's family be made to sit?
(a) $(2n!)\,(m-1)!$
(b) $(2n!)\,(m!)\,(m-1)$
(c) $(2m!)\,(n!)$
(d) none of the above

25 Six *P*s have to be placed in the squares of the diagram given below such that each column contains at least one *P*. In how many ways this can be done?



(a) 26 (b) 13
(c) 8 (d) 24

26 A box contains two red, three green and four blue balls. In how many ways can three balls be drawn from the box if atleast one green ball is to be included in the draw?
(a) 23 (b) 64
(c) 46 (d) none of these

27 Ajay has 7 relatives, 3 men and 4 women. His wife Kajol also has 7 relatives, 3 women and 4 men. In how many ways can they invite 3 men and 3 women so that 3 of them are the Ajay's relatives and 3 his wife Kajol's?
(a) 485 (b) 458
(c) 365 (d) none of these

28 Serena and Venus were only two women participating in a chess tournament. Every participant played two games with every other participant. The number of games that men played between themselves proved to exceed by 66, compared to the number of games the men played with women. How many participants were there?
(a) 156 (b) 610 (c) 13 (d) 108

29 In the previous questions (no. 28) how many games were played?
(a) 208 (b) 156
(c) 316 (d) none of these

30 Six Burfis and six rasgullas are to be distributed among ten girls so that each girl receives at least one piece of sweets out of burfis and rasgullas. Find the number of ways in which the sweets can be distributed.
(a) 26250 (b) 22560
(c) 22330 (d) none of these

31 Mr. John has x children by his first wife and Ms. Bashu has $x + 1$ children by her first husband. They marry and have children of their own. The whole family has 10 children. Assuming that two children of the same parents do not fight, find the maximum number of fights that can take place among children.
(a) 33 (b) 22
(c) 111 (d) none of these

32 Find the number of natural numbers which are smaller than $2 \cdot 10^8$ and are divisible by 3 which can be written by means of the digits 0, 1 and 2.
(a) 7272 (b) 4373
(c) 3437 (d) none of these

33 Find the number of whole numbers formed on the screen of a calculator which can be recognised as numbers with (unique) correct digits when they are read inverted. The greatest number that can be formed on the screen of the calculator is 999999.
(a) 98970 (b) 89912 (c) 110050 (d) 100843

34 Find the number of ways of putting five distinct rings on four fingers of the left hand. (Ignore the difference of size of rings and the fingers)
(a) 1250 (b) 6720
(c) 5260 (d) none of these

35 If n distinct things are arranged in a circle, find the number of ways of selecting three of these things so that no two of them are next to each other.
(a) $n(n-2)(n-3)$ (b) $\frac{1}{6}n(n-4)(n-5)$
(c) $\frac{1}{3}(n^2+3n-5)$ (d) none of these

36 The number of different selections of 5 letters from 1*A*, 2 *B*'s, 3*C*'s, 4*D*'s and 5 *E*'s is :
(a) 71 (b) 41
(c) 117 (d) none of these

37 In the entrance test of Wharton Business School, the maximum marks for each of three papers is n and that for the fourth paper is $2n$. Find the number of ways in which a candidate can get $3n$ marks.
(a) $\frac{1}{6}(n+1)(n+2)$ (b) $\frac{1}{6}(n+1)(5n^2+10n+6)$
(c) $\frac{1}{2}(n^2+3n-6)$ (d) none of these

38 An examination consists of 4 papers. Each paper has a maximum of 'n' marks. Find the number of ways in which a students can get $2n$ marks in the examination.
(a) $\frac{1}{3}(n^2-5n+4)$ (b) $\frac{1}{3}(n+1)(2n^2+4n+3)$
(c) $\frac{1}{6}(n+1)(n+4)$ (d) none of these

39 Mark Shekhar Garg goes to a school to demonstrate how the kids can use the Facebook harmlessly and take the optimum advantage of socialization with fellow kids online at the early age of their social being. He tells the kids, after demonstrating the usage and safety features, that to make someone your facebook friend you have to send her/him a request and the other person has to accept it; as in out of two classmates *A* and *B* if first *A* sends request to *B* then *B* will accept it or if first *B* sends request to *A* then *A* will accept it and thus both *A* and *B* will become facebook friends.

As every kid responds to his instructions, within a minute Mark finds that every student in the class is now facebook friend of the other. In that class the number of female students is twice that of male students. He also notices that the number of friend-requests sent by the female kids is equal to the number of friend-requests sent by the male kids. Which of the following can be the number of friend-requests sent by female students to male students of that class?
(a) 42 (b) 99
(c) 105 (d) 120

40 A king calls 11 masseurs for his queen, as she wants the body massage from Monday to Friday, while on weekends she wants to go on the long trips with the king. She wants everyday a new masseur, so basically 5 masseurs are required. But a confidant of the king tells him that out of 11 masseurs 5 are familiar with the queen before her marriage and she used to get very close to them. But the king has no idea of these 5 people who are familiar with the queen. In spite of knowing this very odd fact he takes the risk of telling the masseurs that they can start giving massage to his lovely queen, as he doesn't want to make any fuss over it. However, he wants to identify the 5 masseurs who are close to the queen. Based on the queen's personal behaviour with him the wise king gets an idea that if in any week out of the 5 familiar masseurs any 3 masseurs give the massage to the beautiful queen he will certainly identify who all these 5 people familiar with the queen are. Minimum how many weeks are required to identify these 5 masseurs familiar with the queen?
(a) 3 (b) 4
(c) 5 (d) 7

41 There is a set of 10 integers {0, 1, 2, 3, ., 9}. In how many ways can you permute this set of integers such that either 3 and 6 or 5 and 4 or 6 and 5 appear consecutively?

(For example, we do not count (4, 5, 0, 6, 9, 2, 3, 7, 8, 1), as we want 5 and 4 to appear consecutively in that order. But we count (7, 2, 0, 1, 4, 3, 6, 5, 8, 9), both 3 and 6, and 6 and 5 appear consecutively in it.)
(a) 962640 (b) 960049
(c) 368460 (d) 313200

42 How many integer solutions are there to the equation $x_1 + x_2 + x_3 + x_4 = 30$, such that $3 \le x_1, x_2, x_3, x_4 \le 10$.
(a) 246 (b) 184
(c) 1084 (d) none of these

43 If ${}^{n-1}C_r = (k^2 - 3)\,{}^{n}C_{r+1}$, then $k \in R$
(a) $(-\alpha, -2]$ (b) $[2, \alpha)$
(c) $[-\sqrt{3}, \sqrt{3}]$ (d) $(\sqrt{3}, 2]$

44 A shopping mall in Kashipur, a meditative and idyllic town near Nainital, has three food courts – Chinese, Thai and Italian, situated on its rooftop. Each food court is designed in such a way that all the restaurants are situated in a circle. Chinese, Thai and Italian food courts have 20, 15 and 10 restaurants, respectively. Having the change (coins and paper currency in smaller denomination) is usually a terrible job due to digital payments and rush in the food courts, so restaurants try to avoid giving the change to each other. Still it is found that each restaurant gives the change to any other restaurant at most three times a day and if the restaurants belong to the same food court then each restaurant gives the change to other restaurant at most two times a day. However, any two adjoining restaurants do not give change to each other at all. On a certain day at most how many times the change can be given to each other among all the restaurants on the roof top?
(a) 3970 (b) 5080 (c) 4370 (d) 6750

45 Find the total number of quadratic polynomial $ax^2 + bx + c$, if a, b, c are some three positive distinct integers less than 2000, such that $(x + 1)$ is the factor of the quadratic polynomial $ax^2 + bx + c$.
(a) 19996002 (b) 1860004
(c) 19876004 (d) none of these

46 Find the number of isosceles triangles with integer sides, if no side exceeds 2014 unit.
(a) 2426980 (b) 402800
(c) 2028098 (d) 3120600

47 A five-digit number is called a mountain number if the first three digits increase and the last three digits decrease. For example, 35763 is a mountain number, but 35663 is not. How many five-digit numbers greater than 70,000 are mountain numbers?
(a) 69 (b) 36 (c) 63 (d) 96

48 If a triangle is inscribed in a regular decagon such that all the three vertices of the triangle are the vertices of the decagon, but none of the triangle's sides is the side of the decagon. How many such triangles can be formed?
(a) 40 (b) 50
(c) 60 (d) 70

49 A wise old woman calls upon all her 7 sons at her eleventh hour and hands them over the keys of a box in which she keeps all her precious jewelry. She tells them that she has locked the box with multiple locks so that the box can be opened only when majority of you are present with the keys I am giving to you. After giving each of her sons the keys of certain locks she takes her last breath. How many locks she uses to secure her jewelry and how many keys does she hand over to each of the seven sons?
(a) 35, 20 (b) 42, 21
(c) 28, 21 (d) 36, 18

50 An engineer in the urban planning department of IIM Kashipur, situated near Jim Corbett National Park in Uttarakhand, wants to connect all the 25 buildings (blocks) mutually. Each road connects only one pair of blocks. No single road connects more than 2 blocks. The roads are designed in such a way that one can reach from one block to any other block through a sequence of roads laid out at the campus. The number of roads (R) in the campus may satisfy the condition
(a) $25 \le R \le 625$ (b) $24 \le R \le 288$
(c) $24 \le R \le 300$ (d) $25 \le R \le 225$

Hints & Solutions

☑ Introductory Exercise 19.1

1 $${}^{9}P_3 = \frac{9!}{6!} \qquad \left(\because {}^{n}P_r = \frac{n!}{(n-r)!}\right)$$

$$= \frac{9\times 8\times 7\times 6!}{6!} = 9\times 8\times 7 = 504$$

2 $${}^{n}P_5 = 20\,.\,{}^{n}P_3$$

$$\Rightarrow \quad \frac{n!}{(n-5)!} = 20\,.\,\frac{n!}{(n-3)!} \Rightarrow \frac{(n-3)!}{(n-5)!} = 20$$

$$\Rightarrow \quad \frac{(n-3)(n-4)(n-5)!}{(n-5)!} = 20$$

$$\Rightarrow \quad (n-3)(n-4) = 20$$

$\Rightarrow n = 8$ ($n = -1$ is inadmissible)

Alternatively Go through options.

3 $$\frac{{}^{56}P_{r+6}}{{}^{54}P_{r+3}} = \frac{30800}{1}$$

$$\frac{\frac{56!}{(50-r)!}}{\frac{54!}{(51-r)!}} = \frac{30800}{1}$$

$$\Rightarrow \quad \frac{56\times 55\times (51-r)!}{(50-r)!} = \frac{30800}{1}$$

$$\Rightarrow \quad \frac{(51-r)!}{(50-r)!} = \frac{10}{1}$$

$$\Rightarrow \quad \frac{(51-r)\times(50-r)!}{(50-r)!} = \frac{10}{1} = 51-r = 10 \Rightarrow r = 41$$

Alternatively Go through options

4 Since there are 6 digits available and out of 6 digits we have to take only 3 digits for the arrangement. Therefore, required number of 3 digits numbers $= {}^{6}P_3 = \frac{6!}{3!} = 120$

Alternatively | 6 | 5 | 4 | $\Rightarrow 6\times 5\times 4 = 120$

We have 6 digits to fill up hundreds place and only 5 digits for tens place and only 4 digits for unit place since repetition is not allowed.

5 **Case 1.** There is only one even number of one digit.

Case 2. | 4 | 1 | $= 4\times 1 = 4$

There are only 4 even numbers of two digit
(Numbers are 38, 58, 78 and 98)

Case 3. | 4 | 3 | 1 | $\Rightarrow 4\times 3\times 1 = 12$

There are only 12 even numbers of 3 digit.

Case 4. | 4 | 3 | 2 | 1 | $\Rightarrow 4\times 3\times 2\times 1 = 24$

There are 24 even numbers of 4 digits
Thus there are total $1 + 4 + 12 + 24 = 41$ even numbers.

NOTE In each case 8 is fixed at unit place, since if the unit digit is an even digit then the whole number is an even number.

6 | 3 | 4 | 3 | 2 | $\Rightarrow 3\times 4\times 3\times 2 = 72$

Thousands place can assume only 3 values *viz.,* 5, 7, 8. Since required numbers are greater than 4000.

| 4 | 4 | 3 | 2 | 1 | $\Rightarrow 4\times 4\times 3\times 2\times 1 = 96$

Ten thousands place can assume all the remaining non-zero digits and thousands place can assume zero also except the digit which has been filled up at thousands place.
Therefore total required numbers
= number of 4 digit numbers + number of 5 digit numbers
$= 72 + 96 = 168$

7 | 4 | 4 | 3 | 2 | $\Rightarrow 4\times 4\times 3\times 2 = 96$

Thousands place cannot assume 3 since required numbers are greater than 5000.

| 5 | 4 | 3 | 2 | 1 | $\Rightarrow 5\times 4\times 3\times 2\times 1 = 120$

Total required numbers = 96 + 120 = 216

8 | 8 | 7 | 6 | 5 | $\Rightarrow 8\times 7\times 6\times 5 = 1680$

3 and 5 have been already used, so we have 8 digits for thousands place, then 7 digits for hundreds place, 6 digits for tens digit and remaining 5 digits for unit place.

Alternatively $${}^{8}P_4 = \frac{8!}{4!} = \frac{8\times 7\times 6\times 5\times 4!}{4!}$$

$$= 8\times 7\times 6\times 5 = 1680$$

9 A number is divisible by 5 only if its unit digit is either 5 or 0. So we fix 5 as unit digit and then we fill up the remaining places.

| 5 | 4 | 3 | 2 | 1 | $\Rightarrow 5\times 4\times 3\times 2\times 1\times 1 = 120$

Hence required number = 120

10 | 4 | 3 | 2 | 1 | $\Rightarrow 4\times 3\times 2\times 1 = 24$

There are total 24 numbers of 4 digit.
Since we have only 4 digits it means we use each of the digit 6 $\left(=\frac{24}{4}\right)$ times in each of the unit, tens hundreds and thousands place.

Therefore the sum of the digits in the units place

$$= 6(1 + 2 + 5 + 6) = 84$$

Similarly, the sum of the digits in each of tens, hundreds. and thousands places = 84

Hence the required sum of all the numbers

$$= 84 \times 1 + 84 \times 10 + 84 \times 100 + 84 \times 1000$$
$$= 84(1 + 10 + 100 + 1000)$$
$$= 84 \times 1111 = 93324$$

11 **Case 1.** | 3 | 3 | 1 | $\Rightarrow 3 \times 3 \times 1 = 9$

When 2 is fixed at unit place we have 3, 4 and 5 *i.e.*, 3 digits for hundreds place and remaining 3 digits (out of 5) for the tens place.

| 2 | 3 | 1 | $\Rightarrow 2 \times 3 \times 1 = 6$

When 4 is fixed at unit place, we have 3 and 5 *i.e.,* only two digits for hundreds place and remaining 3 digits for tens place.

Case 2. | 4 | 3 | 2 | 2 | = 48

4 digit numbers = 48

Case 3. | 4 | 3 | 2 | 1 | 2 | = 48

5 digit numbers = 48

Thus there are total $15 + 48 + 48 = 111$ even numbers greater than 300.

12 | 4 | 4 | 3 | = 48

Hundred's place cannot assume 0.

13 The number of permutations in which he can arrange all his 7 novels together $= 7! = 5040$

Hence choice (a) is the correct one.

14 The number of ways in which he can arrange any 4 novels

$$= {}^7P_4 = \frac{7!}{(7-4)!} = \frac{7!}{3!} = \frac{7 \times 6 \times 5 \times 4 \times 3 \times 2 \times 1}{3 \times 2 \times 1} = 840$$

Hence choice (d) is the correct one.

15 The number of ways in which he can arrange at most 4 novels

$$= {}^7P_1 + {}^7P_2 + {}^7P_3 + {}^7P_4$$
$$= 7 + 42 + 210 + 840 = 1099$$

Hence choice (b) is the correct one.

Hint Either he can arrange 1 novel or 2 novels or 3 novels or 4 novels. But he cannot arrange more than 4 novels.

16 The number of ways in which he can arrange at least 4 novels

$$= {}^7P_4 + {}^7P_5 + {}^7P_6 + {}^7P_7$$
$$= 840 + 2520 + 5040 + 5040 = 13440$$

Hence choice (a) is the correct one.

Hint Either he can arrange 4 novels or 5 novels or 6 novels or 7 novels. But he would not have to arrange less than 4 novels.

17 Number of permutations of 7 different novels taken 4 at a time, when the first novel is always there $= 4 \cdot ({}^6P_3) = 480$

Hence choice (b) is the correct one.

Hint Since one novel is always there in the shelf, so he has to take any 3 novels from the remaining 6 novels to arrange them. But the first novel, which is already there in the bookshelf, can be arranged in 4 ways, as there are four places available to arrange the first novel. X, Y and Z denote the other 3 novels.

$$_X_Y_Z_$$

18 Number of permutations of 7 different novels taken 4 at a time, when the last novel is never kept in the shelf $= {}^6P_4 = 360$

Hence choice (a) is the correct one.

Hint Since the last novel is not to be considered for the arrangements, so there are only 6 novels left from which any 4 novels will be considered for the arrangement.

19 Number of permutations of 7 different things taken 4 at a time, when 2 particular novels always occur

$$= ({}^4P_2)({}^5P_2) = 240$$

Hence choice (c) is the correct one.

Hint Since 2 novels are already selected, so only 2 novels has to be selected from remaining 5 novels. Now arrange the 2 novels that you have just selected. The remaining 3rd novel can be arranged in 3 ways and the 4th novel can be arranged in 4 ways. Therefore total number of arrangements $= 4 \times 3 \times ({}^5P_2)$. If you have any confusion, then solve this problem after studying the Combinations.

20 Number of permutations of n different novels taken 4 at a time, when 2 particular novels never occur $= {}^5P_4 = 120$

Hence choice (d) is the correct one.

21 Number of permutations of 7 different novels, taken all at a time, when 2 specified novels always come together is $2! \times (6!) = 1440$

Hence choice (d) is the correct one.

Hint Since 2 novels come together, then consider them as a single novel. Now there will be total 6 novels only, which can be arranged in 6! ways. But as the 2 novels can be mutually arranged in 2! ways, so the total number of arrangements $= 2! \times 6!$.

22 Number of permutations of 7 different novels, taken all at a time, when 2 specified novels never come together is $7! - [2!(6!)] = 7 \times (6!) - 2 \times (6!) = 6! \times 5 = 3600$

Hence choice (a) is the correct one.

Hint Number of permutations when 2 novels never come together = Total number of permutations – Number of permutations when the 2 specified novels are always together.

23 There are 7 letters in the word RAINBOW and each letter is used only once. So all the 7 letters can be arranged in $7!$ ways.

$$7! = 7 \times 6 \times 5 \times 4 \times 3 \times 2 \times 1 = 5040.$$

24 If we fix R as the initial letter, then we have to arrange only 6 remaining letters.

Hence required number of permutations $= 6!$

$$= 6 \times 5 \times 4 \times 3 \times 2 \times 1 = 720$$

25 If we fix R and W as the first and last letters then we have to arrange only 5 remaining letters which can be arranged in $5! = 120$ ways.

26 When R and W are the first and last letters of all the words then we can arrange them in 5! ways. Similarly when W and R are the first and last letters of the words then the remaining letters can be arrange in 5! ways.
Thus the total number of permutations $= 2 \times 5!$
$= 2 \times 120 = 240$

Alternatively Except R and W all the remaining 5 letters can be arranged in 5! ways and R and W can be arranged in 2! ways at the end positions.
Thus total number of permutations
$= 2! \times 5! = 2 \times 120 = 240$

27 The first and last letters can be arranged in ${}^3P_2$ ways and the remaining letters can be arranged in 5! ways.
Hence required number of permutations
$= {}^3P_2 \times 5! = 6 \times 120 = 720$

28 Assume R and W as a single letter, then we have only 6 letters for the arrangement.
That is A, B, I, N, O, RW, which can be arranged in 6! ways.
Now, R and W can also be mutually arranged in 2! ways.
Therefore, total number of arrangements $= 2! \times 6! = 1440$.

29 Total number of words $= 7! = 5040$
Number of words in which R and W are always together $= 1440$
Number of words in which R and W are never together $= 5040 - 1440 = 3600$.
Hence choice (a) is the correct one.

30 There are three vowels *viz.,* A, I and O
First of all arrange all the four consonants which can be done in 4! ways. Now we have 5 places available for the three vowels to be filled up, which can be done in ${}^5P_3$ ways.
Thus the total number of arrangements $= 4! \times {}^5P_3 = 24 \times \dfrac{5!}{2!}$
$= 24 \times 60 = 1440$

31 First of all we arrange all the 4 consonants in 4! ways.
Now we have 5 places for the 3 vowels as

1	C_1	2	C_2	3	C_3	4	C_4	5

1. When all the three vowels AIO are together then 5 places can be filled in 5 ways.
2. When A and I are together and O is separated from "AI" then the 5 places can be filled up in 10 ways.
3. When I and O are together and A is separated from "IO" then the 5 places can be filled up in 10 ways.
4. When A, I and O are separated from each other then the 5 places can be filled up in 10 ways.

Thus there are total $5 + 10 + 10 + 10 = 35$ ways in which 5 places can be filled up such that A is before I and I is before O.
Hence total number of ways in which all the 7 letters of RAINBOW can be arranged in which A is before I and I is before $O = 4! \times 35 = 24 \times 35 = 840$.

Alternatively All the 7 letters of the word RAINBOW can be arranged in 7! ways and 3 particular letters (A,I,O) can be arranged in 3! ways.
But the given condition is satisfied by only 1 out of 6 ways.
Hence required number of arrangements
$= \dfrac{7!}{3!} = 7 \times 6 \times 5 \times 4 = 840$

32 Let all the vowels be in a single packet and all the consonants be in the other packet.
Now all the vowels can be arranged in 3! ways and all the consonants can be arranged in 4! ways.
Hence total number of arrangements
$= 3! \times 4! = 6 \times 24 = 144$

33 First arrange the 3 vowels which can be done in 3! ways.
Now there are 4 places created by the 3 vowels which can be filled up by 4 consonants in ${}^4P_4$ ways.
Therefore total number of required permutations
$= 3! \times {}^4P_4 = 6 \times 24 = 144$

34 1 $\underline{2}$ 3 $\underline{4}$ 5 $\underline{6}$ 7
In order that vowels may occupy even places arrange all the 3 vowels, then arrange all the four consonants in four places.
Thus the required number of arrangements $= 3! \times 4! = 144$

35 $\underline{1}$ 2 $\underline{3}$ 4 $\underline{5}$ 6 $\underline{7}$
First of all arrange any 3 consonants at even places in ${}^4P_3$ ways. Now the newly created four odd places can be filled by the remaining letters which includes 3 vowels and 1 consonants, which can be done in ${}^4P_4$ ways. Hence the required number of permutation
$= {}^4P_3 \times {}^4P_4 = 24 \times 24 = 576$

36 First of all arrange all the four consonants *R, N, B, W* in 4! ways.
Then there are 5 places to be filled up by the vowels. But any two vowels are always together then we assume that there are only two vowels which can be filled in 5 places in ${}^5P_2$ ways. But we have to take any two vowels together out of 3 vowels then this can be done in ${}^3P_2$ ways.
Hence the total number of permutation $= {}^5P_2 \times {}^3P_2 \times 4!$
$= 20 \times 6 \times 24$
$= 2880$

Alternatively Since there can be only 3 cases
(i) When *A, I* and *O* are separate from each other
(ii) When *A, I* and *O* can always together
(iii) When any two vowels out of three vowels *A, I* and *O* are together.
Now we need to calculate the value of Case (iii).
$\therefore$ Required number of permutations
= Total number of permutations – [Case (i) + Case (ii)]
$\therefore \quad 7! - (1440 + 720) = 5040 - (2160) = 2880$

37 The correct order of the letters is as follows :

A, B, I, N, O, R, W

Number of words begin with $A = 6!$

Number of words begin with $B = 6!$

Number of words begin with $I = 6!$

Number of words begin with $N = 6!$

Number of words begin with $O = 6!$

Number of words begin with $RAB = 4!$

Number of words begin with $RAIB = 3!$

Now the next word is RAINBOW (it is the first word which begins with RAIN)

So the ranking of the word RAINBOW

$$= 5\times 6! + 4! + 3! + 1 = 3631$$

38 There are 5 consonants and 2 vowels in the word STRANGE out of 7 places for the 7 letters, 4 places are odd and 3 places are even.

2 vowels can be arranged in 4 odd places in ${}^4P_2$ ways and then 5 consonants can be arranged in the remaining 5 places in ${}^5P_5$ ways.

Hence, the required number of ways $= {}^4P_2 \times {}^5P_5 = 1440$

39 $_\ \frac{2}{1}\ _\ \frac{4}{3}\ _\ \frac{6}{5}$

First of all arrange 3 vowels at 3 even places, which can be done 3! ways. Again arrange the 3 consonants at 3 odd places which can be done in 3! ways.

Hence required number of permutations $= 3!\times 3! = 36$ ways

Alternatively

3	3	2	2	1	1	= 36 ways

Assume vowels are even numbers say 2, 4, 6 and consonants are odd numbers say 1, 3, 5.

Now, if we have to form the numbers in which odd integers always occupy odd places then this can be done as above. (*O, E, O, E, O, E*)

40 At least two consonants remain together means

(i) Any two consonants are together

(ii) All the three consonants are together

which implies that all of the consonants are not separated from each other.

Hence required number of permutations

= (Total number of permutations

– number of permutations when all of the vowels are separated from each other)

$= 6! - (3!\times {}^4P_3) = 720 - 144 = 576$

41 Since neither two men nor two women sit together, it means they sit on the alternate positions.

M	W	M	W	M	W	M	W	M

Therefore first of all we arrange 4 women in 4! ways then we arrange 5 men in newly created 5 places in ${}^5P_5 = 5!$ ways. Thus the total number of arrangements $= 4!\times 5! = 2880.$

42 Since no two men can sit together, it means there must be 4 women separating all the 5 men. So, first of all let the 4 women sit in a row, then allow the 5 men to sit in such a way so that no two men sit together.

Essentially, this is the same problem as the previous one.

Therefore the required number of permutations

$$= 4!\times 5! = 2880.$$

43 Since no two women can sit together, it means there must be at least 3 men separating all the 4 women. But since men are more than 3, so let them sit before the women take their places. When men sit at 5 places (in 5! ways), there will be 6 places available for 4 women.

Therefore number of required permutations

$$= 5!\times {}^6P_4 = 43200.$$

44 Total number of persons = 9

So they can be arranged, without any restriction, in 9! ways.

But when all the four women sit together, consider them as one unit, then the number of ways in which they can be arranged $= (5+1)!\times 4! = 6!\times 4!$

Therefore the required number of ways in which all the four women do not sit together

$= 9! - (6!\times 4!) = 9\times 8\times 7\times (6!) - (6!\times 4!)$

$= 6!(7\times 8\times 9 - 4\times 3\times 2\times 1)$

$= 345600.$

45 There are total 9 places out of which 4 are even and rest 5 places are odd.

4 women can be arranged at 4 even places in 4! ways.

and 5 men can be placed in remaining 5 places in ${}^5P_5$ ways.

Hence, the required number of permutations

$$= 4!\times {}^5P_5 = 24\times 120 = 2880$$

46 First of all the 6 men can be arranged in 6! ways then the 3 women can be arranged in 7 places in ${}^7P_3$ ways.

Therefore the required number of arrangements

$$= 6!\times {}^7P_3 = 720\times 210 = 151200.$$

47 There are two cases : In the first case a man is sitting at the first chair and in the second case a woman is sitting at the first chair.

M	W	M	W	M	W	M	W
1	2	3	4	5	6	7	8
W	M	W	M	W	M	W	M

First case first chair can be occupied by any 1 of the 4 men, third chair can be occupied by 1 of the remaining 3 men, fifth chair can be occupied by the 1 of the remaining 2 men and the seventh chair can be occupied by the last man. Thus chair numbers 1, 3, 5 are 7 can be occupied by the 4 men in 4! ways. Similarly the remaining chairs can be occupied by the 4 women in 4! ways. Thus all the 8 people

can be seated in $4!\times 4!$ ways.

Second case in this case also, all the 8 people can be arranged in $4!\times 4!$ ways. Therefore total number of required ways $= 4!\times 4! + 4!\times 4! = 2(4!\times 4!) = 1152$

48 12 soldiers can stand in a queue in 12! ways.

49 Any 6 soldiers can stand in one queue and the remaining 6 soldiers can stand in another queue. And then the two queues can be mutually arranged.

Therefore the required number of arrangements

$$= {}^{12}P_4 \times {}^{6}P_6 \times 2! = {}^{12}P_6 \times 6! \times 2!$$

50 The required number of arrangements

$$= {}^{12}P_4 \times {}^{8}P_4 \times {}^{4}P_4 \times 3!$$

51 The required number of ways $= {}^{12}P_3 \times {}^{9}P_4 \times {}^{5}P_5 \times 3!$.

52 Assume that the 3 soldiers constitute only one soldier. So there are now $12 - 3 + 1 = 10$ soldiers. Thus 10 soldiers can be arranged in 10! ways. And the 3 soldiers can be mutually arranged in 3! ways. Therefore the required number of ways

$$= 10!\times 3! = 21772800.$$

53 Required number of ways $= 12! - (11!\times 2!)$

$$= 11!\times(12-2)$$
$$= 11!\times 10 = 399168000$$

54 Total number of permutations = 12!

Number of permutations when three particulars books are together $= 10!\times 3!$

$\therefore$ Number of permutations when three particular books are not together $= 12! - 10!\times 3!$

$$= 10!(12\times 11 - 6) = 10!\times 126 = 457228800$$

NOTE In this question out of the 3 particular books any 2 particular books can be together but all of the 3 particular books cannot be together.

55 First of all arrange the remaining 9 books in 9! ways. Then there will be 10 new places on the either side of these books where the 3 books can be arranged in ${}^{10}P_3 = 720$ ways.

Therefore the total number of ways in which none of the 3 particular books is together $= 9!\times 720 = 261273600$.

56 All the 3 books on Physics can be mutually arranged in 3! ways.

Similarly, 4 books on Chemistry can be mutually arranged in 4! ways.

And 5 books on Biology can be arranged in 5! ways.

Besides, the three sets of Physics, Chemistry and Biology can be mutually arranged in 3! ways.

Therefore, required number of permutations

$$= 3!\times(3!\times 4!\times 5!) = 103680.$$

57 The signals can be made by using at a time one or two or three or four or five or six flags out of 6 different coloured flags.

$\therefore$ Required number of flags

$$= {}^{6}P_1 + {}^{6}P_2 + {}^{6}P_3 + {}^{6}P_4 + {}^{6}P_5 + {}^{6}P_6$$
$$= 6 + 30 + 120 + 360 + 720 + 720 = 1956$$

58 Required number of signals $= {}^{6}P_3 = 120$.

59 Required number of permutations $= {}^{10}P_3 = 720$

Alternatively First prize can be given to any of the 10 students and second prize can be given to any one of the remaining 9 students and the third prize can be given to any one of the remaining 8 students.

Therefore it can be done in

$${}^{10}P_1 \times {}^{9}P_1 \times {}^{8}P_1 = 10\times 9\times 8 = 720 \text{ ways.}$$

60 A passanger from any station may purchase ticket for anyone of the other 9 stations. Therefore, there must be 9 tickets in each station.

Therefore total number of different tickets $= 9\times 10 = 90$

61 Since we cannot wear more than one ring in any finger means repetition is not allowed.

Hence, the first ring can be worn in any of the available 4 fingers in 4 ways and second ring can be worn in any of the remaining 3 fingers in 3 ways and third ring can be worn in any of the remaining 2 fingers in 2 ways.

So the required number of ways in which all the 3 rings can be worn in 4 fingers $= 4\times 3\times 2 = 24$.

Alternatively We have 4 places to be filled up by 3 different things (*i.e.,* rings), which can be done in ${}^{4}P_3$ ways.

$${}^{4}P_3 = 24$$

☑ Introductory Exercise 19.2

1 In the given word there are 6 letters of which *E* occurs 2 times.

Hence the required number of ways $= \dfrac{6!}{2!}$

$$= \frac{6\times 5\times 4\times 3\times 2\times 1}{2} = 360$$

2 There are total 7 letters of which *A* occurs 3 times and *N* occurs 2 times.

Hence, the required number of ways $= \dfrac{7!}{3!.\ 2!} = 420$

3 There are total 10 letters of which *R* occurs 2 times, *E* occurs 3 times.

Hence the required number of ways $= \dfrac{10!}{2!.\ 3!} = 302400$

4 Required number of permutations $= \dfrac{13!}{3!.\ 4!.\ 2!.\ 2!}$

$$= 10810800$$

5 There are 6 different letters in the word which are *A, S, I, N, T, O*.

The number of arrangements of 6 different letters taken 4 at a time = ${}^6P_4 = 360$

6 There are total 9 letters in the word COMMITTEE in which there are 2*M*'s, 2*T*'s, 2*E*'s.

∴ The number of ways in which 9 letters can be arranged

$$= \frac{9!}{2! \times 2! \times 2!} = 45360$$

There are 4 vowels *O, I, E, E* in the given word. If the four vowels always come together, taking them as one letter we have to arrange 5 +1 = 6 letters which include 2Ms and 2Ts and this be done in $\frac{6!}{2! \times 2!} = 180$ ways.

In which of 180 ways, the 4 vowels *O, I, E, E* remaining together can be arranged in $\frac{4!}{2!} = 12$ ways.

∴ The number of ways in which the four vowels always come together = $180 \times 12 = 2160$.

Hence, the required number of ways in which the four vowels do not come together = 45360 – 2160 = 43200

7 Consonants : C, M, M, T, T Vowels : O, I, E, E

Total number of consonants = 5

Number of ways of arranging 5 consonants = $\frac{5!}{2!2!} = 30$

Total number of places created for vowels = 6

Number of ways of arranging 4 consonants in 6 places = ${}^6P_4 = 360$

But since two vowels are same, so the 4 vowels can be arranged in 360 / 2 = 180 ways

Therefore the required number of ways = $30 \times 180 = 5400$

8 $\frac{14!}{4! \times 2! \times 2! \times 2! \times 2!} = 113513400$

9 When *L* and *T* are fixed as first and last letters of the word, then we have only 6 letters to be arranged.

Hence required number of permutations = $\frac{6!}{2! \times 2! \times 2!} = 90$

10 $\underbrace{M, M, T, T, H, C, S}_{7}\ \underbrace{A, A, E, I}_{4}$

When all the vowels are together then $n = 7 + 1 = 8$

∴ Required number of permutations = $\frac{8! \times 4!}{2! \times 2! \times 2!} = 120960$

Hint (*M, T* and *A* occur 2 times and *A A E I* can be arranged mutually in $\frac{4!}{2!}$ ways)

11 *I,M,P,O,R,T,A,N,T*

Total number of permutations = $\frac{9!}{2!} = 181440$

Number of permutations when 2*T*'s are together

$$= \frac{8! \times 2!}{2!} = 8! = 40320$$

∴ Number of permutations when 2*T*'s are not together

$$= 181440 - 40320 = 141120$$

12 *T,T,T, N,N,N, G,G,G, R, I,I,I*

There are total 13 leters of which 3 are *T*'s, 3 are *N*'s, 3 are *G*'s, 3 are *I*'s.

Also there are 6 even places and 7 odd places. *3Is* (*i.e.,* vowels) can be arranged in the 6 even places in $\frac{{}^6P_3}{3!} = 20$ ways.

Now, we are left with 10 places in which 10 letters can be filled up in $\frac{10!}{3! \times 3! \times 3!} = 16800$

∴ The total number of permutations in which vowels occupy even places = $20 \times 16800 = 336000$

13 Correct order of the letters in *D, G, I, I, O, O, P, R, S, U*

Word begin with	**Number of words**
D	$\frac{9!}{2!\,2!}$
G	$\frac{9!}{2!\,2!}$
I	$\frac{9!}{2!}$

Word begin with	**Number of words**
O	$\frac{9!}{2!}$
PD	$\frac{8!}{2!\,2!}$
PG	$\frac{8!}{2!\,2!}$
PI	$\frac{8!}{2!}$
PO	$\frac{8!}{2!}$
PRD	$\frac{7!}{2!\,2!}$
PRG	$\frac{7!}{2!\,2!}$
PRI	$\frac{7!}{2!}$
PRODG	$\frac{5!}{2!}$

Now the next two words are

PRODIGIOSU and PRODIGIOUS

Hence the rank of the word PRODIGIOUS

$$= 2\left(\frac{9!}{2!\,2!}\right) + 2\left(\frac{9!}{2!}\right) + 2\left(\frac{8!}{2!\,2!}\right) + 2\left(\frac{8!}{2!}\right) + 2\left(\frac{7!}{2!\,2!}\right) + \frac{7!}{2!} + \frac{5!}{2!} + 2$$

$$= 3\left(\frac{9!}{2!}\right) + 3\left(\frac{8!}{2!}\right) + 7! + \frac{5!}{2!} + 2$$

$$= 544320 + 60480 + 5040 + 60 + 2$$

$$= 609902$$

14 The correct order of letters is D, E, E, E, E, Q, R, S, S, T, U.

Number of words begin with DEEEEQR $= \frac{4!}{2!} = 12$

Number of words begin with DEEEEQS $= 4! = 24$

Number of words begin with DEEEEQT $= \frac{4!}{2!} = 12$

Now, the next two words are
DEEEEQURSST and DEEEEQURSTS.
Hence the 50^{th} word is DEEEEQURSTS.

15 There are 7 digits 1, 2, 0, 2, 4, 2, 4 in which 2 occurs 3 times, 4 occurs 2 times.

$\therefore$ Number of 7 digit numbers $= \frac{7!}{3! \times 2!} = 420$

But out of these 420 numbers there are some numbers which begin with '0' and they are not 7-digit numbers. The number of such numbers beginning with '0'.

$$= \frac{6!}{3! \times 2!} = 60$$

Hence the required number of 7 digits numbers

$$= 420 - 60 = 360$$

Alternatively

6	6	5	4	3	2	1	$\Rightarrow 6.(6!)$

Since the left most place can assume only non-zero digit hence it can consider only 6 digits. Now the remaining 6 places can be filled up in normal ways.

But since 2 occurs 3 times, 4 occurs 2 times, therefore required number of 7 digit numbers $= \frac{6.(6!)}{3!.\,2!} = 360$

16 Required number of 6 digit numbers $= \frac{6!}{4!.\,2!} = 15$

17

5	4	3	2	1	3	$\Rightarrow 3.(5!)$

Unit place can assume any of the three even digits *viz.*, 2 ,4 ,6 and rest of the places can be filled up in 5! ways.
But since digit 7 occurs 2 times.

$\therefore$ Required number of numbers $= \frac{3.(5!)}{2!} = 180$

18

6	6	5	4	3	2	1

Since left most place can assume only non-zero digit and rest can assume all the given digits.
Therefore the number of numbers $= 6.(6!)$
But since 5 occurs 2 times and 2 occurs 2 times
Hence the required number of numbers $= \frac{6\,(6!)}{2!.\,2!}$

$$= 1080$$

19 *R E G U I T A*
R E G T
There are total 11 letters, but since 2*T* 's are together.
Therefore number of numbers when 2*T* 's are together

$$= \frac{10!}{2! \times 2! \times 2!} \times \frac{2!}{2!} = 453600$$

$\uparrow$ $\uparrow$ $\uparrow$ $\uparrow$
R E G T

Here *R* is 2 times, *E* is 2 times, *G* is 2 times and *T* is 2 times.

20 *S U M P T O*
S U
Number of ways in which 2*U*'s are always together is

$$\frac{7!}{2!} \times \frac{2!}{2!} = 2520$$

Total number of permutations $= \frac{8!}{2!.\,2!} = 10080$

$\therefore$ Number of ways in which 2*U*'s are not together

$$= 10080 - 2520 = 7560$$

21 *A F L T O N*
A O
There are 4 consonants *F, L, T* and *N* and 4 vowels *A, A, O, O*
4 vowels can be arranged in $\frac{4!}{2!.\,2!} = 6$ ways.

Now the 4 consonants can be arranged in 4 places in 4!

$$= 24 \text{ ways.}$$

Therefore required number of permutations

$$= (6 \times 24) \times 2! = 288$$

Hint There are two cases :
(i) *OCOCOCOC* (ii) *COCOCOCO*
where $O \rightarrow$ vowel, $C \rightarrow$ consonant)

22 *S O T H A Y E R*
S O
Since two *S's* and two *O's* together therefore we can consider there are only 8 letters, which can be permuted in $\frac{8! \times 2! \times 2!}{2! \times 2!} = 8! = 40320$ ways

23 Total number of books $= 3 \times 4 = 12$ in which each of 4 different books is repeated 3 times.
Hence the required number of permutations

$$= \frac{12!}{3! \times 3! \times 3! \times 3!} = \frac{12!}{(3!)^4} = 369600$$

24 There are total $3 + 4 + 5 = 12$ marbles of which 3 are red (alike), 4 are green (alike) and 3 are pink (alike).

$\therefore$ The required number of arrangements $= \frac{12!}{3! \times 4! \times 5!}$

$$= 27720$$

25 Total number of ways of arranging the 12 umbrellas

$$= \frac{12!}{3!4!5!}$$

Number of ways of arranging 12 umbrellas when the umbrellas of the same colour are together = 3!
Therefore the required number of ways

$$= \frac{12!}{3!4!5!} - 3! = 27714$$

☑ Introductory Exercise 19.3

1 Ten thousands place can assume only non-zero digits hence ten thousands place can be filled up in 4 ways and thousands place can be filled up in 5 ways since repetition is allowed (and 0 can be filled up in this place). Similarly hundreds, tens and unit places can be filled up in 5 ways each.

$\therefore$ The required number of numbers $= 4 \times 5 \times 5 \times 5 \times 5$

$= 2500$

2 The numbers lying between 9 and 1000 consist of 2 or 3 digits in which repetitions are allowed.

Case 1. (For two digit numbers)
As the tens place can be filled by only non-zero digits and unit digit can be filled up in 6 ways.

$\therefore$ The number of 2 digit numbers $= 5 \times 6 = 30$

Case 2. (For three digit numbers)
Hundreds place can be filled up by only non-zero digits hence it can be done in 5 ways and the rest of the places *i.e.,* tens and unit places can be filled up in 6 ways each.

$\therefore$ The number of 3 digit numbers $= 5 \times 6 \times 6 = 180$

$\therefore$ Total number of numbers $= 30 + 180 = 210$

3 Since even digit may not occupy an even place therefore even places can be filled up in only 3 ways (with odd digits) and rest of the 3 odd places can be filled up in 5 ways with all the 5 digits.
Therefore the required number of numbers

$=$ | 5 | 3 | 5 | 3 | 5 |

$= 5 \times 3 \times 5 \times 3 \times 5 = 1125$

4 Number of numbers of 4 digit in which repetition allowed $= 9 \times 10 \times 10 \times 10 = 9000$
Number of numbers of 4 digit in which repetitions is not allowed $= 9 \times 9 \times 8 \times 7 = 4536$
Hence the required number of numbers of 4 digit

$= 9000 - 4536 = 4464$

5 Total number of 3 digit numbers $= 9 \times 10 \times 10 = 900$
Number of 3 digit numbers in which none of the digits is 9

$= 8 \times 9 \times 9 = 648$

$\therefore$ Number of 3 digit numbers in which there is atleast one digit is $9 = 900 - 648 = 252$

6 Total one digit numbers $= 4$
Total 2 digit numbers $= 4 \times 4 = 16$
Total 3 digit numbers $= 4 \times 4 \times 4 = 64$
Number of 4 digit numbers beginning with
$1 = 4 \times 4 \times 4 = 64$
Number of 4 digit numbers beginning with
$2 = 4 \times 4 \times 4 = 64$
Number of 4 digit numbers beginning with
$3 = 4 \times 4 \times 4 = 64$
Number of 4 digit numbers beginning with $41 = 4 \times 4 = 16$
Number of 4 digit numbers beginning with $42 = 4 \times 4 = 16$
Number of 4 digit numbers beginning with $431 = 4$
Number of 4 digit numbers beginning with $432 = 1$
Total number of 4 digit numbers

$= 64 + 64 + 64 + 16 + 16 + 4 + 1 = 229$

Hence the total number of natural numbers not exceeding 4321 is $4 + 16 + 64 + 229 = 313$

7 First ring can be worn in any of the 3 fingers similarly second, third and fourth ring can be worn in any of the three fingers.

$\therefore$ 4 rings can be worn in $3 \times 3 \times 3 \times 3 = 81$ ways.

8 First prize can be given away to 4 boys in 4 ways.
Similarly second, third, fourth and fifth prizes can also be given away to four boys in 4 ways.
Hence the required number of ways in which all the 5 prizes can be given away to 4 boys

$= 4 \times 4 \times 4 \times 4 \times 4 = 1024$

9 The first ball can be placed in any one of the n cells in n ways. The second ball can also be placed in any one of the n cells in n ways.
$\therefore$ The first and second balls can be placed in n cells in $n \times n$ *i.e.,* n^2 ways.
Similarly each of the rest balls can be placed in n ways.
Hence the required number of ways $= n \times n \times \ldots \times n$ times

$= n^n$

10 Since each cell is to be occupied, 1 ball is to be placed in one cell. First ball can be placed in any one of the n cells in n ways, 2^{nd} ball can be placed in any one of the remaining $(n-1)$ cells in $(n-1)$ ways, similarly 3^{rd}, 4^{th} ... ball can be arranged in $(n-2), (n-3)\ldots$ ways.
Hence the required number of ways

$= n\,(n-1)(n-2)\ldots.\,2.\,1 = n!$

11 First letter can be posted in 4 letter boxes in 4 ways.
Similarly second letter can be posted in 4 letter boxes in 4 ways and so on.
Hence all the 5 letters can be posted in

$= 4 \times 4 \times 4 \times 4 \times 4 = 1024$

☑ Introductory Exercise 19.4

1 Required number of permutations = $5! = 120$

2 Assume there are only 5 boys since two boys always remain together and these two boys can be arranged mutually in 2 ways.

$\therefore$ Required number of permutations = $4! \times 2 = 48$

3 Required number of permutations = $\frac{1}{2} \times 5! = 60$

(Since there is no difference in clockwise and anticlockwise arrangements)

4 Total number of arrangements = $6! = 720$

Number of arrangements in which two ladies are together = $2 \times 5! = 240$

$\therefore$ Number of arrangements in which two ladies are never together = $720 - 240 = 480$

Alternatively First of all place the five men in 4! ways, then place the two ladies in any 5 spaces in ${}^5P_2$ ways.

Hence, the required number of ways = $4! \times {}^5P_2 = 480$

5 Assuming Sahara, Ambani and Mahindra as a single personality, then there are total $(10 - 3) + 1 = 8$ person, which can be arranged in 7! ways.

Also Sahara and Mahindra can be mutually permuted in 2 ways. Therefore required number of arrangements = $2 \times 7! = 10080$

6 A person can be chosen out of 18 people in 18 ways to be seated between Musharraf and Manmohan. Now consider Musharraf, Manmohan and the third person, sitting between them, as a single personality, we can arrange them in 17! ways but Musharraf and Manmohan can also be arranged in 2 ways.

$\therefore$ Required number of permutations = $18 \times (17!) \times 2$

$= 2 \times 18!$

7 6 Men can be arranged in 5! ways then 6 women can be arranged in 6 places in 6! ways.

Hence the required number of ways = $5! \times 6!$

$= 120 \times 720 = 86400$

8 First of all 4 girls can be arranged in 3! ways then 3 boys can be seated in 4 places in ${}^4P_3$ ways.

$\therefore$ Required number of arrangements = $3! \times {}^4P_3$

$= 6 \times 24 = 144$

9 Clearly 7 sisters can sit around a table in 6! ways. But in clockwise and anticlockwise arrangements each of the ladies have the same neighbours.

So, the required number of ways = $\frac{1}{2} \times (6!) = 360$

Hence they dine together only 360 days.

10 Since 3 particulars flowers are together

Hence there can be total $(10 - 3) + 1 = 8$ flowers.

These 8 flowers can be arranged 7! ways but the 3 flowers which are together can be arranged mutually in 3! ways.

Hence, the required number of ways = $3! \times 7! = 6 \times 5040$

$= 30240$

11 Sonu can have only male singer as his neighbours which can be mutually arranged in 2! ways.

Similarly Alka can have only female singers as her neighbours which can be arranged in 2! ways.

Hence the required number of arrangements = $2! \times 2! = 4$

12 Let H_1, H_2, H_3 be the respective husbands of W_1, W_2, W_3.

As they sit in a circular arrangement, so the total number of ways in which they can sit around the table without any restriction = $5! = 120$

Now, we have to subtract all such cases in which the couple sits on the opposite chairs.

Case I When exactly one couple sits on opposite chairs.

Let us consider H_1 sits opposite W_1. So, H_2 can sit on any of the 4 chairs in 4 ways and then W_2 can sit on any of the 2 chairs in 2 ways. After that H_3 can sit on any of the 2 chairs in 2 ways and W_3 can sit on the remaining chair in 1 way. Therefore when a couple $H_1 - W_1$ sits opposite all others can be arranged in $4 \times 2 \times 2 = 16$ ways. But, since there are three couples, so any one couple can be selected in 3 ways.

Therefore, the total number of ways in which a couple sits on opposite chairs = $3 \times 16 = 48$ ways.

Case II When 2 couples sit on opposite chairs.

When two couples sit on opposite chairs, the third couple will naturally be sitting on opposite chairs. So there are 0 ways in which 2 couples sit on opposite chairs.

Case III When all three couples sit on opposite chairs.

Arrange H_1 and W_1 opposite each other, which can be done in 1 way. Now H_2 can be arranged on any 4 chairs and W_2 can be arranged in 1 way as she has to sit opposite her husband. And then H_3can sit in 2 ways and her wife W_3 can sit in 1 way. Therefore the number of ways in which all the three couples sit opposite = $1 \times 4 \times 1 \times 2 \times 1 = 8$ ways

Therefore the required number of ways in which no couple sits opposite each other = $120 - (48 + 0 + 8) = 64$

13 First of all arrange the six students with the higher ranks (1, 2, 3, 4, 5 and 6). Now, arrange the remaining students (of lower ranks 7, 8, 9, 10, 11 and 12) between them.

The number of ways in which first 6 candidates can be arranged in 5!ways and the remaining 6 candidates can be arranged in 6! ways.

Therefore the required number of ways = $5! \times 6! = 86400$

14 First of all 10 girls can be given 10 alternate rooms in 10!ways, as rooms are distinguishable. Now 10 guys can be given 10 alternate rooms in 10! ways. However, girls and guys can exchange their rooms in 2 ways.

Therefore the required number of ways = $2! \times (10!)^2$

☑ Introductory Exercise 19.5

1 $^{8}C_3 = \dfrac{8!}{3!\,5!} = \dfrac{8\times7\times6}{6} = 56$

2 $^{10}C_5 = \dfrac{10\times9\times8\times7\times6\times5!}{5\times4\times3\times2\times1\times(5!)} = 252$

3 $\because \quad {}^{13}C_x = {}^{13}C_y$

$\Rightarrow$ either $x = y$ or $x + y = 13$

But since $x \neq y$, therefore $x + y = 13$

4 Since $^{17}C_r = {}^{17}C_{r+3}$

$\Rightarrow$ either $r = r + 3$ or $r + r + 3 = 17$

But since $r \neq r + 3$

$\therefore \quad r + r + 3 = 17 \Rightarrow r = 7$

5 $^{7}P_3 = n\cdot{}^{7}C_3$

$\Rightarrow \quad 5\times6\times7 = n\times5\times7 \Rightarrow n = 6$

Alternatively $^{n}P_r = r!\,(^{n}C_r)$

$\Rightarrow \quad r! = 3! = 6 = n$

6 $^{2n}C_3 : {}^{n}C_2 = 12:1$

$\Rightarrow \quad \dfrac{2n\,(2n-1)\,(2n-2)}{3\times2\times1} : \dfrac{n\,(n-1)}{2\times1} = 12:1$

$\Rightarrow \quad (2n-1) = 9$

$\Rightarrow \quad n = 5$

Alternatively Go through options.

7 **Go through options** : The least possible value of n is 8. To verify the result put the vlaue of n as given in the choices.

Let us consider choice (a) *i.e.,* $n = 6$, then

$$^{5}C_3 + {}^{5}C_4 > {}^{6}C_3$$

$10 + 5 > 20$, which is wrong.

Again consider choice (c) *i.e.,* $n = 7$, then

$$^{6}C_3 + {}^{6}C_4 > {}^{7}C_3$$

$20 + 15 > 35$, which is also wrong.

Now consider choice (b) *i.e.,* $n = 8$, then

$$^{7}C_3 + {}^{7}C_4 > {}^{8}C_3$$

$35 + 35 > 56$, which is correct.

Hence the least possible value of $n = 8$.

Now you need not to check the option (d).

8 $\dfrac{^{n}P_x}{^{n}C_x} = \dfrac{\dfrac{(n!)}{(n-x)!}}{\dfrac{(n!)}{(x!)\,(n-x)!}} = \dfrac{336}{56}$

$\Rightarrow \quad \dfrac{^{n}P_x}{^{n}C_x} = x! = 6$

$\Rightarrow \quad x! = 3!$

$\Rightarrow \quad x = 3$

Now since $^{n}P_3 = 336$

$\Rightarrow \quad n\,(n-1)\,(n-2) = 8\times7\times6$

$\Rightarrow \quad n = 8$

Alternatively Go though options.

9 If n is odd, the greatest value of $^{n}C_r = {}^{n}C_m$

where $m = \dfrac{(n-1)}{2}$ or $m = \dfrac{(n+1)}{2}$

$\therefore \quad x = \dfrac{(11-1)}{2} = 5$ or $x = \dfrac{(11+1)}{2} = 6$

Hence (d) is the correct choice.

10 If n is even, the greatest value of $^{n}C_r = {}^{n}C_m$

where $m = \dfrac{n}{2} \Rightarrow x = \dfrac{12}{2} = 6$

11 $^{14}C_x$ is maximum when $x = \dfrac{14}{2} = 7$

Alternatively Go through options.

12 Since there are total 10 persons and out of these 10 persons we have to select any 5 persons which can be done in $^{10}C_5$ ways.

$\therefore \quad ^{10}C_5 = \dfrac{10!}{5!\times5!} = 252$

13 Out of 10 questions, 6 questions can be selected in $^{10}C_6$ ways

$\therefore \quad ^{10}C_6 = 210$

14 Since question number 1 is compulsory so we have to choose only 5 questions from rest of the 9 questions, which can be done in $^{9}C_5$ ways

$\therefore \quad ^{9}C_5 = 126$

15 She may invite one or more friends by selecting either 1 or 2 or 3 or 4 or 5 friends out of 5 friends.

$\therefore$ 1 friend can be selected out of 5 in $^{5}C_1$ ways

2 friends can be selected out of 5 in $^{5}C_2$ ways

3 friends can be selected out of 5 in $^{5}C_3$ ways

4 friends can be selected out of 5 in $^{5}C_4$ ways

5 friends can be selected out of 5 in $^{5}C_5$ ways

Hence the required number of ways

$$= {}^{5}C_1 + {}^{5}C_2 + {}^{5}C_3 + {}^{5}C_4 + {}^{5}C_5$$

$$= 5 + 10 + 10 + 5 + 1 = 31$$

Alternatively $^{5}C_1 + {}^{5}C_2 + {}^{5}C_3 + {}^{5}C_4 + {}^{5}C_5$

$$= 2^5 - 1 = 31$$

Since, $^{n}C_1 + {}^{n}C_2 + {}^{n}C_3 + \ldots + {}^{n}C_n = 2^n - 1$

16 4 men can be selected out of 7 men in $^{7}C_4$ ways

and 2 ladies can be selected out of 6 ladies in $^{6}C_2$ ways

Hence, the required number of ways $= {}^{7}C_4 \times {}^{6}C_2$

$$= 35\times15 = 525$$

17 A committee of 5 persons is to be formed from 6 gentlemen and 4 ladies by taking.
(i) 1 lady out of 4 and 4 gentlemen out of 6.
(ii) 2 ladies out of 4 and 3 gentlemen out of 6.
(iii) 3 ladies out of 4 and 2 gentlemen out of 6.
(iv) 4 ladies out of 4 and 1 gentleman out of 6.

In case I the number of ways

$$= {}^4C_1 \times {}^6C_4 = 4 \times 15 = 60$$

In case II the number of ways

$$= {}^4C_2 \times {}^6C_3 = 6 \times 20 = 120$$

In case III the number of ways

$$= {}^4C_3 \times {}^6C_2 = 4 \times 15 = 60$$

In case IV the number of ways

$$= {}^4C_4 \times {}^6C_1 = 1 \times 6 = 6$$

Hence, the required number of ways

$$= 60 + 120 + 60 + 6 = 246$$

18 A committee of 7 persons retaining a majority of Indians can be made from 6 Americans and 7 Indians by taking
(i) 1 American out of 6 and 6 Indians out of 7.
(ii) 2 Americans out of 6 and 5 Indians out of 7.
(iii) 3 Americans out of 6 and 4 Indians out of 7.

In case I the number of ways = ${}^6C_1 \times {}^7C_6 = 6 \times 7 = 42$

In case II the number of ways = ${}^6C_2 \times {}^7C_5 = 15 \times 21 = 315$

In case III the number of ways

$$= {}^6C_3 \times {}^7C_4 = 20 \times 35 = 700$$

Hence, the required number of ways

$$= 700 + 315 + 42 = 1057$$

19 Required number of ways = ${}^6C_4 \times {}^8C_3 = 15 \times 56 = 840$

20 The number of committees in which both Miss. *A* and Mr. *B* are always members. We can select rest 3 men from the remaining 5 in ${}^5C_3$ ways and rest 2 women from the remaining 7 in ${}^7C_2$ ways.

$\therefore$ The required number of ways in which both Miss. *A* and Mr. *B* are always included

$$= {}^5C_3 \times {}^7C_2 = 10 \times 21 = 210$$

Hence the required number of ways in which Miss. *A* and Mr. *B* do not serve together = 840 – 210 = 630

21 Since 3 particular members are already selected, then we are required to select only 4 members out of the remaining 8 members. It can be done in ${}^8C_4$ ways.

$\therefore$ $${}^8C_4 = 70$$

22 Since 3 particular members are not included hence we have to select 7 members out of remaining 8 members. It can be done in ${}^8C_7$ ways

$\therefore$ $${}^8C_7 = 8$$

23 3 experts including atleast an engineer and a manager can be selected by taking.
(i) 2 managers out of 3 and 1 engineer out of 3.
(ii) 1 manager out of 3 and 2 engineer out of 3.
(iii) 2 persons out of 6 (3 managers and 3 engineers) and 1 person out of one who is both engineer and manager.

In case I, the number of ways = ${}^3C_2 \times {}^3C_1 = 9$

In case II, the number of ways = ${}^3C_1 \times {}^3C_2 = 9$

In case III, the number of ways = ${}^6C_2 \times {}^1C_1 = 15$

Hence, the required number of ways = 9 + 9 + 15 = 33.

24 A committee of 5 persons, consisting of at most two ladies, can be formed in the following ways.
(i) selecting 5 gents only out of 6.
(ii) selecting 4 gents only out of 6 and one lady out of 4.
(iii) selecting 3 gents only out of 6 and two ladies out of 4.

In case I, the number of ways = ${}^6C_5$

In case II, the number of ways = ${}^6C_4 \times {}^4C_1$

In case III, the number of ways = ${}^6C_3 \times {}^4C_2$

$\therefore$ Required number of ways

$$= {}^6C_5 + {}^6C_4 \times {}^4C_1 + {}^6C_3 \times {}^4C_2$$

$$= 6 + 60 + 120 = 186$$

25 A voter may cast vote for either 1 candidate or 2 candidates or 3 candidates or 4 candidates out of 7.
The voter may cast vote for 1 candidate in ${}^7C_1$ ways
The voter may cast vote for 2 candidates in ${}^7C_2$ ways
The voter may cast vote for 3 candidates in ${}^7C_3$ ways
The voter may cast vote for 4 candidate in ${}^7C_4$ ways
Hence, the required number of ways

$$= {}^7C_1 + {}^7C_2 + {}^7C_3 + {}^7C_4$$

$$= 7 + 21 + 35 + 35 = 98$$

26 Required number of ways = ${}^5C_1 + {}^5C_2 + {}^5C_3$

$$= 5 + 10 + 10 = 25$$

27 Required number of ways = ${}^8C_6 \times {}^8C_5 = 28 \times 56 = 1568$

28 Required number of ways

$$= ({}^6C_4 \times {}^6C_2) + ({}^6C_3 \times {}^6C_3) + ({}^6C_2 \times {}^6C_4)$$

$$= (15 \times 15) + (20 \times 20) + (15 \times 15)$$

$$= 225 + 400 + 225 = 850$$

29 Required number of ways

$$= {}^7C_3 \times {}^5C_5 + {}^7C_4 \times {}^5C_4 + {}^7C_5 \times {}^5C_3$$

$$= 35 \times 1 + 35 \times 5 + 21 \times 10$$

$$= 35 + 175 + 210 = 420$$

30 Required number of ways

$$= ({}^5C_2 \times {}^5C_3 \times {}^4C_1) + ({}^5C_3 \times {}^5C_2 \times {}^4C_1) + ({}^5C_2 \times {}^5C_2 \times {}^4C_2)$$

$$= (10 \times 10 \times 4) + (10 \times 10 \times 4) + (10 \times 10 \times 6) = 1400$$

31 Required number of ways

$$= {}^{13}C_8 \times {}^5C_2 = 1287 \times 10 = 12870$$

32 One hand shake requires two different persons.
∴ Number of hand shakes
= number of ways of selecting two persons out of 11 persons
$= {}^{11}C_2 = 55$

33 If n is even, ${}^nC_r$ is maximum when $r = \frac{n}{2}$

∴ Number of invitees in a party $= \frac{24}{2} = 12$

and maximum possible number of parties $= {}^{24}C_{12}$
$= 2704156$

34 If n is odd, ${}^nC_r$ is maximum when

$$r = \frac{n-1}{2} \quad \text{or} \quad r = \frac{n+1}{2}$$

$$\therefore \quad r = \frac{11-1}{2} = 5$$

or $$r = \frac{11+1}{2} = 6$$

$$\therefore \quad {}^{11}C_5 = {}^{11}C_6 = 462$$

35 Possible number of members in a family is either 5 or 6.
So, the maximum possible number of family members = 6

36 Let there were n persons in the meeting, then number of handshakes $= {}^nC_2$

$$\therefore \quad {}^nC_2 = 66$$

$$\Rightarrow \quad \frac{n!}{2!(n-2)!} = 66$$

$$\Rightarrow \quad \frac{n(n-1)}{2} = 66$$

$$\Rightarrow \quad n(n-1) = 132$$

$$\Rightarrow \quad n = 12$$

Alternatively Go through options.

37 Since a particular player is always chosen therefore we have to choose only 10 players out of remaining 15 players.
∴ Required number of ways $= {}^{15}C_{10} = 3003$

38 Since a player is never chosen, hence we have to choose 11 players out of remaining 15 players.
∴ Required number of ways $= {}^{15}C_{11} = 1365$

39 Total number of bowlers = 4
Total number of wicket keepers = 2
Rest (normal) players = 10
Possible Combinations :

Bowlers	Wicket keepers	Normal players
3	1	7
3	2	6
4	1	6
4	2	5

∴ Required number of ways
$= ({}^4C_3 \times {}^2C_1 \times {}^{10}C_7) + ({}^4C_3 \times {}^2C_2 \times {}^{10}C_6)$
$+ ({}^4C_4 \times {}^2C_1 \times {}^{10}C_6) + ({}^4C_4 \times {}^2C_2 \times {}^{10}C_5)$
$= (3 \times 1 \times 7) + (3 \times 2 \times 6) + (4 \times 1 \times 6) + (4 \times 2 \times 5)$
$= 960 + 840 + 420 + 252$
$= 2472$

40 Total number of bowles = 6
Total number of wicket keepers = 3
Total number of normal players = 11 [20 – (6 + 3)]
Possible combinations :

Bowlers	Wicket keepers	Normal players
4	2	5
5	2	4
6	2	3

∴ Required number of ways
$= ({}^6C_4 \times {}^3C_2 \times {}^{11}C_5) + ({}^6C_5 \times {}^3C_2 \times {}^{11}C_4)$
$+ ({}^6C_6 \times {}^3C_2 \times {}^{11}C_3)$
$= 20790 + 5940 + 495 = 27225$

41 Total number of wicket keepers = 2
Total number of bowlers = 8
Total number of batsman = 10
Total number of all rounders = 5
1 Wicket keeper can be selected out of 2 in ${}^2C_1$ ways
2 Bowlers can be selected out of 8 in ${}^8C_2$ ways
5 Batsmen can be selected out of 10 in ${}^{10}C_5$ ways
3 All rounders can be selected out of 5 in ${}^5C_3$ ways
∴ Required number of ways $= {}^2C_1 \times {}^8C_2 \times {}^{10}C_5 \times {}^5C_3$
$= 2 \times 28 \times 252 \times 10 = 141120$

42 1 book on Economics can be collected out of 3 in ${}^3C_1$ ways
1 book on Corporate strategy can be collected out of 4 in ${}^4C_1$ ways 1 book on Philosophy can be collected out of 5 in ${}^5C_1$ ways
Hence the required number of collections each of which consists of exactly one book on each subject
$= {}^3C_1 \times {}^4C_1 \times {}^5C_1$
$= 3 \times 4 \times 5 = 60$

43 At least one book on Economics can be collected out of $3 = {}^3C_1 + {}^3C_2 + {}^3C_3 = 2^3 - 1 = 7$ ways.
Similarly one book on corporate strategy can be collected out of $4 = {}^4C_1 + {}^4C_2 + {}^4C_3 + {}^4C_4 = 2^4 - 1 = 15$ ways.
Similarly one book on Philosophy can be collected out of $5 = {}^5C_1 + {}^5C_2 + {}^5C_3 + {}^5C_4 + {}^5C_5 = 2^5 - 1 = 31$ ways.
Hence the required number of ways $= 7 \times 15 \times 31 = 3255$

44 Since all the three balls are red which can be selected from 7 red balls only.

$\therefore$ Required number of selections $= {}^7C_3 = 35$

45 Since red balls cannot be taken thus we can select 3 balls out of 6 white and 4 blue balls.

$\therefore$ Required number of selections $= {}^{10}C_3 = 120$ ways

46 The required number of selections $= {}^7C_1 \times {}^6C_1 \times {}^4C_1 = 168$

47 Total number of red balls = 5

Total number of green balls = 6

Possible combinations are :

Red	Green
2	4
3	3
4	2

$\therefore$ Required number of selections

$= ({}^5C_2 \times {}^6C_4) + ({}^5C_3 \times {}^6C_3) + ({}^5C_4 \times {}^6C_2) = 425$

48 Required number of words $= {}^{15}C_2 \times {}^5C_4$

$= 105 \times 5 = 525$

49 There are 11 letters in the given word of which 2 are *A*'s, 2 are *I*'s, 2 are *N*'s and the remaining 5 letters are different. Thus we have 11 letters of 8 different kinds *viz.,* (*A*, *A*), (*I*, *I*), (*N*, *N*), *E, X, M, T, O*.

A group of 4 letters can be classified as follows :

(i) Two alike of one kind and two alike of another kind.

(ii) Two alike and the other two different.

(iii) All four different.

In case I, the number of ways $= {}^3C_2 = 3$

In case II, the number of ways $= {}^3C_1 \times {}^7C_2 = 63$

In case III, the number of ways $= {}^8C_4 = 70$

Hence, the required number of ways $= 3 + 63 + 70 = 136$

50 There are 11 letters in the given word where *M* occurs 2 times, *A* occurs 2 times and *T* occurs 2 times and rest letters occur one times each.

i.e., M, A, T, H, E, I, C, S

M, A, T

A group of 4 letters can be selected in the following manner.

(i) Two alike of one kind and two alike of other kind.

(ii) Two alike and the other two different.

(iii) All four different.

Case I. ${}^3C_2 \times \dfrac{4!}{2!\,2!} = 18$

Case II. ${}^3C_1 \times {}^7C_2 \times \dfrac{4!}{2!} = 756$

Case III. ${}^8C_4 \times 4! = 1680$

$\therefore$ Total required words of 4 letters $= 18 + 756 + 1680$

$= 2454$

51 Let L_1, L_2, L_3 be 3 ladies and G_1, G_2, G_3 be 3 gents.

Any two of the ladies out of 3 can be selected in ${}^3C_2$ ways and can be arranged mutually in 2! ways.

Now we are left with 3 gents and 1 lady these 4 persons can be arranged at a round table in 3! ways.

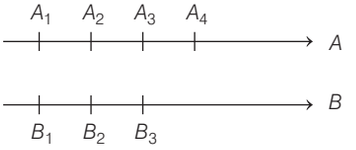
Now we have only two places among 4 persons to place the two selected ladies which can be done in ${}^2P_1$ ways.

Hence the required number of arrangements

$= {}^3C_2 \times 2! \times 3! \times {}^2P_1$

$= 3 \times 2 \times 6 \times 2 = 72$

52 Since 4 guests desire to sit on one side and the other 3 guests desire to sit on the other side.



Hence we are left with 11 guests only out of which we choose 5 guests for the side *A* in ${}^{11}C_5$ ways and remaining 6 guests can be selected for the side *B* in ${}^6C_6$ ways.

Further in each side 9 guests can be arranged in 9! ways.

Hence the required number of arrangements

$= {}^{11}C_5 \times {}^6C_6 \times 9! \times 9!$

$= 462 \times (9!)^2$

53 ${}^{10}C_1 + {}^{10}C_2 + {}^{10}C_3 + \ldots + {}^{10}C_{10} = 2^{10} - 1$

54 $\because {}^{10}C_1 + {}^{10}C_2 + {}^{10}C_3 + \ldots + {}^{10}C_{10} = 2^{10} - 1$

$\therefore {}^{10}C_2 + {}^{10}C_3 + \ldots + {}^{10}C_{10} = (2^{10} - 1) - 10 = 2^{10} - 11$

55 $\because {}^{10}C_1 + {}^{10}C_2 + {}^{10}C_3 + \ldots + {}^{10}C_9 + {}^{10}C_{10} = 2^{10} - 1$

$\therefore {}^{10}C_1 + {}^{10}C_2 + {}^{10}C_3 + \ldots + {}^{10}C_9$

$= (2^{10} - 1) - 1 = 2^{10} - 2$

$= 2(2^9 - 1)$

56 ${}^{10}C_0 + {}^{10}C_2 + {}^{10}C_4 + \ldots + {}^{10}C_{10} = 2^{10-1} = 2^9$

57 $[({}^{10}C_1 + {}^{10}C_3 + {}^{10}C_5 + \ldots) \times ({}^{20}C_1 + {}^{20}C_3 + {}^{20}C_5 + \ldots) \times ({}^{30}C_1 + {}^{30}C_3 + {}^{40}C_5 + \ldots) \times \ldots \times ({}^{100}C_1 + {}^{100}C_3 + {}^{100}C_5 + \ldots)]$

$= 2^9 \times 2^{19} \times 2^{29} \times \ldots \times 2^{99}$

$= 2^{9 + 19 + 29 + \ldots + 99} = 2^{540}$

58 Larry can attend or miss the first session in 2 ways.

She can attend or miss the second session in 2 ways.

She can attend or miss the third session in 2 ways.

She can attend or miss the fourth session in 2 ways.

Thus she can attend the sessions in $2 \times 2 \times 2 \times 2 = 2^4$ ways.

But this includes the case when she does not attend even a single session. Therefore she can attend one or more sessions in $2^4 - 1 = 15$ ways.

Alternatively

She can attend the one session in ${}^4C_1$ ways

She can attend the two sessions in ${}^4C_2$ ways

She can attend the three sessions in ${}^4C_3$ ways

She can attend the four sessions in ${}^4C_4$ ways

Therefore she can attend 1 or 2 or 3 or 4 sessions in ${}^4C_1 + {}^4C_2 + {}^4C_3 + {}^4C_4 = 4 + 6 + 4 + 1 = 15$ ways.

59 The number of ways in which Madhulika can select exactly four languages $= {}^4C_4 + {}^5C_4 + {}^6C_4 + \ldots + {}^{10}C_4$
$= {}^{11}C_5 = 462$

NOTE $(\because {}^rC_r + {}^{r+1}C_r + {}^{r+2}C_r + \ldots + {}^nC_r = {}^{n+1}C_{r+1}; r \le n)$

Madhulika cannot select 4 languages from program 1, 2 or 3 as none of them has 4 languages.

60 $210 = 1 + 2 + 3 + \ldots + 20$.

It means total 20 packs of parathas are there and each pack has distinct number of parathas. The number of ways in which Shivesh can select any 3 parathas

$$= {}^3C_3 + {}^4C_3 + {}^5C_3 + \ldots + {}^{20}C_3$$
$$= {}^{21}C_4 = 5985$$

61 Since Nilekani attempts 2 problems so he can't attempt the module 1, as it has only 1 problem.

Therefore the number of ways in which he can attempt 2 distinct problems

$$= {}^2C_2 + {}^3C_2 + {}^4C_2 + \ldots + {}^{40}C_2 = {}^{41}C_3 = 10660$$

62 Since Narainmurthi attempts 38 problems, so he has to attempt them from module 38 or module 39 or module 40 only, as other modules don't have sufficient number of problems to attempt from.

$$= {}^{38}C_{38} + {}^{39}C_{38} + {}^{40}C_{38} = {}^{41}C_{39} = 820$$

63 They can choose not to watch any movie or can go for 1 or 2 or 3 or all the four movies. Therefore the required number of ways in which they can watch the movies

$${}^4C_0 + {}^4C_1 + {}^4C_2 + {}^4C_3 + {}^4C_4 = 2^4 = 16 = 4^2$$

64 They can watch either 1 or more movies.

Therefore the required number of ways in which they can watch the movies

$$= {}^4C_1 + {}^4C_2 + {}^4C_3 + {}^4C_4 = 2^4 - {}^4C_0 = 2^4 - 1$$

65 They can watch 2 or more movies.

Therefore the required number of ways in which they can watch the movies ${}^4C_2 + {}^4C_3 + {}^4C_4 = 2^4 - {}^4C_0 - {}^4C_1 = 2^4 - 5$

66 They can watch at most 3 movies.

Therefore the required number of ways in which they can watch the movies

$$= {}^4C_0 + {}^4C_1 + {}^4C_2 + {}^4C_3$$
$$= 2^4 - {}^4C_4 = 2^4 - 1$$

67 He may choose to read none, one or any number of scripts offered.

Therefore the number of ways in which he can choose to read the scripts

$$= {}^{100}C_0 + {}^{100}C_1 + {}^{100}C_2 + \ldots + {}^{100}C_{100} = 2^{100}$$

68 Since he reads at most 50 scripts.

Therefore the number of ways in which he can choose to read the scripts

$$= {}^{100}C_0 + {}^{100}C_1 + {}^{100}C_{50} = 2^{100} - ({}^{100}C_{51} + {}^{100}C_{52} + \ldots + {}^{100}C_{100})$$

$$\Rightarrow ({}^{100}C_0 + {}^{100}C_1 + \ldots + {}^{100}C_{49}) + {}^{100}C_{50} = 2^{100} - ({}^{100}C_{51} + {}^{100}C_{52} + \ldots + {}^{100}C_{100})$$

$$\Rightarrow P + {}^{100}C_{50} = 2^{100} - P$$

$$\Rightarrow P + {}^{100}C_{50} = 2^{100} - P - {}^{100}C_{50} + {}^{100}C_{50}$$

$$\Rightarrow P + {}^{100}C_{50} = 2^{100} - (P + {}^{100}C_{50}) + {}^{100}C_{50}$$

$$\Rightarrow 2(P + {}^{100}C_{50}) = 2^{100} + {}^{100}C_{50}$$

$$\Rightarrow P + {}^{100}C_{50} = \frac{1}{2}(2^{100} + {}^{100}C_{50})$$

$$\therefore ({}^{100}C_0 + {}^{100}C_1 + {}^{100}C_2 + \ldots + {}^{100}C_{49}) + {}^{100}C_{50} = \frac{1}{2}(2^{100} + {}^{100}C_{50})$$

Hint $({}^{100}C_0 + {}^{100}C_1 + \ldots + {}^{100}C_{49}) = ({}^{100}C_{51} + {}^{100}C_{52} + \ldots + {}^{100}C_{100})$

And ${}^{100}C_0 + {}^{100}C_1 + \ldots + {}^{100}C_{100} = 2^{100}$

69 The number of ways in which he can choose to read the scripts

$$= {}^{100}C_2 + {}^{100}C_3 + \ldots + {}^{100}C_{98} = 2^{100} - ({}^{100}C_0 + {}^{100}C_1 + {}^{100}C_{99} + {}^{100}C_{100})$$

$$\Rightarrow {}^{100}C_2 + {}^{100}C_3 + \ldots + {}^{100}C_{98} = 2^{100} - (1 + 100 + 100 + 1)$$

$$\Rightarrow {}^{100}C_2 + {}^{100}C_3 + \ldots + {}^{100}C_{98} = 2^{100} - 202$$

70 Since he reads at least 50 scripts.

Therefore the number of ways in which he can choose to read the scripts

$$= {}^{100}C_{50} + {}^{100}C_{51} + {}^{100}C_{100} = 2^{100} - ({}^{100}C_0 + {}^{100}C_1 + \ldots + {}^{100}C_{49})$$

$$\Rightarrow {}^{100}C_{50} + ({}^{100}C_{51} + {}^{100}C_{52} + \ldots + {}^{100}C_{100}) = 2^{100} - ({}^{100}C_0 + {}^{100}C_1 + \ldots + {}^{100}C_{49})$$

$\Rightarrow \quad {}^{100}C_{50} + P = 2^{100} - P$

$\Rightarrow \quad {}^{100}C_{50} + P = 2^{100} - P - {}^{100}C_{50} + {}^{100}C_{50}$

$\Rightarrow \quad {}^{100}C_{50} + P = 2^{100} - (P + {}^{100}C_{50}) + {}^{100}C_{50}$

$\Rightarrow \quad 2({}^{100}C_{50} + P) = 2^{100} + {}^{100}C_{50}$

$\Rightarrow \quad {}^{100}C_{50} + P = \frac{1}{2}(2^{100} + {}^{100}C_{50})$

$\Rightarrow \quad {}^{100}C_{50} + P = 2^{99} + \frac{1}{2}({}^{100}C_{50})$

$\therefore \quad ({}^{100}C_{50} + {}^{100}C_{51} + {}^{100}C_{100}) = 2^{99} + \frac{1}{2}({}^{100}C_{50})$

Hint $({}^{100}C_{51} + {}^{100}C_{52} + \ldots + {}^{100}C_{100})$

$= ({}^{100}C_0 + {}^{100}C_1 + \ldots + {}^{100}C_{49})$

71 If n is even, the greatest value of ${}^nC_r = {}^nC_m$; where $m = \frac{n}{2}$

It implies that the maximum number of modules can be developed when each module has $5\left(=\frac{10}{2}\right)$ subjects.

And the maximum number of modules would be ${}^{10}C_5 = 252$.

72 If n is odd, the greatest value of ${}^nC_r = {}^nC_m$ where $m = \frac{(n-1)}{2}$ or $m = \frac{(n+1)}{2}$

It implies that the maximum number of distinct assortments can be obtained when each assortment has $\frac{(9-1)}{2} = 4$ or $\frac{(9+1)}{2} = 5$ varieties of sweets.

And the maximum number of distinct assortments $= {}^9C_4 = {}^9C_5 = 126$

73 If n is even, the greatest value of ${}^nC_r = {}^nC_m$; where $m = \frac{n}{2}$

It implies that the maximum number of groups can be formed when in each group there are $4\left(=\frac{8}{2}\right)$ members.

And the number of groups $= {}^8C_4 = 70$

74 For maximum number of trips/groups 4 members group will be travelling each time. So a particular member can go with any 3 members out of the remaining 7 members.

Therefore the maximum number of trips by a particular member $= {}^7C_3 = 35$

75 Mr. Shashi uses only even number of characters to write a tweet from the set of 36 characters.

$\because \quad {}^nC_0 + {}^nC_2 + {}^nC_4 + \ldots + {}^nC_n = 2^{n-1}$

$\therefore \quad {}^nC_2 + {}^nC_4 + \ldots {}^nC_n = 2^{n-1} - {}^nC_0$

$\Rightarrow \quad {}^nC_2 + {}^nC_4 + \ldots {}^nC_n = 2^{n-1} - 1$

$\therefore \quad {}^{36}C_2 + {}^{36}C_4 + \ldots {}^{36}C_{36} = 2^{35} - 1$

76 Mr. Shashi uses only odd number of characters to write a tweet from the set of 36 characters.

$\because \quad {}^nC_1 + {}^nC_3 + {}^nC_5 + \ldots = 2^{n-1}$

$\therefore \quad {}^{36}C_1 + {}^{36}C_3 + {}^{36}C_5 + \ldots + {}^{36}C_{35} = 2^{35}$

77 Mr. Shashi uses only even number of characters from 26 alphabets and even number of characters from 10 numerals to write a tweet.

$\therefore \quad ({}^{26}C_0 + {}^{26}C_2 + {}^{26}C_4 \ldots {}^{26}C_{26})$

$({}^{10}C_0 + {}^{10}C_2 + {}^{10}C_4 \ldots {}^{10}C_{10}) = 2^{25} \times 2^9 = 2^{34}$

Thus we get the answer 2^{34}, which includes a case in which 0 characters are used. But, we know that he cannot tweet without writing anything in it, so 1 case has to be subtracted.

Therefore the number of ways in which he can select the required characters $= 2^{34} - 1$

78 Mr. Shashi uses only odd number of characters from 26 alphabets and odd number of characters from 10 numerals to write a tweet.

$\therefore \quad ({}^{26}C_1 + {}^{26}C_3 + {}^{26}C_5 \ldots {}^{26}C_{25})$

$({}^{10}C_1 + {}^{10}C_3 + {}^{10}C_5 \ldots {}^{10}C_9) = 2^{25} \times 2^9 = 2^{34}$

79 When Mr. Shashi selects odd number of characters from 26 alphabets and odd number of characters from 10 numerals, he naturally he selects total even number of characters.

Thus the number of ways in which he can select the characters

$= ({}^{26}C_1 + {}^{26}C_3 + {}^{26}C_5 \ldots {}^{26}C_{25})$

$({}^{10}C_1 + {}^{10}C_3 + {}^{10}C_5 \ldots {}^{10}C_9)$

$= 2^{25} \times 2^9 = 2^{34}$

☑ Introductory Exercise 19.6

1 The number of ways of choosing 4 letters from 2As, 3Bs and 4Cs = coefficient of x^4 in $(1 + x + x^2)$

$(1 + x + x^2 + x^3)(1 + x + x^2 + x^3 + x^4)$

By multiplication we get $(1 + \ldots + 11x^4 + \ldots + x^9)$.

Thus we can see that the coefficient of x^4 is 11.

Therefore the required number of ways of choosing 4 letters from {A, A, B, B, B, C, C, C, C} is 11.

Hence choice (b) is the answer.

Alternatively

Case I : 0, 0 4 {CCCC}

Case II : 0, 1, 3 {ABBB}, {ACCC}, {BCCC}, {CBBB}
Case III : 0, 2, 2 {AABB}, {AACC}, {BBCC}
Case IV : 1, 1, 2 {AABC}, {BBCA}, {CCAB}

2 The number of ways of choosing 4 letters, such that at least 1 letter must be taken from each of 2As, 3Bs and 4Cs = coefficient of x^4 in

$$(x + x^2)(x + x^2 + x^3)(x + x^2 + x^3 + x^4)$$

By multiplication we get

$$(x^3 + \ldots + 3x^4 + \ldots + x^9).$$

Thus we can see that the coefficient of x^4 is 3.

Therefore the required number of ways of choosing 4 letters from {A, A, B, B, B, C, C, C, C} is 3.

Hence choice (a) is the answer.

Alternatively

{AABC}, {ABBC}, {ABCC}

Alternatively

First take out 1A, 1B, 1C.

Now you can select either 1A in 1 way or 1B in 1 way or 1C in 1 way.

So the total number of selections = 1 + 1 + 1 = 3.

Alternatively

{1A, 1B and 2C} or {1A, 2B, 1C} or {2A, 1B, 1C}

$$(1 \times 1 \times 1) + (1 \times 1 \times 1) + (1 \times 1 \times 1) = 3$$

3 Number of ways of selecting 1 tee = 1

Hence choice (b) is the answer.

4 Number of ways of selecting at least 1 tee

= selecting 1 tee or 2 tees or 3 tees or….or 10 tees
= 1 + 1 + 1 + … + 1 = 10

Hence choice (d) is the answer.

5 Number of ways of selecting at most 1 tee = selecting no tee or 1 tee = 1 + 1 = 2

Hence choice (c) is the answer.

6 Number of ways of selecting 4 tees = 1

Hence choice (b) is the answer.

7 Number of ways of selecting at least 4 tees

= selecting 4 tees or 5 tees or 6 tees or ... or 10 tees

= 1 + 1 + 1 … + 1 = 7

Hence choice (d) is the answer.

8 Number of ways of selecting at most 4 tees = selecting no tee or 1 tee or 2 tees or 3 tees or 4 tees

= 1 + 1 + 1 + 1 + 1 = 5

Hence choice (a) is the answer.

9 Number of ways of selecting any number of tees
= selecting no tee or 1 tee or 2 tees or 3 tees or … or 10 tees
= 1 + 1 + 1 + 1 + … + 1 = 11

Hence choice (d) is the answer.

10 Number of ways of selecting 10 tees = 1

Hence choice (b) is the answer.

11 Number of ways of selection of zero or more things out of $(p + q + r + \ldots)$ things, of which p are alike of one kind, q are alike of second kind, r are alike of third kind, and so on

$= [(p + 1)(q + 1)(r + 1)\ldots]$

Therefore the number of ways of selection of any number (≥ 0) of candles out of $(2 + 3 + 4 + 3)$ candles, of which 2 are alike of white colour, 3 are alike of red colour, 4 are alike of green colour and 3 are alike of yellow colour

$$= (2 + 1)(3 + 1)(4 + 1)(3 + 1) = 240.$$

Hence choice (b) is the answer.

NOTE The above solution shows that out of 2 white candles you may select any number of candles (0 or 1 or 2); or out of 3 red candles you may select any number of candles (0 or 1 or 2 or 3); or out of 4 green candles you may select any number of candles (0 or 1 or 2 or 3 or 4); or out of 3 yellow candles you may select any number of candles (0 or 1 or 2 or 3).

Essentially, it manifests that you may select any number of candles (0 or 1 or 2 or … or 12) from the whole lot of 12 candles.

12 Number of ways of selection of one or more things out of $(p + q + r + \ldots)$ things, of which p are alike of one kind, q are alike of second kind, r are alike of third kind, and so on

$= [(p + 1)(q + 1)(r + 1)\ldots] - 1$

Therefore number of ways of selection of at least one (≥ 1) candle out of $(2 + 3 + 4 + 3)$ candles, of which 2 are alike of white colour, 3 are alike of red colour, 4 are alike of green colour and 3 are alike of yellow colour

$= [(2 + 1)(3 + 1)(4 + 1)(3 + 1) - 1] = 239.$

Hence choice (b) is the answer.

Hint As it's clear from the previous question that there are 240 ways in which you may select 0 or 1 or 2 or … or 12 candles. It obviously includes 1 way in which none of the candles can be selected. So if we subtract 1 way from 240 ways, we get the answer in which at least one candle must be selected.

NOTE Always keep in mind that the number of ways in which you can select nothing (i.e., number of ways in which you can select 0 things) is 1.

13 Number of ways in which you can select 1 candle of each colour = No. of ways of selecting 1 white candle × No. of ways of selecting 1 red candle × No. of ways of selecting 1 green candle × No. of ways of selecting 1 yellow candle $= 1 \times 1 \times 1 \times 1 = 1$. Hence choice (d) is the answer.

Hint Number of ways of selecting 1 article from n identical articles = 1.

14 Number of ways of selecting at least one candle of each colour = $2 \times 3 \times 4 \times 3 = 72$
Hence choice (b) is the answer.

Hint Number of ways of selecting r articles from $n (r \le n)$ identical articles = 1.

15 Number of ways in which you can select 2 candles of each colour = No. of ways of selecting 2 white candles × No. of ways of selecting 2 red candles × No. of ways of selecting 2 green candles × No. of ways of selecting 2 yellow candles
$= 1 \times 1 \times 1 \times 1 = 1.$
Hence choice (b) is the answer.

Hint Number of ways of selecting r article from $n (r \le n)$ identical articles = 1.

16 Number of ways of selection of at least 2 white candles = 1
Number of ways of selection of at least 2 red candles $= 1 + 1 = 2$
Number of ways of selection of at least 2 green candles $= 1 + 1 + 1 = 3$. Number of ways of selection of at least 2 yellow candles $= 1 + 1 = 2$
Therefore number of ways of selection of at least 2 candles of each colour $= 1 \times 2 \times 3 \times 2 = 12$
Hence choice (a) is the answer.

17 Number of ways of selection of at most 2 white candles $= 1 + 1 + 1 = 3$
Number of ways of selection of at most 2 red candles $= 1 + 1 + 1 = 3$
Number of ways of selection of at most 2 green candles $= 1 + 1 + 1 = 3$
Number of ways of selection of at most 2 yellow candles $= 1 + 1 + 1 = 3$
Therefore number of ways of selection of at most 2 candles of each colour $= 3 \times 3 \times 3 \times 3 = 81$
Hence choice (d) is the answer.

18 The number of ways of choosing r objects from p objects of one kind, q objects of second kind, and so on is the coefficient of x^r in the expansion $(1 + x + x^2 + \ldots + x^p)$ $(1 + x + x^2 + \ldots + x^q) \ldots$
Therefore number of ways of choosing 2 candles from 2 candles of white colour, 3 candles of red colour, 4 candles of green colour and 3 candles of yellow colour is the coefficient of x^2 in the expansion
$(1 + x + x^2)(1 + x + x^2 + x^3)$
$(1 + x + x^2 + x^3 + x^4)(1 + x + x^2 + x^3)$
By multiplication we get $(1 + \ldots + 10x^2 + \ldots + x^{12})$.
Thus we can see that the coefficient of x^2 is 10.
Hence choice (d) is the answer.

Alternatively

Case I : 2, 0, 0, 0 {WW}, {RR}, {GG}, {YY}

Case II : 1, 1, 0, 0 {WR}, {WG}, {WY}, {RG}, {RY}, {GY}
Therefore there are total 10 ways of selection (or combination) of 2 candles. In case I both the candles have same colour and in case II each of the two candles has different colour.

No. of Combinations	Case I				Case II			
	White	Red	Green	Yellow	White	Red	Green	Yellow
1	2	0	0	0	1	1	0	0
2	0	2	0	0	1	0	1	0
3	0	0	2	0	1	0	0	1
4	0	0	0	2	0	1	1	0
5	–	–	–	–	0	1	0	1
6	–	–	–	–	0	0	1	1

19 Number of ways of selecting 1 white, 2 red, 3 green and 2 yellow candles $= 1 \times 1 \times 1 \times 1 = 1$
Hence choice (b) is the answer.

Hint Number of ways of selecting r articles from $n (r \le n)$ identical articles = 1.

20 Number of ways of selecting 2 white, 3 red, 4 green and 2 yellow candles $= 1 \times 1 \times 1 \times 1 = 1$
Hence choice (b) is the answer.

Hint Number of ways of selecting n articles from n identical articles = 1.

21 Number of ways of choosing 4 candles from 2 candles of white colour, 3 candles of red colour, 4 candles of green colour and 3 candles of yellow colour is the coefficient of x^4 in the expansion $(1 + x + x^2)(1 + x + x^2 + x^3)$
$(1 + x + x^2 + x^3 + x^4)(1 + x + x^2 + x^3)$
By multiplication we get $(1 + 4x + 10x^2 + 19x^3 + 29x^4 + 37x^5 + 40x^6 + 37x^7 + 29x^8 + 19x^9 + 10x^{10} + 4x^{11} + x^{12})$.
Thus we can see that the coefficient of x^4 is 29.
Hence choice (b) is the answer.

Alternatively

Case I : 4, 0, 0, 0 → No. of selections = 1
Case II : 3, 1, 0, 0 → No. of selections = 9
Case III : 2, 2, 0, 0 → No. of selections = 6
Case IV : 2, 1, 1, 0 → No. of selections = 12
Case V : 1, 1, 1, 1 → No. of selections = 1
Therefore total number of required selections $= 1 + 9 + 6 + 12 + 1 = 29$

22 Number of ways of choosing 6 candles from 2 candles of white colour, 3 candles of red colour, 4 candles of green colour and 3 candles of yellow colour is the coefficient of x^6 in the expansion $(1 + x + x^2)$ $(1 + x + x^2 + x^3)$ $(1 + x + x^2 + x^3 + x^4)(1 + x + x^2 + x^3)$
By multiplication we get

$(1 + 4x + 10x^2 + 19x^3 + 29x^4 + 37x^5 + 40x^6$
$+ 37x^7 + 29x^8 + 19x^9 + 10x^{10} + 4x^{11} + x^{12})$.

Thus we can see that the coefficient of r^6 is 40.
Hence choice (c) is the answer.

Alternatively

Case I : 4, 2, 0, 0 → No. of selections = 3
Case II : 4, 1, 1, 0 → No. of selections = 3
Case III : 3, 3, 0, 0 → No. of selections = 3
Case IV : 3, 2, 1, 0 → No. of selections = 18
Case V : 3, 1, 1, 1 → No. of selections = 3
Case VI : 2, 2, 2, 0 → No. of selections = 4
Case VII : 2, 2, 1, 1 → No. of selections = 6
Therefore total number of required selections
= 3 + 3 + 3 + 18 + 3 + 4 + 6 = 40.

Hint Please keep in mind that you can select more than 2 candles from the set of red candles, not more than 3 candles from the set of red and yellow candles. There is only one set, of green candles, which have 4 candles. So it must be obvious to you that you cannot select more than 4 candles from any set of candles.

23 Number of ways of selecting at least 6 candles = Number of ways in which one can select either 6 candles or 7 candles or 8 candles or ... or 12 candles
= 40 + 37 + 29 + 19 + 10 + 4 + 1 = 140
Hence choice (b) is the answer.

24 Number of ways of selecting at most 6 candles = Number of ways in which one can select either 6 candles or 5 candles or 4 candles or … or 1 candle or no candle
= 40 + 37 + 29 + 19 + 10 + 4 + 1 = 140
Hence choice (d) is the answer.

25 In order to select the 6 candles such that there must be 1 candle of each colour, first of all we can take out 4 candles 1 from each colour. Now 2 more candles have to be selected which can be done in the following ways:
Case I: 2, 0, 0, 0 → No. of selections = 3
Case II: 1, 1, 0, 0 → No. of selections = 6
Therefore total number of required selections = 3 + 6 = 9
Hence choice (a) is the answer.

Alternatively

Case I: 3, 1, 1, 1 → No. of selections = 3
Case II: 2, 2, 1, 1 = No. of selections = 6
Therefore total number of required selections = 3 + 6 = 9
Hence choice (a) is the answer.

Hint Remember that you cannot select more than 2 candles of white colour, so in case-I, you will have only 3 ways of selections, instead of 4 ways.

Alternatively

The number of ways of choosing k objects, from p objects of one kind, q objects of second kind, and so on, such that one object of each kind must be included is the coefficient of x^k in the expansion $(x + x^2 + \ldots + x^p)(x + x^2 + \ldots + x^q)\ldots$
Therefore required number of ways of selecting 6 candles, such that at least one candle of each colour must be there, is the coefficient of x^6 in the expansion of $(x + x^2)$ $(x + x^2 + x^3)(x + x^2 + x^3 + x^4)(x + x^2 + x^3)$
By multiplication we get, $(x^4 + 4x^5 + 9x^6 + .. + x^{12})$.
It shows that the coefficient of x^6 is 9. Therefore the required number of selections = 9.

26 Number of ways of selection of zero or more things from p identical things of one kind, q identical things of second kind, r identical things of third kind, and remaining n things are different = $[(p + 1)(q + 1)(r + 1)\,2^n]$
Therefore the number of ways of selection of zero or more pen-drives = $(3 + 1)(4 + 1)(2^5) = 640$
Hence choice (d) is the answer.

27 The number of ways of section of zero or more pen-drives = 640
Number of ways of selection of zero pen-drives = 1
Therefore number of ways of selection of one or more pen-drives = 640 – 1 = 639.
Hence choice (a) is the answer.

28 The number of ways of selecting at most 1 pen-drive
= number of ways of selecting no pen-drive
+ number of ways of selecting 1 pen drive.
Number of ways of not selecting any pen-drive = 1.
Number of ways of selecting 1 pen-drive is shown below:

	Number of pen-drives from		
	Box 1	**Box 2**	**Box 3**
Case I	1	0	0
Case II	0	1	0
Case III	0	0	1

Case I : $1 \times 1 \times 1 = 1$
Case II : $1 \times 1 \times 1 = 1$
Case III : $1 \times 1 \times 5 = 5$
Therefore total number of ways in which 1 pen-drive can be selected = 1 + 1 + 5 = 7.
Thus the total number of ways in which at most 1 pen-drive can be selected = 1 + 7 = 8.
Hence choice (b) is the answer.

29 The number of ways of selecting 1 pen-drive from each box = No. of ways of selecting 1 pen-drive from first box × No. of ways of selecting 1 pen-drive from second box × No. of ways of selecting 1 pen-drive from third box = $1 \times 1 \times 5 = 5$
Hence choice (a) is the answer.

30 The number of ways of selecting 3 pen-drives is shown below:

Case	Number of pen-drives from			No. of ways of selection	Total
	Box 1	Box 2	Box 3		
I	3	0	0	$1\times1\times1=1$	12
	0	3	0	$1\times1\times1=1$	
	0	0	3	$1\times1\times10=10$	
II	2	1	0	$1\times1\times1=1$	32
	2	0	1	$1\times1\times5=5$	
	1	0	2	$1\times1\times10=10$	
	1	2	0	$1\times1\times1=1$	
	0	1	2	$1\times1\times10=10$	
	0	2	1	$1\times1\times5=5$	
III	1	1	1	$1\times1\times5=5$	5

Therefore total number of ways in which 3 pen-drives can be selected $= 12 + 32 + 5 = 49$.
Hence choice (a) is the answer.

31 The number of ways of selecting 3 distinct pen-drives is shown below:

	Number of pen-drives from			No. of ways of selection
	Box 1	Box 2	Box 3	
Case I	0	0	3	$1\times1\times10=10$
Case II	0	1	2	$1\times1\times10=10$
	1	0	2	$1\times1\times10=10$
Case III	1	1	1	$1\times1\times5=5$

Therefore total number of ways in which 3 pen-drives can be selected $10 + 10 + 10 + 5 = 35$
Hence choice (c) is the answer.

32 The number of ways of selecting 2 pen-drives of 4 GB, 3 pen-drives of 2 GB and 4 pen-drives of different storage capacities other than 2 GB and 4 GB $= 1\times1\times5 = 5$

Hence choice (a) is the answer.

33 Number of ways of selecting at most 2 pen-drives from the first box $= 3$
Number of ways of selecting at most 3 pen-drives from the first box $= 4$
Number of ways of selecting at most 4 pen drives from the first box $= 31$
Therefore the required number of ways

$$= 3\times4\times31$$
$$= 372$$

Hence choice (a) is the answer.

34 The number of ways of selecting any 2 identical pen-drives = Number of ways of selecting 2 pen-drives either from box 1 or 2 pen-drives from box $2 = 1 + 1 = 2$
Hence choice (c) is the answer.

35 Number of ways of selecting any two distinct pen-drives is shown below:

	Number of pen-drives from			No. of ways of selection
	Box 1	Box 2	Box 3	
Case I	0	0	2	$1\times1\times10=10$
Case II	0	1	1	$1\times1\times5=5$
	1	0	1	$1\times1\times5=5$
Case III	1	1	0	$1\times1\times1=1$

Therefore total number of required ways
$= 10 + 5 + 5 + 1 = 21$.
Hence choice (c) is the answer.

36 We have to select 7 coupons from 4 identical coupons and 6 distinct coupons. Then the coupons can be selected in the following ways.
4 identical and 3 distinct coupons in $1\times {}^6C_3$ ways
3 identical and 4 distinct coupons in $1\times {}^6C_4$ ways
2 identical and 5 distinct coupons in $1\times {}^6C_5$ ways
1 identical and 6 distinct coupons in $1\times {}^6C_6$ ways
Hence the required number of ways

$$= {}^6C_3 + {}^6C_4 + {}^6C_5 + {}^6C_6$$
$$= 2^6 - ({}^6C_0 + {}^6C_1 + {}^6C_2) = 64 - 22 = 42$$

37 We have to select 3 coupons from 4 identical coupons and 6 distinct coupons. Then the coupons can be selected in the following ways.
3 identical and 0 distinct coupons in $1\times {}^6C_0$ ways
2 identical and 1 distinct coupons in $1\times {}^6C_1$ ways
1 identical and 2 distinct coupons in $1\times {}^6C_2$ ways
0 identical and 3 distinct coupons in $1\times {}^6C_3$ ways
Hence the required number of ways

$$= {}^6C_0 + {}^6C_1 + {}^6C_2 + {}^6C_3$$
$$= 2^6 - ({}^6C_4 + {}^6C_5 + {}^6C_6) = 64 - 22 = 42$$

☑ Introductory Exercise 19.7

1 The required number of ways = 10 − 3 + 1 = 8

2 When there is no restriction, the number of ways of selection of 3 candles = ${}^{10}C_3 = 120$. The number of ways of selection of 3 consecutive candles = 8

Therefore the required number of ways = 120 − 8 = 112

3 The number of ways of selection of 3 consecutive candles = 10 − 3 + 1 = 8

The number of ways of selection of 2 consecutive candles = 10 − 2 + 1 = 9

The number of ways of selection of 3 candles such that the third candle is not the adjacent to any of the two consecutive candles
= 7 + 6 + 6 + 6 + 6 + 6 + 6 + 6 + 7 = 56

Thus the number of selection of 3 candles such that at least 2 candles are consecutive = 8 + 56 = 64

Hint Let *a, b, c, d, e, f, g, h, i, j* be 10 consecutive candles in that order only. Then we have the following explanation.

2 consecutive candles	Third candle	Total number of cases
ab	Except *c*, any 7 candles	7
bc	Except *a* and *d*, any 6 candles	6
cd	Except *b* and *e*, any 6 candles	6
de	Except *c* and *f*, any 6 candles	6
ef	Except *d* and *g*, any 6 candles	6
fg	Except *e* and *h*, any 6 candles	6
gh	Except *f* and *i*, any 6 candles	6
hi	Except *g* and *j*, any 6 candles	6
ij	Except *h*, any 7 candles	7

4 Number of selections of *k* consecutive things out of *n* things in a row = $(n - k + 1)$. Therefore number of selection of 5 consecutive seats = 10 − 5 + 1 = 6

Hence choice (c) is the answer.

Hint (1-5), (2-6), (3-7), (4-8), (5-9), (6-10)

5 Number of selections of *k* consecutive things out of *n* things in a row = $(n - k + 1)$

Therefore number of selection of 4 consecutive seats = 10 − 4 + 1 = 7

Hence choice (a) is the answer.

6 Number of selections of *k* consecutive things out of *n* things in a row = $(n - k + 1)$

Therefore number of selection of 4 consecutive seats = 7 − 4 + 1 = 4

Hence choice (a) is the answer.

7 The number of ways of selecting 4 months, out of 12 months, such that no two months are consecutive = ${}^{12-4+1}C_4 = {}^{9}C_4 = 126$

Hence choice (c) is the answer.

8 The number of ways of selecting 4 bogies out of 10 bogies, such that no two bogies are adjacent ones = ${}^{10-4+1}C_4 = 35$

Number of ways of selecting 4 terrorists out of 8 terrorists who board the train = ${}^{8}C_4 = 70$

And the number of ways of arranging 4 terrorists in the four bogies = 4! = 24

Therefore the number of ways in which 4 terrorists board the train in the required manner = $35 \times 70 \times 24 = 58800$

9 Total number of teams = 4, Total number of members = 16

Total number of chairs = 21, Extra number of chairs = 5
Now for a moment, solve the problem considering the four teams as 4 individuals.
So, the number of seats available for 4 teams = 4 + 5 = 9
Number of ways of selecting 4 seats out of 9 seats for the 4 teams, such that no teams sit in the adjacent chairs = ${}^{9-4+1}C_4 = 15$

Number of ways of mutually arranging the 4 teams = 4! = 24

Number of ways of arranging the individuals within a team when they are sitting next to each other = $2! \times 3! \times 5! \times 6!$ = 1036800
Number of ways of selecting 16 chairs out of 21 chairs so that no two members of different teams sit together and members of each team must sit together

$$= 15 \times 24 \times 1036800 = 373248000$$

10 Number of couples = 6, Number of seats required = 12

Number of seats available = 20, Number of extra seats = 8

For a moment consider each couple as an individual, then the number of seats available for the couples = 6 + 8 = 14

Number of ways of selecting 6 seats out of 14 seats for the 6 couples, such that no two couples sit in the adjacent chairs = ${}^{14-6+1}C_6 = 84$.

Number of ways of mutually arranging the 6 couples = 6! = 720

As each couple can be arranged in 2!ways so all the couples can be internally arranged in

$$2! \times 2! \times 2! \times 2! \times 2! \times 2! = 64 \text{ ways.}$$

Number of ways of selecting 12 seats out of 20 seats so that no two couples sit together and each couple must sit together = $84 \times 720 \times 64 = 3870720$

11 Number of selections of k consecutive things out of n things in a circle = n ; when $k < n$.

Therefore number of selections of 6 consecutive lights out of 12 lights = 12 .

Hence choice (d) is the answer.

12 Number of selections of k consecutive things out of n things in a circle = n; when $k < n$.

Therefore number of selections of 2 consecutive chairs out of 5 chairs = 5.

Hence choice (d) is the answer.

13 Number of selections of 4 consecutive chairs out of 10 chairs = 10.

Hence choice (b) is the answer.

14 Let V_1, V_2, V_3, ... V_{10} be the 10 vertices of the 10-sided polygon, then there will be 10 consecutive pairs of vertices viz. V_1V_2, V_2V_3, V_3V_4, ..., $V_{10}V_1$.

Now each pair can be connected with 7 other vertices. 1 vertex is not counted here to avoid the repetition.

For example, V_1V_2 can be connected to V_3, V_4, V_5, V_6, V_7, V_8, V_9.

Similarly, V_2V_3 can be connected to V_4, V_5, V_6, V_7, V_8, V_9, V_{10} .

…

…

Similarly, $V_{10}V_1$ can be connected to V_2, V_3, V_4, V_5, V_6, V_7, V_8.

So the total number of required triangles = $10 \times 7 = 70$.

15 Total number of triangles obtained by connecting 10 vertices of the polygon = ${}^{10}C_3 = 120$

And the number of triangles with at least one coinciding side = 70

Therefore the number of triangles with no coinciding sides = 120 − 70 = 50.

16 The problem is equivalent to the selection of 3 points on the circumference of a circle so that none of the 3 points are adjacent to each other.

Let us consider the 10 points P_1, P_2, P_3, ...,P_{10} in that order on the circumference. Now let us select a point P_1, then we cannot select the points P_2 and P_{10} as they are the adjacent points to P_1.

Now we have 7 points P_3, P_4, P_5, P_6, P_7 , P_8, P_9, from which we have to select 2 points such that they are not the adjacent to each other. This is like selecting 2 non-consecutive points from the 7 points in a row.

Number of ways of selection of 2 points out of 7 points, without any restriction = ${}^7C_2 = 21$

Number of ways of selection of 2 consecutive points out of 7 points in a row = 7 − 2 + 1 = 6

Therefore the number of ways of selection of 2 points which are non-consecutive = 21 − 6 = 15.

Since the first point (in this assumption it is P_1) can be selected in 10 ways, as there are total 10 points. So the total number of selections of 3 points such that none of them is adjacent to each other = $10 \times 15 = 150$.

But, since in the above solution each combination occurs 3 times, so the required number of ways = $\frac{150}{3} = 50$.

NOTE When you select the first point P_1, then the other two points will be (say) P_3 and P_5. But when you select the first point P_3, then the other two points will be (say) P_5 and P_1. Similarly, when you select the first point P_5, then the other two points will be (say) P_1 and P_3. That's why I'm saying that each combination occurs 3 times.

17 (i) First of all keep all the chairs of same color together. Now the two groups can be arranged in 2! ways. Now the red chairs can be arranged in 6! ways and blue chairs can be arranged in 4! ways. Therefore the required number of arrangements = $2! \times (6! \times 4!)$

(ii) At first, consider all the 6 red chairs as a single bundle. Now, there are 4 blue chairs and 1 bundle of red chairs, so total 5 articles are to be arranged, which can be done in 5! ways. But just a while back we have assumed that 6 red chairs as a bundle, which can be arranged in 6! ways. Therefore the total number of arrangements = $5! \times 6!$

(iii) First of all arrange all the 6 red chairs, which can be done in 6! ways. Now after arranging 6 chairs there will be 7 places available for the 4 blue chairs to be arranged, which can be done in ${}^7C_4 \times 4! = 840$ ways.

Therefore, the required number of ways = ${}^7C_4 \times 4! \times 6!$

(iv) First of all arrange all the 5 red chairs in 5! ways and then arrange all the blue chairs in the right side of each red color chair in 5!. ways. Similarly all the blue chairs can be arranged in the left side of the each red chair. Therefore the total number of arrangements

$$= 5! \times 5! + 5! \times 5! = 2(5! \times 5!)$$

(v) First of all arrange all the 6 identical red chairs in a row that can be done in 1 way. Now there will be 7 places for the 4 blue chairs to be arranged and that can be done in ${}^7C_4$ ways. Therefore, the required number of ways = $1 \times {}^7C_4 = {}^7C_4$

(vi) First of all arrange all the 6 identical red chairs in a row, which can be done in 1 way. Now there will be 7 places for the 4 blue chairs to be arranged and that can be done in ${}^7C_4 \times 4!$ ways. Therefore, the required number of ways = $1 \times {}^7C_4 \times 4! = {}^7C_4 \times 4!$

Thus we see that none of the statements is wrong.

18 On the first day of the week she can choose any of the 7 activities, but on the remaining days she can choose only 6 activities as she cannot choose the activity that she chooses the previous day.

So the required number of ways

$$= 7 \times 6 \times 6 \times 6 \times 6 \times 6 \times 6 = 7 \times 6^6$$

☑ Introductory Exercise 19.8

1 8 CDs can be selected from 12 CDs in ${}^{12}C_8$ ways and 4 CDs can be selected from the remaining 4 CDs in ${}^{4}C_4$ ways.

Therefore total number of ways

$$= {}^{12}C_8 \times {}^{4}C_4 = \frac{12!}{8! \times 4!} \times \frac{4!}{4! \times 0!} = \frac{12!}{8! \times 4!} = 495$$

Hence choice (b) is the answer.

2 8 CDs can be selected from 12 CDs in ${}^{12}C_8$ ways and 4 CDs can be selected from the remaining 4 CDs in ${}^{4}C_4$ ways. And since these CDs are given to 2 different students which can be exchanged mutually; that means if one student receives 8 CDs then another student will receive 4 CDs and vice-versa.

Therefore total number of ways in which 12 CDs can be given to 2 students

$$= ({}^{12}C_8 \times {}^{4}C_4) \times 2! = \left(\frac{12!}{8! \times 4!}\right) \times 2! = 990$$

Hence choice (a) is the answer.

3 6 CDs can be selected from 12 CDs in ${}^{12}C_6$ ways and 4 CDs can be selected from 6 CDs in ${}^{6}C_4$ ways and the remaining 2 CDs can be selected from remaining 2 CDs in ${}^{2}C_2$ ways.

Therefore total number of ways

$$= {}^{12}C_6 \times {}^{6}C_4 \times {}^{2}C_2$$

$$= \frac{12!}{6! \times 6!} \times \frac{6!}{4! \times 2!} \times \frac{2!}{2! \times 0!}$$

$$= \frac{12!}{6! \times 4! \times 2!} = 13860$$

Hence choice (c) is the answer.

4 The number of ways in which these CDs can be divided in the groups of 6, 4 and 2 is $\frac{12!}{6! \times 4! \times 2!}$

But since these CDs can be exchanged among 3 students in 3! ways, so the number of ways in which these CDs can be given to three students $= \frac{12!}{6! \times 4! \times 2!} \times 3! = 13860 \times 6$

$= 83160$

Hence choice (d) is the answer.

19 If Siddhartha practices with Deepika only once in a week, it can be done in 7 ways. If Siddhartha practices with her twice a week, it can be done in 6 ways. Similarly, if Siddhartha practices with her for 3, 4, 5, 6 and 7 days, it can be done in 5, 4, 3, 2 and 1 ways.

Therefore the required number of ways

$$= 7 + 6 + 5 + 4 + 3 + 2 + 1 = 28$$

5 6 CDs can be selected from 12 CDs in ${}^{12}C_6$ ways and other 6 CDs can be selected from the remaining 6 CDs in ${}^{6}C_6$ ways.

Therefore total number of ways

$$= {}^{12}C_6 \times {}^{6}C_6 \times \frac{1}{2!} = \frac{12!}{6! \times 6!} \times \frac{6!}{6! \times 0!} \times \frac{1}{2!}$$

$$= \frac{12!}{6! \times 6!} \times \frac{1}{2!} = \frac{12!}{(6!)^2} \times \frac{1}{2!} = 462$$

The division by 2! indicates that since the number of CDs in each group is same so only half of the combinations will be there.

Hence choice (c) is the answer.

6 Number of ways in which 12 CDs can be distributed to two French students equally $= \left(\frac{12!}{(6!)^2} \times \frac{1}{2!}\right) \times 2! = 924$

The division by 2! indicates that the two groups are having equal number of CDs, so they are indistinguishable. And the multiplication by 2! indicates that since the two students are distinguishable so they can exchange the packets in 2! ways.

Hence choice (d) is the answer.

7 Number of ways in which 12 CDs can be divided equally into three groups $= \frac{12!}{4! \times 4! \times 4!} \times \frac{1}{3!} = \frac{12!}{(4!)^3} \times \frac{1}{3!} = 5775$

The division by 3! indicates that the three groups are having equal number of CDs, so they are indistinguishable.

Hence choice (d) is the answer.

8. Number of ways in which 12 CDs can be distributed among three French students equally $= \frac{12!}{(4!)^3} \times \frac{1}{3!} \times 3! = 34650$

The division by 3! indicates that the three groups are having equal number of CDs, so they are indistinguishable. And the multiplication by 3! indicates that the three students are distinguishable so they can exchange the packets in 3! ways. Hence choice (a) is the answer.

9 Number of ways in which 12 CDs can be distributed among six French students equally $= \frac{12!}{(2!)^6} \times \frac{1}{6!} \times 6! = \frac{12!}{(2!)^6}$

Hence choice (a) is the answer.

10 Number of ways in which 12 CDs can be distributed to 6 French students

= First CD can be given to any 6 students, similarly second CD, third CD….etc. can be given to any of the 6 students

$= 6 \times 6 \times 6 \times 6 \times 6 \times 6 \times 6 \times 6 \times 6 \times 6 \times 6 \times 6 = 6^{12}$

Hence choice (a) is the answer.

11 First of all distribute 2 CDs to each of the four French students. Then distribute the remaining 4 CDs in all the possible ways. After distributing all the 12 CDs there will be five cases, as presented in the following table. Suppose A, B, C and D are four French students.

Case	A	B	C	D
i	2	2	2	6
ii	2	2	3	5
iii	2	2	4	4
iv	2	3	3	4
v	3	3	3	3

Case (i) $({}^{12}C_2 \times {}^{10}C_2 \times {}^{8}C_2 \times {}^{6}C_6) \times \frac{4!}{3!}$

$= 83160 \times 4 = 110880$

Case (ii) $({}^{12}C_2 \times {}^{10}C_2 \times {}^{8}C_3 \times {}^{5}C_5) \times \frac{4!}{2!}$

$= 166320 \times 12 = 1995840$

Case (iii) $({}^{12}C_2 \times {}^{10}C_2 \times {}^{8}C_4 \times {}^{4}C_4) \times \frac{4!}{2!\,2!}$

$= 207900 \times 6 = 1247400$

Case (iv) $({}^{12}C_2 \times {}^{10}C_3 \times {}^{7}C_3 \times {}^{4}C_4) \times \frac{4!}{2!}$

$= 277200 \times 12 = 3326400$

Case (v) $({}^{12}C_3 \times {}^{9}C_3 \times {}^{6}C_3 \times {}^{3}C_3) \times \frac{4!}{4!}$

$= 369600 \times 1 = 369600$

Therefore total number of the required ways = 7050120

12 Since none of the 4 students can have more than 3 CDs, which implies that each one has to have exactly 3 CDs. This can be easily done using the following formula.

The number of ways in which 12 CDs can be distributed among 4 students equally

$$= \frac{12!}{(3!)^4} \times \frac{1}{4!} \times 4! = \frac{12!}{(3!)^4} = 369600$$

13 The number of ways of dividing n identical items among r persons (where $0 \le r \le n$), each one of whom can receive any number (0, 1, 2,…, n) of items = ${}^{n+r-1}C_{r-1}$

Therefore the number of ways in which 12 identical chocolates can be distributed among 4 kids

$$= {}^{12+4-1}C_{4-1} = {}^{15}C_3 = 455$$

Hence choice (a) is the answer.

14 The number of ways of dividing n identical items among r persons (where $0 \le r \le n$), each one of whom must receive at least one item = ${}^{n-1}C_{r-1}$

Therefore the number of ways in which 12 identical chocolates can be distributed among 4 kids such that each of them must receive at least one chocolate

$= {}^{12-1}C_{4-1} = {}^{11}C_3 = 165$

Hence choice (d) is the answer.

Alternatively Since each kid has to receive at least one chocolate, so first of all give 1 chocolate to each of the 4 kids, which will be done in 1 way as the chocolates are identical and each one is getting equal number of chocolates. Now you have to distribute just 8 chocolates among 4 kids in such a way that anyone receives any number of chocolates. Since each kid has already received minimum 1 chocolate, so it won't matter anymore that any particular kid is not getting any chocolate from the remaining 8 chocolates.

Now, the number of ways in which 8 chocolates can be distributed among 4 kids such that any kid can get any number of chocolates = ${}^{8+4-1}C_{4-1} = 165$

Therefore the number of ways in which 12 identical chocolates can be distributed among 4 kids such that each of them must receive at least one chocolate = $165 \times 1 = 165$

15 Since each kid has to receive at least two chocolates, so first of all give 2 chocolates to each of the 4 kids, which will be done in 1 way, as the chocolates are identical and each one is getting equal number of chocolates.

Now you have to distribute just 4 chocolates among 4 kids in such a way that anyone receives any number of chocolates. Since each kid has already received minimum 2 chocolates, so it won't matter anymore that any particular kid is not getting any chocolate from the remaining 4 chocolates. Now, the number of ways in which 4 chocolates can be distributed among 4 kids such that any kid can get any number of chocolates

$$= {}^{4+4-1}C_{4-1} = 35$$

Therefore the number of ways in which 12 identical chocolates can be distributed among 4 kids such that each of them must receive at least two chocolates = $35 \times 1 = 35$.

16. Since each of the 4 kids has to receive at least 3 chocolates, it means all the 12 chocolates will have to be distributed evenly (or equally). That means every one of them will get any 3 chocolates and this can be done in only 1 way as chocolates are identical and being distributed evenly.

17 Since each kid has to receive at least two chocolates, so first of all give 2 chocolates to each of the 4 kids, which will be done in 1 way as the chocolates are identical and each one is getting equal number of chocolates.

After distributing 8 chocolates, now you have to distribute remaining 4 chocolates among 4 kids.

(i) Since each kid has to receive at least 2 chocolates, so now it's not necessary to give any chocolate to every kid, from the remaining 4 chocolates.

(ii) Since each kid has to receive not more than 4 chocolates, so now it is obvious that no kid gets more than 2 chocolates, from the remaining 4 chocolates.

This can be done in the following ways:

Case I 0, 0, 2, 2 → No. of selections = 6

Case II 0, 1, 1, 2 → No. of selections = 12

Case III 1, 1, 1, 1 → No. of selections = 1

Therefore total number of required selection

$$= 6 + 12 + 1 = 19$$

Hence choice (b) is the answer.

Alternatively

Case I 2, 2, 4, 4 → No. of selections = 6

Case II 2, 3, 3, 4 → No. of selections = 12

Case III 3, 3, 3, 3 = No. of selections = 1

Therefore total number of required selections

$= 6 + 12 + 1 = 19.$

Alternatively The number of ways in which n identical things can be divided into r groups so that no group contains less than m items and more than k items (where $m < k$) is coefficient of x^n in the expansion of $(x^m + x^{m+1} + \ldots + x^k)^r$

Therefore the required number of ways of distribution of chocolates = coefficient of x^{12} in the expansion of $(x^2 + x^3 + x^4)^4$

Now, $(x^2 + x^3 + x^4)^4 = (x^2 + x^3 + x^4)^2 \times (x^2 + x^3 + x^4)^2$

$\Rightarrow \quad (x^2 + x^3 + x^4)^4 = (x^4 + 2x^5 + 3x^6 + 2x^7 + x^8)$
$(x^4 + 2x^5 + 3x^6 + 2x^7 + x^8)$

$\Rightarrow \quad (x^2 + x^3 + x^4)^4 = (x^8 + \ldots + 19x^{12} + \ldots + x^{16})$

Since the coefficient of x^{12} is 19, so the required number of ways = 19. Hence choice (b) is the answer.

18 Since the first kid can get any one lot out of 4 lots (1 or 2 or 4 or 5) of chocolates, then the second kid can get any one lot of remaining 3 lots of chocolates and so on.
Therefore the number of ways of distributing 12 chocolates $= 4 \times 3 \times 2 \times 1 = 24$

Hence choice (b) is the answer.

19 Since it's already decided that who gets how many chocolates, then the number of ways in which 12 chocolates can be distributed is 1.
Hence choice (d) is the answer.

20 Since each kid gets 3 identical chocolates so the number of ways in which 12 chocolates can be distributed = 1.
Hence choice (d) is the answer.

21 Total number of non-negative integral solutions of the given equation $= {}^{30+3-1}C_{3-1} = {}^{32}C_2 = 496$

22 Total number of positive integral solutions of the given equation $= {}^{30-1}C_{3-1} = {}^{29}C_2 = 406$

23 When $a = 2$, $b + c = 28$, and the number of even positive integral solutions is 13, namely (2, 26), (4, 24), (6, 22), …, (26, 2)

Similarly we can find the number of solutions for every value of a, as shown in the following table.

a	$b + c$	Number of solutions
2	28	13
4	26	12
6	24	11
…	…	…
26	4	1

Therefore the total number of required solutions
$= 1 + 2 + 3 + \ldots + 13 = 91$

24 As you know, odd + odd + odd = odd, but since 30 is an even number.

So the required number of solutions = 0.

25 For $a = 1$, $b + c = 29$ and then it has 13 solutions such that $a < b < c$, namely $(b, c) = (2, 27), (3, 26), (4, 25), \ldots, (14, 15)$

Similarly, we can find the number of solutions for $a = 2, 3, 4, \ldots$ as shown in the table below.

a	$b + c$	Number of solutions
1	29	13
2	28	11
3	27	10
4	26	8
5	25	7
6	24	5
7	23	4
8	22	2
9	21	1

Therefore the number of solutions

$$= (1 + 4 + 7 + 10 + 13) + (2 + 5 + 8 + 11) = 61$$

Since a, b, c can be mutually arranged in 3! ways, so the required number of solutions

$$= 61 \times 3! = 366$$

26 For $a = 0$, $b + c = 30$ and then it has 14 solutions such that $a < b < c$, namely $(b, c) = (1, 29), (2, 28), (3, 27), (4, 26), \ldots, (14, 16)$

Similarly, we can find the number of solutions for $a = 2, 3, 4, \ldots$ as shown in the table below.

a	$b + c$	Number of solutions
0	30	14
1	29	13
2	28	11
3	27	10
4	26	8
5	25	7
6	24	5
7	23	4
8	22	2
9	21	1

Therefore the number of solutions

$= (1 + 14) + (2 + 13) + (4 + 11) + (5 + 10) + (7 + 8) = 75$

27 For $a = 0$, $b + c = 30$ and then it has 31 solutions such that $a \le b$ and $0 \le c \le 30$, namely $(b, c) = (0, 30), (1, 29), (2, 28), (3, 27), (4, 26), \ldots, (29, 1), (30, 0)$

Similarly, we can find the number of solutions for $a = 2, 3, 4, \ldots$ as shown in the table below.

a	$b + c$	Number of solutions
0	30	31
1	29	29
2	28	27
3	27	25
4	26	23
...	...	...
...	...	...
15	15	1

Therefore the number of solutions

$= (1 + 3 + 5 + \ldots + 29 + 31) = 256$

28 Consider the following table.

For example, when $a = 1$, $2b + c = 27$,

it will have 13 positive solutions.

As in $(b, c) = (1, 25), (1, 23), (3, 21), \ldots, (13, 1)$.

Similarly, you can find the number of solutions for other values of a.

a	$2b + c$	Number of solutions
1	27	13
2	24	11
3	21	10
4	18	8
5	15	7
6	12	5
7	9	4
8	6	2
9	3	1

Therefore total number of solutions

$= 13 + 11 + 10 + 8 + 7 + 5 + 4 + 2 + 1 = 61$

NOTE The above sum can be broken into two parts for the sake of convenience, as in $(13 + 10 + 7 + 4 + 1) + (11 + 8 + 5 + 2) = 61$. Clearly there are 2 arithmetic progressions.

29 Let the number of red, pink and yellow roses be r, p and y, respectively. Then, $r + p + y = 30$, such that $r, p, y \ge 0$.

Therefore the required number of ways = Number of ways of distributing 30 identical things among 3 persons such that each may get 0 or more things

$= {}^{30+3-1}C_{3-1} = {}^{32}C_2 = 496$

30. Let the number of red, pink and yellow roses be r, p and y, respectively. Then, $r + p + y = 30$, such that $r, p, y \ge 1$.

Therefore the required number of ways = Number of ways of distributing 30 identical things among 3 persons such that each may get 1 or more things

$= {}^{30-1}C_{3-1} = {}^{29}C_2 = 406$

31 The number of non-negative integral solutions of the equation $x_1 + x_2 + x_3 + \ldots + x_r = n$ is ${}^{n+r-1}C_{r-1}$

Therefore number of non-negative integral solutions of the equation $a + b + c + d = 12$ is ${}^{12+4-1}C_{4-1} = {}^{15}C_3 = 425$.

Hence choice (d) is the answer.

NOTE This problem is same as distribution of 12 identical chocolates among 4 different persons.

32 The number of positive integral solutions of the equation $x_1 + x_2 + x_3 + \ldots + x_r = n$ is ${}^{n-1}C_{r-1}$.

Therefore number of positive integral solutions of the equation ${}^{12-1}C_{4-1} = {}^{11}C_3 = 165$

Hence choice (b) is the answer.

NOTE This problem is same as distribution of 12 identical chocolates among 4 different persons, in such a way that everyone gets at least 1 chocolate.

33 The number of solutions of $a + b + c + d = 12$ is the coefficient of x^{12} in the expansion of $(x^2 + x^3 + x^4)^4$

Since, $(x^2 + x^3 + x^4)^4 = (x^2 + x^3 + x^4)^2 \times (x^2 + x^3 + x^4)^2$

$\Rightarrow (x^2 + x^3 + x^4)^4 = (x^4 + 2x^5 + 3x^6 + 2x^7 + x^8)$

$(x^4 + 2x^5 + 3x^6 + 2x^7 + x^8)$

$\Rightarrow (x^2 + x^3 + x^4)^4 = (x^8 + \ldots + 19x^{12} + \ldots + x^{16})$

As the coefficient of x^{12} is 19, so the required number of solutions = 19. Hence choice (a) is the answer.

Alternatively Let us assume that there are 12 identical balls that you are supposed to distribute among four kids such that each of them receives at least 2 balls but not more than 4 balls.

So, first of all give 2 balls to each of the four kids, now you are left with four balls to distribute. That can be done in the following way.

Case I 0, 0, 2, 2 → No. of selections = ${}^4C_2 = 6$

Case II 0, 1, 1, 2 → No. of selections = ${}^4C_1 \times {}^3C_2 = 12$

Case III 1, 1, 1, 1 → No. of selections = 1

Therefore total number of required selections
$= 6 + 12 + 1 = 19$

In case I, you can select any two kids out of four kids to dole out 2 balls to each one.

In case II, you can select 1 kid out of four kids to give her 2 balls, then you can select any 2 kids out of the remaining 3 kids to dole out 1 ball to each of them.

In case III, you can give 1 ball to each one of the four kids in 1 way.

Alternatively The number of integral solutions of the equation $a + b + c + d = 12$, such that $2 \le a, b, c, d \le 4$ is same as the number of non-negative integral solutions of $p + q + r + s = 4$, such that $0 \le a, b, c, d \le 2$ for $p = a - 2$, $q = b - 2$, $r = c - 2$, $s = d - 2$.

Now the number of solutions of $p + q + r + s = 4$, such that $0 \le a, b, c, d \le 2$ = (number of solutions of $p + q + r + s = 4$, such that $0 \le a, b, c, d \le 4$) − (number of solutions of $p + q + r + s = 4$, such that $3 \le a, b, c, d \le 4$)

But number of solutions of $p + q + r + s = 4$, such that $0 \le a, b, c, d \le 4$ is ${}^{4+4-1}C_{4-1} = {}^7C_3 = 35$

And number of solutions of $p + q + r + s = 4$, such that $3 \le a, b, c, d \le 4$ is $4\,[{}^{(4-3)+4-1}C_{4-1}] = 4\,[{}^4C_3] = 16$

Therefore, number of solutions of $p + q + r + s = 4$, such that $0 \le a, b, c, d \le 2$, $= 35 - 16 = 19$.

So the number of integral solutions of the equation $a + b + c + d = 12$, such that $2 \le a, b, c, d \le 4$ is 19.

34 The given equation $a + b + c + d = 12$ can be expressed as following.

$(a - 2) + (b - 2) + (c - 2) + (d - 2) = 12 - (2 + 2 + 2 + 2)$

$\Rightarrow w + x + y + z = 4$;

(Where $w = a - 2$, $x = b - 2$, $y = c - 2$, $z = d - 2$)

Now the number of non-negative integer solutions of $w + x + y + z = 4$ is ${}^{4+4-1}C_{4-1} = {}^7C_3 = 35$

Therefore the number of integral solutions of $a + b + c + d = 12$, when $a, b, c, d \ge 2$ is 35.

Hence choice (a) is the answer.

NOTE This problem is same as distribution of 12 identical chocolates among 4 different persons, in such a way that everyone gets at least 2 chocolates.

35 Finding the number of integral solutions of the equation, such that $a > 0$, $b > 1$, $c > 2$, $d > 3$ is same as finding the number of integral solutions of the equation, such that $a \ge 1$, $b \ge 2$, $c \ge 3$ $d \ge 4$

Now the given equation $a + b + c + d = 12$ can be expressed as following.

$(a - 1) + (b - 2) + (c - 3) + (d - 4)$
$= 12 - (1 + 2 + 3 + 4)$

$\Rightarrow w + x + y + z = 2$;

(Where $w = a - 1$, $x = b - 2$, $y = c - 3$, $z = d - 4$)

Now the number of non-negative integral solutions of $w + x + y + z = 2$ is

$${}^{2+4-1}C_{4-1} = {}^5C_3 = 10$$

Therefore the number of integral solutions of $a + b + c + d = 12$, when $a > 0$, $b > 1$, $c > 2$, $d > 3$ is 10.

Hence choice (a) is the answer.

NOTE This problem is same as distribution of 12 identical chocolates among 4 different persons, in such a way that one particular person gets more than 1 chocolate, another particular person gets more than 2 chocolates, another particular person gets more than 3 chocolates and there is another person who gets more than 4 chocolates.

36 Finding the number of integral solutions of the equation, such that $a > -4$, $b > -3$, $c > -2$, $d > -1$ is same as finding the number of integral solutions of the equation, such that $a \ge -3$, $b \ge -2$, $c \ge -1$, $d \ge 0$.

The given equation $a + b + c + d = 12$ can be expressed as following.

$(a + 3) + (b + 2) + (c + 1) + (d + 0) = 12 + (3 + 2 + 1 + 0)$

$\Rightarrow w + x + y + z = 18$;

(Where $w = a + 3$, $x = b + 2$, $y = c + 1$, $z = d + 0$)

Now the number of non-negative integral solutions of $w + x + y + z = 18$ is

$${}^{18+4-1}C_{4-1} = {}^{21}C_3 = 1330$$

Therefore the number of integral solutions of $a + b + c + d = 12$ when $a > -4$, $b > -3$, $c > -2$, $d > -1$ is 1330

Hence choice (a) is the answer.

37 The given equation $a + b + c + d = 12$ can be expressed as following $a + b + 6 + 0 = 12 \Rightarrow a + b = 6$

Now the number of non-negative integral solutions of the equation $a + b = 6$ such that $a \ge 1$ and $b \le 4$.

a	b	$a + b$
2	4	6
3	3	6
4	2	6
5	1	6
6	0	6

Therefore the total number of solutions of the given equation will be 5. Hence choice (c) is the correct one.

38 The given equation $a + b + c + d = 12$ can be expressed as following.

$(a + 2) + (b + 2) + (c + 2) + (d + 2) = 12 + (2 + 2 + 2 + 2)$

$\Rightarrow \quad w + x + y + z = 20$;

(where $w = a + 2,\ x = b + 2,\ y = c + 2,\ z = d + 2$)

Now, finding the number of integral solutions of the equation $a + b + c + d = 12$, such that $-2 \le a, b, c, d \le 19$ is same as finding the number of integral solutions of the equation $w + x + y + z = 20$, such that $0 \le w, x, y, z \le 21$.

Since none of w, x, y or z can have any value greater than 20, so the upper limit (21) on w, x, y and z is irrelevant.

Thus the given problem is same as finding the number of non-negative integral solutions of $w + x + y + z = 20$.

Therefore the required number of solutions

$$= {}^{20+4-1}C_{4-1} = {}^{23}C_3 = 1771$$

39 The following two problems are just the same, the only difference lies in the sign.

There are four numbers a, b, c, d such that $a + b + c + d = -12$. Find the number of integral solutions of the equation, such that $a, b, c, d < 0$ Answer : 165	There are four numbers a, b, c, d such that $a + b + c + d = 12$. Find the number of integral solutions of the equation, such that $a, b, c, d > 0$ Answer : 165

40 The following two problems are just the same, the only difference lies in the sign.

There are four numbers a, b, c, d such that $a + b + c + d = -12$. Find the number of integral solutions of the equation, such that $a, b, c, d \le 0$ Answer : 425	There are four numbers a, b, c, d such that $a + b + c + d = 12$. Find the number of integral solutions of the equation, such that $a, b, c, d \ge 0$ Answer : 425

Solutions (for Q. Nos. 41 to 44) $a + b + c = 8$

Case I	0	0	$8 \to 3$ ways/solutions
Case II	0	1	$7 \to 6$ ways/solutions
Case III	0	2	$6 \to 6$ ways/solutions
Case IV	0	3	$5 \to 6$ ways/solutions
Case V	0	4	$4 \to 3$ ways/solutions
Case VI	1	1	$6 \to 3$ ways/solutions
Case VII	1	2	$5 \to 6$ ways/solutions
Case VIII	1	3	$4 \to 6$ ways/solutions
Case IX	2	2	$4 \to 3$ ways/solutions
Case X	2	2	$33 \to 3$ ways/solutions

NOTE Please keep in mind that this is just a reference list to aid to your visualization of solutions. Actually, when the number of solutions are too big to determine by preparing the list we have to resort to more logical methods. So it is important to learn the following methods, otherwise whenever large figures (or numbers) will be involved you will be grouping in the dark with no way out to get the solutions.

41 The number of integral solutions of $a + b + c = 8$, if $0 \le a, b, c \le 4$ = (Number of integral solutions of $a + b + c = 8$, if $0 \le a, b, c \le 8$) − (number of integral solutions of $a + b + c = 8$, if any of a, b or c is such that $5 \le a, b, c \le 8$). Number of integral solutions of $a + b + c = 8$, if $0 \le a, b, c \le 8 = {}^{8+3+1}C_{3-1} = {}^{10}C_2 = 45$.

Number of integral solutions of $a + b + c = 8$, if any of a, b or c is such that $5 \le a, b, c \le 8$)

$$= 3[{}^{(8-5)+3-1}C_{3-1}] = 3[{}^5C_2] = 30$$

Therefore number of solutions of $a + b + c = 8$, if

$$0 \le a, b, c \le 4 = 45 - 30 = 15.$$

Hence choice (a) is the answer.

Hint The above solution works on the basis of inclusion-exclusion principle. According to that principle, the set of integral solutions of $a + b + c = 8$, if $0 \le (a, b, c) \le 4$ do not include those solutions in which either of a, b or c is greater than 4.

However, the set of integral solutions of $a + b + c = 8$, if $5 \le (a, b, c) \le 8$ includes only those solutions which have at least one variable out of a, b and c greater than or equal to 5; so it's obvious that few of the variables will be certainly greater than or equal to 5 and few of them must be less than 5. So in this case each of the variables may not be greater than or equal to 5. Why does it happen? It's because of the objective.

As our objective is to exclude all those solutions in which even if one variable is greater than or equal to 5 rather than to include all those solutions in which every variable is greater than or equal to 5. For better understanding have a look at the above list of solutions.

Alternatively The number of solutions of $a + b + c = 8$ is the coefficient of x^8 in the expansion of

$$(1 + x + x^2 + x^3 + x^4)^3$$

Since, $(1 + x + x^2 + x^3 + x^4)^3$

$$= (1 + x + x^2 + x^3 + x^4)^2 \times (1 + x + x^2 + x^3 + x^4)$$

$$\Rightarrow (1 + x + x^2 + x^3 + x^4)^3$$

$$= (1 + 2x + 3x^2 + 4x^3 + 5x^4 + 4x^5 + 3x^6 + 2x^7 + x^8)(1 + x + x^2 + x^3 + x^4)$$

$$\Rightarrow (1 + x + x^2 + x^3 + x^4)^3$$

$$= (1 + 3x + \ldots + 15x^8 + \ldots + 3x^{11} + x^{12})$$

As the coefficient of x^8 is 15, so the required number of solutions = 15.

Alternatively

a	4	4	4	4	4	3	3	3	3	2	2	2	1	1	0
b	4	3	2	1	0	4	3	2	1	4	3	2	4	3	4
c	0	1	2	3	4	1	2	3	4	2	3	4	3	4	4

Thus there are total 15 solutions.

42 For the number of integral solutions of $a + b + c = 8$, for $0 \le a, b, c \le 3$, first of all find the total number of integral solutions of $a + b + c = 8$ for $0 \le a, b, c \le 8$ and then subtract the number of integral solutions of $a + b + c = 8$ if any of a, b or c is such that $4 \le a, b, c \le 8$.

The number of integral solutions of $a + b + c = 8$ for $0 \le (a, b, c) \le 8$ is ${}^{8+3-1}C_{3-1} = {}^{10}C_2 = 45$.

And the number of integral solutions of $a + b + c = 8$ if any of a, b or c is such that $4 \le a, b, c \le 8$ is $3[{}^{(8-4)+3-1}C_{3-1}] - 3[{}^{(8-2\times4)+3-1}C_{3-1}]$

$$= 3[{}^6C_2] - 3[{}^2C_2] = 42$$

Therefore number of integral solutions of $a + b + c = 8$, for $0 \le a, b, c \le 3$ is $45 - 42 = 3$.

Hence choice (c) is the answer.

Alternatively The number of solutions of $a + b + c = 8$ is the coefficient of x^8 in the expansion of $(1 + x + x^2 + x^3)^3$ which is 3 as

$$(1 + x + x^2 + x^3)^3 = (1 + 3x + \ldots + 3x^8 + x^9)$$

Alternatively Given that $a + b + c = 8$ and $0 \le a, b, c \le 3$, then we have the following solutions.

a	b	c
3	3	2
3	2	3
2	3	3

Therefore the required number of total solutions = 3

43 To find the number of integral solutions of $a + b + c = 8$, for $0 \le a, b, c \le 2$, first of all find the total number of integral solutions of $a + b + c = 8$ for $0 \le a, b, c \le 8$ and then subtract the number of solutions of $a + b + c = 8$ if any of a, b or c is such that $3 \le a, b, c \le 8$. The number of solutions of $a + b + c = 8$ for $0 \le a, b, c \le 8$ is 45.

The equation $a + b + c = 8$ for $3 \le a, b, c \le 8$ suggests that we have to find the solutions of this equation in which at least one variable must be greater than or equal to 3. So, we see that there can be at most two variables that will be greater than or equal to 3. But we also know that the solutions which have only one variable greater than or equal to 3 also include those solutions which have two variables greater than or equal to 3.

Therefore number of solutions of $a + b + c = 8$ for $3 \le a, b, c \le 8$ is

$$3[{}^{(8-3)+3-1}C_{3-1}] - 3[{}^{(8-2\times3)+3-1}C_{3-1}]$$

$$= 3[{}^7C_2] - 3[{}^4C_2] = 45$$

Thus the number of solutions of $a + b + c = 8$ for $0 \le a, b, c \le 2$ is $45 - 45 = 0$.

It shows that there are no solutions to the equation $a + b + c = 8$ for $0 \le a, b, c \le 2$

Hence choice (d) is the answer.

Alternatively The number of solutions of $a + b + c = 8$ is the coefficient of x^8 in the expansion of $(1 + x + x^2)^3$, which is 0, as the highest coefficient in this expansion is x^6.

44 To find the number of integral solutions of $a + b + c = 8$, for $0 \le (a, b, c) \le 1$, first of all find the total number of solutions of $a + b + c = 8$ for $0 \le (a, b, c) \le 8$ and then subtract the number of solutions of $a + b + c = 8$ if any of a, b or c is such that $2 \le (a, b, c) \le 8$. The number of solutions of $a + b + c = 8$ for $0 \le (a, b, c) \le 8$ is 45.

And the number of solutions of $a + b + c = 18$ if any of a, b or c is such that $2 \le (a, b, c) \le 8$ is

$$3[{}^{(8-3)+3-1}C_{3-1}] - 3[{}^{(8-2\times2)+3-1}C_{3-1}] +$$

$$[{}^{(8-2\times3)+3-1}C_{3-1}] = 3[{}^8C_2] - 3[{}^6C_2] + [{}^4C_2] = 45$$

Therefore number of integral solutions of $a + b + c = 8$,for $0 \le (a, b, c) \le 1 = 45 - 45 = 0$

Hence choice (d) is the answer.

Alternatively The number of solutions of $a + b + c = 8$ is the coefficient of x^8 in the expansion of $(1 + x + x^2)^3$, which is 0 as the highest coefficient in this expansion is x^6.

Alternatively Since the highest value of a, b and c is 2, so the total sum $a + b + c \le 6$. Thus we cannot attain $a + b + c = 8$ even once.

Therefore we have no solution for the given equation.

45 The number of integral solutions of $a + b + c + d = 30$, if $0 \le (a, b, c, d) \le 15$ = (Number of integral solutions of $a + b + c + d = 30$, if $0 \le (a, b, c, d) \le 30$) − (number of integral solutions of $a + b + c + d = 30$, if any of a, b, c or d is such that $16 \le (a, b, c, d) \le 30$).

Number of integral solutions of $a + b + c + d = 30$, if $0 \le (a, b, c, d) \le 30 = {}^{30+4-1}C_{4-1} = {}^{33}C_3$

Number of integral solutions of $a + b + c + d = 30$, if any of a, b, c or d is such that $16 \le (a, b, c, d) \le 30$

$$= 4[{}^{(30-16)+4-1}C_{4-1}] = 4[{}^{17}C_3]$$

Therefore number of solutions of $a + b + c + d = 30$, if $0 \le (a, b, c, d) \le 6 = {}^{33}C_3 - 4({}^{17}C_3) = 2736$.

Hence choice (a) is the answer.

Alternatively The number of integral solutions of $a + b + c + d = 30$, if $0 \le (a, b, c, d) \le 15$ = Coefficient of x^{30} in the expansion of $(1 + x + x^2 + x^3 + \ldots + x^{15})^4$

Now $(1 + x + x^2 + x^3 + \ldots + x^{15})^4$

$= (1 + 2x + 3x^2 + \ldots + 14x^{13} + 15x^{14}$
$+ 16x^{15} + 15x^{16} + 14x^{17} + \ldots + 2x^{29} + x^{30})^2$

Therefore coefficient of
$x^{30} = 2(1^2 + 2^2 + 3^2 + \ldots + 15^2) + 16^2 = 2736$

46 The number of integral solutions of $a + b + c + d = 30$, if $0 \le (a, b, c, d) \le 10$ = (Number of integral solutions of $a + b + c + d = 30$, if $0 \le (a, b, c, d) \le 30$) − (Number of integral solutions of $a + b + c + d = 30$, if any of a, b, c or d is such that $11 \le (a, b, c, d) \le 30$).

Number of integral solutions of $a + b + c + d = 30$, if $0 \le (a, b, c, d) \le 30 = {}^{30+4-1}C_{4-1} = {}^{33}C_3$

Number of integral solutions of $a + b + c + d = 30$, if any a, b, c or d is such that $11 \le (a, b, c, d) \le 30$
$= 4[{}^{(30+11)4-1}C_{4-1}] - 6[{}^{(30-2\times11)+4-1}C_{4-1}]$

$= 4[{}^{22}C_3] - 6[{}^{11}C_3]$.

Therefore number of solutions of $a + b + c + d = 30$, if $0 < a, b, c, d \le 6$
$= {}^{33}C_3 - [4({}^{22}C_3) - 6({}^{11}C_3)] = 286.$

Hence choice (b) is the answer.

Hint If any of a, b, c or d is such that $11 \le a, b, c, d \le 30$ then there are two cases.

(a) When one variable out of a, b, c is certainly at least 11, then one 11 is taken out from 30 and then remaining 19 is to be divided among a, b, c, d in ${}^{19+4-1}C_3 = {}^{22}C_3 = {}^{22}C_3$ ways. And this one 11 is later on arranged in ${}^4C_1 = 4$ ways.

(b) When any two variables out of a, b, c, d are certainly at least 11, then two 11s are taken out from 30 and then remaining 8 is to be divided among a, b, c, d in ${}^{8+4-1}C_3 = {}^{11}C_3$ ways. And these two 11s are later on arranged in ${}^4C_2 = 6$ ways.
But since case (a) includes case (b) also, so we have to subtract case (b) from case (a) as per inclusion-exclusion principle.

Alternatively The number of integral solutions of $a + b + c + d = 30$, if $0 \le a, b, c, d \le 10$ = Coefficient of x^{30} in the expansion of $(1 + x + x^2 + x^3 + \ldots + x^{10})^4$

Now, $(1 + x + x^2 + x^3 + \ldots + x^{10})^4$
$= (1 + 2x + 3x^2 + \ldots + 9x^8 + 10x^9 +$
$11x^{10} + 10x^{11} + 9x^{12} + \ldots + 2x^{19} + x^{20})^2$

Therefore coefficient of
$x^{30} = 2(11 \times 1 + 10 \times 2 + 9 \times 3 + 8 \times 4$
$+ 7 \times 5) + (6 \times 6) = 286$

47 The number of integral solutions of $a + b + c + d = 30$, if $0 \le (a, b, c, d) \le 8$ = (Number of integral solutions of $a + b + c + d = 30$, if $0 \le (a, b, c, d) \le 30$) − (Number of integral solutions of $a + b + c + d = 30$, if any of a, b, c or d is such that $9 \le (a, b, c, d) \le 30$).

Number of integral solutions of $a + b + c + d = 30$, if $0 \le (a, b, c, d) \le 30 = {}^{30+4-1}C_{4-1} = {}^{33}C_3$

Number of integral solutions of $a + b + c + d = 30$, if any of a, b, c or d is such that
$9 \le (a, b, c, d) \le 30 = 4[{}^{(30-9)+4-1}C_{4-1}]$
$- 6[{}^{(30-2\times9)+4-1}C_{4-1}] + 4[{}^{(30-3\times9)+4-1}C_{4-1}]$
$= 4[{}^{24}C_3] - 6[{}^{15}C_3] + 4[{}^6C_3] = 5446$

Therefore number of solutions of $a + b + c + d = 30$, if $0 \le (a, b, c, d) \le 8 = {}^{33}C_3 - [4({}^{24}C_3) - 6({}^{15}C_3) + 4({}^6C_3)]$
$= 5456 - 5446 = 10$
Hence choice (b) is the answer.

Alternatively The number of integral solutions of $a + b + c + d = 30$, if $0 \le (a, b, c, d) \le 10$ = Coefficient of x^{30} in the expansion of $(1 + x + x^2 + x^3 + \ldots + x^8)^4$ which is 10.

48 The number of ways in which $(m + n + p + q + r)$ different things can be divided into five different groups containing m, n, p, q and r things respectively, if the order of the group is important $= \dfrac{(m + n + p + q + r)!}{m!n!p!q!r!} \times 5!$

Therefore number of ways of distributing 15 rings among his 5 daughters such that one daughter gets 1 ring, another daughter gets 2 rings, and so on $= \dfrac{15!}{1!2!3!4!5!} \times 5!$

Hence choice (d) is the answer.

NOTE Please take stock of the situation that the articles (rings) as well as receivers (girls) are different.

Since the articles are different so we will use the division formula $\dfrac{(m+n+p+q+r)!}{m!n!p!q!r!}$ for distinct things.

Further, since the receivers are distinct (as girls are distinguishable) so we can arrange the different sets of rings among different girls. That means the order is important, so we have to multiply the possible divisions of groups by 5! In order to bring out all the possibilities in which these 15 rings can be distributed among his 5 daughters.

49 Again rings as well as girls are distinct from each other. However, it is certain that who gets how many rings, so we cannot interchange the set of rings among these girls. That means we can only choose the different rings but not the number of rings for each girl. Since it is already decided that the eldest daughter gets 1 ring, second eldest daughter gets 2 rings, the middle one gets 3 rings, the second youngest daughter gets 4 rings and the youngest daughter gets 5 rings. Therefore number of ways of distributing 15 rings among his 5 daughters $= \dfrac{15!}{1!2!3!4!5!}$

Hence choice (b) is the answer.

50 Primarily, there are two different cases in which 15 different rings can be divided. As per the statement there will be only one girl who is eldest and only one girl

who is youngest. Since the problem states that there are no twins but it does not say that there can't be any triplet (i.e. three kids born at the same time). So the case II arises.

Case I. 1, 2, 3, 4, 5; Case II. 1, 3, 3, 3, 5

Case I. Number of ways of distributing 15 rings

$$= \frac{15!}{1!2!3!4!5!}$$

Here we are not multiplying by 5! because it is already known that which particular daughter gets the particular number of rings.

Case II. Number of ways of distributing 15 rings

$$= \frac{15!}{1!3!3!3!5!} \times \frac{1}{3!} \times 3!$$

Here multiplication by 1!/3! indicates that there are 3 groups containing the same number of rings. And the multiplication by 3! indicates that the 3 groups of equal number of rings can be arranged among 3 distinct girls. Note that the age of girls is same, but girls are distinguishable by their names, features and all sorts of attributes that may distinguish two or more individuals. Also, note that we are arranging it among the 3 girls only, because we already know that the youngest daughter gets 5 rings and the oldest daughter gets 1 ring, so these two girls cannot be considered for arrangement.

Therefore total number of ways of distributing 15 different rings

$$= \frac{15!}{1!2!3!4!5!} + \frac{15!}{1!3!3!3!5!} = \frac{15!}{3!5!} \times \left[\frac{1}{2! \times 4!} + \frac{1}{3! \times 3!}\right] = \frac{15!}{3!5!} \times \frac{7}{144}$$

Hence choice (a) is the answer.

51 Primarily, there are three different cases in which 15 different rings can be divided such that none of them gets less than 2 and more than 4 rings.

Case I: 2, 2, 3, 4, 4; Case II: 2, 3, 3, 3, 4;

Case III: 3, 3, 3, 3, 3

Case I Number of ways of distributing 15 rings

$$= \frac{15!}{2!2!3!4!4!} \times \frac{1}{2! \times 2!} \times 5!$$

Here multiplication by $\frac{1!}{2!2!}$ indicates that there are 2 groups containing 2 rings in each group and there are 2 groups containing 4 rings in each group. And the multiplication by 5! indicates that there 5 distinct girls among which all the ring are to be distributed.

Case II Number of ways of distributing 15 rings

$$= \frac{15!}{2!3!3!3!4!} \times \frac{1}{3!} \times 5!$$

Here multiplication by 1!/3! indicates that there are 3 groups containing the same number of rings. And the multiplication by 5! indicates that there are 5 distinct girls among which all the rings are to be distributed.

Case III Number of ways of distributing 15 rings

$$= \frac{15!}{3!3!3!3!3!} \times \frac{1}{5!} \times 5!$$

Here multiplication by 1!/5! indicates that there are 5 groups containing the same number of rings. And the multiplication by 5! indicates that there are 5 distinct girls among which all the rings are to be distributed.

Therefore total number of ways of distributing 15 different rings

$$= 15! \times 5! \times \left[\frac{1}{(2!)^4 \times 3! \times (4!)^2} + \frac{1}{(2!) \times (3!)^4 \times 4!} + \frac{1}{(3!)^5 \times 5!}\right]$$

Hence choice (d) is the answer.

52 The number of ways of distributing 15 different rings among 5 girls equally $= \frac{15!}{3!3!3!3!3!} \times \frac{1}{5!} \times 5! = \frac{15!}{(3!)^5}$

Here multiplication by 1!/5! indicates that there are 5 groups containing the same number of rings. And the multiplication by 5! indicates that there are 5 distinct girls among which all the rings are to be distributed.

Hence choice (c) is the answer.

53 The number of ways of distributing 15 different rings among 5 girls such that a girl may get nothing or all the rings

$$= \underbrace{5 \times 5 \times 5 \times 5 \times 5 \times \ldots \times 5}_{15 \text{ times}} = 5^{15}$$

Hence choice (d) is the answer.

54 The number of ways of selection of 1 ring, 2 rings, 3 rings, 4 rings and 5 rings $= 1 \times 1 \times 1 \times 1 \times 1 = 1$

Number of ways of distributing these 5 sets of rings containing 1, 2, 3, 4, 5 rings $= 5 \times 4 \times 3 \times 2 \times 1 = 120$

Hence choice (a) is the answer.

Hint Number of ways of selecting 1 ring out of 15 rings = 1, selecting 2 rings out of remaining 14 rings = 1, and so on. Thus there will be 5 different sets of rings.

First set can be given to any 5 girls, second set can be given to any 4 girls, third set can be given to any three girls, fourth set can be given to any 2 girls and the last and fifth set can be given to the remaining girl.

55 The number of ways of selection of 1 ring, 2 rings, 3 rings, 4 rings and 5 rings $= 1 \times 1 \times 1 \times 1 \times 1 = 1$

Since it is already known that who gets how many rings, so the number of ways of distributing 5 different sets of rings = 1

Hence choice (a) is the answer.

56 Primarily, there are two different cases in which 15 identical rings can be divided. As per the statement there will be only one girl who is the eldest and only one girl who is the youngest. Since the problem states that

there are no twins but it does not say that there can't be triplets. So the case II arises.

Case I 1, 2, 3, 4, 5; **Case II** 1, 3, 3, 3, 5

Case I Number of ways of distributing 15 rings = 1

Case II Number of ways of distributing 15 rings = 1

Therefore total number of ways of distributing 15 rings = 2

Hence choice (b) is the answer.

Alternatively Let us consider a, b, c, d, e be his five daughters, then

$a + b + c + d + e = 15$ $\quad 1 + 2 + 3 + 4 + 5 = 15$

$1 + 3 + 3 + 3 + 5 = 15$

Thus there are only 2 ways of distribution as per the given conditions. Please note that the absence of twins in the family does not rule out the possibility of triplets.

57 The number of ways of dividing 15 identical rings among 5 girls such that none of them receives less than 2 or more than 4 = coefficient of x^{15} in the expansion of $(x^2 + x^3 + x^4)^5$

But $(x^2 + x^3 + x^4)^5 = (x^2 + x^3 + x^4)^4 (x^2 + x^3 + x^4)$

$\Rightarrow (x^2 + x^3 + x^4)^5 = (x^4 + 2x^5 + 3x^6 + 2x^7 + x^8)^2(x^2 + x^3 + x^4)$

$\Rightarrow (x^2 + x^3 + x^4)^5 = (x^8 + 4x^9 + 10x^{10} + 16x^{11} + 19x^{12} + 16x^{13} + 10x^{14} + 4x^{15} + x^{16})(x^2 + x^3 + x^4)$

$\Rightarrow (x^2 + x^3 + x^4)^5 = (x^{10} + \ldots + 51x^{15} + \ldots + x^{20})$

Since the coefficient of x^{15} in the expansion of $(x^2 + x^3 + x^4)^5$ is 51. Therefore the required number of ways = 51.

Hence choice (a) is the answer.

Alternatively Primarily, there are three different cases in which 15 different rings can be divided such that none of them gets less than 2 and more than 4 rings.

Case I: 2, 2, 3, 4, 4; ways of distribution $= \dfrac{5!}{2! \times 2!} = 30$

Case II: 2, 3, 3, 3, 4; ways of distribution $= \dfrac{5!}{3!} = 20$

Case III: 3, 3, 3, 3, 3; ways of distribution $= \dfrac{5!}{5!} = 1$

Therefore the number of ways in which 15 identical rings can be distributed among 5 girls such that none of them gets less than 2 or more than 4 is 51 (= 30 + 20 + 1).

Alternatively This problem is similar to finding the number of solutions to the equation $a + b + c + d + e = 15$, such that $2 \le a, b, c, d, e \le 4$.

In turn, it is equivalent to finding the number of solutions to the equation $u + v + w + x + y = 5$, such that $0 \le u, v, w, x, y \le 2$.

In turn number of solutions of the equation $u + v + w + x + y = 5$, such that $0 \le u, v, w, x, y \le 2 =$ (number of solutions to the equation $u + v + w + x + y = 5$, such that $0 \le u, v, w, x, y \le 5$) – (number of solutions of the equation $u + v + w + x + y = 5$, such that at least one of the variables is $3 \le u, v, w, x, y, \le 5$)

Now the solution to the equation $u + v + w + x + y = 5$, such that $0 \le u, v, w, x, y \le 5$ is ${}^{5+5-1}C_{5-1} = {}^9C_4 = 126$.

And the solution to the equation $u + v + w + x + y = 5$, such that at least one of the variables is $3 \le u, v, w, x, y \le 5$ is $5\,[{}^{(5-3)+5-1}C_{5-1}] = 5[{}^6C_4] = 75$

Therefore number of solutions to the equation $u + v + w + x + y = 5$, such that $0 \le u, v, w, x, y \le 2$ is $= 126 - 75$

In turn, the number of solutions of the equation $a + b + c + d + e = 15$, such that $2 \le a, b, c, d, e \le 4$ is 51.

It implies that the number of ways in which 15 identical rings can be distributed among 5 girls such that none of them gets less than 2 or more than 4 is 51.

58 The number of ways of dividing 15 rings equally into 5 parts = 1

Now arranging the 5 sets of rings containing 5 rings each = 1

Therefore number of ways of distributing 15 identical rings equally among 5 girls = $1 \times 1 = 1$

Hence choice (b) is the answer.

Alternatively This problem is similar to finding the number of solutions to the equation $a + b + c + d + e = 15$, such that $a = b = c = d = e$.

As $a + b + c + d + e = 15$, therefore $a = b = c = d = e = 3$.

Thus we have only 1 solution to this equation. So we can say that there is only 1 way of distribution of the 15 rings equally among his daughters.

59 The number of ways of dividing 15 identical rings among 5 girls such that these girls may get any number of rings $= {}^{15+5-1}C_{5-1} = {}^{19}C_4 = 3876$

Hence choice (c) is the answer.

60 **Case I** 1, 1, 3

Number of ways of selection of rolls $= {}^5C_1 \times {}^4C_1 \times {}^3C_3 = 20$

Number of ways of arranging the 3 distinct boxes, where 2 boxes have the same number of rolls $= \dfrac{3!}{2!}$

Number of ways of distribution of rolls

$$= {}^5C_1 \times {}^4C_1 \times {}^3C_3 \times \frac{3!}{2!} = 60$$

Case II: 1, 2, 2

Number of ways of selection of rolls $= {}^5C_1 \times {}^4C_2 \times {}^2C_2$

Number of ways of arranging the 3 distinct boxes, where 2 boxes have the same number of rolls $= \dfrac{3!}{2!}$

Number of ways of distribution of rolls

$$= {}^5C_1 \times {}^4C_2 \times {}^2C_2 \times \frac{3!}{2!} = 90$$

Therefore the required number of ways = 60 + 90 = 150

Alternatively Consider the following table.

Case	Box 1	Box 2	Box 3	Number of ways of distribution
i	1	1	3	$\frac{5!}{1!1!3!} = 20$
ii	1	3	1	$\frac{5!}{1!3!1!} = 20$
iii	3	1	1	$\frac{5!}{3!1!1!} = 20$
iv	1	2	2	$\frac{5!}{1!2!2!} = 30$
v	2	1	2	$\frac{5!}{2!1!2!} = 30$
vi	2	2	1	$\frac{5!}{2!2!1!} = 30$

Therefore the required number of ways

$$= 3 \times (20 + 30) = 150$$

61 **Case I** 1, 1, 3

Number of ways of selection of rolls = 1

Number of ways of arranging the 3 distinct boxes, where 2 boxes have the same number of rolls = $\frac{3!}{2!}$

Number of ways of distribution of rolls = $1 \times \frac{3!}{2!} = 3$

Case II 1, 2, 2

Number of ways of selection of rolls = 1

Number of ways of arranging the 3 distinct boxes, where 2 boxes have the same number of rolls = $\frac{3!}{2!}$

Number of ways of distribution of rolls = $1 \times \frac{3!}{2!} = 3$

Therefore the required number of ways = 3 + 3 = 6

Alternatively

Keeping 5 distinct rolls in 3 identical boxes so that none of the box remains empty implies that at least 1 roll must be kept in each box.

Therefore the required number of ways

$= {}^{5-1}C_{3-1} = {}^4C_2 = 6$

62 **Case I** (1, 1, 3)

Number of ways of selection of rolls

$$= \frac{5!}{1!1!3!} \times \frac{1}{2!}$$

Number of ways of distribution of rolls

$$= 1 \times \frac{5!}{1!1!3!} \times \frac{1}{2!} = 10$$

Case II (1, 2, 2)

Number of ways of selection of rolls

$$= \frac{5!}{1!2!2!} \times \frac{1}{2!}$$

Number of ways of distribution of rolls

$$= 1 \times \frac{5!}{1!2!2!} \times \frac{1}{2!} = 15$$

Therefore the required number of ways = 10 + 15 = 25

63 **Case I :** (1, 1, 3)

Number of ways of selection of rolls = $1 \times 1 \times 1 = 1$

Number of ways of distribution of rolls = 1

Case II : (1, 2, 2)

Number of ways of selection of rolls = $1 \times 1 \times 1 = 1$

Number of ways of distribution of rolls = 1

Therefore the required number of ways = 1 + 1 = 2

64 Consider the following table. Assume that the crate 1 contains the least number of bouquets in every case.

Case	Crate 1	Crate 2	Crate 3	Total number of ways
i	0	0, 1, 2, 3, 4, 5, 6	12, 11, 10, 9, 8, 7, 6	7
ii	1	1, 2, 3, 4, 5	10, 9, 8, 7, 6	5
iii	2	2, 3, 4, 5	8, 7, 6, 5	4
iv	3	3, 4	6, 5	2
v	4	4	4	1

Therefore the required number of ways

$$= 7 + 5 + 4 + 2 + 1 = 19$$

Alternatively Let us consider, for a moment, that the crates are distinct.

The number of ways of distribution of 12 identical bouquets into 3 distinct crates = $^{12+3-1}C_{3-1} = 91$

Case I When each crate has same number of bouquets.

(4, 4, 4)

Then it can be done in only 1 way.

Even though the crates are distinct, the number of ways of distribution will be 1 only, as each crate receives equal number of bouquets.

Case II When any 2 crates have same number of bouquets.

(0,0,12), (1,1,10), (2, 2, 8), (3,3,6), (5,5,2), (6,6,0)

Number of ways = 6

When we assume that the crates are distinct the number of ways of distribution of bouquets = $\frac{3!}{2!} \times 6 = 18$

Case III When all the crates have distinct number of bouquets. Let us assume that the number of ways of distribution of 12 identical bouquets among 3 identical crates is k. Then the number of ways of distribution of 12 identical bouquets among 3 distinct crates = $3! \times k = 6 \times k$

Therefore, we have $1 + 18 + 6k = 91$

Or $k = 12$

Thus the required number of ways = $1 + 6 + 12 = 19$.

65 The number of ways in which 12 distinct bouquets can be kept in 3 distinct crates = ${}^{12+3-1}C_{3-1} = 91$

66 The number of ways in which 12 distinct bouquets can be kept in 3 distinct crates, so that no box remains empty = ${}^{12-1}C_{3-1} = 55$

67 In order to keep at least 2 bouquets in each of the crates you can take away 6 bouquets separately. Now you are left with just 6 bouquets to distribute among 3 distinct crates, which you can now distribute any number of bouquets among 3 crates. This is equivalent to the distribution of 6 identical bouquets among 3 distinct crates so that any number of bouquets can be kept in any crate = ${}^{6+3-1}C_{3-1} = 28$

68 Let us consider that a, b and c are three distinct crates, so that $a \geq 2$, $b \geq 3$, $c \geq 4$ and $a + b + c = 12$.

Consider $a \geq 2 \Rightarrow a - 2 \geq 0 \Rightarrow x \geq 0$

Similarly, $b \geq 3 \Rightarrow b - 3 \geq 0 \Rightarrow y \geq 0$

And, $c \geq 4 \Rightarrow c - 4 \geq 0 \Rightarrow x \geq 0$

Therefore $a + b + c = 12$

$\Rightarrow$ $x + y + z = 12 - (2 + 3 + 4)$

$\Rightarrow$ $x + y + z = 3$

Thus the number of ways of distribution of 12 identical bouquets among 3 distinct crates so that one particular crate has at least 2 bouquets and another one has at least 3 bouquets and the third one has at least 4 bouquets is same as the number of distribution of 3 identical bouquets so that each of them can have any number of bouquets.

Therefore the required number of ways = ${}^{3+3-1}C_{3-1} = 10$

Alternatively First of all take away 2, 3 and 4 bouquets for crate 1, 2 and 3, assuming crate 1 is the smallest one and crate 3 is the largest one. Now you have to distribute the remaining bouquets, which can be done in the following ways.

Case I (0, 0, 3) Number of ways of distribution = $\frac{3!}{2!} = 3$

Case II (0, 1, 2) Number of ways of distribution = $3! = 6$

Case III (1, 1, 1) Number of ways of distribution = 1

Therefore total number of required ways of distribution of 12 bouquets = $3 + 6 + 1 = 10$

69 Let us consider that (a, b, c) is the notation for the number of bouquets distributed among three crates. It is imperative to note that the number of selection in each case will be 1 as all the bouquets are identical. The only thing we need to calculate is the number of ways of distribution among 3 distinct crates.

Case I (0, 1, 11), (0, 2, 10), (0, 3, 9), (0, 4, 8), (0, 5, 7)

Case II (1, 2, 9), (1, 3, 8), (1, 4, 7), (1, 5, 6)

Case III (2, 3, 7), (2, 4, 6)

Case IV (3, 4, 5)

Total number of combinations = $5 + 4 + 2 + 1 = 12$

And since crates are distinct and no two crates has same number of bouquets, so each combination further can be arranged in 3! ways.

Therefore the required number of ways of distributions $3! \times 12 = 72$

Alternatively

The number of ways of distribution of 12 identical bouquets among 3 distinct crates = ${}^{12+3-1}C_{3-1} = 91$

Case I When each crate has the same number of bouquets. (4, 4, 4)

Then it can be done in only 1 way.

Case II When any 2 crates have the same number of bouquets.

(0,0,12), (1,1,10), (2, 2, 8), (3,3,6), (5,5,2), (6,6,0)

Number of ways of selection of 12 bouquets = 6

Since there are 3 distinct crates out of which the 2 crates are having the same number of bouquets, therefore the number of arrangements of 3 crates = $\frac{3!}{2!}$.

Therefore the number of ways of distribution of 12 identical bouquets so that exactly 2 crates have the same number of bouquets = $\frac{3!}{2!} \times 6 = 18$

Case III When all the crates have distinct number of bouquets.

Then, let us assume that the number of ways of distribution of 12 identical bouquets among 3 distinct crates = k

Therefore, we have $1 + 18 + k = 91$ Or $k = 72$

Thus the required number of ways = 72

70 The number of selection of identical bouquets in three groups = $1 \times 1 \times 1 = 1$

Further, since in each crate the number of bouquets are same, so the number of arrangements of crates = 1

Therefore the required number of ways of distribution = number of ways of selection of bouquets $\times$ number of ways of arrangements of crates = 1

It's like an equation $a + b + c = 12$, such that $a = b = c = 4$.

This obviously has 1 solution as in $4 + 4 + 4 = 12$

71 Number of ways of selection of 4 balls from 10 balls of distinct colours = ${}^{10}C_4 = 210$

72 Number of ways of selection of 4 balls from a pool of unlimited balls of 10 distinct colours = number of non-negative integral solutions of

$$x_1 + x_2 + \ldots + x_9 + x_{10} = 4,$$

such that $x_1, x_2, \ldots, x_9, x_{10} \geq 0$

Therefore, the required number of selections

$$= {}^{4+10-1}C_{10-1} = {}^{13}C_9 = 715$$

73 Number of ways of selection of 10 cookies from a pool of unlimited cookies of 4 distinct types = number of positive integral solutions of $x_1 + x_2 + x_3 + x_4 = 10$,

such that $x_1, x_2, x_3, x_4 \geq 1$

Therefore, the required number of selections

$$= {}^{10-1}C_{4-1} = {}^{9}C_3 = 84$$

☑ Introductory Exercise 19.9

1 Since the number of ways in which n different letters can be placed in their n addressed envelopes so that all the letters are in the wrong envelopes

$$= n!\left[1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \ldots + (-1)^n \frac{1}{n!}\right]$$

Therefore the required number of ways

$$= 6!\left[1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \ldots + (-1)^6 \frac{1}{6!}\right]$$

$$= 6!\left(1 - \frac{1}{1} + \frac{1}{2} + \frac{1}{6} + \frac{1}{24} - \frac{1}{120} + \frac{1}{720}\right)$$

$$= 720\left(\frac{360 - 120 + 30 - 6 + 1}{720}\right) = 265$$

2 The number of ways in which exactly r letters can be placed in wrongly addressed envelopes when n letters are placed in n addressed envelopes

$$= {}^nP_r\left[1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \ldots + (-1)^r \frac{1}{r!}\right]$$

Therefore the required number of ways

$$= {}^6P_4\left[1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!}\right]$$

$$= 60\left[1 - 1 + \frac{1}{2} - \frac{1}{6} + \frac{1}{24}\right]$$

$$= 360\left[\frac{12 - 4 + 1}{24}\right] = 135$$

3 At least 2 letters are correctly placed

= At most 4 letters are correctly placed

= Either 4 letters are wrongly placed or 3 letters are wrongly placed or 2 letters are wrongly placed or 1 letter is wrongly placed or no letter is wrongly placed.

Number of ways when 4 letters are wrongly placed

$$= {}^6P_4\left[1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!}\right] = 135$$

Number of ways when 3 letters are wrongly placed

$$= {}^6P_3\left[1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!}\right] = 40$$

Number of ways when 2 letters are wrongly placed

$$= {}^6P_2\left[1 - \frac{1}{1!} + \frac{1}{2!}\right] = 15$$

Number of ways when 1 letter is wrongly placed

$$= {}^6P_1\left[1 - \frac{1}{1!}\right] = 0$$

Number of ways when none of the letters is wrongly placed = 1

Therefore the required number of ways

$$= 135 + 40 + 15 + 0 + 1 = 191$$

4 Given that a, b, c, d, e, f can take any value from the set $\{1, 2, 3, 4, 5, 6\}$.

N is a non-zero integer only when $a \neq 1, b \neq 2, c \neq 3, d \neq 4, e \neq 5, f \neq 6$. That is a can be anything but not 1, b can be anything but not 2, …, f can be anything but not 6.

It means this problem is same as placing 6 letters in 6 envelops such that no letter is placed in the right envelope.

Therefore the required number of ways

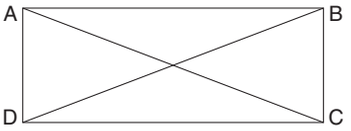
$$= 6!\left[1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \ldots + (-1)^6 \frac{1}{6!}\right]$$

$$= 6!\left(1 - \frac{1}{1} + \frac{1}{2} - \frac{1}{6} + \frac{1}{24} - \frac{1}{120} + \frac{1}{720}\right)$$

$$= 720\left(\frac{360 - 120 + 30 - 6 + 1}{720}\right) = 265$$

☑ Introductory Exercise 19.10

Solutions (for Q. No. 1 and 2) **:** *Consider the following diagram.*



1 There are 4 points,*A*, *B*, *C* and *D*. So using these 4 points we have total 6 lines :*AB*, *BC*, *CD*, *AD*, *AC* and *BD*.

Since each line needs 2 points to be connected, therefore the total number of lines = ${}^4C_2 = 6$

2 Using any 3 of the 4 points we have total 4 triangles: *ACD*, *ABC*, *DAB* and *BCD*.

Since each triangle needs 3 points to be connected, therefore the total number of triangles = ${}^4C_3 = 4$

Solutions (for Q Nos. 3 to 6)**:** *In these sums you have to consider those figures (lines, triangles, hexagons and decagons), whose vertices are the points already given in the plane.*

3 The maximum number of straight lines that can be formed using 10 non-collinear points = ${}^{10}C_2 = 45$

4 The maximum number of triangles that can be formed using 10 non-collinear points = ${}^{10}C_3 = 120$

5 The maximum number of hexagons that can be formed using 10 non-collinear points = ${}^{10}C_6 = 210$

6 The maximum number of diagonals in a decagon that can be formed using 10 non collinear points

$$= {}^{10}C_2 - 10 = 45 - 10 = 35$$

Hint Number of diagonals = total number of lines − number of sides

Solutions (for Q. Nos. 7 to10) **:**

7 Since all the 15 points are on the circumference of a circle, it implies that no 3 lines are collinear. Therefore the number of straight lines formed by joining the 15 points $= {}^{15}C_2 = 105$

8 Since no three points are collinear, so the number of triangles that can be formed by joining 15 points $= {}^{15}C_3 = 455$

9 Since no three points are collinear, so the number of quadrilaterals that can be formed by joining 15 points $= {}^{15}C_4 = 1365$

10 Since no three points are collinear, so the number of octagons that can be formed by joining 15 points $= {}^{15}C_8 = 6435$

Solutions (for Q. Nos. 11 to 14) **:**

11 Total number of lines if 12 non-collinear points are connected = ${}^{12}C_2 = 66$

Number of lines if 4 non-collinear points are connected = ${}^4C_2 = 6$

Since 4 points are collinear, so there would be only 1 line instead of 6 lines.
Thus, the maximum number of lines = (66 − 6) + 1 = 61.

12 Since out of 12 points 4 points are collinear, so the maximum number of triangles
$= {}^{12}C_3 - {}^4C_3 = 220 - 4 = 216$

13 Since out of 12 points 4 points are collinear, so the maximum number of quadrilaterals
$= {}^{12}C_4 - {}^4C_4 = 495 - 1 = 494$

14 Since 4 points are not sufficient to form a hexagon, so it does not matter that the 4 points are collinear. Therefore the maximum number of hexagons = ${}^{12}C_6 = 924$

Solutions (for Q. Nos. 15 to18) **:**

15 Maximum number of straight lines = ${}^nC_2 - {}^mC_2 + 1$

16 Maximum number of triangles = ${}^nC_3 - {}^mC_3$

17 Maximum number of quadrilaterals = ${}^nC_4 - {}^mC_4$

18 Maximum number of hexagons = ${}^nC_6 - {}^mC_6$

Solutions (for Q. Nos. 19 to 22) **:**

19 Number of sides in a heptagon = 7

Then the total number of lines that can be formed by connecting 7 points (vertices) of the heptagon = ${}^7C_2$

Therefore the total number of diagonals in the heptagon
$$= {}^7C_2 - 7 = 21 - 7 = 14$$

20 Number of sides in a polygon = n

Then the total number of lines that can be formed by connecting n points of the polygon = ${}^nC_2$

Therefore the total number of diagonals in the polygon
$= {}^nC_2 - n$

21 Number of diagonals in a polygon

$$= {}^nC_2 - n = \frac{n!}{(n-2)! \times 2!} - n$$

$$= \frac{n(n-1)}{2} - n = \frac{n(n-3)}{2}$$

$\because \quad \frac{n(n-3)}{2} = 54$

$\Rightarrow \quad n = 12$

22 $\because {}^9C_3 - {}^mC_3 = 28 \Rightarrow {}^mC_3 = 56$

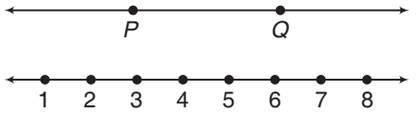
$$\Rightarrow \frac{m(m-1)(m-2)}{6} = 56$$

$$\Rightarrow m(m-1)(m-2) = 8 \times 7 \times 6$$

$$\Rightarrow m = 8$$

Solutions (for Q. Nos. 23 and 24) **:**

23



A triangle can be formed by selecting 1 point out of P and Q and selecting 2 points out of 8 points on the other parallel line.

or a triangle can be formed by selecting 2 points out of 2 points (P and Q) and selecting 1 point out of 8 points.

$\therefore$ Required number of triangles

$$= ({}^2C_1 \times {}^8C_2) + ({}^2C_2 \times {}^8C_1)$$

$$= (2 \times 28) + (1 \times 8) = 64$$

24 Number of triangles whose vertex is P = total number of triangles – number of triangles which do not contain P as a vertex.

$\therefore$ Number of triangles which do not contain P as a vertex

$$= {}^1C_1 \times {}^8C_2 = 28$$

$\therefore$ Required number of triangles = 64 – 28 = 36

Solutions (for Q. Nos. 25 - 27) **:**

25 An intersection point is formed by the intersection of two lines. Hence number of intersection points is equal to the number of ways of selecting 2 lines out of the given 20 non-parallel and non-concurrent lines.

i.e., Required number of points = ${}^{20}C_2 = 190$.

26 A parallelogram is formed by choosing two straight lines. From the set of m parallel lines and two straight lines from the set of n parallel lines.

Two straight lines from the set of m parallel lines can be chosen in ${}^mC_2$ ways and two straight lines from the set of n parallel lines can be chosen in ${}^nC_2$ ways. Hence the number of parallelograms formed

$$= {}^mC_2 \times {}^nC_2 = \frac{m(m-1)}{2} \times \frac{n(n-1)}{2}$$

$$= \frac{mn(m-1)(n-1)}{4}$$

27 The number of points of intersection of 37 lines is ${}^{37}C_2$. But 13 straight lines out of the given 37 straight lines pass through the same point A. Therefore instead of getting ${}^{13}C_2$ points, we get only one point A. Similarly 11 straight lines out of the given 37 straight lines intersect at point B.

Therefore instead of getting ${}^{11}C_2$ points, we get only one point B. Hence the number of intersection points of the lines is ${}^{37}C_2 - {}^{13}C_2 - {}^{11}C_2 + 2 = 535$

Solutions (for Q. Nos. 28 to 31) **:**

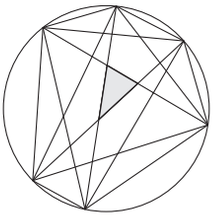
28 The number of regions into which this plane will be divided by 6 lines = ${}^6C_0 + {}^6C_1 + {}^6C_2 = 1 + 6 + 15 = 22$

29 $\frac{n^2 + n + 2}{2} = 22 \Rightarrow n = 6$

Hint ${}^nC_0 + {}^nC_1 + {}^nC_2 = \frac{n(n+1)}{2} + 1 = \frac{n^2 + n + 2}{2}$

30 $n^2 - n + 2$ is the number of disjoint regions that can be formed in the plane by n simple closed curves which pair-wise meet in at most two points. It is same as you see with the Venn-diagrams.

31 If n points are given on the circumference of a circle and the chords determined by them are drawn. If no three chords have a common point, then the number of triangles all of whose vertices lie inside the circle = ${}^nC_6 = \frac{n!}{6!(n-6)!}$



Therefore required number of triangles = ${}^6C_6 = 1$

Solutions (for Q. Nos. 32 to 38) **:**

32 Maximum number of pieces of pizza

$$= {}^8C_0 + {}^8C_1 + {}^8C_2 = 1 + 8 + 28 = 37$$

33 $\because {}^nC_0 + {}^nC_1 + {}^nC_2 = \frac{n(n+1)}{2} + 1 = \frac{n^2 + n + 2}{2}$

$$\therefore \frac{n^2 + n + 2}{2} = 20 \Rightarrow n(n+1) = 38 \Rightarrow n \geq 6$$

If $n = 5$, $n(n+1) < 38 \Rightarrow \frac{n^2 + n + 2}{2} < 20$, which is inadmissible.

34 Number of friends present, initially = maximum number of pieces obtained after making 7 cuts = $\frac{7^2 + 7 + 2}{2} = 29$

Total number of friends including the ones who arrived later = maximum number of pieces obtained after making 8 cuts = $\frac{8^2 + 8 + 2}{2} = 37$

Therefore the maximum number of friends that arrived later at the party = 37 – 29 = 8.

35 If n points lie on the circumference of a circle and are connected by straight lines intersecting the circle such that no three lines are concurrent (that is no three lines ever pass through the same point), then the maximum number of parts/regions into which these lines divide the circle is ${}^nC_0 + {}^nC_2 + {}^nC_4$.

Therefore the required number of pieces

$$= {}^8C_0 + {}^8C_2 + {}^8C_4 = 1 + 28 + 70 = 99$$

36 When n lines intersect a circle, the maximum number of bounded regions created $= \frac{n^2 - 3n + 2}{2} = 15 \Rightarrow n = 7$

37 When n lines intersect a circle, the maximum number of bounded regions created

$$= \frac{n^2 - 3n + 2}{2} = \frac{8^2 - 3 \times 8 + 2}{2} = 21$$

Since there are only 21 Cheesers, so 4 (= 25 – 21) persons have to compromise with an Edger piece.

38 Let B and U denote the BOUNDED regions and UNBOUNDED regions, where bounded regions represent the Cheesers and unbounded regions represent the Edgers.

Then, $B = \frac{n^2 - 3n + 2}{2} \Rightarrow U = 2n$

As, $B > U$ therefore $\frac{n^2 - 3n + 2}{2} > 2n \Rightarrow n^2 - 7n + 2 > 0$

The above inequality is valid only when the minimum integral value of $n = 7$.

Solutions (for Q. Nos. 39 and 40) **:**

39 The maximum possible number of regions on a plane that can be created by a Venn diagram with n circles

$$= n(n-1) + 2 = n^2 - n + 2$$

Therefore the required number of maximum regions

$$= 6^2 - 6 + 2 = 32$$

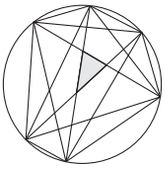
40 If n ellipses are drawn in the plane such that no two of them are tangent, none of them lies entirely within or outside of another one and no three of them are concurrent, then the maximum number of parts/regions into which these ellipses divide the plane is $2n(n-1) + 2 = 2(n^2 - n + 1)$.

Therefore the required number of maximum regions

$$= 2(5^2 - 5 + 1) = 42$$

Solutions (for Q. Nos. 41 and 42) **:**

41 If n points are given on the circumference of a circle and the chords determined by them are drawn.



If no three chords have a common point, number of triangles all of whose vertices lie inside the circle

$$= {}^nC_6 = \frac{n!}{6!(n-6)!}$$

42 The required number of triangles

$${}^nC_6 = \frac{n!}{6!(n-6)!} = \frac{6!}{6!(0)!} = 1$$

43 The maximum number of regions into which a 3-dimensional cube/sphere/cylinder can be partitioned by exactly n planes is

$${}^nC_0 + {}^nC_1 + {}^nC_2 + {}^nC_3 = \frac{n^3 + 5n + 6}{6}$$

Therefore the maximum number of required pieces

$$= \frac{6^3 + 5 \times 6 + 6}{6} = 42$$

44 Since, $\frac{n^3 + 5n + 6}{6} \geq 300$

$\Rightarrow n^3 + 5n \geq 1794$

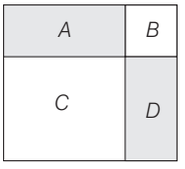
$\Rightarrow n > 12 \Rightarrow n = 13$

Solutions (for Q. Nos. 45 to 60) **:**

45 Total number of squares = 3

(i) B (ii) C

(iii) $A + B + C + D$



Total number of rectangles = 9

(i) A (ii) B

(iii) C (iv) D

(v) $A + B$ (vi) $C + D$

(vii) $A + C$ (viii) $B + D$

(ix) $A + B + C + D$

46 Total number of squares in a square having n columns and n rows $= 1^2 + 2^2 + 3^2 + \ldots\ldots + n^2 = \Sigma n^2 = \frac{n(n+1)(2n+1)}{6}$

Since, $n = 3$, therefore total number of squares = 14.

Total number of rectangles in a square having n columns and n rows $= 1^3 + 2^3 + 3^2 + \ldots + n^3 = \Sigma n^3 = \left[\frac{n(n+1)}{2}\right]^2$

Since, $n = 3$, therefore total number of rectangles = 36.

47 Total number of squares in a rectangle having m columns and n rows $= m \cdot n + (m-1)(n-1)$

$+ (m-2)(n-2) + \ldots + 0$

Since, $m = 5$, $n = 2$, therefore total number of squares

$$= 10 + 4 = 14$$

Total number of rectangles in a rectangle having m columns and n rows

$$= (1 + 2 + 3 + \ldots + m)(1 + 2 + 3 + \ldots + n)$$

Therefore total number of rectangles $= (3) \times (15) = 45$

48 Total number of squares

$$= \Sigma 10^2 = 1^2 + 2^2 + \ldots + 10^2 = 385$$

49 Total number of rectangles

$$= \Sigma n^3 = 1^3 + 2^3 + \ldots + 3^3 = 3025$$

50 Total number of squares in a rectangle having m columns and n rows

$$= m \cdot n + (m-1)(n-1) + (m-2)(n-2) + \ldots + 0$$

Since, $m = 8$, $n = 15$, therefore total number of squares

$$= 120 + 98 + 78 + 60 + 44 + 30 + 18 + 8 = 456$$

51 Total number of rectangles in a rectangle having m columns and n rows $= (1 + 2 + 3 + \ldots + m)$ $(1 + 2 + 3 + \ldots + n)$

Therefore total number of rectangles $= (36) \times (120) = 4320$

52 Total number of quadrilaterals in a square having n columns and n rows

$$= 1^3 + 2^3 + 3^3 + \ldots + n^3 = \Sigma n^3 = \left[\frac{n(n+1)}{2}\right]^2$$

Since, $n = 10$, therefore total number of rectangles $= 3025$.

NOTE In this case quadrilaterals and rectangles are one and the same thing.

53 Total number of quadrilaterals in a rectangle having m columns and n rows

$$= (1 + 2 + 3 + \ldots + m)(1 + 2 + 3 + \ldots + n)$$

Therefore total number of quadrilaterals

$$= (36) \times (120) = 4320$$

NOTE In this case quadrilaterals and rectangles are one and the same thing.

54 Total number of quadrilaterals when a set of 8 parallel lines intersects another set of 15 parallel lines

$$= {}^8C_2 \times {}^{15}C_2 = 28 \times 105 = 2940$$

55 Total number of rectangles when 8 vertical lines intersect 15 horizontal lines such that all the vertical lines are parallel and equidistant to each other, and all the horizontal lines are also parallel and equidistant to each other $= {}^8C_2 \times {}^{15}C_2 = 28 \times 105 = 2940$

NOTE The only difference between a quadrilateral and a rectangle is that in a rectangle opposite sides are parallel and adjacent sides intersect each other perpendicularly, while it may not be the case in a normal quadrilateral.

56 The 8 vertical lines will create 7 columns and 15 horizontal lines will create 14 rows.
Now, the total number of squares in a rectangle having m columns and n rows

$$= m \cdot n + (m-1)(n-1) + (m-2)(n-2) + \ldots + 0$$

Since, $m = 7$, $n = 14$, therefore total number of squares

$$= 98 + 78 + 60 + 44 + 30 + 18 + 8 = 336$$

57 In any standard chessboard there are total 8 rows and 8 columns, so the total number of squares

$$= 1^2 + 2^2 + 3^2 + \ldots + n^2$$

$$= \Sigma n^2 = \frac{n(n+1)(2n+1)}{6} = \frac{8 \times 9 \times 17}{6} = 204$$

58 In any standard chessboard there are total 8 rows and 8 columns, so the total number of squares

$$= 1^3 + 2^3 + 3^3 + \ldots + n^3 = \Sigma n^3$$

$$= \left[\frac{n(n+1)}{2}\right]^2 = \left(\frac{8 \times 9}{2}\right)^2 = 1296$$

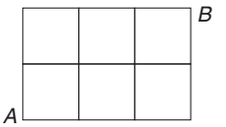
59 Total number of squares

$$= (9 + 4 + 1) + (9 + 4) + (9 + 4) = 40$$

Hint To get the answer easily, first you clear all the squares from the central square. Then you will have $9 + 4 + 1 = 13$ squares of distinct sizes. Then you can proceed like this for the central squares as well.

60 There are three different sizes of triangles. Total number of triangles $= 1 + 4 + 4 = 9$

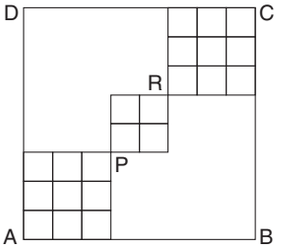
61 You can see in the following diagram that if you want to go from A to B, you have to take 3 steps towards the right side and 2 steps in the upward direction. Thus you have to take total 5 steps.



So the total number of ways

$$= {}^5C_3 \times {}^{(5-3)}C_2 = {}^5C_3 \times {}^2C_2 = \frac{5!}{3!2!} = 10$$

62 Total number of paths from A to $P = {}^6C_3 \times {}^3C_3 = \frac{6!}{3!3!} = 20$



Total number of paths from P to

$$R = {}^4C_2 \times {}^2C_2 = \frac{4!}{2!2!} = 6$$

Total number of paths from R

to $C = {}^6C_3 \times {}^3C_3 = \frac{6!}{3!3!} = 20.$

Therefore the number of paths from A to B , via P and R

$= 20 \times 6 \times 20 = 2400$

And the number of paths from A to C, via B and $D = 2$

Thus the required number of paths = 2400 + 2 = 2402

63 Let us consider you have to go from A to its opposite corner C.

Total number of paths from P to $R = {}^6C_3 \times {}^3C_3 = \frac{6!}{3!3!} = 20.$

Total number of paths from A to C, via P to R, when there is a grid in the square $PQRS$ = (number of paths from A to P) × (number of paths from P to R) × (number of paths from R to C)

$= 2 \times 20 \times 2 = 80$

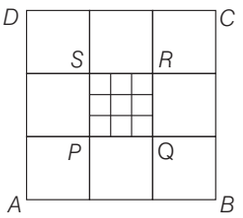
Total number of paths from A to C, when there is NO grid in the square $PQRS = {}^6C_3 \times {}^3C_3 = \frac{6!}{3!3!} = 20.$

Total number of paths from A to C, via P to R, when there is NO grid in the square $PQRS$ = (number of paths from A to P) × (number of paths from P to R) × (number of paths from R to C)

$= 2 \times 2 \times 2 = 8$

Therefore the required number of paths = Total number of paths from A to C, when there is NO grid in the square $PQRS$ + (Total number of paths from A to C, via P to R, when there is a grid in the square – Total number of paths from A to C, via P to R, when there is no grid in the square $PQRS$)

$= 20 + (80 - 8) = 92$



64 Using the same approach as in the previous sum, we can say that the total number of the shortest paths from P to $R = 92$

Total number of paths from A to C, via P to R, when there is a grid in the square $PQRS$

= (number of paths from A to P)
× (number of paths from P to R)
× (number of paths from R to C)

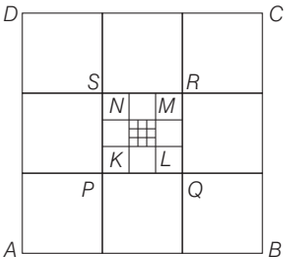
$= 2 \times 92 \times 2 = 368$

Total number of paths from A to C, when there is NO grid in the square $PQRS = {}^6C_3 \times {}^3C_3 = \frac{6!}{3!3!} = 20$

Total number of paths from A to C, via P to R, when there is NO grid in the square $PQRS$ = (number of paths from A to P) × (number of paths from P to R) × (number of paths from R to C) $= 2 \times 2 \times 2 = 8$

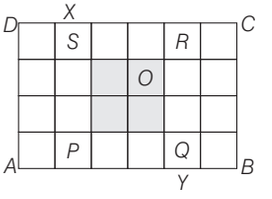
Therefore the required number of paths = Total number of paths from A to C, when there is NO grid in the square $PQRS$ + (Total number of paths from A to C, via P to R, when there is a grid in the square – Total number of paths from A to C, via P to R, when there is no grid in the square $PQRS$)

$= 20 + (368 - 8) = 380$

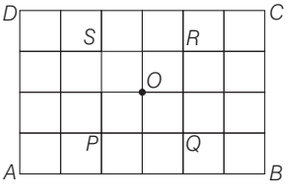


65 Total number of shortest paths from A to C = (number of paths from A to Q) × (number of paths from Q to C) + (number of paths from A to Y × (number of paths from Y to C) + (number of paths from A to S) × (number of paths from S to C) + (number of paths from A to X) × (number of paths from X to C.)

$= 5 \times 10 + 1 \times 5 + 5 \times 10 + 1 \times 5 = 110$



Alternatively This problem is like you can go through any point from A to C, but cannot pass through the point O.



The number of shortest paths from A to $O = 5!/3!2! = 10$

The number of shortest paths from O to $C = 5!/3!2! = 10$

Total number of shortest paths from A to C via O

$= 10 \times 10 = 100$

Total number of shortest paths from A to $C = \frac{10!}{6!4!} = 210$

Therefore the required number of shortest paths

= (Total number of paths from A to C) – (Total number of paths from A to C, via O) = 210 – 100 = 110

66 Number of triangles with all three vertices taken from the pentagon = ${}^5C_3 = 10$

Number of triangles with two vertices taken from the two adjacent vertices of the outer pentagon and one vertex from the 3 vertices of inner pentagon = $5\,({}^2C_2 \times {}^3C_1) = 15$

Number of triangles with two vertices from the non-adjacent vertices of outer pentagon and 1 vertex from the inner pentagon = $({}^2C_2 \times {}^5C_1) = 5$

Number of triangles with one vertex from outer pentagon and two vertices from inner pentagon = ${}^5C_1 \times {}^2C_2 = 5$

Therefore total number of required triangles

$$= 10 + 15 + 5 + 5 = 35$$

67 A rail-loop can be formed by joining any 3 vertices of the regular polygon. It can be done in ${}^{16}C_3 = 560$ ways.

Therefore there are 560 rail-loops.

68 When n is odd, the maximum diagonals intersect at any point inside the polygon is 2. Now, the number of maximum intersections when any two diagonals intersect each other inside a regular polygon with odd number of vertices is ${}^nC_4$. Therefore the maximum number of intersections = ${}^{25}C_4 = 12650$.

Thus there are maximum 12650 warehouses in the SEZ.

69 When n is odd, the maximum diagonals intersect at any point inside the polygon is 2. So, no 3 (or more than 3) diagonals intersect at the same point inside the polygon with 49 (odd number of) vertices. Therefore, there is no government office.
Hence choice (a) is correct.

70. When n is even, but not divisible by 6, the maximum number of diagonals intersect at any point inside the regular polygon is 3. So there cannot be more than 3 diagonals intersecting at any common point inside the polygon. Since no 5 diagonals intersect at any common point, so the number of required intersection is zero. That is there is no airport in the given SEZ.
Hence choice (d) is correct.

☑ Level 01 *Basic Level Exercise*

1 $9 \times 9 \times 9 \times 9 = 9^4$.

2 $9^4 - 1$ (It is considered that the lock opens in the last attempt.)

3 **Case I.** *MW MW MW MW*
Case II. *WM WM WM WM*
Let us arrange 4 men in 4! ways, then we arrange 4 women in ${}^4P_4$ ways at 4 places either left of the men or right of the men.
Hence required number of arrangements

$$= 4! \times {}^4P_4 + 4! \times {}^4P_4$$

$$= 2 \times 576 = 1152$$

4 First of all we arrange 4 women in 4! ways then we arrange 4 men in 5 places in ${}^5P_4$ ways.

Hence, the total number of arrangements = $4! \times {}^5P_4 = 2880$

5 Let us arrange 4 persons in 4! ways then we place their respective wives adjacent to them in 2! ways i.e., either left or right sides of the husbands.

Hence, the required number of ways

$$= 4! \times 2! \times 2! \times 2! \times 2!$$

6 Let us first of all we arrange 4 men in 3! ways then 4 women can be arranged in 4 places in ${}^4P_4$ ways.

Hence the required number of ways = $3! \times {}^4P_4 = 144$.

7 All the 4 men can be arranged in 4! ways.
Similarly all the 4 women can be arranged in 4! ways but the two different groups of men and women can be mutually arranged in 2! ways.
Hence the required number of ways = $(4!)^2 \times 2! = 1152$.

8 *H L C N T A U I O*
L N A I

There are total 13 letters out of which 7 are consonants and 6 are vowels. Also there are $2L's$, $2N's$, $2A's$, and $2I's$.

If all the consonants are together then the number of arrangements $= \frac{7!}{2!.2!}$. but the 7 consonants can be arranged themselves in $\frac{7!}{2!.2!}$ ways.

Hence the required number of ways $= \frac{7!}{2!\times 2!} \times \frac{7!}{2!\times 2!}$

$= (1260)^2 = 1587600$

9 There are 7 odd places and 6 vowels of which 2 vowels occur two times.

Hence number of arrangements of vowels $= \frac{^7P_6}{2!\times 2!}$.

Now the remaining 7 consonants of which two consonants occur two times, can be arranged in 7 places in $\frac{7!}{2!\times 2!}$ ways.

Hence, the required number of ways $= \frac{^7P_6}{2!\times 2!} \times \frac{7!}{2!\times 2!}$

$= 1587600$

10 *S U C E F L*
S U C
S

There are 10 letters in the word SUCCESSFUL and *S* occurs 3 times, *U* occurs 2 times and *C* occurs 2 times.

$\therefore$ The letters of the word SUCCESSFUL can be arranged in

$= \frac{10!}{3!\times 2!\times 2!} = 151200$ ways

11 Since all three S'_s are together, hence there will be 8 letters of which *C* occurs 2 times and *U* occurs 2 times.

Thus the required number of arrangements $= \frac{8!}{2!\times 2!}$

$= 10080$

12 (*C, C*), (*U, U*), *S, S, S, E, F, L*

These 8 letters now can be arranged in $\frac{8!}{3!}$ ways.

13 Total number of 4 digit numbers without repetition of digits $= 4! = 24$.

Each of the digits in each of the 4 places (thousands, hundreds and tens and unit) place will be 3! times *i.e.,* 6 times.

Hence the sum of all the digits at each of the four places

$= 6\,(1 + 2 + 3 + 4) = 60$

Hence the sum of all the required 4 digit numbers

$= 60\,(1000 + 100 + 10 + 1)$

$= 60 \times 1111 = 66660$

14 Total number of 5 digit numbers (including which begins with zero) $= 5! = 120$.

Number of 5 digit numbers which begin with zero $= 4! = 24$.

Sum of all 5 digit numbers

$= (0 + 1 + 2 + 3 + 4) \times 4! \times (11111)$

$= 240 \times 11111 = 2666640$

Sum of all five digit numbers which begin with zero

$= (1 + 2 + 3 + 4) \times 3! \times (1111)$

$= 66660$

Hence the sum of the required numbers

= sum of all 5 digit numbers including those numbers which begin with zero

– sum of all 5 digit numbers which begin with zero

$= 2666640 - 66660 = 2599980$

15 Number of polygons $= {}^nC_2 -$ Number of sides (n)

$\therefore \quad {}^nC_2 - n = n$

$\Rightarrow \quad {}^nC_2 = 2n$

$\Rightarrow \quad \frac{n(n-1)}{2} = 2n$

$\Rightarrow \quad n = 5$

16 There are 10 letters in the given word PROPORTION and we have 10 letters of 6 different kinds *viz.,*
(0, 0, 0), (*P*, *P*), (*R*, *R*), *T*, *I*, *N*.

For a group of four letters, we have four cases :

(i) Three alike and one different.

(ii) Two alike and two other alike.

(iii) Two alike and other two different.

(iv) All four different.

In case I, the number of selections $= {}^1C_1 \times {}^5C_1 = 5$.

In case II, the number of selections $= {}^3C_2 = 3$.

[Since we can select two pairs out of 3 pairs (0, 0), (*P*, *P*), (*R*, *R*)]

In case III, the number of selections $= {}^3C_1 \times {}^5C_2 = 30$.

($\therefore$ We can select one of 3 pairs and then two from the remaining 5 letters say, *P, R, T, I, N.*)

In case IV, the number of selections $= {}^6C_4 = 15$.

($\therefore$ We can select 4 different letters from 6 letters *O, P, R, T, I, N.*)

In case I, the number of arrangements $= 5 \times \frac{4!}{3!} = 20$.

In case II, the number of arrangements $= 3 \times \frac{4!}{2!\times 2!} = 18$.

In case III, the number of arrangements $= 30 \times \frac{4!}{2!} = 360$.

In case IV, the number of arrangements $= 15 \times 4! = 360$.

Hence the required number of arrangements

$= 20 + 18 + 360 + 360 = 758$

17 Vowels themselves can be permuted in $\frac{4!}{3!}$ ways

and consonants can be permuted in $\frac{6!}{2!\times 2!}$ ways

Therefore the required number of ways $= \frac{4!}{3!}\times\frac{6!}{2!\times 2!}$

$= 4\times 180 = 720$

18 Total number of ways of arranging 16 people $= 15!$ ways

Number of ways in which two brothers are together $= 14!\times 2$

$\therefore$ Number of ways in which two brothers are never together

$= 15! - 14!\times 2$

$= 14!(15-2) = 14!\times 13$

19 A person out of remaining 14 persons can be selected in ${}^{14}C_1 = 14$ ways.

Now consider Lehman, Mckinsey and a third (selected person) as a single person, then we can arrange all of them in 13! ways. But the two brothers mutually can be arranged in 2! ways. Hence the required number of ways

$= 14\times 13!\times 2$

$= 14!\times 2$

20 Every ball can be distributed in 4 ways.

Hence the required number of ways $= 4\times 4\times 4\times 4\times 4\times 4$

$= 4^6 = 4096$

21 Number of ways of distribution of 'n' identical things taken r at a time $= {}^{n+r-1}C_{r-1}$

$\therefore$ Required number of ways $= {}^{6+4-1}C_{4-1} = {}^{9}C_3 = 84$

22 Number of non-negative integral solutions $= {}^{n+r-1}C_{r-1}$

$= {}^{21+3-1}C_{3-1}$

$= {}^{23}C_2 = 253$

23 Number of positive integral solutions $= {}^{n-1}C_{r-1}$

$= {}^{21-1}C_{3-1} = {}^{20}C_2$

$= 190$

24 Number of ways of selecting items from 6 different items $= 2^6$.

Similarly from second set of 6 different objects we can select items in 2^6 ways.

Therefore, total number of selections $= 2^6\times 2^6$

but we have to select at least one item therefore we subtract one case in which none of the items is selected

$= 2^6\times 2^6 - 1 = 2^{12} - 1 = 4095$

25 Number of ways of selecting the items from 6 identical items $= 6 + 1 = 7$

Similarly we can select from other set of 6 identical items $= 7$

$\therefore$ Total number of ways in which at least one item can be selected from the two sets $= (7\times 7) - 1 = 48$

Hint Since we can select either 0, 1, 2, 3, 4, 5, or 6 items which can be done in 7 ways.

26 We can select atleast one item from 6 different items $= (2^6 - 1)$

Similarly we can select atleast one item from other set of 6 different items in $(2^6 - 1)$ ways.

$\therefore$ Required number of ways $= (2^6 - 1)(2^6 - 1)$

$= (2^6 - 1)^2 = 3969$

27 We can select atleast one item from 6 identical items in 6 ways.

Similarly from other set also we can select atleast one item in 6 ways.

Hence, the required number of ways $= 6\times 6 = 36$.

28

Single step	Double step	Number of ways
12	0	$\frac{12!}{12!} = 1$
10	1	$\frac{11!}{10!} = 11$
8	2	$\frac{10!}{(8!\times 2!)} = 45$
6	3	$\frac{9!}{(6!\times 3!)} = 84$
4	4	$\frac{8!}{(4!\times 4!)} = 70$
2	5	$\frac{7!}{(2!\times 5!)} = 21$
0	6	$\frac{6!}{6!} = 1$

$\therefore$ Total number of ways $= 1 + 11 + 45 + 84 + 70 + 21 + 1$

$= 233$

29 Using ${}^{n+r-1}C_{r-1}$, we get ${}^{8+3-1}C_{3-1} = {}^{10}C_2 = 45$

30 ${}^{100}C_{10}\times {}^{90}C_{20}\times {}^{70}C_{30}\times {}^{40}C_{40} = \frac{100!}{10!\times 20!\times 30!\times 40!}$

31 There are two sets of numbers 0, 1, 3, 5 and 0, 2, 3, 4.

Therefore number of 4 digit numbers using digits 0, 1, 3, 5

$= 3\times 3\times 2\times 1 = 18$

Similarly number of 4 digit numbers using digits 0, 2, 3, 4

$= 3\times 3\times 2\times 1 = 18$

Hence the total required numbers $= 18 + 18 = 36$.

32 When 7 is at ten thousands place →

1	1	9	9	9	→ 9^3
1	9	1	9	9	→ 9^3
1	9	9	1	9	→ 9^3
1	9	9	9	1	→ 9^3

When 7 is not at the ten thousands place →

8	1	1	9	9	→ 8×9^2
8	1	9	1	9	→ 8×9^2
8	1	9	9	1	→ 8×9^2
8	9	1	1	9	→ 8×9^2
8	9	1	9	1	→ 8×9^2
8	9	9	1	1	→ 8×9^2

Hence the required number of ways $= 4 \times 9^3 + 6 \times 8 \times 9^2$
$= 9^2 (36 + 48)$
$= 81 \times 84 = 6804$

33 Required number of ways $= \dfrac{15!}{3! \times 4! \times 8!}$.

34 Total number of ways $= 7!$

Let A has to speak before B.
Now since there are half of the total cases in which A speaks before B (Similarly in half of the total cases B speaks before A)

$\therefore$ Required number of ways $= \dfrac{1}{2} \times 7! = 2520.$

35

1	10	10	10	10	10	10

$\Rightarrow \quad 10^6$

Total number of 7 digit telephone numbers which begin with digit $2 = 10^6$.

36 ${}^6P_4 = 360.$

Alternatively First son can accept any of the 6 proposals and second son can accept any of the 5 proposals and so on.
Hence required number of ways $= 6 \times 5 \times 4 \times 3 = 360$

37 ${}^{16}C_4 = 1820$

38 ${}^{16}P_4 = 43680$

39 ${}^{16}C_4 \times {}^{12}C_4 \times {}^8C_4 \times {}^4C_4 \times \dfrac{1}{4!} = \dfrac{16!}{(4!)^5}.$

40 ${}^nC_2 = 105$, where n is the number of players

$\Rightarrow \quad \dfrac{n(n-1)}{2} = 105 \quad \Rightarrow \quad n = 15$

41 ${}^9P_6 = 60480$

42 $\dfrac{6!}{2! \times 4!} = 15$

43 $4 \times 6 = 24$

44 Total number of 5 digit numbers $= 9 \times 10^4 = 90000$
Number of 5 digit numbers without any repetition
$= 9 \times 9 \times 8 \times 7 \times 6 = 27216$
$\therefore$ Required number of 5 digit numbers in which atleast one of the digit repeats $= 90000 - 27216 = 62784$

45 Total number of possible outcomes $= 6^4$.
The number of possible outcomes in which 4 does not appear on any die is 5^4.
Therefore the number of possible outcomes in which atleast one die shows digit $4 = 6^4 - 5^4 = 671$

46 Required number of signals
$= {}^5P_1 + {}^5P_2 + {}^5P_3 + {}^5P_4 + {}^5P_5$
$= 5 + 20 + 60 + 120 + 120$
$= 325$

47 The number of words begin with A is 4!.
The number of words begin with E is 4!.
The number of words begin with M is 4!.
The number of words begin with R is 4!.
Number of words begin with VA is 3!
Words begin with VE are $VEAMR$

VEARM	*VEMAR*
VEMRA	*VERAM*
VERMA	

$\therefore$ The rank of the word $VERMA = 4 \times 4! + 3! + 6$
$= 96 + 6 + 6 = 108$

48 **Case I** 0, 1, 2, 4, 5
Case II 1, 2, 3, 4, 5
Since we know that a number is divisible by 3, if and only if the sum of its digits is divisible by 3.
Case I, number of 5 digit numbers $= 4 \times 4 \times 3 \times 2 = 96$
Case II, number of 5 digit numbers $= 5 \times 4 \times 3 \times 2 = 120$
$\therefore$ Total required numbers $= 216$

49 We can choose two men out of 8 in ${}^8C_2$ ways. Since no husband and wife are to play in the same game, two women out of the remaining 6 can be chosen in ${}^6C_2$ ways.

If M_1, M_2, W_1, W_2 are chosen, then a team may consist of M_1 and W_1 or M_1 and W_2. Thus the number of ways of arranging the game is
$= {}^8C_2 \times {}^6C_2 \times 2 = 840$

50 Let us consider $n = 5$, then we have $\{a, b, c, d, e\}$ in a row.
Now we can select 3 of them so that no two are adjacent to each other is only one possible way that is $\{a, c, e\}$.
Now, let us consider $n = 6$, then we have $\{a, b, c, d, e, f\}$ in a row. Now we can select 3 of them so that no two are adjacent to each other is as follows.
$\{a, c, e\}, \{a, c, f\}, \{a, d, f\}, \{b, d, f\}$
That is total four ways.

Now, we know that if $n = 5$, required number of ways = 1 and if $n = 6$, required number of ways = 3.

This is true for ${}^{n-2}C_3$.

Basically, we know that the number of ways of selecting r things out of n things in a row so that no two of the selected things are adjacent to each other = ${}^{n+1-r}C_r$.

Hence choice (b) is correct.

51 Since 8 does not occur in 1000, we have to count the number of times 8 occurs when we list the integers from 1 to 999. Any number between 1 and 999 is of the form xyz, where $0 \le x, y, z \le 9$. Let us first count the numbers in which 8 occurs exactly once. Since 8 can occur at one place in ${}^3C_1$ ways. There are ${}^3C_1\ (9 \times 9) = 3 \times 9^2$ such numbers.

Next, 8 can occur in exactly two places in ${}^3C_2\ (9) = 3 \times 9$ such numbers. Lastly, 8 can occur in all three digits in one number only. Hence, the number of times 8 occurs is

$$1 \times (3 \times 9^2) + 2 \times (3 \times 9) + 3 \times 1 = 300$$

52 **Case I** | 2 | 2 | 1 |

Number of possible arrangements

$$= {}^5C_2 \times {}^3C_2 \times {}^1C_1 \times 3 = 90$$

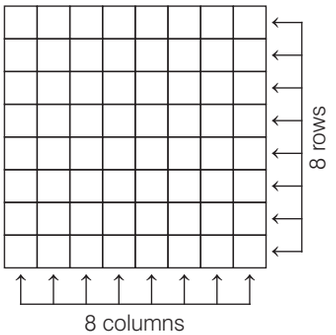
Case II | 1 | 1 | 3 |

Number of possible arrangements

$$= {}^5C_1 \times {}^4C_1 \times {}^3C_3 \times 3 = 60$$

Hence, the total number of ways is 90 + 60 = 150.

53 In a chess board there are 8 columns and 8 rows.



Since number of columns = number of rows

Hence it is considered as a square.

∴ Number of square in a square of

$$n \times n = 1^2 + 2^2 + \ldots + n^2$$

Hence required number of squares

$$= 1^2 + 2^2 + 3^2 + \ldots + 8^2$$

$$= \frac{8 \times 9 \times 17}{6} = 204 \qquad \left[\because \Sigma n^2 = \frac{n(n+1)(2n+1)}{6}\right]$$

54

Since these five people enter the train during journey it means they must have enter the train after Lucknow.

Hence if a person enters at S_1 he can have 7 different tickets for S_2, S_3, … S_7 and Mumbai.

Similarly if a person enters at S_2 he can have 6 different tickets and if a person enters at S_3 he can have 5 different tickets and so on.

∴ Total numer of possible tickets

$$= 7 + 6 + 5 + 4 + 3 + 2 + 1 = 28$$

Now, the five different tickets must be out of these 28 tickets. Therefore, the required number of ways

$$= {}^{28}C_5 = 98280$$

55 The number of ways of choosing the committee when Ms. B is a member (when Mr. A refuses to serve)

$$= {}^8C_3 \times {}^6C_5 = 56 \times 6 = 336$$

The number of ways of choosing the committee when Ms. B is not a member (when Mr. A can serve)

$$= {}^8C_4 \times {}^7C_5 = 70 \times 21 = 1470$$

Thus the required number of ways = 336 + 1470 = 1806.

Alternatively Total number of ways of selecting 4 women and 5 men = ${}^9C_4 \times {}^7C_5 = 2646$.

Number of ways of selecting 4 women and 5 men in which Ms. B and Mr. A are not present together

$$= {}^8C_3 \times {}^6C_4 = 840$$

Hence the number of ways in which Ms. B and Mr. A do not serve together = 2646 − 840 = 1806

56 Required number of ways = $5 \times 5 \times 5 \times 5 \times 5 = 3125$

57 Required number of arrangements = $5 \times 5 \times 5 \times 5 = 625$

Since we fix cap C_1 in box B_1 then we arrange the remaining 4 caps in any of the 5 boxes.

Alternatively Total number of arrangements = 5^5

Number of arrangements in which B_1 have cap $C_1 = \frac{5^5}{5} = 5^4$

58 Required number of arrangements = ${}^5P_5$

$\therefore \quad {}^5P_5 = 5 \times 4 \times 3 \times 2 \times 1 = 120$

59 1 cap can be selected in ${}^5C_1$ ways.

Now this selected cap can be arranged in 5 boxes in ${}^5P_1$ ways. Again 2 caps can be selected in ${}^5C_2$ ways.

Now, these selected caps can be arranged in 5 boxes in ${}^5P_2$ ways and so on.

Hence the required number of ways

$$= {}^5C_1 \times {}^5P_1 + {}^5C_2 \times {}^5P_2 + {}^5C_3 \times {}^5P_3 + {}^5C_4 \times {}^5P_4 + {}^5C_5 \times {}^5P_5$$

$$= 25 + 200 + 600 + 600 + 120 = 1545$$

60 Since all the boxes are filled with exactly one cap and all the caps are identical.

Hence the required number of ways = 1.

61 Required number of ways = $\frac{5!}{2!} = 60$

(Since 2 caps are identical)

62 B_3 can be filled in 2! ways and rest can be filled in 4! ways.

Hence, required number of ways $= 2 \times 4! = 48$.

63 B_1 and B_5 can be filled up in $2 \times 2 = 4$ ways and B_2, B_3, B_4 can be filled up in $= 5 \times 5 \times 5 = 125$ ways.

Hence the required number of ways $= 4 \times 125 = 500$

64 Since Juliet never writes more number of letters than the number of letters Romeo writes, it implies that out of the total 6 letters first letter is written by Romeo. Now the remaining 5 letters can be written in the following order.

Case	Order of Letters in which they are written by Romeo and Juliet					
	1	2	3	4	5	6
I	R	R	R	R	J	J
II	R	R	R	J	R	J
III	R	R	R	J	J	R
IV	R	R	J	R	R	J
V	R	R	J	R	J	R
VI	R	R	J	J	R	R
VII	R	J	R	R	R	J
VIII	R	J	R	R	J	R
IX	R	J	R	J	R	R
X	R	J	J	R	R	R

Out of the above 10 cases, case X is invalid as in this case Juliet writes 2 letters by the time Romeo writes only 1 letter, which is contradictory to what is stated in the problem. Therefore total valid possibilities $= 10 - 1 = 9$.

Alternatively

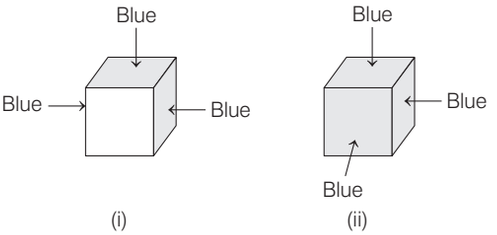
Since Juliet never writes more number of letters than that of Romeo, it implies that out of the total 6 letters Romeo writes first letter. Number of ways in which the remaining 5 letters can be arranged $= \frac{5!}{3!2!} = 10$. But if the second and third both letter are written by Juliet then it would be contradictory and so unacceptable. That is the case when the order of writing the letters is RJJRRR. Therefore the actual possible ways of writing the love-letters $= 10 - 1 = 9$

65

Case	Blue	Pink	Number of ways	Reason
I	6	0	1	Since all the faces are of the same color
II	5	1	1	Since there is a symmetric view
III	4	2	2	2 cases arise depending on whether the 2 pink faces are adjacent or opposite
IV	3	3	2	In one scenario all three blue faces are adjacent and in another scenario one blue face is adjacent to the other two blue faces but the other two blue faces are not adjacent to each other
V	2	4	2	2 cases arise depending on whether 2 blue faces are adjacent or opposite
VI	1	5	1	Since there is a symmetric view
VII	0	6	1	Since all the faces are of the same color

Total number of ways $= 1 + 1 + 2 + 2 + 2 + 1 + 1 = 10$

NOTE In case IV there are two possibilities as depicted in the following diagrams.



In the figure (i) all three blue faces are not adjacent to each other. In figure (ii) all three faces are adjacent to each other.

66 The number of ways of selecting 4 days out of 7 days $= {}^7C_4 = 35$

The number of ways of selecting a shift from the 4 days $= 2^4 = 16$

Therefore total number of ways of attending the gym $= 35 \times 16 = 560$

67 If you do not repeat the use of digits you cannot form more than 3! = 6 numbers. Since, you have to form 900 numbers, so you have to repeat the use of digits.

Since there are 3 digits namely, 2, 5, 7 and they have to be placed at n-places. So each place can be filled in 3 ways. Thus n places can be filled in 3^n ways.

It implies that $3^n \geq 900 \Rightarrow 3^{n-2} \geq 100 \Rightarrow n - 2 \geq 5 \Rightarrow n \geq 7$

So the least value of n is 7.

Hence choice (b) is the answer.

Alternatively Consider the following table.

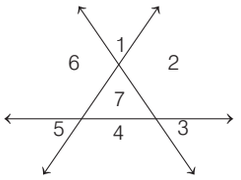
n	Number of n digit numbers	
1	3	3
2	3×3	9
3	$3 \times 3 \times 3$	27
4	$3 \times 3 \times 3 \times 3$	81
5	$3 \times 3 \times 3 \times 3 \times 3$	243
6	$3 \times 3 \times 3 \times 3 \times 3 \times 3$	729
7	$3 \times 3 \times 3 \times 3 \times 3 \times 3 \times 3$	2187

If n is less than 7, you cannot form 900 numbers. So n must be at least 7 to form 900 (or more) n-digit numbers.

68 Let us discuss the various possibilities of arranging the 3 lines in a plane.

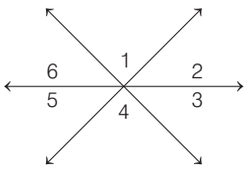
Case I No 2 lines are parallel and no 3 lines are concurrent.

Then the 3 lines divide the plane into 7 regions.



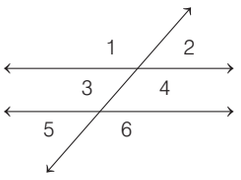
Case II No 2 lines are parallel but the 3 lines are concurrent.

Then the 3 lines divide the plane into 6 regions.



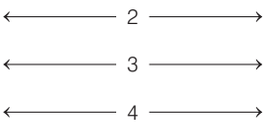
Case III Exactly 2 lines are parallel and the third line is a transversal.

Then the 3 lines divide the plane into 6 regions.



Case IV All the 3 lines are parallel.

Then the 3 lines divide the plane into 4 regions.



Thus it is evident that 3 lines can divide a plane into 4, 6 or 7 regions but not into 5 regions.

69 There will be total $10 + 1 = 11$ spots where 4 security posts can be established.

Therefore number of different ways of selecting 4 spots out of 11 spots $= {}^{11}C_4 = 330$

70 The rectangle is divided by $2m - 1$ vertical lines, so there are total $2m$ vertical lines.

Similarly the rectangle is divided by $2n - 1$ horizontal lines, so there are total $2n$ horizontal lines.

Since we are supposed to have the rectangles of odd dimensions (e.g. , 1, 3, 5,…). So we will select two vertical lines such that one is even numbered and another is odd numbered and similarly two horizontal lines.

Therefore the number of rectangles

$$= {}^{m}C_1 \times {}^{m}C_1 \times {}^{n}C_1 \times {}^{n}C_1 = m^2n^2$$

Hence choice (c) is the answer.

Alternatively

Number of possible rectangles

$= [1 + 3 + 5 + \ldots + (2m - 1)] \times [1 + 3 + 5 + \ldots + (2n - 1)]$

$= m^2n^2$

71 Total number of shortest paths from A to C

$${}^{10}C_6 \times {}^{6}C_6 = 210$$

Number of shortest paths from A to R

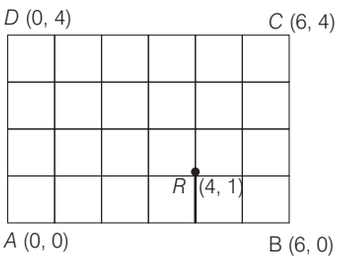
$$= {}^{5}C_4 \times {}^{1}C_1 = 5$$

Number of shortest paths from R to C

$$= {}^{5}C_2 \times {}^{3}C_3 = 10$$

Number of shortest paths from A to C, via R

$$= 5 \times 10 = 50$$



Therefore the required number of shortest paths from A to C, without going via R

$$= 210 - 50 = 160$$

72 The possible combinations are

(i) 1, 1, 1, 1, 1, 2, 3

(ii) 1, 1, 1, 1, 2, 2, 2

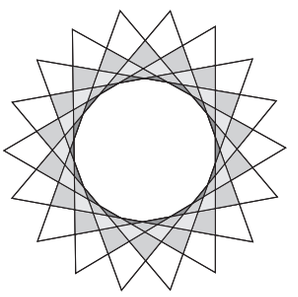
Hence total number of seven digits number

$$= \frac{7!}{5!} + \frac{7!}{4!3!} = 77$$

Hence choice (c) is the answer.

73 The maximum possible number of regions created by n triangles $= 3n^2 - 3n + 2$.

Therefore the maximum possible number of regions created by 6 triangles $= 3(6)^2 - 3(6) + 2 = 92$



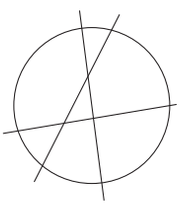
Six overlapping triangles, dividing the plane into 92 distinct regions

74 Here are few examples of the required numbers:
123, 124, 125, . . . , 129 and 134, 135, 136,…, 139 and 145, 146, 147,…149.
For all such numbers please consider the following table.

a	*b*	*c*	Total values
1	2 3 ... ... 6 7 8	3, 4, ..., 9 4, 5, ..., 9 .... 7, 8, 9 8, 9 9	28
2	3 4 8	4, 5, ..., 9 5, 6, ..., 9 9	21
3	4 8	5, 6, ..., 9 9	15
4	...	...	10
5	...	...	6
6	...	...	3
7	...	...	1
8	...	...	0
9	...	...	0

Therefore the total number of required three digit numbers
$= 1 + 3 + 6 + 10 + 15 + 21 + 28 = 84$

75 When there is no line the number of regions = 1
When 1st line is drawn, new regions added = 1
When 2nd line is drawn, new regions added = 2
When 3rd line is drawn, new regions added = 3
When 4th line is drawn, new regions added = 4
When 5th line is drawn, new regions added = 5
When 6th line is drawn, new regions added = 6



Thus maximum number of regions when 3 lines are drawn
$= 1 + 1 + 2 + 3 = 7$

Similarly, maximum number of regions when 6 lines are drawn $= 1 + 1 + 2 + 3 + 4 + 5 + 6 = 22$
Therefore maximum additional number of regions
$= 22 - 7 = 15$

Alternatively If n straight lines are intersecting a circle such that no two lines are parallel and no three lines are concurrent, the maximum number of parts/regions into which these lines divide the circle is

$$^nC_0 + {}^nC_1 + {}^nC_2 = \frac{n(n+1)}{2} + 1 = \frac{n^2 + n + 2}{2}.$$

Then the maximum number of regions when there are
3 lines $= \frac{1}{2}(9 + 3 + 2) = 7$

And, the maximum number of regions when there are
6 lines $= \frac{1}{2}(36 + 6 + 2) = 22$

Therefore, maximum number of additional regions
$= 22 - 7 = 15$

76 If the number of countries in the four continents are a, b, c and d, so he has to visit at least $(a-1) + (b-1) + (c-1) + (d-1)$ number of countries and then one more country from any continent.

	Asia	Africa	Europe	America	Total number of Countries
Number of countries to be visited	21	16	11	6	54
Minimum number of countries he must visit in each continent	20	15	10	5	50

First let him visit $20 + 15 + 10 + 5 = 50$ countries. Now, if he visits 1 more country in any of these four continents, then we can say that he visits at least 21 Asian or at least 16 African or at least 11 European or at least 6 American countries. Thus, he should visit minimum 51 countries to satisfy the given condition.

Hence choice (b) is the correct answer.

77 When A sits next to B, number of seating arrangements $= 5! \times 2! = 240$

When A sits next to B, and P sits next to T, number of arrangements $= 4! \times 2! \times 2! = 96$

Therefore, the required number of seating arrangements $= 240 - 96 = 144$

78 Given that $9 + 1 + a + b + c + d = 16$

$\Rightarrow \quad a + b + c + d = 6$

$\therefore$ Number of integral solutions $= {}^9C_3 = 84$

79 There can be total 3 main cases (Assuming Sindhu wins the series):

Case	Number of matches won by Jwala	Number of matches won by Sindhu	Total matches played to end the series	Number of ways to arrange the matches
I	0	3	3	$\frac{3!}{3!}$
II	1	3	4	$\frac{3!}{2!}$
III	2	3	5	$\frac{4!}{2!\times 2!}$

Case I Since all matches are won by only one person, so there is only 1 way Sindhu can win this series.

Case II Out of the 4 matches, Jwala cannot win the last match. If Jwala wins the last match, it means Sindhu has already won the first 3 matches, so there is no need to play the fourth match. Therefore, the last match has to be won by the winner of the series.

Valid arrangements, since the last winner is Sindhu –

{JSSS, SJSS, SSJS}

Invalid arrangements, since Sindhu has already won the series before 4th match of the series – {SSSJ}

Since, we have observed that in this type of questions, it is the winner of the series who always plays the last winning match, so to solve this problem we should keep away the last winning match separately, and arrange the remaining matches.

In this case there are 4 matches (1 match is won by Jwala and other 3 are won by Sindhu), so we will keep the last match of Sindhu separately, and arrange the remaining matches (1 match of Jwala and 2 matches of Sindhu).

This can be done in $\frac{3!}{2!} = 3$ ways

Case III Since we know that the last match has to be definitely won by the winner of the series (Sindhu), so we have to arrange the remaining 2 matches in which Sindhu wins and the two matches in which Jwala wins.

This can be done in $\frac{4!}{2!2!} = 6$ ways

Valid arrangements, since the last winner is Sindhu –

{JJSS**S**, JSJS**S**, JSSJ**S**, SJJS**S**, SJSJ**S**, SSJJ**S**}

Invalid arrangements, since the Sindhu has already won the series before 4th/5th match of the series –

{SSSJJ, SSJSJ, SJSSJ, JSSSJ}

Thus, Sindhu wins the series in 10 (= 1 + 3 + 6) ways.

Similarly, there are 10 ways in which Jwala wins the series.

Therefore, total number of ways in which this series could be won = 20.

80 Given that $10^9 < n < 10^{10}$. It implies that n is a 10-digit number.

Case I $n = 6\times1\times1\times1\times1\times1\times1\times1\times1\times1$

Number of possible numbers = 10

Case II $n = 3\times2\times1\times1\times1\times1\times1\times1\times1\times1$

Number of possible numbers = ${}^{10}P_2 = 90$

Total required numbers = 10 + 90 = 100

81 First of all he picks 1 rose, 2 lilies, 3 orchids and 4 carnations in order to fulfill the minimum requirement criterion. Thus 10 flowers have already been kept aside for the bouquet.

Now, the remaining 5 flowers can be chosen from any of the four types of flowers, such that $R + L + O + C = 5$ and $R, L, O, C \geq 0$.

Therefore, the required number of ways

$$= {}^{5+4-1}C_{4-1} = {}^{8}C_3 = 56$$

☑ Level 02 *Higher Level Exercise*

1 First and second prizes can be given in Mathematics in (30×29) ways. First and second prizes can be given in Physics in (30×29) ways.

First prize can be given in Chemistry in 30 ways.

First prize can be given in English in 30 ways.

Hence, the number of ways to give prizes in all the four subjects

$$(30\times29)\times(30\times29)\times30\times30 = (30)^4\times(29)^2$$

2 $1 + 1\cdot P_1 + 2\cdot P_2 + 3\cdot P_3 + 4\cdot P_4 + \ldots + n\cdot P_n$

$= 1 + 1 + 2\cdot 2! + 3\cdot 3! + 4\cdot 4! + \ldots + n\cdot n!$

$= 1 + [(2!-1!) + (3!-2!) + (4!-3!) + \ldots$

$+ ((n+1)!-n!)]$

$= 1 + [(n+1)!-1!] = (n+1)!$

Alternatively Consider $n = 1, 2, 3, \ldots$ etc. and then verify the result.

3

	Row-1	Row-2	Row-3	Row-4
Case 1.	Class 1	Class 2	Class 1	Class 2
Case 2.	Class 2	Class 1	Class 2	Class 1

Required seating arrangement can be done in two ways-case 1 and case 2. Total numer of arrangements

= Number of arrangements in case 1

+ Number of arrangements in case 2

Now, 12 students of class 1 can be seated in 12 chairs in ${}^{12}P_{12}$ ways and 12 students of class 2 can be seated in 12 chairs in ${}^{12}P_{12}$ ways. Hence, the total number of arrangements

$= (12!\times12!) + (12!\times12!)$ $(\because {}^{12}P_{12} = 12!)$

$= 2\,(12!)^2$

4 There are 5 even digits *viz.,* 0, 2, 4, 6 and 8. Digit 3 cannot be at the tens place, since if 3 is at tens place, then 9 must be at unit place which is impossible. Hence 3 can be only at hundred's place. Now there are two cases :

1. **When 3 is at hundred's place :** If 3 is at hundred's place, then 9 will be at ten's place. So unit place can be filled up in only 5 ways by using even digits.
   So, the total number of even numbers = $1 \times 1 \times 5 = 5$.
2. **When 3 is not at hundred's place :** In this case hundred's place can be filled up in 8 ways (0 and 3 cannot be used). In tens place we can use any one of the 10 digits except 3. So tens place can be filled up in 9 ways and unit place can be filled up in 5 ways by using 0, 2, 4, 6 and 8.

So, the total number of even numbers = $8 \times 9 \times 5 = 360$
Hence the total number of required 3 digit even numbers
$= 5 + 360 = 365$

5 Number of vehicles registered upto R Z 9999
$= 18 \times 26 \times (9999)$
Number of vehicles registered between SA-0001
and SJ 9999 $= 1 \times 10 \times 9999$
Therefore number of vehicles registered before SK-0123
$= 18 \times 26 \times 9999 + 1 \times 10 \times 9999 + 122$
$= 9999 \times 478 + 122 = 4779644$

6 Available digits are 1, 2, 3, 4 and 5. Now since we know that a number is divisible by 4 if and only if the number formed by last two digits is divisible by 4. So the following cases are possible.

Thousands	Hundreds	Tens	Unit
x	y	1	2
x	y	2	4
x	y	3	2
x	y	5	2

In each case thousands and hundreds places can be filled up in ${}^3P_2$ ways.
Hence the required number of ways = ${}^3P_2 \times 4 = 24$.

7 Total number of seats = $2(3 + 4) = 14$
Total number of persons = $3 + 9 = 12$
$\therefore$ Total number of required arrangements = ${}^{14}P_{12}$.

8 Three girls can be seated together in a back row on adjacent seats in the following ways :
1, 2, 3 or 2, 3, 4 of first van and 1, 2, 3 or 2, 3 4 of second van.
In each of the above four cases all the three girls can be inter change among themselved in 3! ways.
So the total number of ways = $4 \times 3!$
Now, 9 boys can be seated in remaining 11 seats, which can be done in ${}^{11}P_9$ ways.
Hence, the required number of ways = ${}^{11}P_9 \times 4 \times 3!$.

9 5 '+' (plus) signs can be arranged in 1 way, then we have 6 places to arrange 5 '–' (minus) signs in ${}^6C_5$ ways but since all the minus (–) signs are identical, therefore minus signs can be arranged in only 1 way in 5 chosen places out of 6.
Hence the required number of arrangements
$= 1 \times {}^6C_5 \times 1 = 6$

10 In order that no two books on Maths be together we first arrange 11 identical books on English which can be done in 1 way.
Now we can choose 9 places out of 12 (11 + 1) places for Maths books, which can be done in ${}^{12}C_9$ ways.
Again since all books on Maths are identical which can be mutually arranged in only 1 way.
Hence the required number of arrangements $= 1 \times {}^{12}C_9 \times 1$
$= 220$

11 $1680 = 2^4 \times 3 \times 5 \times 7$
Since if $N = a^p \cdot b^q \cdot c^r \cdot \ldots$
we have number of factors of $N = (p + 1)(q + 1)(r + 1)\ldots$
Hence the total number of factors of the given number
$= (4 + 1)(1 + 1)(1 + 1)(1 + 1) = 40$

12 $\sum_{k=m}^{n} {}^kC_r = {}^mC_r + {}^{m+1}C_r + {}^{m+2}C_r + \ldots + {}^{(n-1)}C_r + {}^nC_r$
Now assume some values of m and n, then verify the correct result from the choices given in the question.

13 The number of students answering exactly k $(1 \le k \le n-1)$ questions wrongly is $2^{n-k} - 2^{n-k-1}$.
The number of students answering all n questions wrongly is 2^0. Thus, the total number of wrong answers is :
$1(2^{n-1} - 2^{n-2}) + 2(2^{n-2} - 2^{n-3}) + \ldots$
$\ldots + (n-1)(2^1 - 2^0) + n(2^0)$
$= 2^{n-1} + 2^{n-2} + 2^{n-3} + \ldots + 2^0 = 2^n - 1$
$\Rightarrow 2^n - 1 = 2047 \Rightarrow 2^n = 2048 \Rightarrow n = 11$

14 Required number of triangles = Total number of triangles
– Number of triangles having one side common with the octagon
– Number of triangles having two sides common with the octagon
$= {}^8C_3 - ({}^8C_1 \times {}^4C_1) - 8 = 16$

15 The number of ways of selecting any five numbers from the given set = ${}^{25}C_5$.
Now, the five consecutive numbers can be chosen in the following ways
(1, 2, 3, 4, 5); (2, 3, 4, 5, 6); (3, 4, 5, 6, 7);...(21, 22, 23, 24, 25)
Thus the required number of ways = ${}^{25}C_5 - 21 = 53109$

16 $\because a \ge -1, b \ge -1, c \ge -1, \quad d \ge -1$.
Let $u \ge 0, \quad v \ge 0, \quad w \ge 0, \quad x \ge 0$.
$\therefore \quad a + b + c + d = 12$

$\Rightarrow \quad (u-1)+(v-1)+(w-1)+(x-1)=12$

$\Rightarrow \quad u+v+w+x=16$

$\therefore$ Required number of solutions $= {}^{16+4-1}C_{4-1} = {}^{19}C_3$

17 Assume some value of k then find 'n' and hence ${}^nC_2$.

Now, verify the correct option.

18 $42 = 2\times 3\times 7$

Here each of a, b and c can take 3 values.

Hence the required number of solutions $= 3\times 3\times 3 = 27$.

19 Let (r, b, g) denotes the number of red, blue and green balls respectively.

Therefore the possibilities are (0, 10, 0), (2, 7, 1), (4, 4, 2) and (6, 1, 3).

Hence, the required number of ways = 4.

20 Let x_1 be the number of stations before the first halting station, x_2 between first and second, x_3 between second and third, x_4 between third and fourth and x_5 on the right of the fourth station, then

$$x_1 \geq 0, \quad x_2, x_3, x_4 \geq 1 \quad \text{and} \quad x_5 \geq 0$$

such that $x_1 + x_2 + x_3 + x_4 + x_5 = 6$.

Now, the total number of ways is the number of solutions of the above equation.

Let $y_2 \geq 0, \quad y_3 \geq 0, \quad y_4 \geq 0.$

$\therefore \quad x_1 + x_2 + x_3 + x_4 + x_5 = 6$

$\Rightarrow \quad x_1 + (y_2+1) + (y_3+1) + (y_4+1) + x_5 = 6$

$\Rightarrow \quad x_1 + y_2 + y_3 + y_4 + x_5 = 3$

$\therefore$ The number of solutions $= {}^{3+5-1}C_{5-1} = {}^7C_4 = 35$

21 Let x_i denote the marks assigned to the i^{th} question. Then

$$x_1 + x_2 + x_3 + \ldots + x_7 + x_8 = 30$$

where $i = 1, 2, 3, \ldots, 8 \quad \text{and} \quad x_i \geq 2$

and $y_1 + y_2 + \ldots + y_7 + y_8 = 14$

where $y_i = x_i - 2, \quad i = 1, 2, 3, \ldots$

$\therefore$ The total number of solutions of this equation is

$${}^{14+8-1}C_{8-1} = {}^{21}C_7$$

22 $\therefore$ The exponent of 3 in 33! is 15.

$$\begin{array}{l|l} 3 & 33 \\ 3 & 11 \leftarrow \\ 3 & 3 \leftarrow \\ & 1 \leftarrow \end{array} \Big\} 15$$

Hint For more information about exponents refer the first chapter of the book.

23 There are two distinct possibilities

(i) When any of the four digits may repeat thrice.

(ii) When any two of the four digits may repeat twice.

(i) $\dfrac{6!}{3!}\times {}^4C_1 = 480$

(ii) $\dfrac{6!}{2!\,2!}\times {}^4C_2 = 1080$

Therefore the required number = 480 + 1080 = 1560.

24

9	10	10	10	10	10	5

$= 4500000$

Since if we fix first digit then unit digit will determine the odd/even nature of the numbers so formed.

But unit place can assume half even and half odd. Hence unit place can assume just 5 digits which makes the sum of previous six digits even.

25 Required number of ways $= {}^6P_4$.

26 Suppose x one rupee coins, y fifty paise coins and z twenty paise coins are selected.

Then $x + y + z = 6$

$\therefore$ Total number of ways

= Number of solutions of the above equation

$= {}^{6+3-1}C_{3-1} = {}^8C_2 = 28$

27 Required number of times

= Number of selections of 3 children taking at a time

$= {}^8C_3 = 56$

28 Each child will go as often as he or she can be accompanied by two others. Therefore the required number

$= {}^7C_2 = 21$

29 Total number of points = 12

Total number of triangles $= {}^{12}C_3$

But there are 3 cases which must be excluded for the required number of triangles.

Case 1. The number of triangles formed by 3 points on

$AB = {}^3C_3 = 1$

Case 2. The number of triangles formed by 4 points on

$BC = {}^4C_3 = 4$

Case 3. The number of triangles formed by 5 points on

$CA = {}^5C_3 = 10$

Hence, the required number of triangles

$= 220 - (10 + 4 + 1) = 205$

30 Each question can be attempted in 3 ways *i.e.,* either it can be omitted or one of the two parts can be attempted.

Hence required number of ways $= 3^{10} - 1 = 59048$.

31 Required number of ways $= {}^{16}C_9$.

32 Since each bulb has two choices, either switched on or off, therefore required number $= 2^{10} - 1 = 1023$.

33 Since each digit of a 10 digit number can be written as either 2 or 3, therefore required number of 10 digit number is 2^{10}.

34 Consider some value of n then verify the result.

35 Any divisor of $2^3\cdot 3^4\cdot 5^2$ is of the form $2^a\cdot 3^b\cdot 5^c$ where $0\leq a\leq 3$, $0\leq b\leq 4$ and $0\leq c\leq 2$. Thus, the sum of the

divisors of $2^3 \cdot 3^4 \cdot 5^2$ is

$(1 + 2 + \ldots + 2^3)(1 + 3 + \ldots + 3^4)(1 + 5 + 5^2)$

$= \dfrac{(2^4 - 1)(3^5 - 1)(5^3 - 1)}{(2-1)(3-1)(5-1)} = \dfrac{15 \times 242 \times 124}{1 \times 2 \times 4}$

$= 56265$

36 Required number of ways $= {}^{10+4-1}C_{4-1} = {}^{13}C_3 = 286$

37 Since we know that out of n things arranged in a row then we can select r things out of n such that no two of them are adjacent to each other in ${}^{n+1-r}C_r$ ways.

Hence required number of ways $= {}^{10+1-3}C_3 = {}^{8}C_3 = 56$

Alternatively To each selection of 3 objects we associated a binary sequence of the form 1001000100 where 1 at i^{th} place means the i^{th} object is selected and 0 at ith place means the i^{th} object is not selected.

There exists one to one correspondence between the set of selections of 3 objects and set of binary sequences containing 7 zeros and 3 ones.

Actually we are concerned with the binary sequences in which 2 ones are consecutive we first arrange 7 zeros.

This can be done in just one way. Now, 3 ones can be arranged at any of the 3 places marked with a cross in the following arrangement.

$$\times 0 \times 0 \times 0 \times 0 \times 0 \times 0 \times 0 \times$$

We can arrange 3 ones at 8 places in ${}^8C_3$ ways $= 56$

38 Let x_5 be such that $x_1 + x_2 + x_3 + x_4 + x_5 = n$

Now we require the non-negative integral solutions of

$$x_1 + x_2 + x_3 + x_4 + x_5 = n$$

The number of required solutions $= {}^{n+5-1}C_{5-1} = {}^{n+4}C_4$

39 When we arrange things one at a time, the number of possible permutations is n.

When we arrange them two at a time, the number of possible permutations is $n \times n = n^2$ and so on.

Hence, the total number of required permutations is

$$n + n^2 + n^3 + \ldots + n^r = \frac{n(n^r - 1)}{n - 1}$$

40 In a chess board there are 8 columns and 8 rows.

Hence the number of rectangles $= 1^3 + 2^3 + 3^3 + \ldots + 8^3$

$$= \left(\frac{8 \times 9}{2}\right)^2 = 1296$$

Alternatively A chessboard is a network of 9 vertical and 9 horizontal lines.

Since we know that number of quadrilaterals formed by m vertical and n horizontal lines is ${}^mC_2 \times {}^nC_2$.

Hence the required numer of rectangles $= {}^9C_2 \times {}^9C_2 = 1296$

41 Order of speaking is equivalent to the order of placing the things.

Thus *A, B* and *C* can be placed in ${}^{10}C_3$ ways and the remaining 7 persons can be placed in 7! ways.

Hence, the number of ways in which they can speak is

$${}^{10}C_3 \times 7! = \frac{10!}{3!}$$

Alternatively All the 10 persons can speak in 10! ways in which *A, B* and *C* can speak in 6 different ways.

But we are required to find a single case out of 6 cases in which *A* speaks before *B* and *B* speaks before *C*.

Hence the required number of ways $= \dfrac{10!}{3!} = \dfrac{10!}{6}$

42 Total one digit number = 2

Total two digit numbers $= 2^2$

Total three digit numbers $= 2^3$

Total four digit numbers $= 2^4$

… … … … …

Total eight digit numbers $= 2^8$

There are total 9 digit numbers $= 2^9$

but out of these 2^9 numbers half of the numbers begin with digit 1 and rest half numbers begin with digit 2.

The greatest possible number less than $2 \cdot 10^8$ is 122222222, which in turn is the greatest possible number of 9 digit begin with 1. Thus the maximum possible number of 9 digit numbers $= \dfrac{2^9}{2} = 2^8$

Hence, the required total numbers

$= 2 + 2^2 + 2^3 + 2^4 + \ldots + 2^8 + 2^8$

$= \dfrac{2(2^8 - 1)}{2 - 1} + 2^8 = 2^9 - 2 + 2^8 = 2^8(2 + 1) - 2 = 766$

43 Required number of ways $= {}^{12+1-4}C_4 = {}^9C_4 = 126.$

44 Since $2k < n \Rightarrow k < \dfrac{n}{2}$

Hence, number of zeros is less than the number of ones.

Now, first of all we arrange $(n - k)$ ones as follows

$$\times 1 \times 1 \times 1 \times 1 \times 1 \times \ldots \times 1 \times$$

The above arrangement leaves $(n - k + 1)$ places marked with $\times$.

Now we can arrange k zeros in the $(n - k + 1)$ places in ${}^{n-k+1}C_k$ ways.

45 Part *A* can be attempted in 3 ways

(i) The student do not solve the question.

(ii) The student attempts the first part of the question.

(iii) The student attempts the second (*i.e.,* alternative) part of the question.

$\therefore$ Total number of choices in the first part $= 3^5$

Hence, the required number of ways in which a student must attempt at least one question $= 3^5 - 1 = 242$

Similarly we can show that there are $2^4 - 1$

i.e. 15 choices for part *B*.

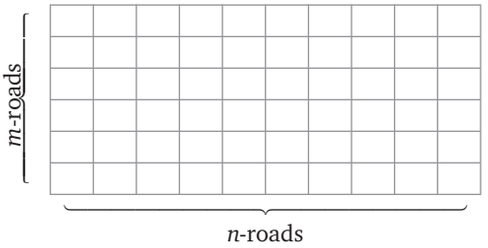
Hence the required number of ways $= 242 \times 15 = 3630$.

46 Required number of number plates of licences
$$= (26)^2 \times (999) = 675324$$

47 Required number of plates $= {}^{26}P_2 \times {}^{10}P_3 = 468000$

48 We can arrange r persons on m chairs on a particular side in ${}^{m}P_r$ ways and s persons on m chairs on the other side in ${}^{m}P_s$ ways. Now, we can arrange $(2m - r - s)$ persons on the remaining $(2m - r - s)$ chairs in ${}^{(2m-r-s)}P_{(2m-r-s)}$ ways.
Thus, the required number of ways of arranging the persons $= ({}^{m}P_r)\,({}^{m}P_s)\,({}^{2m-r-s}P_{2m-r-s})$

49 The diagram of roads can be as follows :



Suppose the distance between two successive parallel roads be one unit then a person can travel $(m-1)$ steps in north-south direction and he can travel $(n-1)$ steps in east-west direction.
Thus he has to travel $\{(m-1)+(n-1)\} = (m+n-2)$ steps to reach from one corner to diagonally opposite corner.
Thus he can arrange his steps in
$${}^{(m+n-2)}C_{(m-1)} \times {}^{(n-1)}C_{(n-1)} \text{ ways}$$
i.e. $${}^{m+n-2}C_{m-1} \text{ ways.}$$

50 The required number of ways is equal to the number of ways in which they can select the same number of toys from the collection of their combined number of toys – the number of ways in which each can select her original toys.
Hence, required number of ways $= ({}^{19}C_{11} \times {}^{8}C_8) - 1$
$$= {}^{19}C_{11} - 1$$

51 Go through options.

52 The number of ways of choosing 26 cards out of 52 cards is ${}^{52}C_{26}$. There are two ways in which each card can be dealt because a card can be either from a first pack or from the second pack.
Hence, the number of ways in which the card can be dealt is
$${}^{52}C_{26} \times 2^{26}$$

53 There are 4 suits and each suit contains 13 cards so we can select any one card from the first suit in 13 ways. Similarly we can select one card different from the first card out of second suit in 12 ways and so on.
Hence, the required number of ways $= 13 \times 12 \times 11 \times 10$
$$= 13!/9!$$

54 First digit (i.e. ten thousands place) can be filled up in 2! ways by the digit 3, but since 3 is being repeated twice, hence the actual number of ways $= \frac{2!}{2!} = 1$
Remaining 4 places can be filled up in 4! ways but since zero is being repeated thrice hence the actual number of ways $= \frac{4!}{3!} = 4$
$\therefore$ The required number of ways $= 1 \times 4 = 4$.

55 Digit 5 can be placed in any one of the 4 places in 4 ways.
Now the remaining 3 places can be filled up with remaining 8 digits in 8^3 ways.
Hence, the required number of ways $= 4 \times 8^3 = 2048$.

56 Required number of ways $= 4 \times 8 \times 7 \times 6 = 1344$

57 Digit 2 can be arranged in two places out of 8 places in $\frac{{}^{8}P_2}{2!}$ ways.
Now, the remaining 6 places can be filled by the rest 3 digits in 3^6 ways.
Hence, the required number of ways $= \frac{{}^{8}P_2}{2!} \times 3^6$
$$= {}^{8}C_2 \times 3^6 = 20412$$

58 Required number of ways $= 3^8 = 6561$.

59 Since chairs are numbered, hence these are distinguishable.
Therefore 3 boys can be arranged in 3! ways on alternate chairs and 3 girls can be arranged in remaining 3 chairs in 3! ways.
Also 3 girls can be arranged before the boys are arranged.
Hence the required number of ways $= 2 \times (3!)^2 = 72$

60 First rook can be selected in 64 ways ${}^{64}C_1$.
Second rook cannot be selected from the same row and same column from which the first rook has been selected hence there are only $64 - (8 + 7) = 49$ places for the second rook.
Hence, the second rook can be selected in ${}^{49}C_1$ ways.
$\therefore$ Required number of ways $= {}^{64}C_1 \times {}^{49}C_1 = 3136$.

61 Number of white shoes = 9 pairs
$\Rightarrow$ 9 left and 9 right shoes
Number of black shoes = 6 pairs
$\Rightarrow$ 6 left and 6 right
In such questions we always consider the worst situation.
Therefore we assume that initially we get $6 + 6 = 12$ black shoes and 9 white shoes either left or right.
Thus we have taken out $12 + 9 = 21$ shoes still we don't have required pair of white shoes.
Now we drawout just one white shoe which will fulfill our requirement of getting one pair of white shoes.
[One pair of white shoes means 1 left shoe and 1 right shoe.]
Thus we have to draw out $12 + 9 + 1 = 22$ shoes to get correct pair of white shoes.

62 The worst possible situations are :

White	Black
9 left	6 left
9 left	6 right
9 right	6 left
9 right	6 right

Thus before getting the required correct pair of shoes we have to draw out $9 + 6 = 15$ shoes.

Now when we will draw out one more shoe which will give the required combination of correct shoes either white or black.

Hence we have to draw out minimum $15 + 1 = 16$ shoes.

63 We cannot put only one incorrect ball since if we make a wrong choice it will simultaneously make another choice wrong. For example if we put red colour ball in either of green, blue or black box then we have to fill the red colour box with different colour ball, hence one colour combination can never be wrong.

Since atleast two combinations will be different.

64 Select any two balls out of 4 then interchange the combination of colours.

Hence the required number of ways = ${}^4C_2 = 6$.

Alternatively

$$\begin{Bmatrix} R & B & G & W \\ B & R & G & W \end{Bmatrix}' \qquad \begin{Bmatrix} R & B & G & W \\ G & B & R & W \end{Bmatrix}$$

$$\begin{Bmatrix} R & B & G & W \\ W & B & G & R \end{Bmatrix}' \qquad \begin{Bmatrix} R & B & G & W \\ R & G & B & W \end{Bmatrix}$$

$$\begin{Bmatrix} R & B & G & W \\ R & W & G & B \end{Bmatrix}' \qquad \begin{Bmatrix} R & B & G & W \\ R & B & W & G \end{Bmatrix}$$

65 For one digit number 1 to $9 \to 1 \times 9 = 9$

For two digit numbers 10 to $99 \to 2 \times 90 = 180$

For threee digit numbers 100 to $300 \to 3 \times 201 = 603$

Hence, total number of required digits $= 9 + 180 + 603 = 792$

66 Four odd digits (1, 1, 3, 3) can be arranged in 4 odd places in $\frac{4!}{2!\,2!} = 6$ ways.

Now the remaining 3 even digits (2, 2, 4) can be arranged in 3 even place in $\frac{3!}{2!} = 3$ ways.

Hence the required number of ways $= 6 \times 3 = 18$.

67 Each of the 7 balls can be distributed into 5 ways.

Hence the required number of ways $= 5^7$.

68 There can be two cases

(1) 1, 1, 1, 1, 3

(2) 1, 1, 1, 2, 2

Case 1. A box (in which 3 balls can be put) is selected in ${}^5C_1$ ways.

Now, 3 balls can be selected in ${}^7C_3$ ways and remaining 4 balls can be arranged in 4! ways.

Hence, total number of ways $= {}^5C_1 \times {}^7C_3 \times 4!$.

Case 2. There are 2 boxes (each box contains 2 balls) is selected in ${}^5C_2$ ways.

Now, any two ball can be selected in ${}^7C_2$ ways and for the other selected box, 2 balls can be selected from the remaining 5 balls in ${}^5C_2$ ways and the remaining balls can be distributed in 3! ways.

Hence, the total number of ways $= {}^5C_2 \times ({}^7C_2 \times {}^5C_2) \times 3!$

$\therefore$ The required number of ways

$= ({}^5C_1 \times {}^7C_3 \times 4!) + ({}^5C_2 + {}^7C_2 \times {}^5C_2 \times 3!) = 16800$

69 Required number of ways $= {}^{7+5-1}C_{5-1}$

(using ${}^{n+r-1}C_{r-1}$) $= {}^{11}C_4 = 330$

70 Possible ways of distribution are as follows :

(i) (7) (ii) (6 + 1)

(iii) (5 + 2) (iv) (4 + 3)

(v) (5 + 1 + 1) (vi) (4 + 2 + 1)

(vii) (3 + 2 + 2) (viii) (3 + 3 + 1)

(ix) (4 + 1 + 1 + 1) (x) (3 + 2 + 1 + 1)

(xi) (2 + 2 + 2 + 1) (xii) (3 + 1 + 1 + 1 + 1)

(xiii) (2 + 2 + 1 + 1 + 1)

Hence total number of ways of distribution = 13.

71 There is only one way, which is as follows :

1, 2, 1, 2, 1.

72 One ball can be selected for the box 2 in ${}^7C_1$ ways and two balls can be selected out of remaining 6 balls for the box 4 in ${}^6C_2$ ways and the remaining 4 balls can be distributed in 3 boxes in 3^4 ways.

Hence, the required number of ways

$= {}^7C_1 \times {}^6C_2 \times 3^4 = 8505$

73 Ball 2 can be distributed between 2 boxes (*viz.,* box 2 and box 4) in 2 ways.

Now, the remaining 6 balls can be distributed in any of the 5 boxes in 5^6 ways.

Hence, the required number of ways $= 2 \times 5^6$ ways

$= 31250$ ways

74 Required number of distribution

= Total number of distribution

– Number of distribution in which ball 2 and ball 4 are together.

Here total number of distribution (as calculated in question number 68) = 16800.

Now, consider ball 2 and ball 4 are stuck together and this arrangement is assumed to be a single ball.

Thus we have 6 balls to be distributed into 5 boxes. Which can be done as 1, 1, 1, 1, 2 in ${}^5C_1 \times {}^6C_2 \times 4!$ ways = 1800.

${}^5C_1 \to$ Number of ways of selecting one box in which two balls are kept together.

${}^6C_2 \rightarrow$ Number of ways of selecting 2 balls out of 6 balls.

$4! \rightarrow$ Number of ways of distribution of remaining 4 balls in remaining 4 boxes.

Hence, the required number of ways

$$= 16800 - 1800 = 15000$$

75 Required number of ways = 3^4.

76 Following 4 distributions are possible :

$$(4, 0, 0), (3, 1, 0), (2, 2, 0), (2, 1, 1)$$

77 Required number of ways = ${}^{4+3-1}C_{3-1}$

(using ${}^{n+r-1}C_{r-1}$) = ${}^6C_2 = 15$

78 Since pots are identical then there will be 4 cases (4, 0, 0), (3, 1, 0), (2, 2, 0) and (2, 1, 1) but since all coins are different hence selection of coins matters.

Therefore for the first case number of selections = ${}^4C_4 = 1$

For the second case number of selections = ${}^4C_3 \times {}^1C_1 = 4$

For the third case number of selections = $\frac{{}^4C_2 \times {}^2C_2}{2!} = 3$

For the fourth case number of selections

$$= \frac{{}^4C_2 \times {}^2C_1 \times {}^1C_1}{2!} = 6$$

Hence the total number of distributions
$= 1 + 4 + 3 + 6 = 14$.

79 Since no box is empty and all pots are identical so the possible case is (1, 1, 2).

But since all the coins are different, then the 2 balls can be selected in ${}^4C_2$ ways and rest can be put in $\frac{{}^2C_1 \times {}^1C_1}{2!}$ ways.

Hence, the required number of distribution

$$= \frac{{}^4C_2 \times {}^2C_1 \times {}^1C_1}{2!} = 6$$

80 Since no pot is empty and all coins are identical, the possible case is (1, 1, 2).

But since all three pots are different hence a pot (which contains 2 coins together) can be selected in ${}^3C_1$ ways.

Hence the required number of distribution = ${}^3C_1 \times 1 = 3$.

81 The possible arrangements are as follows :

(4, 0, 0) $\rightarrow$ can be done in 2 ways
i.e., 4 balls can be put either one of the two identical pots or can be put in different pot.

(3, 1, 0) $\rightarrow$ can be done in 3 ways
either distinct pot can be filled up with 3 balls, or 1 ball or remained empty.

(2, 2, 0) $\rightarrow$ can be done in 2 ways
either distinct pot can be filled by 2 balls or remained empty.

(2, 1, 1) $\rightarrow$ can be done in 2 ways
either distinct pot can be filled up with 1 ball or 2 ball.

Hence, the required number of ways = 2 + 3 + 2 + 2 = 9.

82 The possible arrangements are as follows :

(4, 0, 0) $\rightarrow$ can be done in 3 ways
let the 4 coins be *A, A, B* and *C* then all these 4 coins as a single packet of coins can be arranged 3 different pots in 3 ways.

(3, 1, 0) $\rightarrow$ can be done in 18 ways
out of *A, A, B* and *C* we can select one coin in 3 ways *i.e.,* either *A* or *B* or *C*.

Now we can arrange this selected coin in any 3 pots in 3 ways and the remaining 3 coins as a single packet of coins can be arranged in remaining 2 pots in 2 ways.

Hence, the required number of ways = $3 \times 3 \times 2 = 18$.

(2, 2, 0) $\rightarrow$ can be done in 12 ways

There are two possible cases :

(i) $(A, A), (B, C)$ (ii) $(A, B), (A, C)$

In each of two cases we assume that there are two packets of coins which can be arranged in $3 \times 2 = 6$ ways.

Since there are two cases, hence the total number of required ways = $6 \times 2 = 12$.

(2, 1, 1) $\rightarrow$ can be done in 21 ways.

There are 4 possible cases :

(i) $(A, A), (B), (C)$ (ii) $(A, B), (A), (C)$

(iii) $(A, C), (A), (B)$ (iv) $(B, C), (A), (A)$

For the first 3 cases in each cases all the 3 packets of coins can be arranged in 3! ways.

Hence, the number of arrangements = $3 \times 3! = 18$.

Now in the fourth (iv) case two coins are identical so the third packet of coins can be arranged in 3 pots in 3 ways.
Hence, the total number of arrangements = 18 + 3 = 21.

Thus the required number of ways

$$= 3 + 18 + 12 + 21 = 54 \text{ ways.}$$

83 Since he switches off the bulb immediately after switching it on, so he basically switches on 3 times (6 = 3 times on + 3 times off). So, for every time he wants to switch a bulb on he can choose any of the two bulbs, so for 3 different occasions he has 8 options = $(2 \times 2 \times 2)$.
Therefore the required number of ways = 8

84 In order to come back to the same point he has to take same number of steps in North and South directions or same number of steps in East and West directions. Then we have the following five cases:

Case	North	South	East	West	Number of ways
I	4	4	0	0	$\frac{8!}{4!4!} = 70$
II	3	3	1	1	$\frac{8!}{3!3!} = 1120$

Case	North	South	East	West	Number of ways
III	2	2	2	2	$\frac{8!}{2!2!2!2!} = 2520$
IV	1	1	3	3	$\frac{8!}{3!3!} = 1120$
V	0	0	4	4	$\frac{8!}{4!4!} = 70$

Therefore the total required number of ways

$$= 2(70) + 2(1120) + 2520 = 4900$$

85 It is like dividing 100 identical things among 3 persons, such that each one must get at least 1 thing.

Therefore we have ${}^{100-1}C_{3-1} = 4851$

Since there are 3 parties and 100 seats, so it's obvious that all the 3 parties cannot get the same number of seats.

However, there can be ways in which any 2 parties can get the same number of seats.

These 2 parties (or allies) can be selected in ${}^{3}C_{2} = 3$ ways.

The 2 parties can get the same number of seats in the following ways.

(1, 1, 98), (2, 2, 96), (3, 3, 94), ..., (48, 48, 4), (49, 49,2)

That means there are total 49 ways.

Thus the total number of ways in which any 2 parties can get the same number of seats $= 3 \times 49 = 147$

Number of ways in which all the three parties get the same number of seats = 0.

Therefore the required number of ways

$$= 4851 - 147 = 4704.$$

86 If $a > b > c$, the number of solutions of $a + b + c = 49$, is $\lfloor n^2 + 6/12 \rfloor$.

Therefore, the required number of solutions

$$= \left\lfloor \frac{49^2 + 6}{12} \right\rfloor = \left\lfloor \frac{2407}{12} \right\rfloor = \lfloor 200.5833 \rfloor = 200$$

Alternatively Consider the following explanation.

Number of toilets			Total Case
Village C	Village B	Village A	
0	1	48	24
...	...	...	
...	...	...	
0	24	25	
1	2	46	22
...	...	...	
...	...	...	
1	23	25	
2	3	44	21
...	...	...	
...	...	...	
2	23	24	
3	4	42	
...	...	...	19
...	...	...	
3	22	24	
...			
...			
14	15	20	
...	...	...	3
14	17	18	
15	16	18	1

Therefore total number of ways of building the toilets in 3 selected villages

$$= 1 + (3 + 4) + (6 + 7) + (9 + 10) + (12 + 13) + (15 + 16) + (18 + 19) + (21 + 22) + 24$$

$$= (1 + 7 + 13 + 19 + 25 + 31 + 37 + 43) + 24$$

$$= \frac{(1 + 43)8}{2} + 24 = 200$$

Hence, choice (d) is the answer.

Alternatively

Total number of ways of building 49 toilets in 3 villages.

$$= {}^{49+3-1}C_{3-1} = {}^{51}C_{2} = \frac{51 \times 50}{2} = 1275$$

Now look out for all the possibilities when any two villages receive equal number of toilets.

Village 1	Village 2	Village 3
0	0	49
1	1	47
2	2	45
...	...	...
...	...	...
22	22	5
23	23	3
24	24	1

There are total 25 possibilities in which village 1 and village 2 will have equal number of toilets. Similarly there are 25 possibilities in which village 2 and village 3 will have equal number of toilets. And so there will be 25 possibilities when village 1 and village 3 will have equal number of toilets.

Thus, it shows that there are total 75 possibilities in which any two villages will have equal number of toilets.

Therefore the net possibilities in which all the three villages will have distinct number of toilets = 1275 – 75 = 1200

But there is only 1 case out of 3! cases in which village A will have more toilets than that of village B and village B will have more toilets than that of village C

Therefore the required number of ways $= \frac{1200}{3!} = 200$

Hint Please note that there is no any possibility in which all the three villages will have equal number of toilets, since 49 is not divisible by 3.

87 Let's say the numbers of persons of this family seeking the appointments at the 6 salons are a, b, c, d, e and f. Then we have $a + b + c + d + e + f = 4$.

The number of non-negative integral solutions of the above equation is ${}^{4+6-1}C_{6-1} = 126$

Since each person of the family is distinct (or distinguishable), so each of them can be mutually arranged in 4! ways.

Therefore, the required number of ways in which they can be given the appointments at these salons

$= 4! \times 126 = 3024.$

Alternatively

Case I When each person is given the appointment at distinct salons.

The number of ways of selection of 4 distinct salons ${}^6C_4 = 15$

The number of ways of arranging these people among 4 salons = 4!

The number of ways of getting the appointments at these 4 salons $= 4! \times 15 = 360$

Case II When 2 persons are given the appointment at one salon and the other 2 persons are given the appointment at 2 distinct salons.

The number of ways of selection of 3 distinct salons $= {}^6C_3 = 20$

The number of ways of arranging these people among 3 salons = 3!

The number of ways of selection of 2 persons who are given the appointment at the same salon $= {}^4C_2 = 6$

The number of ways of arranging the 2 persons who are given the appointment at the same salon = 2!

The number of ways of giving the appointments at the 3 salons $= 3! \times 20 \times 6 \times 2 = 1440$

Case III When 2 persons are given the appointment at one salon and the other 2 persons are given the appointment at the other salon.

The number of ways of selection of 2 distinct salons $= {}^6C_2 = 15$

The number of ways of arranging these people between 2 salons = 2!

The number of ways of selection of 2 people for each salon $= {}^4C_2 \times {}^2C_2 \times \frac{1}{2!} = 3$

The number of ways of arranging the 2 persons in each salon $= 2! \times 2! = 4$

The number of ways of giving the appointments at these 2 salons $= 2! \times 15 \times 3 \times 4 = 360$

Case IV When 3 persons are given the appointment at one salon and the 1 person takes the appointment at the other salon.

The number of ways of selection of 2 distinct salons $= {}^6C_2 = 15$

The number of ways of arranging these people between 2 salons = 2!

The number of ways of selecting 3 persons for the one salon $= {}^4C_3 = 4$

The number of ways of arranging 3 persons at one salon $= 3! = 6$

The number of ways of giving the appointments at these 2 salons $= 2! \times 15 \times 4 \times 6 = 720$

Case V When all the 4 persons are given the appointment at the same salon.

The number of ways of selection of 1 salon $= {}^6C_1 = 6$

The number of ways arranging the 4 persons at one salon = 4!

The number of ways of giving the appointments at a salon $= 4! \times 6 = 144$

Therefore the required number of ways

$= 360 + 1440 + 360 + 720 + 144 = 3024$

88 There are two distinct cases:

Case I When there are 11 digits –

$x_1 + x_2 + \ldots\ldots + x_{11} = 3$; for $x_1 \geq 1$

and $x_2, x_3, \ldots\ldots, x_{11} \geq 0$

$\Rightarrow x_1 + x_2 + \ldots + x_{11} = 2$; for $x_1, x_2, x_3, \ldots. x_{11} \geq 0$

Number of solutions $= {}^{2+11-1}C_{11-1} = {}^{12}C_{10} = 66$

Case II When there are 12 digits –

$x_1 + x_2 + \ldots + x_{12} = 3$; for $x_1 \geq 1$ and $x_2, x_3, \ldots. x_{12} \geq 0$

$\Rightarrow \quad x_1 + x_2 + \ldots + x_{12} = 2$; for $x_1, x_2, x_3, \ldots x_{12} \geq 0$

Number of solutions $= {}^{2+12-1}C_{12-1} = {}^{13}C_{11} = 78$

Therefore, the total required number of values of $N = 66 + 78 = 144$

Alternatively As per the given information, N can be an 11 digit or a 12-digit number.

(A) **When *N* is an 11 digit number**

Case I Out of eleven digits three digits are 1 and eight digits are 0.

In this case a number will start with only one number that is 1. Then you have to arrange only 10 digits of which 2 digits will be same (i.e.) and other 8 digits will be same (i.e. 0).

Therefore the total required numbers $= 1 \times \frac{10!}{8!\,2!} = 45$

Case II Out of eleven digits one digit is 1, another digit is 2 and remaining nine digits are 0. In this case a number will start with two digits that is either 1 or 2. Then you have to arrange only 10 digits of which one digits is either 1 or 2, while rest of nine digits will be same. (i.e., 0).

Therefore the total required numbers $= 2x\,\frac{10!}{9!} = 20$

Case III Out of the eleven digits one digit is 3 and the remaining ten digits are 0.

In this case a number will start with the digit 3 and the other 10 digits will be same (i.e., 0).

Therefore the total required numbers $= 1 \times \frac{10!}{10!} = 1$

Thus the total 11-digit numbers = 45 + 20 + 1 = 66.

(B) **When *N* is a 12 digit number**

Case I Out of twelve digits three digits are 1 and nine digits are 0.

In this case a number will start with only one number that is 1. Then you have to arrange only 11 digits of which 2 digits will be same (i.e., 1) and other 9 digits will be same (i.e., 0).

Therefore the total required numbers $= 1 \times \frac{11!}{9! \times 2!} = 55$

Case II Out of the twelve digits one digit is 1, another digit is 2 and remaining ten digits are 0.

In this case a number will start with two digits that is either 1 or 2. Then you have to arrange only 11 digits of which one digit is either 1 or 2, while rest of the 10 digits will be same (i.e., 0).

Therefore the total required numbers $= 2 \times \frac{11!}{10!} = 22$

Case III Out of the twelve digits one digit is 3 and the remaining eleven digits are 0.

In this case a number will start with the digit 3 and the other 11 digits will be same (i.e., 0).

Therefore the total required numbers $= 1 \times \frac{11!}{11!} = 1$

Thus the total 11-digit numbers = 55 + 22 + 1 = 78

Therefore, the total required number of values of $N = 66 + 78 = 144$

89 If out of 32 volunteers everybody befriended on Facebook, the maximum number of friendships $= {}^{32}C_2 = 496$

It means at most 496 pairs can be formed, which, in turn, implies that at most 496 regions can be visited.

However, since certain number of guys and girls are not the Facebook friends, so they are not allowed to visit the regions together. It implies that the required answer would be less than 496.

Let us consider that m guys and f girls don't befriend each other on the Facebook.

Therefore the total number of pairs who are Facebook friends $= 496 - m \times f$

Now we know that one-fifth of the girls deny becoming Facebook friend with one-third of the boys, so we must have $3m + 5f = 32$

Therefore the possible values of m and f are (4, 4) and (9, 1).

Now the possible number of pairs who are the Facebook friends $= 496 - 4 \times 4 = 480$ and $496 - 9 \times 1 = 487$

Since 487 is given in the choices, so it could be the required possible value.

Thus the number of regions that these volunteers could have visited = 487.

90 Any number between 1 and 1000 must be less than 4 digits. Therefore it must be of the form $x_1 + x_2 + x_3 = 10$, where $0 \le x_i \le 9$ for every $i = 1, 2, 3$.

Therefore, the required number

$= $ Coefficient of x^{10} in $(1 + x + x^2 + \ldots + x^9)^3$

$= $ Coefficient of x^{10} in $\left(\frac{1 - x^{10}}{1 - x}\right)^3$

$= $ Coefficient of x^{10} in $[(1 - x^{10})^3\,(1 - x)^{-3}]$

$= $ Coefficient of x^{10} in $[(1 - {}^3C_1 x^{10} \ldots)(1 - x)^{-3}]$

$= $ Coefficient of x^{10} in $(1 - x)^{-3} - {}^3C_1 \cdot$ [Coefficient of $x^{(10-10)}$ in $(1 - x)^{-3}$]

$= {}^{3+10-1}C_{3-1} - 3.\,({}^{3+0-1}C_{3-1})$

$= {}^{12}C_2 - 3.\,({}^2C_2) = 66 - 3 = 63$

Alternatively The number of non-negative integral solutions of $x_1 + x_2 + x_3 = 10$ will be ${}^{10+3-1}C_{3-1} = 66$

But out of these 66 solutions there are the following 3 solutions which need to be excluded.

$10 + 0 + 0 = 10$, $0 + 10 + 0 = 10$, $0 + 0 + 10 = 10$

Therefore the required number of solutions = 66 – 3 = 63.

Alternatively Number of 1 digit number is zero.

Number of 2-digit numbers

= Number of solutions of $a + b = 10$; $(1 \le a \le 9,\ 0 \le b \le 9)$

= Number of solutions of $a + b = 9$; $(0 \le a \le 9,\ 0 \le b \le 9)$

$= {}^{10}C_1 = 10$

But, this involves a solution in which $a = 10$. Which is unacceptable, so there are only 9 numbers of 3 digit numbers.

= Number of solutions of $a + b + c = 10$. $(1 \le a \le 9,\ 0 \le b \le 9,\ 0 \le c \le 9)$

= Number of solutions of $a + b + c = 9$; $(0 \le a \le 9,\ 0 \le b \le 9,\ 0 \le c \le 9)$, ${}^{11}C_2 = 55$

But, this involves a solution in which $a = 10$, which is unacceptable, so there are only 54 numbers.

Thus, we have total 63 numbers (= 0 + 9 + 54).

91 Primarily, there are six different cases in which 15 different rings can be divided such that there are twins in the family and none of the daughters gets less than one and more than five rings.

Case I: 1, 1, 3, 5, 5; Case II: 1, 1, 4, 4, 5;
Case III: 1, 2, 2, 5, 5 Case IV: 1, 3, 3, 4, 4;
Case V: 2, 2, 3, 3, 5; Case VI: 2, 2, 3, 4, 4

Case I Number of ways of distributing 15 rings

$$= \frac{15!}{1!1!3!5!5!} \times \frac{1}{2! \times 2!} \times 2! \times 2!$$

Case II Number of ways of distributing 15 rings

$$= \frac{15!}{1!1!4!4!5!} \times \frac{1}{2! \times 2!} \times 2! \times 2!$$

Case III Number of ways of distributing 15 rings

$$= \frac{15!}{1!2!2!5!5!} \times \frac{1}{2! \times 2!} \times 2! \times 2!$$

Case IV Number of ways of distributing 15 rings

$$= \frac{15!}{1!3!3!4!4!} \times \frac{1}{2! \times 2!} \times 2! \times 2!$$

Case V Number of ways of distributing 15 rings

$$= \frac{15!}{2!2!3!3!5!} \times \frac{1}{2! \times 2!} \times 2! \times 2!$$

Case VI Number of ways of distributing 15 rings

$$= \frac{15!}{2!2!3!4!4!} \times \frac{1}{2! \times 2!} \times 2! \times 2!$$

Therefore total number of ways of distributing 15 different rings

$$= 15! \times \left[\frac{1}{3! \times (5!)^2} + \frac{1}{(4!)^2 \times 5!} + \frac{1}{(2!)^2 \times (5!)^2} + \frac{1}{(3!)^2 \times (4!)^2} + \frac{1}{(2!)^2 \times (3!)^2 \times 5!} + \frac{1}{(2!)^2 \times 3! \times (4!)^2} \right]$$

Hence choice (d) is the answer.

92 Primarily, there are six different cases in which 15 different rings can be divided such that there are twins in the family and none of the daughters gets less than one and more than five rings.

Case I : 1, 1, 3, 5, 5; Case II : 1, 1, 4, 4, 5;
Case III : 1, 2, 2, 5, 5 Case IV : 1, 3, 3, 4, 4;
Case V : 2, 2, 3, 3, 5; Case VI : 2, 2, 3, 4, 4

Case I Number of ways of distributing 15 rings $= \frac{5!}{2! \times 2!}$

Case II Number of ways of distributing 15 rings $= \frac{5!}{2! \times 2!}$

Case III Number of ways of distributing 15 rings $= \frac{5!}{2! \times 2!}$

Case IV Number of ways of distributing 15 rings $= \frac{5!}{2! \times 2!}$

Case V Number of ways of distributing 15 rings $= \frac{5!}{2! \times 2!}$

Case VI Number of ways of distributing 15 rings $= \frac{5!}{2! \times 2!}$

Therefore total number of ways of distributing 15 different rings $= 6 \times \left(\frac{5!}{(2!)^2} \right) = \frac{6!}{(2!)^2} = 180$

Hence choice (a) is the answer.

93 $462 = 2 \times 3 \times 7 \times 11$

Since, there are exactly 4 prime factors, so each of the prime number can be assigned to each x_i in 4 ways. Therefore the total number of ways of assigning the prime factors to all the x_i is $4^4 = 256$

94 $462 = 2 \times 3 \times 7 \times 11$

Since, there are exactly 4 prime factors, so each of the four prime numbers can be assigned to x_i in 4 ways. Therefore the total number of assigning the prime factor to all the x_is is 4^4.

The required solution will be positive only when either 0 or 2 or 4 prime factors are negative. This can be achieved in ${}^4C_0 + {}^4C_2 + {}^4C_4 = 1 + 6 + 1 = 8$ ways.

Thus the required number of solutions $= 8 \times 4^4 = 2048$.

95 Let $L(A, C)$ denotes the total number shortest paths from A to C, without any restriction; $L(A, P, C)$ denotes the total number of shortest paths from A to C, via P; $L(A, Q, C)$ denotes the total number of shortest paths from A to C, via Q; $L(A, P, Q, C)$ denotes the total number of shortest paths from A to C, via P and Q Now,

$$L(A, C) = {}^{16}C_6 \times {}^6C_6 = 8008; \quad L(A, P, C) = L(AP) \times L(PC)$$

$$= ({}^7C_4 \times {}^3C_3) \times ({}^9C_6 \times {}^3C_3) = 35 \times 84 = 2940$$

$$L(A, Q, C) = L(AQ) \times L(QC) = ({}^{12}C_8 \times {}^4C_4) \times ({}^4C_2 \times {}^2C_2)$$

$$= 495 \times 6 = 2970$$

$$L(A, P, Q, C) = L(AP) \times L(PQ) \times L(QC)$$

$$= ({}^7C_4 \times {}^3C_3) \times ({}^5C_4 \times {}^1C_1) \times ({}^4C_2 \times {}^2C_2) = 1050$$

By the inclusion-exclusion principle, the total number of the shortest paths from A to C, such that Runnbeer doesn't go through any of the points P or Q

$$= L(A, C) - L(A, P, C) - L(A, Q, C) + L(A, P, Q, C)$$

$$= 8008 - 2940 - 2970 + 1050 = 3148$$

96 Total number of delegates in all 3 countries is 60, so the number of handshakes among the delegates of any two countries (only once) is ${}^{60}C_2$.

Total number of delegates in all 4 states of each country is 20, so the number of total number of handshakes among the delegates of any two states of each country (only once) is ${}^{20}C_2$.

Total number of delegates in all 5 cities of each state is 5, so the number of total number of handshakes among the delegates of any two cities of each sate (only once) is ${}^5C_2$.

Out of 60 delegates any two delegates shake hands 2 times.

Out of 20 delegates (in each country) any two delegates shake hands 5 times, but since some of their handshakes have been already counted, so we have to consider only 3 times, instead of 5 times.

Out of 5 delegates (in each state) any two delegates shake hands 9 times, but since some of their handshakes have been already counted, so we have to consider only 4 times, instead of 9 times.

Thus the total number of handshakes

$$= [2({}^{60}C_2)] + 3[3({}^{20}C_2)] + 12[4({}^5C_2)]$$

$$= 3540 + 1710 + 480$$

$$= 5730$$

97 Number of zones = 4

Number of blocks in each zone = 5

Total number of blocks = $4 \times 5 = 20$

Total number of connections between any two blocks across all the zones = ${}^{20}C_2 = 190$

Number of connections between any two blocks in a zone = ${}^5C_2 = 10$

Total number of trucks carrying goods between any two blocks across all the zones = 3

Number of trucks carrying goods between any two blocks in each zone = 2

Since the number of dedicated trucks between two cities of each block is less than the number of dedicated trucks between two cities across all the blocks of four zones, so we have to subtract the excess number of trucks.

Total number of trucks between any two blocks across all the zones = $3 \times 190 = 570$

Extra number of trucks in each zone = $1 \times 10 = 10$

Extra number of trucks across all the 4 zones = $4 \times 10 = 40$

Therefore the actual number of trucks engaged in the market

$$= 3({}^{20}C_2) - 4[1 \times ({}^5C_2)]$$

$$= 570 - 40$$

$$= 530$$

98 Consider the following table.

Case	Polygon	Value
I	Triangle	${}^{10}C_3 - {}^6C_3 = 100$
II	Quadrilateral	${}^{10}C_4 - {}^6C_4 = 195$
III	Pentagon	${}^{10}C_5 - {}^6C_6 = 246$
IV	Hexagon	${}^{10}C_6 - {}^6C_6 = 209$
V	Heptagon	${}^{10}C_7 = 120$
VI	Octagon	${}^{10}C_8 = 45$
VII	Nonagon	${}^{10}C_9 = 10$
VIII	Decagon	${}^{10}C_{10} = 1$

Therefore the total required number of polygons such that at least one of the vertices is green and rest of the vertices are red = 100 + 195 + 246 + 209 + 120 + 45 + 10 + 1 = 926

99 $10! = 2^a 3^b 5^c 7^d$

Since, there are four distinct prime factors so there will be $2^4 = 16$ subsets including the empty one, as in

$$\{\}, \{2^a\}, \{3^b\}, \{5^c\}, \{7^d\}, \{2^a 3^b\}, \{2^a 5^c\}, \{2^a 7^d\},$$

$$\{3^b 5^c\}, \{3^b 7^d\}, \{5^c 7^d\}, \{2^a 3^b 5^c\}, \{2^a 3^b 7^d\}, \{2^a 5^c 7^d\}$$

$$\{3^b 5^c 7^d\}, \{2^a 3^b 5^c 7^d\}.$$

In this kind of problems empty set should be replaced with a set containing the element 1.

Now we have the following combination for $m \times n$, as shown in the below.

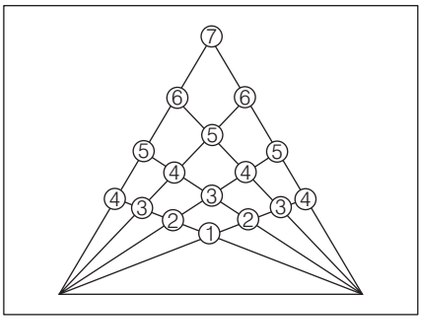
m	$\times$	n
1	$\times$	$2^a 3^b 5^c 7^d$
2^a	$\times$	$3^b 5^c 7^d$
3^b	$\times$	$2^a 5^c 7^d$
5^c	$\times$	$2^a 3^b 7^d$
7^d	$\times$	$2^a 3^b 5^c$
$2^a 3^b$	$\times$	$5^c 7^d$
$2^a 5^c$	$\times$	$3^b 7^d$
$2^a 7^d$	$\times$	$3^b 5^c$
$3^b 5^c$	$\times$	$2^a 7^d$
$3^b 7^d$	$\times$	$2^a 5^c$
$5^c 7^d$	$\times$	$2^a 3^b$
$2^a 3^b 5^c$	$\times$	7^d
$2^a 3^b 7^d$	$\times$	5^c
$2^a 5^c 7^d$	$\times$	3^b
$3^b 5^c 7^d$	$\times$	2^a
$2^a 3^b 5^c 7^d$	$\times$	1

In all such 16 cases there are half of the cases in which $m < n$.

Therefore, for $0 < \frac{m}{n} < 1$, the total number of required rational numbers

$$= \frac{1}{2} \times 2^4 = 8$$

100 Look at the following diagram and figure out all the unique triangles.



Since there are four slant lines emerging from each vertex at the base of the triangle.

Therefore the total number of triangles can be calculated as shown below.

$$1\times1+2\times2+3\times3+4\times4+3\times5+2\times6+1\times7=64$$

Alternatively Total number of triangles = the number of triangles with left bottom point as a vertex + the number of triangles with right bottom point as a vertex – the number of triangles with both bottom points as the vertices

$$=\frac{n\times n\times(n+1)}{2}+\frac{n\times n\times(n+1)}{2}-(n\times n)=n\times n\times n$$

Therefore the required number of triangles

$$=4\times4\times4=64$$

101 In the 1st transaction, PayTM or PayU can receive money from PayPal in 1 way.

In the 2nd transaction, PayPal can receive money either from PayTM or from PayU in 2 ways. But PayTM and PayU can receive money in 1 way from each other, as PayPal had no money after 1st transaction.

In the 3rd transaction, PayPal can receive money either from PayTM or PayU in 2 ways. But, each of PayTM and PayU can receive money in 3 ways.

Remember that we have to count the number of ways cumulatively. Now, follow the same principle and continue counting until the 7th transaction.

Transaction	1st	2nd	3rd	4th	5th	6th	7th
PayPal	–	2	2	6	10	22	42
PayTM	1	1	3	5	11	21	43
PayU	1	1	3	5	11	21	43

Thus we see that there are total 42 different ways in which PayPal wallet can have same amount after the 7th transaction that it had before the 1st transaction.

102 $2(l+b)\le100\ \ (l,b\ge0)$

$\Rightarrow\quad l+b\le50\qquad(l,b\ge0)$

$\Rightarrow\quad l+b\le48\qquad(l,b\ge1)$

$\Rightarrow\quad l+b+c=48\qquad(l,b\ge1)$

Number of solutions $(N)={}^{48+3-1}C_{3-1}={}^{50}C_2=1225$

$\Rightarrow\quad N_{(l>b)}+N_{(l=b)}+N_{(l<b)}=1225$

Now, we know that when $l=b$, we have

$$\{l+b\}=\{1+1\},\{2+2\}\ldots,\{25+25\}$$

$\therefore\quad N_{(l=b)}=25$

But, numerically, $N_{(l>b)}=N_{(l<b)}$

$$\therefore\quad N_{(l>b)}=\frac{1225-25}{2}=600$$

Total number of rectangles $=N_{(l>b)}+N_{(l=b)}$

$$=600+25=625$$

Alternatively $2(l+b)=100\ \Rightarrow\ l+b=50$. We will consider only combinations in which $l\ge b$, but we cannot consider $l<b$, as practically it violates the basic definition of rectangle.

$l+b$	Number of solutions	Solutions
2	1	{1, 1}
3	1	{2, 1}
4	2	{2, 2} {3, 1}
5	2	{3, 2}, {4, 1}
6	3	{3, 3}, {4, 2}, {5, 1}
7	3	{4, 3}, {5, 2}, {6, 1}
...	...	...
50	25	{25, 25}, {26, 24}, (27, 23), . . . , {49, 1}

Therefore total number of rectangles

$$=2(1+2+3+\ldots+24)+25=625.$$

103 $a+b+c=12;\{0\le a,b,c\le6\}-\{a,b,c=5\}$

Number of solutions of $a+b+c=12\ ;\ \{0\le a,b,c\}$ is ${}^{14}C_2=91$

If we allocate 7 to one of a, b, c we can make sure that the solution has $a, b, c>6$.

Therefore, number of solutions of $a+b+c=12$ $\{0\le a,b,c\le6\}$ is equivalent to the number of solutions of $a+b+c=5;\{a,b,c\ge0\}$ is ${}^{7}C_2=21$.

Since any of a, b, c can take value greater than 6, so it can be chosen in ${}^{3}C_1=3$ ways.

Now, we have following 3 sets in which one or more teams score 5 runs in a ball –

$$\{5,6,1\}\to6$$

$$\{5,5,2\}\to3$$

$$\{5,4,3\}\to6$$

So, the number of solutions involving 5 is 15.

Therefore, required number of solutions

$$=91-3(21)-15=13$$

Alternatively There are certain triplets that can be arranged to find the valid possibilities.

$$\{6,6,0\}\to3$$

$\{6, 4, 2\} \rightarrow 6$

$\{6, 3, 3\} \rightarrow 3$

$\{4, 4, 4\} \rightarrow 1$

Therefore, the possible number of ways

$3 + 6 + 3 + 1 = 13$

104 $105 = N(\text{Shirts}) \times N(\text{Ties}) \times N(\text{Pants})$

$\Rightarrow \quad 105 = 3 \times 5 \times 7$

Since there are exactly three prime factors in 105, each of these 3 prime numbers can be allocated to three articles (shirts, ties and pants) in 3 ways. Therefore the required number of arrangements $= 3^3 = 27$.

Alternatively There are certain triplets that can be arranged to find the valid possibilities.

$\{1 \times 1 \times 105\} \rightarrow 3$

$\{1 \times 3 \times 35\} \rightarrow 6$

$\{1 \times 5 \times 25\} \rightarrow 6$

$\{1 \times 7 \times 15\} \rightarrow 6$

$\{3 \times 5 \times 7\} \rightarrow 6$

Therefore, the possible number of arrangements

$= 3 + 6 + 6 + 6 + 6 = 27.$

105 There are four pairs (12), (34), (56) and (78).

Case I When only one pair exists, the number of arrangements $= 7!$.

Since we can select any 1 pair out of 4 pairs in 4 ways, so the total number of arrangements $= 4 \times (7!)$

Case II When exactly two pairs exist, the number of arrangements $= 6!$

Since we can select any 2 pairs out of 4 pairs in 6 ways, so the total number of arrangements $= 6 \times (6!)$

Case III When exactly three pairs exist, the number of arrangements $= 5!$

Since we can select any 3 pairs out of 4 pairs in 4 ways, so the total number of arrangements $= 3 \times (5!)$

Case IV When exactly two pairs exist, the number of arrangements $= 4!$

Since we can select any 4 pairs out of 4 pairs in 1 way only, so the total number of arrangements $= 1 \times (4!)$

By the Inclusion-Exclusion Principle, we have

$$|A12 \cup A34 \cup A56 \cup A78| = |A12| + |A34| + |A56| + |A78| - |A12 \cap A34| - |A12 \cap A56| - |A12 \cap A78| - |A34 \cap A56| - |A34 \cap A78| - |A56 \cap A78| + |A12 \cap A34 \cap A56| + |A12 \cap A34 \cap A78| + |A12 \cap A56 \cap A78| + |A34 \cap A56 \cap A78| - |A12 \cap A34 \cap A56 \cap A78|$$

Therefore, $|A12 \cup A34 \cup A56 \cup A78| = 4(7!) + 4(5!) - 4!$

The total number of arrangements of numbers 1, 2, ... 8 is 8!.

But, we need to find out the value of 8!

$$-|A_{12} \cup A_{34} \cup A_{56} \cup A_{78}|.$$

Thus the required number of arrangements

$= 8! - [4(7!) - 6(6!) + 4(5!) - 4!] = 24024$

☑ Level 03 *Final Round*

1 Number of intersections $= 2 \times ({}^6C_2) = {}^6P_2 = 30$.

2 ${}^6C_2 = 15$.

3 3 lines intersect each other in ${}^3C_2 = 3$ points.

3 circles intersect each other in ${}^3P_2 = 6$ points.

Every line cuts 3 circles into 6 points. Therefore 3 lines cuts 3 circles into 18 points. Therefore, the maximum number of points $= 3 + 6 + 18 = 27$

4 $\dfrac{8!}{4!\,4!} = 70$

5 Required number of triangles $= {}^{m+n}C_3 - {}^mC_3 - {}^nC_3$.

6 Number of even places = 4

Number of even digits = 5 (2, 2, 8, 8, 8)

Number of odd places = 5

Number of odd digits = 4 (3, 3, 5, 5)

Odd digits can be arranged in $\dfrac{4!}{2! \times 2!}$ ways = 6 ways.

Even digits can be arranged in $\dfrac{5!}{2! \times 3!} = 10$ ways.

Hence the required number of ways $= 6 \times 10 = 60$ ways.

7 Required number of triangles

$= {}^{m+n+k}C_3 - {}^mC_3 - {}^nC_3 - {}^kC_3$

8 Let $n = 2m + 1$, for the three numbers are in AP we have the following patterns :

Common differences	Numbers	Number of ways
1	$(1, 2, 3)(2, 3, 4) \ldots (n-2, n-1, n)$	$(n-2)$
2	$(1, 3, 5), (2, 4, 6) \ldots (n-4, n-2, n)$	$(n-4)$
3	$(1, 4, 7), (2, 5, 8) \ldots (n-6, n-3, n)$	$(n-6)$
—	... ...	—
—	... ...	—
m	$(1, m+1, 2m+1)$	1

$\therefore$ Favourable number of ways

$= (n-2) + (n-4) + (n-6) + \ldots + 3 + 1$ (total m terms)

$= \dfrac{m}{2}(n - 2 + 1) = \dfrac{(n-1)}{2} \cdot \dfrac{(n-1)}{2} = \dfrac{(n-1)^2}{4}$

Alternatively Consider some proper value of n and verify the result.

9 Required number of parts $= 1 + \sum_{r=1}^{8} r = 1 + \dfrac{8 \times 9}{2} = 37$

Alternatively We can use the following formula too.

$${}^nC_0 + {}^nC_1 + {}^nC_2 = \frac{n\times(n+1)}{2} + 1 = \frac{n^2+n+2}{2}$$

Therefore the required number of parts $= \frac{64+8+2}{2} = 37$

10 $$\frac{240}{4n+2} = k \in I$$

$$\therefore \quad k = \frac{120}{2n+1} = \frac{2^3\times 3\times 5}{2n+1}$$

Since probable divisors are 1, 3, 5, 7, 9, 11, 13, …, $(2n+1)$ but we have only 4 possible divisors 1, 3, 5, 15.

11 Total number of rectangles

$$= (1+2+3+\ldots+12)\times(1+2+\ldots+8)$$
$$= \frac{12\times 13}{2}\times\frac{8\times 9}{2} = 2808$$

Total number of squares

$$= (12\times 8)+(11\times 7)+(10\times 6)+\ldots+(5\times 1) = 348$$

$\therefore$ Required number of rectangles $= 2808 - 348 = 2460$

Hint Number of squares $= \sum_{r=1}^{8}(13-r)(9-r)$

12 Required number of triangles $= ({}^{2n}C_3 - {}^nC_3 - {}^nC_3) + (n\times n)$

$$= n^2(n-1) + n^2 = n^3$$

Alternatively Required number of triangles

$$= ({}^nC_2\times{}^nC_1) + ({}^nC_1\times{}^nC_2) + (n\times n) = n^3$$

13 There are 12 ways as follows :

(9, 0, 0), (8, 1, 0), (7, 2, 0), (6, 3, 0), (5, 4, 0), (7, 1, 1), (6, 2, 1), (5, 3, 1), (5, 2, 2), (4, 4, 1) (4, 3, 2), (3, 3, 3).

14 First of all we give 4 coins to each of the six persons so that each one must have at least 4 coins.

Now we are left with $= 30 - (6\times 4) = 6$ coins.

These remaining 6 coins can be distributed among 6 persons in such a way that any one can receive any number of coins which can be done in

$${}^{6+6-1}C_{6-1} = {}^{11}C_5 \text{ ways}$$

$$= 462 \text{ ways}$$

15 Required number of circles $= {}^{10}C_3 - {}^7C_3 = 85$.

16 0 cannot be placed as the left most digit so we have only 9 digits to be placed.

Also we will not consider 1 digit numbers.

Now we can form a two digit number in ${}^9C_2$ ways.

Now we can form a three digit number in ${}^9C_3$ ways.

Now we can form a four digit number in ${}^9C_4$ ways.

… … … … … … … … …

… … … … … … … … …

We can form 9 digit number in ${}^9C_9$ way.

Hence the required numbers $= {}^9C_2 + {}^9C_3 + {}^9C_4 + \ldots + {}^9C_9$

$$= 502$$

17 The possible ways are given below.

	I	II	III	IV	V	VI	VII	VIII	IX
Number of fours	25	22	19	16	13	10	7	4	1
Number of sixes	0	2	4	6	8	10	12	14	16

Therefore the required number of ways = 9.

18 Total number of permutations $= 8! = 40320$

Number of permutations when word LURY occurs

$$= (8-4+1)! = 5! = 120$$

Number of permutations when word MINA occurs $= 5! = 120$

Number of permutation when words LURY and MINA both occurs $= 3! = 6$

Required number of permutations

$$= 40320 - (120+120) + 6 = 40086$$

19 5 students can be selected out of 10 students in ${}^{10}C_5$ ways remaining 5 students can be selected in ${}^5C_5$ ways. These students (in each row) can be arranged mutually in $5!\times 5!$ ways.

Besides it the two set of papers can be arranged in 2! ways between two rows.

Hence, the required number of arrangements

$$= {}^{10}C_5\times(5!)^2\times 2 = 7257600$$

20 Number of handshakes among guests $= {}^nC_2$

Number of handshakes between the hosts and guests $= 2n$

Therefore total number of handshakes $= {}^nC_2 + 2n = 65$

Now for your convenience go through the options and verify the correct one.

21 First of all deduce $3\times 10 = 30$ marks to assign atleast 3 marks to each of the 10 students.

Now remaining 20 marks can be assigned to 10 students in

$${}^{20+10-1}C_{10-1} \text{ ways} = {}^{29}C_9 \text{ ways}$$

22 $$\left[\frac{1}{3}\right] = \left[\frac{1}{3}+\frac{1}{100}\right] = \left[\frac{1}{3}+\frac{2}{100}\right]$$
$$= \ldots\left[\frac{1}{3}+\frac{65}{100}\right] = \left[\frac{1}{3}+\frac{66}{100}\right] = 0$$

and $$\left[\frac{1}{3}+\frac{67}{100}\right] = \left[\frac{1}{3}+\frac{68}{100}\right] = \left[\frac{1}{3}+\frac{69}{100}\right]$$
$$= \ldots\left[\frac{1}{3}+\frac{98}{100}\right] = \left[\frac{1}{3}+\frac{99}{100}\right] = 1$$

Hence, $$E = \left[\frac{1}{3}\right] + \left[\frac{1}{3}+\frac{1}{100}\right] + \ldots + \left[\frac{1}{3}+\frac{99}{100}\right]$$
$$= 33\times 1 = 33$$

23 Total numbers $= 10^6$ $(1, 2, 3, 4, \ldots, 10^6)$

$$n^2 \Rightarrow \left.\begin{matrix}\{1, 4, 9, 16, 25, \ldots 10^6\}\\ \{1, 2, 3, 4, 5, \ldots (10^3)\}\end{matrix}\right\} \rightarrow 10^3 = 1000$$

$$n^3 \Rightarrow \begin{Bmatrix} 1, 8, 27, 64, 125, \ldots, 10^6 \\ 1, 2, 3, 4, 5, \ldots, (10^2) \end{Bmatrix} \rightarrow 10^2 = 100$$

$$n^4 \Rightarrow \begin{Bmatrix} 1, 16, 81, 256, \ldots, 923521 \\ 1, 2, 3, 4, \ldots, 31 \end{Bmatrix} \rightarrow 31$$

Hint $\sqrt[4]{10^6} = 10^{6/4} = 10^{3/2} = \sqrt{1000} \Rightarrow 31$

$$n^2 \cap n^3 \Rightarrow n^6 \begin{Bmatrix} 1, 64, 729, 4096, \ldots, 10^6 \\ 1, 2, 3, 4, \ldots, 10 \end{Bmatrix} \rightarrow 10$$

$$n^3 \cap n^4 \Rightarrow n^{12} \begin{Bmatrix} 1^{12}, 2^{12}, 3^{12} \\ 1, 2, 3 \end{Bmatrix} \rightarrow 3$$

Hint $\sqrt[12]{10^6} = 10^{6/12} = 10^{1/2} = \sqrt{10} \Rightarrow 3$

$$n^2 \cap n^4 \Rightarrow n^4 \begin{Bmatrix} 1, 16, 81, 256, \ldots, (31)^4 \\ 1, 2, 3, 4, \ldots, 31 \end{Bmatrix} \rightarrow 31$$

$$n^2 \cap n^3 \cap n^4 \Rightarrow n^{12} \begin{Bmatrix} 1^{12}, 2^{12}, 3^{12} \\ 1, 2, 3 \end{Bmatrix} \rightarrow 3$$

Hence the number of numbers which are either perfect square or perfect cube or perfect fourth powers or all of these

$$= n^2 + n^3 + n^4 - (n^2 \cap n^3 + n^3 \cap n^4 + n^2 \cap n^4) + n^2 \cap n^3 \cap n^4$$

$$= 1131 - 44 + 3 = 1090$$

Hence, the required number of ways

= Total numbers – Numbers which are perfect squares or perfect cubes or perfect fourth powers

$$= 10^6 - 1090 = 998910$$

24 Total number of required seats = $1 + m + 2n$

The Grandchildren can occupy the n seats on either side of the table in $({}^{2n}P_{2n})$ ways. Remaining seats are $(1 + m)$.

Since grandfather can not occupy adjacent seats of the grandchildren hence the grandfather can access only $m + 1 - 2 = m - 1$ seats. Hence he can occupy a seat in ${}^{(m-1)}P_1$ ways. Now the remaining seats can be occupied in ${}^mP_m$ ways by the 'm' sons and daughters.

Hence the required number of ways

$$= {}^{2n}P_{2n} \times {}^mP_m \times {}^{m-1}P_1 = (2n!)\,(m!)\,(m-1)$$

25 The 4 possible cases are as follows :

	C_1	C_2	C_3
$C_1 \rightarrow$ First column	2	3	1
$C_2 \rightarrow$ Second column	2	2	2
$C_3 \rightarrow$ Third column	1	4	1
	1	3	2

Hence, the required number of ways

$$= {}^2C_2 \times {}^4C_3 \times {}^2C_1 + {}^2C_2 \times {}^4C_2 \times {}^2C_2 + {}^2C_1 \times {}^4C_4 \times {}^2C_1 + {}^2C_1 + {}^2C_1 \times {}^4C_3 \times {}^2C_2$$

$$= 1 \times 4 \times 2 + 1 \times 6 \times 1 + 2 \times 1 \times 2 + 2 \times 4 \times 1$$

$$= 8 + 6 + 4 + 8 = 26$$

26 The total number of balls in the box = 2 + 3 + 4 = 9.

Total number of selections of 3 balls out of 9 balls = ${}^9C_3$

Number of selections in which no any green ball is selected = ${}^6C_3$

Hence the required number of selections = ${}^9C_3 - {}^6C_3 = 64$.

27 There are four possible cases.

	H	W
M	0	3
F	3	0

(i)

	H	W
M	1	2
F	2	1

(ii)

	H	W
M	2	1
F	1	2

(iii)

	H	W
M	3	0
F	0	3

(iv)

H → husband's relatives W → wife's relatives

M → male F → female

Hence the required number of ways

$$= ({}^4C_3 \times {}^4C_3) + ({}^3C_1 \times {}^4C_2)\,({}^4C_2 \times {}^3C_1) + ({}^3C_2 \times {}^4C_1)\,({}^4C_1 \times {}^3C_2) + ({}^3C_3 \times {}^3C_3)$$

$$= (4 \times 4) + (3 \times 6 \times 6 \times 3) + (3 \times 4 \times 4 \times 3) + (1 \times 1)$$

$$= 485$$

28 Let the number of men participating in the tournament be n. Since every participant played two games with every other participant.

Therefore the total number of games played among men is $2 \times {}^nC_2 = n\,(n-1)$.

And the number of games played with each woman = $2n$.

but since there are two women, hence the total number of games men played with 2 women = $2 \times 2n = 4n$

$$\therefore \quad \{n\,(n-1)\} - 4n = 66$$

$$\Rightarrow \quad n^2 - 5n - 66 = 0$$

$$\Rightarrow \quad n = 11 \qquad (\because n < 0, \text{ is not possible})$$

$\therefore$ Number of participants = 11 men + 2 women = 13.

29 Number of games played by them is $2\,({}^{13}C_2) = 156$.

30 There are two possible cases in which 12 sweets can be distributed among 10 girls.

(i) Any 9 girls get one sweets each and the remaining 1 girl gets 3 sweets.

(ii) Any 8 girls get one sweets each and the remaining 2 girls get 2 pieces of sweets each.

Case I. 3 pieces of sweets can be given to a girl in the following four way :

Burfi	3	2	1	0
Rasgulla	0	1	2	3

After giving 3 pieces of sweets to a single girl. We can distribute the remaining 9 sweets to the 9 girls in the following ways :

$${}^9C_3 \times {}^6C_6 + {}^9C_4 \times {}^5C_5 + {}^9C_5 + {}^4C_4 + {}^9C_6 \times {}^3C_3$$
$$= 2({}^9C_3 + {}^9C_4)$$

One particular girl can be chosen in ${}^{10}C_1$ ways.

Therefore 3 sweets can be given to a single girl in

$${}^{10}C_1 \times 2 \times ({}^9C_3 + {}^9C_4) = 4200 \text{ ways.}$$

Case II. We can give two sweets to two girls (say A and B) in the following ways :

A	Burfi	2	1	0	2	1	0	2	1	0
	Rasgulla	0	1	2	0	1	2	0	1	2
B	Burfi	2	2	2	1	1	1	0	0	0
	Rasgulla	0	0	0	1	1	1	2	2	2

Now, remaining 8 pieces of sweets can be distributed among eight girls in the following ways

$$({}^8C_2 \times {}^6C_6) + ({}^8C_3 \times {}^5C_5) + ({}^8C_4 \times {}^4C_4) + ({}^8C_3 \times {}^5C_5)$$
$$+ ({}^8C_4 \times {}^4C_4) + ({}^8C_5 \times {}^3C_3)$$
$$+ ({}^8C_4 \times {}^4C_4) + ({}^8C_5 \times {}^5C_5) + ({}^8C_6 \times {}^2C_2)$$
$$= 2({}^8C_2) + 4({}^8C_3) + 3({}^8C_4)$$

Further, two girls can be selected in ${}^{10}C_2$ ways.

Therefore two girls can get two sweets each in

$$({}^{10}C_2)[2({}^8C_2) + 4({}^8C_3) + 3({}^8C_4)] = 22050 \text{ ways}$$

Hence, the required number of ways $= 4200 + 22050$
$= 26250$

31 Number of common children of Mr. John and Ms. Bashu

$$= 10 - (x + x + 1) = 9 - 2x$$

Let N = The number of fights between children of different parents
= (Total number of fights that can take place among all the children)
– (The number of fights among the children of the same parents)

$$= {}^{10}C_2 - [{}^xC_2 + {}^{x+1}C_2 + {}^{9-2x}C_2] \quad \ldots(i)$$
$$= 45 - \left[\frac{x(x-1)}{2} + \frac{(x+1)(x)}{2} + \frac{(9-2x)(8-2x)}{2}\right]$$
$$= 45 - \frac{1}{2}[x^2 - x + x^2 + x + 72 - 34x + 4x^2]$$
$$= \frac{397}{12} - 3\left(x - \frac{17}{6}\right)^2$$

For N to be maximum, x must be $\frac{17}{6}$. As x cannot be in fraction, we take $x = 3\left(\approx \frac{17}{6}\right)$.

Thus, maximum value of $N = 33$ which is attained at $x = 3$.

Alternatively After making the equation (i) go through options.

32 Let the form of the required numbers be $a_1, a_2 \ldots a_9$, where $0 \le a_1 \le 1$ and $0 \le a_i \le 2$ for $i = 2, 3, \ldots, 9$ and where all $a_1, a_2, \ldots, a_9$ cannot be equal to zero.

Now, we can choose a_1 in two ways (0 or 1) and a_i for $i = 2, 3, \ldots 8$ in 3 ways (0, 1, 2).

After selecting $a_1, a_2, a_3 \ldots, a_8$ we find the sum $s = a_1 + a_2 + \ldots a_8$ which is of the form $3m - 2$, $3m - 1$ or $3m$. Now we can select a_9 in just one way.

Actually a_9 can be selected out of 2, 1 or 0 depending on whether $s = 3m - 2$, $3m - 1$ or $3m$. Therefore, we can choose the numbers in $2 \times 3^7 \times 1 = 4374$ ways.

But this includes the case in which each of $a_i = 0$. Thus, the required number of numbers $= 4374 - 1 = 4373$

33 The digits which can be recognised as digits on the screen of a calculator when they are read inverted *i.e.,* upside down are 0, 1, 2, 5, 6, 8 and 9.

Since a number cannot begin with zero hence left most digit and right most digit can never be 0 as when an 'n' digit number read upside down it will become a number of less than n digit. Hence,

Number of digits	Total number of numbers
1	7
2	$6 \times 6 = 6^2$
3	$6 \times 7 \times 6 = 6^2 \times 7$
4	$6 \times 7 \times 7 \times 6 = 6^2 \times 7^2$
5	$6 \times 7 \times 7 \times 7 \times 6 = 6^2 \times 7^3$
6	$6 \times 7 \times 7 \times 7 \times 7 \times 6 = 6^2 \times 7^4$

Thus, the number of required numbers

$$= 7 + 6^2 + 6^2 \cdot 7 + \ldots + 6^2 \cdot 7^4$$
$$= 7 + 6^2 \frac{(7^5 - 1)}{(7 - 1)} = 7 + 6(7^5 - 1)$$
$$= 6 \cdot 7^5 + 1 = 100843$$

34 Since rings are distinct, hence they can be named as R_1, R_2, R_3, R_4 and R_5.

The ring R_1 can be placed on any of the four fingers in 4 ways.

The ring R_2 can be placed on any of the four fingers in 5 ways since the finger in which R_1 is placed now has 2 choices, one above the R_1 and one below the ring R_1.

Similarly R_3, R_4 and R_5 can be arrange in 6, 7 and 8 ways respectively.

Hence, the required number of ways

$$= 4 \times 5 \times 6 \times 7 \times 8 = 6720$$

35 We can select first object out of n objects in ${}^nC_1$ ways.

Now, number of ways of choosing two objects such that they are always together $(n - 4)$ ways.

Since we assume two objects as a single object. Further we can select three objects *viz.,* the one object which has been already selected and two objects of one either side of the first object. Therefore the number of ways of choosing two objects such that they are not together $= {}^{(n-3)}C_2 - (n-4)$

$$= \frac{1}{2}(n-4)(n-5)$$

Since these two objects can be arranged in 2! ways, the number of ways of choosing three objects (in order of the first, second and third) is

$$n \times \frac{1}{2}(n-4)(n-5) \times 2 = n(n-4)(n-5)$$

But, since the order in which the objects are taken is immaterial, the number of ways of choosing the objects is $\frac{1}{6} n(n-4)(n-5)$.

36

Number of similar letters	Number of different letters	Number of selections
5	0	${}^1C_1 = 1$
4	1	${}^4C_1 \times {}^2C_1 = 8$
3	2	${}^3C_1 \times {}^4C_2 = 18$
3 of one type and 2 of another type	0	${}^3C_1 \times {}^3C_1 = 9$
2 of one type and 2 of another type	1	${}^4C_2 \times {}^3C_1 = 18$
2	3	${}^4C_1 \times {}^4C_3 = 16$
0	5	${}^5C_5 = 1$

Hence, the total number of selections

$$= 1 + 8 + 18 + 9 + 18 + 16 + 1 = 71$$

37

	Ist paper	2nd paper	3rd paper	4th paper
Max. marks	n	n	n	$2n$

Let us consider $n = 1$, then a candidate required 3 marks out of 5 marks, which can be done in the following ways :

Ist paper	2nd paper	3rd paper	4th paper	Total
0	0	1	2	3
0	1	0	2	3
1	0	0	2	3
1	1	1	0	3
1	1	0	1	3
1	0	1	1	3
0	1	1	1	3

Hence, there are total 7 ways.

Now, go through options.

Let us consider option (b).

Putting $n = 1$, we get

$$\frac{1}{6}(1+1)(5 \times 1^2 + 10 \times 1 + 6) = 7$$

Hence the choice (b) is correct.

38 Do this problem similarly as discussed in the previous problem.

NOTE The general solution of this type of problems involves higher mathematics. But we have given in question number 37 a very simple, lucid and a novel solution for the lay students.

39 Let the number of male students is x, the number of female students in that class will be $2x$.

The number of friendships among male students

$$= {}^xC_2 = \frac{x(x-1)}{2}$$

The number of friendships among female students

$$= {}^{2x}C_2 = \frac{2x(2x-1)}{2}$$

The number of friendships between male and female students $= x \times 2x = 2x^2$

Let's assume that the number of friend requests sent by female students to male students is y. Therefore, the number of friend requests sent by male students to female students $= 2x^2 - y$.

But you must know the following fact about intra group friend requests as in among boys only or among girls only.

The number of friendships = number of friend requests sent = number of friend requests accepted

So, the number of friend requests sent/accepted by male students among themselves $= \frac{x(x-1)}{2}$

Similarly, the number of friend requests sent/accepted by female students among themselves $= \frac{2x(2x-1)}{2}$

Further it is given that, The total number of friend requests sent by male students = Total number of friend requests sent by female students

$$\therefore \quad \frac{x(x-1)}{2} + (2x^2 - y) = \frac{2x(2x-1)}{2} + y$$

$$\Rightarrow \qquad 4y = x(x+1)$$

Among the given choices, only choice (c) is valid.

40 Let *A, B, C, D, E, F, G, H, I, J, K* be the 11 masseurs, then divide them in two groups say one group has 5 masseurs (*A, B, C, D* and *E*), while another group has 6 masseurs *(F, G, H, I, J* and *K*). In the first week, employ first group of 5 masseurs.

Case	Number of masseurs familiar with queen		Number of weeks required to identify	Reason
	First week	Second week		
I	5	0	1	All 5 are familiar in the first week itself
II	4	1	1	4 out of 5 are familiar in the first week itself
III	3	2	1	3 out of 5 are familiar in the first week itself
IV	2	3	>2	3 out of 6 are familiar so 3 must be strangers, thus, if all 3 strangers and any 2 familiar masseurs give the massage out of 5 days on the 2nd, 3rd or 4th week, king still can't identify them. So king needs 5th week to identify the masseurs familiar with the queen.
V	1	4	2	4 out of 6 are familiar and 2 are strangers, so even if all 2 strangers give the massage out of 5 days, 3 familiar masseurs will still be giving the massage in the second week, so king can identify them.
VI	0	5	2	5 out of 6 are familiar and 1 is stranger, so even if 1 stranger gives the massage out of 5 days, 4 familiar masseurs will still be giving the massage in the second week, so king can identify them.

Suppose in the first week *A, B, C, D* and *E* give her massage and the king could not identify them. It implies that there are maximum 2 familiar masseurs among *A, B, C, D* and *E*. In turn, it implies that there are minimum 3 familiar masseurs among the *F, G, H, I, J, K.* If there are 5 familiar masseurs in the group *F, G, H, I, J* and *K*, so whoever the 5 masseurs, among these 6 masseurs, are giving the massage king would certainly identify them.

Similarly, if there are 4 familiar masseurs in the group *F, G, H, I, J* and *K*, so whoever the 5 masseurs, among these 6 masseurs, are giving the massage king would certainly identify them.

But when there are only 3 familiar masseurs in the group *F, G, H, I, J* and K, then we will have the following possibilities assuming that *I, J* and *K* are the 3 familiar masseurs.

$\{F, G, H, I, J\}$, $\{F, G, H, I, K\}$, $\{F, G, H, J, K\}$, $\{F, G, I, J, K\}$, $\{F, H, I, J, K\}$, $\{G, H, I, J, K\}$

Out of the 6 possibilities there are 3 cases in which king cannot identify the familiar masseurs.

It means in the worst case scenario king has to wait for 5 weeks to identify the 5 familiar masseurs as illustrated below.

Week 1: *A, B, C, D, E* can't identify
Week 2: *F, G, H, I, J* can't identify
Week 3: *F, G, H, I, K* can't identify
Week 4: *F, G, H, J, K* can't identify
Week 5: *F, G, I, J, K* can identify
Week 6: *F, H, I, J, K* can identify
Week 7: *G, H, I, J, K* can identify

So, in the worst case scenario, king would require at least 5 weeks to be 100% sure if he wants to identify the masseurs familiar with the queen.

41 Let A be the set of permutations where 3 and 6 appear consecutively, B be the set of permutations, where 6 and 5 appear consecutively, and let C be the set of permutations, where 5 and 4 do. Then $|A| = |B| = |C| = 9!$

For example, permutations in A correspond to permutations of the alphabet {0, 1, 2, 36, 4, 5, 7, 8, 9}, where 36 is considered as a single symbol.

Similarly, $|A \cap B| = |B \cap C| = |C \cap A| = 8!$

For example, permutations in $A \cap B$ correspond to permutations of the alphabet with symbol 365 replacing 3, 5 and 6.

Similarly, $|A \cap B \cap C| = 7!$

$$\therefore \quad |A \cup B \cup C| = |A| + |B| + |C| - |A \cap B| - |B \cap C| - |C \cap A| - |A \cap B \cap C|$$

$$\Rightarrow \quad |A \cup B \cup C| = 3(9!) - 3(8!) - 7! = 191(7!) = 962640$$

42 Number of solutions of $x_1 + x_2 + x_3 + x_4 = 30$ for $3 \le x_1, x_2, x_3, x_4 \le 10$ is same as the number of solutions of $y_1 + y_2 + y_3 + y_4 = 18$ for $0 \le y_1, y_2, y_3, y_4 \le 7$

But the number of solutions of $y_1 + y_2 + y_3 + y_4 = 18$ for $0 \le y_1, y_2, y_3, y_4 \le 7$ = (number of solutions of $y_1 + y_2 + y_3 + y_4 = 18$ for $0 \le y_1, y_2, y_3, y_4 \le 18$) – (number of solutions of $y_1 + y_2 + y_3 + y_4 = 18$ for $8 \le y_1, y_2, y_3, y_4 \le 18$)

Now, number of solutions of $y_1 + y_2 + y_3 + y_4 = 18$ for $0 \le y_1, y_2, y_3, y_4 \le 18$ is ${}^{18+4-1}C_{4-1} = {}^{21}C_3 = 1330$.

Now the number of solutions of $y_1 + y_2 + y_3 + y_4 = 18$ for $8 \le y_1, y_2, y_3, y_4 \le 18$ can be determined as follows.

Since, $y_i \ge 8$ so out of four values of y either one value of y or two values of y can be equal to or greater than 8 as $y_1 + y_2 + y_3 + y_4 = 18$.

Then number of solutions of $y_1 + y_2 + y_3 + y_4 = 18$ for $8 \le y_1, y_2, y_3, y_4 \le 18$ is

$$|A_1 \cup A_2 \cup A_3 \cup A_4| = \sum_{1 \le i \le 4} |A_i| - \sum_{1 \le i < j \le 4} |A_i \cap A_j|$$

$$= 4[^{(18-8)+4-1}C_{4-1}] - 6[^{(18-2\times 8)+4-1}C_{4-1}]$$

$$= 4(^{13}C_3) - 6(^5C_3) = 4 \times 286 - 6 \times 10 = 1084$$

Therefore the number of solutions of $y_1 + y_2 + y_3 + y_4 = 18$ for $0 \le y_1, y_2, y_3, y_4 \le 7$ is $1330 - 1084 = 246$

So the number of solutions of $x_1 + x_2 + x_3 + x_4 = 30$ for $3 \le x_1, x_2, x_3, x_4 \le 10$ is 246.

Hint $|A_i|$ can be selected in 4 ways. For example, $|A_1|$ indicates that $z_1 + y_2 + y_3 + y_4 = 18 - 8$; where $z_1 = y_1 - 8$.

Similarly, $|A_i \cap A_j|$ can be selected in 6 ways. For example $|A_1 \cap A_2|$ indicates that $z_1 + z_2 + y_3 + y_4 = 18 - (8 + 8)$; where $z_1 = y_1 - 8$ and $z_2 = y_2 - 8$.

43 If $x \le \sqrt{3}$, the given expression will be zero or negative, which is impossible. So choices (a) and (c) are wrong ones. Again if you consider k as a large number, the given relation won't satisfy.

Hence, choice (d) is the answer.

Alternatively $^{n-1}C_r = (k^2 - 3)(^nC_{r+1})$

$$\Rightarrow \frac{(n-1)!}{(r)! \cdot (n-1-r)!} = (k^2 - 3)\frac{(n)!}{(r+1)! \cdot (n-r-1)!}$$

$$\Rightarrow \frac{(n-1)!}{(r)!(n-1-r)!} = (k^2 - 3)\frac{(n) \cdot [(n-1)]}{(r+1) \cdot [(r)!] \cdot (n-r-1)!}$$

$$\Rightarrow (k^2 - 3) = \frac{r+1}{n}$$

The minimum value of $\frac{r+1}{n}$ will be close to zero but positive when n is extremely high.

And the maximum value of $r + 1/n$ will be 1 when $n = r + 1$, since $r + 1$ cannot exceed n.

Therefore, $0 < (k^2 - 3) \le 1 \Rightarrow 3 < k^2 \le 4 \Rightarrow \sqrt{3} < k \le 2$.

Hence choice (d) is the answer.

44 Total number of restaurants = 20 + 15 + 10 = 45

Number of transactions among 45 restaurants = $^{45}C_2$.

Number of transactions within each type of restaurants = $^{20}C_2 + {}^{15}C_2 + {}^{10}C_2$

Number of transactions among different categories of restaurants = $^{45}C_2 - (^{20}C_2 + {}^{15}C_2 + {}^{10}C_2)$

Since these restaurants can make up to 3 transactions a day, total number of transactions

$$= 3 \times \{^{45}C_2 - (^{20}C_2 + {}^{15}C_2 + {}^{10}C_2)\}$$

Number of transactions among Chinese restaurants = $^{20}C_2$

But since no two neighboring restaurants make any transaction, so the actual number of transactions among the Chinese restaurants = $^{20}C_2 - 20$

Similarly, number of transactions among Thai restaurants = $^{15}C_2 - 15$

And, the number of transactions among Italian restaurants = $^{10}C_2 - 10$

Total number of transactions

$$= (^{20}C_2 - 20) + (^{15}C_2 - 15) + (^{10}C_2 - 10)$$

But since these restaurants can make up to 2 transactions a day, total number of transactions

$$= 2 \times \{(^{20}C_2 - 20) + (^{15}C_2 - 15) + (^{10}C_2 - 10)\}$$

Therefore, total number of transactions

$$= 3 \times \{^{45}C_2 - (^{20}C_2 + {}^{15}C_2 + {}^{10}C_2)\} + 2 \times \{(^{20}C_2 - 20) + (^{15}C_2 - 15) + (^{10}C_2 - 10)\}$$

Now, as you know that when two people make a transaction so either of them can give or take change, so the total number of times the change can be given

$$= 2 \times [3 \times \{^{45}C_2 - (^{20}C_2 + {}^{15}C_2 + {}^{10}C_2)\} + 2 \times \{(^{20}C_2 - 20) + (^{15}C_2 - 15) + (^{10}C_2 - 10)\}]$$

$$= 2 \times [3 \times (^{45}C_2) - \{(^{20}C_2) + (^{15}C_2) + (^{10}C_2)\} - 2(20 + 15 + 10)]$$

$$= 5080$$

NOTE I have used the term "transactions" which indicates, for my purpose, the flow of something in one direction, that's why I have multiplied by 2 in the last part to accommodate the two-way transactions.

45 Since $x + 1$ is a factor of $ax^2 + bx + c$, therefore $x + 1 = 0$ or $x = -1$.

Then we have $a - b + c = 0 \Rightarrow a + c = b$. But, since $a \ne b \ne c$, so let us consider $a < c$, then we have the following possibilities for a, b and c.

a	c	b	Number of solutions
1	2, 3, ...1998	3, 4, ..., 1999	1997
2	3, 4, ..., 1997	5, 6, ..., 1999	1995
3	4, 5, ..., 1996	7, 8, ..., 1999	1993
…			
…			
997	998, ..., 1002	1995, ..., 1999	5
998	999, 1000, 1001	1997, 1998, 1999	3
999	1000	1999	1

Total number of solutions

$$= 1 + 3 + 5 + \ldots + 1993 + 1995 + 1997 = 999^2$$

Thus for $a < c$, we have total 999^2 number of solutions.

Similarly for $a > c$, we will have total 999^2 number of solutions.

Therefore the required number of solutions (or polynomials) $= 999^2 + 999^2 = 2(999)^2 = 1996002$

Alternatively $a + c \le 1999 \{a, c \ge 1\}$

$\Rightarrow \quad a + c \le 1997 \quad \{a, c \ge 0\}$

$\Rightarrow \quad a + c + d = 1997 \quad \{a, c, d \ge 0\}$

Number of solutions of the above equation is

$${}^{1997+3-1}C_{3-1} = {}^{1999}C_2 = 999 \times 1999$$

When $a = c$, we have $2a + d = 1997$

$\{a, c, d \ge 0\}$

Then the number of solutions of $2a + d = 1997$ is 999, as $a = 0, 1, 2, \ldots 998$.

Therefore the number of required solutions when $a \ne c$, is

$999 \times 1999 - 999$

$= 999\,(1998) = 999^2 \times 2 = 1996002$

46 Let the three sides of isosceles triangle be a, a and b, then there will be a triangle if $2a > b$.

Case I If $1 \le a \le 1007$

a	b	Number of possibilities
1	1	1
2	1, 2, 3	3
3	1, 2, 3, 4, 5	5
...	....	....
1007	1, 2, 3, ..., 2013	2013

Thus the number of triangles

$$= 1 + 3 + 5 + \ldots + 2013 = (1007)^2$$

Case II If $1008 \le a \le 2014$

a	b	Number of possibilities
1008	1, 2, 3, ..., 2014	2014
1009	1, 2, 3, ..., 2014	2014
1010	1, 2, 3, ..., 2014	2014
...	...	...
2014	1, 2, 3, ..., 2014	2014

Thus the number of triangles

$$= 2014 + 2014 + 2014 + \ldots + 2014$$

$$= 1007 \times 2014 = 2(1007)^2$$

Therefore total number of isosceles triangles

$$= (1007)^2 + 2(1007)^2 = 3(1007)^2 = 2028098$$

47 The numbers in 2nd and 3rd position can only be 8 and 9 because they have to be strictly increasing.
So the first 3 numbers have to be 789.

There are many possibilities for the numbers in position 4 and 5.

In position 4 we can have 8, 7, 6, 5, 4, 3, 2, 1

In position 5 what we have depends on what we have in previous position. If we have 8 in the previous position, we have 8 possibilities 7, 6, 5, 4, 3, 2, 1, 0. If the number is in the 4th position is 7, we have 7 possibilities - 6, 5, 4, 3, 2, 1, 0 and so on and finally if there is 1 in position 4, we have only 1 possibility 0.

So basically, the number of possibilities is

$$8 + 7 + 6 + 5 + 4 + 3 + 2 + 1 = 36$$

Hint We can use the formula for the sum of first n natural numbers, $\frac{n(n+1)}{2}$.

Therefore, $1 + 2 + 3 + \ldots + 8 = \frac{8 \times 9}{2} = 36$

48 Total number of triangles $= {}^{10}C_3 = 120$

Number of triangles, which share exactly one side of the decagon: first we can choose any 10 sides. Now, we cannot choose the two adjacent vertices of the chosen side, so we can choose the third vertex out of the remaining $6 (= 10 - 4)$ vertices. Therefore, the number of triangles that share only one side of the decagon $= 10 \times 6 = 60$.

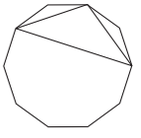
Number of triangles, which share exactly two sides of the decagon: first we can choose any two adjacent sides in 10 ways, out of the 10 sides of the decagon. The third side will be naturally formed by joining the two non-common vertices of the two chosen sides. Therefore, the number of triangles that share exactly two sides of the decagon $= 10$

Thus the required number of triangles

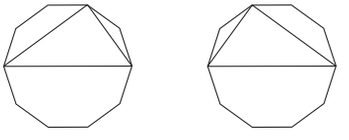
$$= 120 - (60 - 10) = 50$$

Alternatively What we want is that any three vertices which are not adjacent to each other. So let us assume that A, B and C are the three vertices of the triangle taken clockwise, then have to select three vertices A, B, C such that at least one vertex of decagon lies between A and B and so between B and C. There are the various possibilities to choose from the remaining $7\ (= 10 - 3)$ vertices between A, B and C.

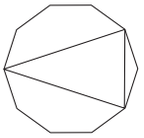
Case (i) (5, 1, 1)-Number of triangles = 10



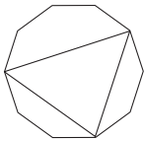
Case (ii) (4, 2, 1) - Number of triangles = 20



Case (iii) (3, 3, 1) - Number of triangles = 10



Case (iv) (3, 2, 2) - Number of triangles = 10



Thus the total number of require triangles

$$= 10 + 20 + 10 + 10 = 50$$

49 We can get a majority if we have 4 or more people together to unlock the box. If there are 3 or fewer people trying to open the box, they should not be able to open it.

So, in order to have the optimal solution to this problem, we will focus on the closest values. That is 3 and 4.

If we form groups of 3 people each, no such group should be able to open all the locks. But, when we form groups of 4 people each, every such group must be able to open all the locks.

It shows that there are ${}^{7}C_{3} = 35$ groups of 3 people each, and for each group there is a lock that the pertinent group cannot open it. But, any group of 4 people can open every lock. It implies that there must be at least 35 locks. If there are fewer than 35 locks, then all these locks can be opened without even majority being present, as there must be some group of 3 people having the keys of all the locks.

Thus the minimum number of locks = 35.

Now, associate each group of 3 people (G_i) with each lock (L_i) and give the keys of the corresponding lock to all other people not associated with a particular lock. Therefore, each person (in a group of 3) receives ${}^{6}C_{3} = 20$ keys.

Thus the minimum number of keys = 20.

50 When a block is at the centre and connected with all other 24 blocks we have minimum number of required roads = 24

The maximum number of roads can be laid out when any blocks are directly connected with each other. It is

$${}^{25}C_{2} = 300.$$

Therefore, we have $24 \le R \le 300$.

CHAPTER 20

Probability

Generally this chapter is considered as an extension of permutation and combination, since it is as logical in nature as permutation and combination. I hope that you must have been well-versed with the permutation and combination (previous chapter) which will enable you to solve the problems of this chapter quickly and easily.

This chapter is important for XAT, SNAP and other MBA entrance tests. Over the past years CAT has shown no great interest in this chapter, still you should learn it heartly due to uncertain syllabus and irregular pattern of CAT.

Remember that so far CAT has asked very simple and logical problems from this chapter which could be solved by applying just commonsense. The literal meaning of probability is the chance of occurrence of an event. For example, if a person is standing at the crossing of two roads which direct towards North, South, East and West.

Thus he has total four alternatives (*i.e,* four different directions) to proceed. Now if he wish to go towards a particular direction then the probability of completing his wish is $1/4$ since he can choose only one direction at a time out of four directions.

Consider another example, A person has two different cars *viz.,* Scorpio and Safari, which he uses randomly,then it can be said that the probability of using Scorpio is $1/2$ since out of two cars he can use any one car at a time. Similarly the probability of using Safari is also $\frac{1}{2}$. Thus we can say that the probability of using any one car at a time is $1/2$ *i.e.,* 50%. So there are chances that in 50% cases he can use Scorpio and in other 50% cases he can use Safari.

Hence from the above illustrations we can conclude that the probability of an event

$$= \frac{(\text{No. of ways in which favourable (or desired event occurs)})}{(\text{Total number of possible outcomes})}$$

20.1 Important Definitions

Experiment

An operation which can produce some well-defined outcomes, is known as an experiment.

The various experiments, when repeated under identical conditions, results. (*i.e.,* outcomes) in each case are same *e.g.,* standard scientific experiments.

But there are some other experiment, when repeated under identical conditions, results in each case are different *e.g.,* rolling of a fair die, tossing of a coin etc.

Random Experiment

If in each trial of an experiment conducted under identical conditions, the outcome is not unique, but may be any of the possible outcomes then such an experiment is known as a random experiment. *e.g.,* rolling of an unbiased die, tossing of a fair coin, drawing of a card from a well shuffled pack of cards.

Sample Space

The set of all possible outcomes in a random experiment is called a sample space and it is generally denoted by S.

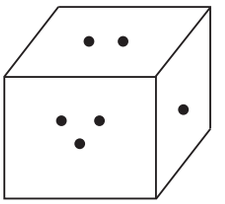
If $E_1, E_2, E_3 \ldots E_n$ are the possible outcomes of a random experiment, then $S = \{E_1, E_2, \ldots . E_n\}$. Also, each of the element of sample space 'S' is called a **sample point.**

***Exp.* 1)** In tossing of a fair coin, there are two possible outcomes, viz., head (H) and tail (T). So, the sample space in this random experiment is $S = \{H, T\}$

***Exp.* 2)** When two fair coins are tossed together, the possible outcomes of the experiment are HH, HT, TH and TT. So the sample space is given by $S = \{HH, HT, TH, TT\}$

***Exp.* 3)** When unbiased die is thrown, it gives 6 possible outcomes viz., 1,2, 3, 4, 5 and 6. So, the sample space $S = \{1, 2, 3, 4, 5, 6\}$

NOTE A die is a cubical solid having 6 similar faces. In each of the six faces there are unique number of holes *viz.*, 1 hole, 2 holes, 3 holes, 4 holes, 5 holes and 6 holes.
Remember that the sum of number of holes in any two opposite faces is always 7 *viz.*, $1+6 = 2+5 = 3+4 = 7$.



- Die means one (single) die
- Dice means more than one die.
- In throwing a die, the outcome is the number of holes on the uppermost face

***Exp.* 4)** When two unbiased dice are rolled (or tossed) simultaneously then there are total $6 \times 6 = 36$ possible outcomes. So, the sample space

$$S = \begin{Bmatrix} (1,1), (1,2), (1,3), (1,4), (1,5), (1,6) \\ (2,1), (2,2), (2,3), (2,4), (2,5), (2,6) \\ (3,1) \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (3,6) \\ (4,1) \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (4,6) \\ (5,1) \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (5,6) \\ (6,1) \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (6,6) \end{Bmatrix}$$

***Exp.* 5)** When a die and a coin are tossed simultaneously, then there are total 12 possible outcomes. So the sample space

$$S = \begin{Bmatrix} (1,H), (2,H), (3,H), (4,H), (5,H), (6,H) \\ (1,T), (2,T), (3,T), (4,T), (5,T), (6,T) \end{Bmatrix}$$

***Exp.* 6)** A coin is tossed twice. If the second throw results in a tail, then a die is thrown. So in this random experiment sample space.

$$S = \begin{Bmatrix} HH, TH, HT1, HT2, HT3, HT4, HT5, HT6, \\ TT1, , TT2, , TT3, TT4, TT5, TT6, \end{Bmatrix}$$

***Exp.* 7)** From a bag containing 2 black and 3 white balls we draw two balls.

Let B_1, B_2 be the black balls and W_1, W_2 and W_3 be the white balls then the sample space

$$S = \begin{Bmatrix} B_1W_1, & B_1W_2, & B_1W_3 \\ B_2W_1, & B_2W_2, & B_2W_3 \\ B_1B_2, & W_1W_2, & W_2W_3 \\ W_1W_3 & & \end{Bmatrix}$$

Event

Any subset of a sample space is called an event.

***Exp.* 1)** In a single throw of a die, the event of getting an even number is given by $E = \{2, 4, 6\}$

Clearly, here the sample space $S = \{1, 2, 3, 4, 5, 6\}$

Hence $E \subset S$ *i.e.,* E is the subset of S.

***Exp.* 2)** Consider a random experiment of tossing two dice at a time. The sample space $S = \{(1, 1), (1, 2), (1, 3), (1, 4), (1, 5), (1, 6), (2, 1), (2, 2), (2, 3), (2, 4), (2, 5) \ldots (6, 1), (6, 2) \ldots (6, 6)\}$. Some different events associated with the above sample space are given below.

$E_1 = \{(1, 1), (2, 2), (3, 3), (4, 4), (5, 5), (6, 6)\}$

$E_2 = \{(1, 8), (2, 7), (3, 6), (4, 5), (5, 4), (6, 3), (7, 2), (8, 1)\}$

$E_3 = \{(1, 2), (1, 4), (1, 6), (3, 2), (3, 4), (3, 6), (5, 2), (5, 4), (5, 6)\}$

$E_4 = \{(2, 2), (2, 3), (2, 5), (3, 2), (3, 3), (3, 5), (5, 2), (5, 3), (5, 5)\}$ etc.

Clearly $E_1 \subset S, E_2 \subset S, E_3 \subset S, E_4 \subset S$

Where E_1 is the event of getting a doublet and E_2 is the event of getting 9 as the sum. E_3 is the event of getting odd number on the first die and an even number on the second die. E_4 is the event of getting only prime number on each of the two dice.

***Exp.* 3)** Consider a random experiment of tossing three coins at a time. The sample space S = {HHH, HHT, HTH, THH, TTH, HTT, THT, TTT}

Following are the various events associated with the above sample space.

$E_1 = \{HHH, HHT, HTH, THH\}$

$E_2 = \{HHT, HTH, THH, TTH, HTT, THT\}$

$E_3 = \{HHH, TTT\}$

$E_4 = \{THH, TTH, THT, TTT\}$

Where E_1 is the event of getting atleast two heads and E_2 is the event of getting atleast one head and atmost two heads.

E_3 is the event of getting all the three coins identical and E_4 is the event of getting tail on the first coin.

Elementary Events An event containing only a single sample point is called an elementary event, or simple event.

***Exp.* 1)** In a simultaneous toss of two coins the sample space $S = \{HH, HT, TH, TT\}$

then $E_1 = \{HH\}$

$E_2 = \{TT\}$ are the elementary events.

***Exp.* 2)** Consider a random experiment in which two dice rolled simultaneously, the sample space

$S = \{(1, 1), (1, 2) \ldots (6, 5), (6, 6)\}$

then $E_1 = \{(1, 1)\}$

$E_2 = \{(6, 6)\}$

$E_3 = \{(5, 5)\}$ are the elementary events.

Here E_1 is the event of getting the sum of two.

E_2 is the event of getting the sum of twelve

E_3 is the event of getting the product of 25.

Compound Events Events which are not elementary are known as compound events or the events which contains more than one element are called compound or composite events.

***Exp.* 1)** Consider a random experiment in which two dice are rolled simultaneously, the sample space

$S = \{(1, 1), (1, 2) \ldots\ldots (6, 5), (6, 6)\}$.

then $E_1 = \{(1, 5), (2, 4), (3, 3), (4, 2), (5, 1)\}$

$E_2 = \{(1, 1), (2, 2), (3, 3), (4, 4), (5, 5), (6, 6)\}$

$E_3 = \{(1, 2), (2, 4), (3, 6)\}$

are the compound events.

Here E_1 is the event of getting the sum of 6

E_2 is the event of getting identical results

E_3 is the event of getting the twice number by the second die than that by first die.

Occurrence of Events In a random experiment, let S be the sample space and E be the event such that $E \subseteq S$, Let w be an outcome of a trial such that $w \in A$, then we say that the event E has occurred. If $w \notin E$, we say that the event E has not occurred.

***Exp.* 1)** Consider the random experiment of throwing an unbiased die. Let E be the event of getting an odd number, then $E = \{1, 3, 5\}$

Now, in a trial, let the outcome be 3, Since $3 \in E$, so in this trial, the event E has occurred. In another trial, let the outcome be 4.

Since $4 \notin E$ so in this trial, the event E has not occurred.

***Exp.* 2)** Consider the random experiment of throwing a die. Let the outcome of the trial is 6. Then we can say that the following events have occurred.

(i) Getting a number greater than or equal to 3, represented by the set {3, 4, 5, 6}

(ii) Getting an even number represented by the set {2, 4, 6}

We can also say that the following events have not occurred

(i) Getting an odd number represented by the set {1, 3, 5}.

(ii) Getting a prime number represented by the set {2, 3, 5}

Impossible Events Let S be a sample space associated with a random experiment, Now, since $\phi \subseteq S$, so ϕ is an event, called an impossible event.

Sure (or certain) **Event** Let S be a sample space associated with a random experiment. Now, since $S \subseteq S$, so S is an event, called a sure or certain event.

Example Consider the random experiment of throwing an unbiased die. The sample space $S = \{1, 2, 3, 4, 5, 6\}$.

Let E_1 be the event of getting a number less than 1.

and E_2 be the event of getting a number greater than 6.

Here E_1 and E_2 both are impossible events.

Let E_3 be the event of getting a number less than or equal to 7. and E_4 be the event of getting a number multiple of 2 but less than 7. Here E_3 and E_4 are the certain events.

Equally Likely Events Events are said to be equally likely, if none of them is expected to occur in preference to the other.

Example If an unbiased die is rolled, then each outcome is equally likely to happen i.e., all elementary events are equally likely to happen. If however, the die is so formed that a particular face occurs most often, then the die is biased. So in this case, the outcomes are not equally likely to happen.

Favourable Events Let S be the sample space associated with a random experiment and let $E \subset S$. Then the elementary events belonging to E are known as the favourable events to A.

***Exp.* 1)** Consider a random experiment of throwing a die. Let E be the event of getting an even number, then $E = \{2, 4, 6\}$. So there are three favourable events of event E *viz.* {2}, {4} and {6}.

***Exp.* 2)** Consider a random experiment of throwing a pair of dice. Let E be the event of getting the sum as 8, then $E = \{(1, 7), (2, 6), (3, 5), (4, 4), (5, 3), (6, 2), (7, 1)\}$

So, there are 7 favourable events to event E.

Complementary Events In a random experiment, let S be the sample space and let E be an event. Then $E \subseteq S$. Clearly, $E^c \subseteq S$. So E^c is also an event, called the complementary of E. Sometimes E^c is denoted by $\overline{E}$ or E'. Where $\overline{E}$ is called as "not-E". Thus it is clear that $\overline{E}$ occurs only when E does not occur. Also in a trial one and only of E and $\overline{E}$ must occur.

Algebra of Events

In a random experiment, let the sample space be S. Let $E \subseteq S$, $F \subseteq S$ and $G \subseteq S$, then we can define the following relations in the set theory mode.

(i) $\overline{E}$ is an event that occurs only when E does not occur.

(ii) $(E \cup F)$ is an event that occurs only when E occurs or F occurs or both occurs.

(iii) $(E \cap F)$ is an event that occurs only when each one of E and F occurs.

(iv) $(E \cap \overline{F})$ is an event that occurs only when E occurs but not F.

(v) $(\overline{E} \cap \overline{F}) = (\overline{E \cup F})$ is an event that occurs when neither E nor F occurs.

(vi) $(E \cup F \cup G)$ is an event that occurs when at least one of E, F or G occurs.

(vii) $(E \cap F \cap G)$ is an event that occurs when all three E, F and G occurs.

(viii) $(E \cap \overline{F}) \cup (\overline{E} \cap F)$ is an event that occurs when exactly one of E and F occurs.

(ix) $(E \cap F \cap \overline{G}) \cup (E \cap \overline{F} \cap G) \cup (\overline{E} \cap F \cap G)$ is an event that occurs when exactly two of E, F and G occurs.

Mutually Exclusive Events

Let S be the sample space associated with a random experiment and let E_1 and E_2 be the two events. Then E_1 and E_2 are mutually exclusive events if $E_1 \cap E_2 = \phi$

***Exp.* 1)** Consider a random experiment of throwing a die. Let E_1, E_2 and E_3 be three events such that

$E_1 = \{1, 3, 5\}$, the event of getting an odd number

$E_2 = \{2, 4, 6\}$, the event of getting an even number

$E_3 = \{2, 3, 5\}$, the event of getting a prime number.

Clearly $E_1 \cap E_2 = \phi$

and $E_1 \cap E_3 \neq \phi, E_2 \cap E_3 \neq \phi$

Hence E_1 and E_2 are mutually exclusive events but E_1 and E_3, E_2 and E_3 are not mutually exclusive.

Mutually Exclusive & Exhaustive System of Events

Let S be the sample space associated with a random experiment.

Let $E_1, E_2, \ldots, E_n$ be the subsets of S such that

(i) $E_i \cap E_j = \phi$ for $i \neq j$ and

(ii) $E_1 \cup E_2 \cup E_3 \cup \ldots \cup E_n = S$

then the set of events $E_1, E_2, E_3, \ldots, E_n$ is said to form a mutually exclusive and exhaustive system of events.

***Exp.* 1)** In a sample space all the elementary events form a mutually exclusive and exhaustive system of events.

***Exp.* 2)** Let $S = \{1, 2, 3, 4, 5, 6\}$ be the sample space when an unbiased die is rolled.

Let $E_1 = \{1, 3, 5\}$ and $E_2 = \{2, 4, 6\}$, then E_1 and E_2 form the mutually exclusive and exhaustive system of events.

Also, let $E_3 = \{1, 2\}$, $E_4 = \{4, 5\}$, then E_3 and E_4 do not form the mutually exclusive and exhaustive system of events since E_3 and E_4 do not include all the elementary events of S.

Again if $E_5 = \{3, 6\}$ and $E_6 = \{2, 4, 6\}$, then E_5 and E_6 do not form mutually exclusive and exhaustive system of events since $E_5 \cap E_6 \neq \phi$ and E_5, E_6 do not include all the elementary events of the sample space S. *A* pack of cards consists of 52 cards. There are four suits each containing 13 cards called as spades, clubs, hearts and diamonds.

All the spades and clubs are black faced cards while hearts and diamonds are red faced cards. The aces, kings, queens and jacks are known as face cards.

In each suit there is one ace, one king, one queen and one jack and rest 9 cards are numbered cards.

20.2 **Probability**

In a random experiment, let S be the sample space and let $E \subseteq S$. where E is an event.

The probability of occurrence of the event E is defined as

$$P(E) = \frac{\text{number of favourable outcomes}}{\text{number of possible outcomes}}$$

$$= \frac{\text{number of elements in } E}{\text{number of elements in } S} = \frac{n(E)}{n(S)}$$

$$= \frac{\text{number of elementary events in } E}{\text{number of elementary events in } S}$$

From the above definitions it is clear that

(i) $0 \le P(E) \le 1$

(ii) $P(\phi) = 0$

(iii) $P(S) = 1$

Also, $P(\bar{E}) = \frac{\text{number of elementary events in } \bar{E}}{\text{number of elementary events in } S}$

$$= \frac{n(S) - n(E)}{n(S)}$$

$$= 1 - \frac{n(E)}{n(S)} = 1 - P(E)$$

$\Rightarrow \quad P(\bar{E}) = 1 - P(E)$

$\therefore \quad P(E) + P(\bar{E}) = 1$

Odds in Favour of An Event and Odds Against An Event

In m be the number of ways in which an event occurs and n be the number of ways in which it does not occur, then

(i) odds in favour of the event $= \frac{m}{n}$ (or $m : n$)

(ii) odds against the event $= \frac{n}{m}$ (or $n : m$)

Introductory Exercise 20.1

1. Find the probability of getting a head in a throw of a coin.

(a) $\frac{1}{2}$ (b) 1

(c) 2 (d) none of these

Directions (for Q. Nos. 2 to 5) *Two fair coins are tossed simultaneously. Find the probability of*

2. Getting only one head.

(a) 1/2 (b) 1/3 (c) 2/3 (d) 3/4

3. Getting atleast one head.

(a) $\frac{1}{4}$ (b) $\frac{3}{4}$ (c) $\frac{1}{2}$ (d) $\frac{3}{8}$

4. Getting two heads.

(a) $\frac{2}{7}$ (b) $\frac{1}{4}$ (c) $\frac{1}{2}$ (d) $\frac{4}{5}$

5. Getting atleast two heads :

(a) $\frac{3}{4}$ (b) $\frac{1}{2}$

(c) $\frac{1}{4}$ (d) 1

Directions (for Q. Nos. 6 to 12) *Three fair coins are tossed simultaneously. Find the probability of*

6. Getting one head.

(a) 0 (b) 3/4 (c) $\frac{5}{8}$ (d) $\frac{3}{8}$

7. Getting one tail.

(a) 1 (b) $\frac{1}{4}$ (c) $\frac{5}{8}$ (d) $\frac{3}{8}$

8. Getting atlest one head.

(a) $\frac{7}{8}$ (b) $\frac{1}{8}$ (c) $\frac{3}{4}$ (d) $\frac{1}{4}$

9. Getting two heads.

(a) $\frac{3}{5}$ (b) $\frac{3}{8}$ (c) $\frac{5}{8}$ (d) $\frac{2}{5}$

10. Getting atleast two heads.

(a) $\frac{3}{8}$ (b) $\frac{7}{8}$ (c) $\frac{1}{2}$ (d) $\frac{1}{4}$

11. Getting atleast one head and one tail.

(a) $\frac{2}{8}$ (b) $\frac{1}{2}$ (c) $\frac{3}{10}$ (d) $\frac{3}{4}$

12. Getting more heads than the number of tails.
(a) 2 (b) 7/8 (c) $\frac{5}{8}$ (d) $\frac{1}{2}$

Directions (for Q. Nos. 13 to16) *An unbiased die is rolled. Find the probability of*

13. Getting a number less than 7 but greater than zero.
(a) 0 (b) 3/4 (c) 1 (d) $\frac{7}{8}$

14. Getting a multiple of 3.
(a) $\frac{1}{6}$ (b) $\frac{1}{3}$
(c) $\frac{5}{6}$ (d) none of these

15. Getting a prime number.
(a) $\frac{1}{2}$ (b) $\frac{3}{5}$ (c) $\frac{5}{7}$ (d) $\frac{5}{8}$

16. Getting an even number.
(a) $\frac{1}{2}$ (b) $\frac{4}{5}$ (c) $\frac{2}{8}$ (d) $\frac{3}{4}$

Directions (for Q. Nos. 17 and 18): *A coin is tossed successively three times. Find the probability of*

17. Getting exactly one head or two heads.
(a) $\frac{1}{4}$ (b) $\frac{3}{4}$ (c) $\frac{1}{2}$ (d) $\frac{3}{8}$

18. Getting no heads.
(a) 0 (b) 1 (c) $\frac{1}{8}$ (d) $\frac{7}{8}$

Directions (for Q. Nos. 19 to 27) *Two dice are rolled simultaneously.Find the probability of*

19. Getting a total of 9.
(a) $\frac{1}{3}$ (b) $\frac{1}{9}$ (c) $\frac{8}{9}$ (d) $\frac{9}{10}$

20. Getting a sum greater than 9.
(a) $\frac{10}{11}$ (b) $\frac{5}{6}$ (c) $\frac{1}{6}$ (d) $\frac{8}{9}$

21. Getting a total of 9 or 11.
(a) $\frac{2}{99}$ (b) $\frac{20}{99}$ (c) $\frac{1}{6}$ (d) $\frac{1}{10}$

22. Getting a doublet.
(a) 1/12 (b) 0 (c) 5/8 (d) 1/6

23. Getting a doublet of even numbers.
(a) 5/8 (b) 1/12 (c) 3/4 (d) 1/4

24. Getting a multiple of 2 on one die and a multiple of 3 on the other.
(a) $\frac{15}{36}$ (b) $\frac{25}{36}$ (c) $\frac{11}{36}$ (d) $\frac{5}{6}$

25. Getting the sum of numbers on the two faces divisible by 3 or 4.
(a) $\frac{4}{9}$ (b) $\frac{1}{7}$ (c) $\frac{5}{9}$ (d) $\frac{7}{12}$

26. Getting the sum as a prime number.
(a) $\frac{3}{5}$ (b) $\frac{5}{12}$ (c) $\frac{1}{2}$ (d) $\frac{3}{4}$

27. Getting atleast one '5'.
(a) $\frac{3}{5}$ (b) $\frac{1}{5}$ (c) $\frac{5}{36}$ (d) $\frac{11}{36}$

Directions (for Q. Nos. 28 to 35) *One card is drawn from a pack of 52 cards, each of the 52 cards being equally likely to be drawn. Find the probability that*

28. The card drawn is black.
(a) $\frac{1}{2}$ (b) $\frac{1}{4}$
(c) $\frac{8}{13}$ (d) can't be determine

29. The card drawn is a queen.
(a) $\frac{1}{12}$ (b) $\frac{1}{13}$
(c) $\frac{1}{4}$ (d) $\frac{3}{4}$

30. The card drawn is black and a queen.
(a) $\frac{1}{13}$ (b) $\frac{1}{52}$ (c) $\frac{1}{26}$ (d) $\frac{5}{6}$

31. The card drawn is either black or a queen.
(a) $\frac{15}{26}$ (b) $\frac{13}{17}$ (c) $\frac{7}{13}$ (d) $\frac{15}{26}$

32. The card drawn is either king or a queen.
(a) $\frac{5}{26}$ (b) $\frac{1}{13}$ (c) $\frac{2}{13}$ (d) $\frac{12}{13}$

33. The card drawn is either a heart, a queen or a king.
(a) $\frac{17}{52}$ (b) $\frac{21}{52}$ (c) $\frac{19}{52}$ (d) $\frac{9}{26}$

34. The card drawn is neither a spade nor a king.
(a) 0 (b) $\frac{9}{13}$ (c) $\frac{1}{2}$ (d) $\frac{4}{13}$

35. The card drawn is neither an ace nor a king.
(a) $\frac{11}{13}$ (b) $\frac{1}{2}$ (c) $\frac{2}{13}$ (d) $\frac{11}{26}$

36. From a well shuffled pack of 52 cards, three cards are drawn at random. Find the probability of drawing an ace, a king and a jack.
(a) $\frac{16}{5525}$ (b) $\frac{16}{625}$
(c) $\frac{16}{3125}$ (d) none of these

37. Four cards are drawn at random from a pack of 52 cards. Find the probability of getting all the four cards of same number.
(a) $\frac{17}{1665}$ (b) $\frac{1}{20825}$
(c) $\frac{7}{25850}$ (d) none of these

38. From a well shuffled pack of 52 playing cards, four cards are accidently dropped. Find the probability that one card is missing from each suit.
(a) $\frac{17}{20825}$ (b) $\frac{2197}{20825}$
(c) $\frac{197}{1665}$ (d) none of these

39. Four cards are drawn at random from a pack of 52 cards. Find the probability of getting all the four cards of different numbers.
(a) $\frac{141}{4165}$ (b) $\frac{117}{833}$
(c) $\frac{264}{4165}$ (d) none of these

Directions (for Q. Nos. 40 to 43) *Four dice are thrown simultaneously. Find the probability that*

40. All of them show the same face.
(a) $\frac{1}{216}$ (b) $\frac{15}{16}$ (c) $\frac{15}{36}$ (d) $\frac{1}{2}$

41. All of them show the different face.
(a) $\frac{3}{28}$ (b) $\frac{5}{18}$ (c) $\frac{15}{36}$ (d) $\frac{11}{36}$

42. Two of them show the same face and remaining two show the different faces.
(a) $\frac{4}{9}$ (b) $\frac{5}{9}$ (c) $\frac{11}{18}$ (d) $\frac{7}{9}$

43. Atleast two of them show the same face.
(a) $\frac{37}{72}$ (b) $\frac{11}{36}$ (c) $\frac{47}{72}$ (d) $\frac{25}{36}$

44. What is the probability that a number selected from the numbers 1, 2, 3, ..., 20, is a prime number when each of the given numbers is equally likely to be selected?
(a) 7/10 (b) 2/15 (c) 2/5 (d) 3/5

45. Tickets are numbered from 1 to 18 are mixed up together and then 9 ticket is drawn at random. Find the probability that the ticket has a number, which is a multiple of 2 or 3.
(a) $\frac{1}{3}$ (b) $\frac{3}{5}$ (c) $\frac{2}{3}$ (d) $\frac{5}{6}$

46. In a lottery of 100 tickets numbered 1 to 100, two tickets are drawn simultaneously. Find the probability that both the tickets drawn have prime numbers.
(a) $\frac{2}{33}$ (b) $\frac{7}{50}$ (c) $\frac{7}{20}$ (d) $\frac{5}{66}$

47. In the previous question (number 46), find the probability that none of the tickets drawn has a prime number.
(a) $\frac{29}{66}$ (b) $\frac{17}{33}$ (c) $\frac{37}{66}$ (d) $\frac{17}{50}$

48. Find the probability that a leap year selected at random will contain 53 Sundays.
(a) $\frac{5}{7}$ (b) $\frac{3}{4}$ (c) $\frac{4}{7}$ (d) $\frac{2}{7}$

Directions (for Q. Nos. 49 to 53) *A bag contains 8 red and 4 green balls. Find the probability that*

49. The ball drawn is red when one ball is selected at random.
(a) $\frac{2}{3}$ (b) $\frac{1}{3}$ (c) $\frac{1}{6}$ (d) $\frac{5}{6}$

50. All the 4 balls drawn are red when four balls are drawn at random.
(a) $\frac{17}{32}$ (b) $\frac{14}{99}$
(c) $\frac{7}{12}$ (d) none of these

51. All the 4 balls drawn are green when four balls are drawn at random.
(a) $\frac{1}{495}$ (b) $\frac{7}{99}$ (c) $\frac{5}{12}$ (d) $\frac{2}{3}$

52. Two balls are red and one ball is green when three balls are drawn at random.
(a) $\frac{56}{99}$ (b) $\frac{112}{495}$
(c) $\frac{78}{495}$ (d) none of these

53. Three balls are drawn and none of them is red.
(a) $\frac{68}{99}$ (b) $\frac{7}{99}$
(c) $\frac{4}{495}$ (d) none of these

54. The odds in favour of an event are 2 : 7. Find the probability of occurrence of this event.
(a) $\frac{2}{9}$ (b) $\frac{5}{12}$ (c) $\frac{7}{12}$ (d) $\frac{2}{5}$

55. The odds against of an event are 5 : 7, find the probability of occurrence of this event.
(a) $\frac{3}{8}$ (b) $\frac{7}{12}$ (c) $\frac{2}{7}$ (d) $\frac{5}{12}$

56. If there are two children in a family, find the probability that there is atleast one girl in the family.
(a) $\frac{1}{4}$ (b) $\frac{1}{2}$
(c) $\frac{3}{4}$ (d) none of these

57. From a group of 3 men and 2 women, two persons are selected at random. Find the probability that atleast one woman is selected.
(a) $\frac{1}{5}$ (b) $\frac{7}{10}$ (c) $\frac{2}{5}$ (d) $\frac{5}{6}$

58. A box contains 5 defective and 15 non-defective bulbs. Two bulbs are chosen at random. Find the probability that both the bulbs are non-defective.

(a) $\frac{5}{19}$ (b) $\frac{3}{20}$

(c) $\frac{21}{38}$ (d) none of these

59. In the previous question (number 58), find the probability that atleast 3 bulbs are defective when 4 bulbs are selected at random.

(a) $\frac{31}{969}$ (b) $\frac{7}{20}$

(c) $\frac{1}{20}$ (d) none of these

20.3 Important Value

Important Addition Theorems

1. $P(E) \geq 0$ 2. $P(\phi) = 0$ 3. $P(S) = 1$

Addition Theorem 1. If A and B are two events associated with a random experiment.

Then $P(A \cup B) = P(A) + P(B) - P(A \cap B)$

$\Rightarrow$ $P(A \text{ or } B) = P(A) + P(B) - P(A \text{ and } B)$

Corollary If A and B are mutually exclusive events. then $P(A \cap B) = 0$, therefore $P(A \cup B) = P(A) + P(B)$

Addition Theorem 2. If A, B and C three events associated with a random experiment,

then $P(A \cup B \cup C) = P(A) + P(B) + P(C)$

$- P(A \cap B) - P(B \cap C) - P(A \cap C) + P(A \cap B \cap C)$

Corollary If A, B and C are the three mutually exclusive events, then $P(A \cap B) = P(B \cap C) = P(A \cap C)$

$= P(A \cap B \cap C) = 0$

$\therefore$ $P(A \cup B \cup C) = P(A) + P(B) + P(C)$

Theorem 3. If A and B be two events such that $A \subseteq B$, then $P(A) \leq P(B)$

Theorem 4. If E is an event associated with a random experiment, then $0 \leq P(E) \leq 1$

Theorem 5. For any two events A and B

$P(A - B) = P(A) - P(A \cap B)$

$P(B - A) = P(B) - P(A \cap B)$

$P(\overline{A} \cap B) = P(B) - P(A \cap B)$

$P(A \cap \overline{B}) = P(A) - P(A \cap B)$

Some Important Results

(A) If A, B and C are three events, then

(i) P [Exactly one of A, B, C occurs]

$= P(A) + P(B) + P(C) - 2[(A \cap B) + (B \cap C) + (A \cap C)] + 3P(A \cap B \cap C)$

(ii) P [Exactly two of A, B, C occur]

$= P(A \cap B) + P(B \cap C) + P(A \cap C) - 3P(A \cap B \cap C)$

(iii) P (Atleast two of A, B, C occur)

$= P(A \cap B) + P(B \cap C) + P(A \cap C) - 2P(A \cap B \cap C)$

(B) If A and B are two events, then

P (Exactly one of A, B occurs)

$= P(A) + P(B) - 2P(A \cup B)$

$= P(A \cup B) - P(A \cap B)$

Introductory Exercise 20.2

1. The probability of occurrence of two events A and B are 1/4 and 1/2 respectively. The probability of their simultaneous occurrence is $\frac{7}{50}$. Find the probability that either A or B must occur.

(a) $\frac{61}{100}$ (b) $\frac{29}{100}$

(c) $\frac{39}{100}$ (d) $\frac{56}{99}$

2. In the previous question, find the probability that neither A nor B occurs.

(a) $\frac{25}{99}$ (b) $\frac{39}{100}$ (c) $\frac{61}{100}$ (d) $\frac{17}{100}$

3. If A and B be two events in a sample space such that $P(A) = \frac{3}{10}$ and $P(B) = \frac{1}{2}$ and $P(A \cap B) = \frac{1}{5}$.

Find $P(A \cup B)$.

(a) $\frac{1}{5}$ (b) $\frac{2}{5}$ (c) $\frac{3}{5}$ (d) $\frac{4}{5}$

4. If A and B be two events in a sample space such that $P(A) = \frac{2}{5}$, $P(B) = \frac{1}{2}$ and $P(A \cup B) = \frac{3}{5}$, find $P(A \cap B)$.

(a) $\frac{3}{10}$ (b) $\frac{7}{10}$

(c) $\frac{4}{7}$ (d) $\frac{4}{15}$

Directions (for Q. Nos. 5 to 10) *If A and B be two mutually exclusive events in a sample space such that,* $P(A)=\frac{2}{5}$ *and* $P(B)=\frac{1}{2}$, *then*

5. Find $P(\bar{A})$:
(a) $\frac{2}{5}$ (b) $\frac{3}{5}$ (c) $\frac{4}{5}$ (d) $\frac{6}{7}$

6. Find $P(\bar{B})$:
(a) $\frac{1}{4}$ (b) $\frac{3}{4}$ (c) $\frac{1}{2}$ (d) $\frac{4}{5}$

7. Find $P(A \cup B)$:
(a) $\frac{7}{16}$ (b) $\frac{9}{16}$ (c) $\frac{9}{10}$ (d) $\frac{1}{2}$

8. Find $P(\bar{A} \cap \bar{B})$:
(a) $\frac{4}{5}$ (b) $\frac{1}{10}$ (c) $\frac{8}{9}$ (d) $\frac{13}{20}$

9. Find $P(\bar{A} \cap B)$:
(a) $\frac{1}{2}$ (b) $\frac{3}{5}$ (c) $\frac{4}{7}$ (d) $\frac{7}{15}$

10. Find $P(A \cap \bar{B})$:
(a) $\frac{1}{5}$ (b) $\frac{2}{5}$ (c) $\frac{4}{15}$ (d) $\frac{3}{10}$

11. If $P(\bar{A}) = 0{\cdot}65$, $P(A \cup B) = 0{\cdot}65$, where A and B are two mutually exclusive events, then find $P(B)$.
(a) $0{\cdot}60$ (b) $0{\cdot}30$
(c) $0{\cdot}70$ (d) none of these

12. If A, B and C are three mutually exclusive and exhaustive events. Find $P(A)$, if $P(B)=\frac{3}{2}P(A)$ and $P(C)=\frac{1}{2}P(B)$.
(a) $\frac{8}{13}$ (b) $\frac{5}{13}$ (c) $\frac{4}{13}$ (d) $\frac{9}{13}$

13. Two dice are tossed once. Find the probability of getting an even number on first die, or a total of 8.
(a) $\frac{4}{9}$ (b) $\frac{2}{3}$ (c) $\frac{5}{9}$ (d) $\frac{1}{3}$

14. A die is thrown twice, what is the probability that atleast one of the two throws comes up with the number 5?
(a) $\frac{11}{36}$ (b) $\frac{5}{6}$ (c) $\frac{15}{36}$ (d) none

15. In a single throw of two dice, find the probability that neither a doublet nor a total of 8 will appear.
(a) $\frac{7}{15}$ (b) $\frac{5}{18}$ (c) $\frac{13}{18}$ (d) $\frac{3}{16}$

16. A die is thrown twice, what is the probability that atleast one of the two numbers is 6?
(a) $\frac{11}{12}$ (b) $\frac{11}{36}$ (c) $\frac{1}{6}$ (d) $\frac{7}{36}$

17. A card is drawn at random from a well-shuffled deck of 52 cards. Find the probability of its being a heart or a king.
(a) $\frac{4}{13}$ (b) $\frac{9}{13}$ (c) $\frac{8}{13}$ (d) $\frac{11}{26}$

18. Two cards are drawn at random from a well-shuffled pack of 52 cards. What is the probability that either both are red or both are queens?
(a) $\frac{17}{112}$ (b) $\frac{55}{221}$ (c) $\frac{55}{121}$ (d) $\frac{33}{221}$

19. A card is drawn from a deck of 52 cards. Find the probability of getting a red card or a heart or a king.
(a) $\frac{6}{13}$ (b) $\frac{7}{13}$ (c) $\frac{11}{26}$ (d) $\frac{15}{26}$

20. Four cards are drawn at a time from a pack of 52 playing cards. Find the probability of getting all the four cards of the same suit.
(a) $\frac{5}{13}$ (b) $\frac{12}{65}$ (c) $\frac{44}{4165}$ (d) $\frac{44}{169}$

21. From a well-shuffled pack of 52 cards, a card is drawn at random. Find the probability that the drawn card is a king or a queen.
(a) $\frac{2}{13}$ (b) $\frac{8}{13}$ (c) $\frac{11}{13}$ (d) none

22. Two cards are drawn at random from a pack of 52 cards. What is the probability that either both are black or both are jacks?
(a) $\frac{65}{121}$ (b) $\frac{55}{221}$ (c) $\frac{17}{221}$ (d) none

23. A natural number is chosen at random from amongst the first 300. What is the probability that the number, so chosen is divisible by 3 or 5?
(a) $\frac{48}{515}$ (b) $\frac{4}{150}$
(c) 1/2 (d) none of these

24. A natural number is chosen at random from the first 100 natural numbers. What is the probability that the number chosen is a multiple of 2 or 3 or 5?
(a) $\frac{30}{100}$ (b) $\frac{1}{33}$
(c) $\frac{74}{100}$ (d) $\frac{7}{10}$

25. A box contains 5 red balls, 8 green balls and 10 pink balls. A ball is drawn at random from the box. What is the probability that the ball drawn is either red or green?
(a) $\frac{13}{23}$ (b) $\frac{10}{23}$ (c) $\frac{11}{23}$ (d) $\frac{13}{529}$

26. A basket contains 10 apples and 20 oranges out of which 3 apples and 5 oranges are defective. If we choose two fruits at random, what is the probability that either both are oranges or both are non defective?
(a) $\frac{136}{345}$ (b) $\frac{17}{87}$ (c) $\frac{316}{435}$ (d) $\frac{158}{435}$

27. In a class 40% of the students offered Physics 20% offered Chemistry and 5% offered both. If a student is selected at random, find the probability that he has offered Physics or Chemistry only.
(a) 45% (b) 55%
(c) 36% (d) none of these

20.4 Conditional Probability

Let A and B be two events associated with a random experiment. Then, the probability of occurrence of A under the condition that B has already occurred and $P(B) \neq 0$, is called the conditional probability and it is denoted by $P\left(\frac{A}{B}\right)$.

Thus, $P\left(\frac{A}{B}\right)$ = Probability of occurrence of A given that B has already occurred. Similarly, $P\left(\frac{B}{A}\right)$ = Probability of occurrence of B given that A has already occurred.

NOTE

(i) Sometimes $P\left(\frac{A}{B}\right)$ is used to denote the probability of occurrence of A when B occurs.

(ii) Similarly $P\left(\frac{B}{A}\right)$ is used to denoted the probability of occurrence of B when A occurs. The above two cases happens due to the simultaneous occurrence of two events since the two events are the subsets of the same sample space.

***Exp.* 1)** An urn contains 6 red and 9 blue balls. Two balls are drawn from the urn one after another without replacement. Find the probability of drawing a red ball when a blue ball has been drawn from the urn.

Solution Let A = drawing of a red ball in the second draw and B = drawing of a blue ball in the first draw

Now $P\left(\frac{A}{B}\right)$ = Probability of drawing a red ball in second draw when a blue ball has been drawn in the first draw. Now, since there are only 14 balls after drawing a blue ball in first draw and out of these 14 balls, 6 balls are red.

Therefore $P\left(\frac{A}{B}\right) = \frac{6}{14} = \frac{3}{7}$

***Exp.* 2)** A pair of dice is thrown simultaneously, find the probability that the sum is obtained 9 when there is an odd number on the first die.

28. The probability that an MBA aspirant will join IIM is $\frac{2}{5}$ and that he will join XLRI is $\frac{1}{3}$. Find the probability that he will join IIM or XLRI.
(a) $\frac{4}{15}$ (b) $\frac{7}{15}$ (c) $\frac{11}{15}$ (d) $\frac{8}{15}$

29. In a given race, the odds in favour of horses H_1, H_2, H_3 and H_4 are $1:2, 1:3, 1:4, 1:5$ respectively. Find the probability that one of them wins the race.
(a) $\frac{57}{60}$ (b) $\frac{1}{20}$ (c) $\frac{2}{7}$ (d) $\frac{7}{60}$

Solution Let A be the event of getting a sum of 9 and B be the event of getting an odd number on the first die.

$\therefore A = \{(3, 6) (4, 5), (5, 4), (6, 3)\}$

$B = \{(1,1), (1,2), (1,3) \ldots (3,1), (3,2), (3,3) \ldots (5,1), (5,2) \ldots (5,6)\}$

$P(A) = \frac{4}{36} = \frac{1}{9}$ and $P(B) = \frac{18}{36} = \frac{1}{2}$

$\therefore P\left(\frac{A}{B}\right)$ = Probability of occurrence of A when B Occurs.

$\Rightarrow P\left(\frac{A}{B}\right)$ = Probability of getting 9 as the sum when there is an odd number on first die.

$\Rightarrow P\left(\frac{A}{B}\right) = \frac{n(A \cap B)}{n(B)} = \frac{2}{18} = \frac{1}{9}$ [Here $(A \cap B) = (3, 6), (6, 3)$]

20.5 Multiplication Theorem

Let A and B be two events associated with the same random experiment then

NOTE

$$P(A \cap B) = P(A)\, P\left(\frac{B}{A}\right), \text{if } P(A) \neq 0 \quad \ldots(i)$$

or $$P(A \cap B) = P(B)\, P\left(\frac{A}{B}\right), P(B) \neq 0 \quad \ldots(ii)$$

$P\left(\frac{B}{A}\right) = \frac{P(A \cap B)}{P(A)}$ from (i) and $P\left(\frac{A}{B}\right) = \frac{P(A \cap B)}{P(B)}$ from (ii)

In general, if $A_1, A_2, A_3 \ldots A_n$ are events associated with the same random experiment, then $P(A_1 \cap A_2 \cap A_3 \cap \ldots \cap A_n)$

$$= P(A_1)\, P\left(\frac{A_2}{A_1}\right) P\left(\frac{A_3}{A_1 \cap A_2}\right) \ldots P\left(\frac{A_n}{A_1 \cap A_2 \cap \ldots \cap A_{n-1}}\right)$$

***Exp.* 1)** Let A and B be the two events such that $P(A) = \frac{1}{2}$, $P(B) = \frac{1}{3}$ and $P(A \cap B) = \frac{1}{4}$, find

(i) $P\left(\frac{A}{B}\right)$ (ii) $P\left(\frac{B}{A}\right)$ (iii) $P(A \cup B)$ (iv) $P\left(\frac{\overline{A}}{\overline{B}}\right)$

Solution

(i) $P\left(\frac{A}{B}\right)=\frac{P(A\cap B)}{P(B)}=\frac{1/4}{1/3}=\frac{3}{4}$

(ii) $P\left(\frac{B}{A}\right)=\frac{P(A\cap B)}{P(A)}=\frac{1/4}{1/2}=\frac{1}{2}$

(iii) $P(A\cup B)=P(A)+P(B)-P(A\cap B)$

$=\frac{1}{2}+\frac{1}{3}-\frac{1}{4}=\frac{7}{12}$

(iv) $P\left(\frac{\overline{A}}{\overline{B}}\right)=\frac{P(\overline{A}\cap\overline{B})}{P(\overline{B})}=\frac{P(\overline{A\cup B})}{P(\overline{B})}$

$=\frac{1-P(A\cup B)}{1-P(B)}=\frac{1-\frac{7}{12}}{1-\frac{1}{3}}=\frac{\frac{5}{12}}{\frac{2}{3}}=\frac{5}{8}$

***Exp.* 2)** An urn contains 6 red balls and 9 green balls. Two balls are drawn in succession without replacement. What is the probability that first is red and second is green.

Solution Let A be the event of drawing a red ball in first draw and B be the event of getting a green ball in the second draw.

$\therefore \quad P(A)=\frac{{}^6C_1}{{}^{15}C_1}=\frac{6}{15}=\frac{2}{5}$

$P\left(\frac{B}{A}\right)$ = Probability of getting a green ball in second draw when a red ball has been selected in first draw $=\frac{{}^9C_1}{{}^{14}C_1}=\frac{9}{14}$

$\therefore$ Required probability $=P(A\cap B)=P(A)\ P\left(\frac{B}{A}\right)=\frac{2}{5}\times\frac{9}{14}=\frac{9}{35}$

Introductory *Exercise 20.3*

1. If A and B are two events such that $P(A)=0.5$, $P(B)=0.6$ and $P(A\cup B)=0.8$. Find $P\left(\frac{A}{B}\right)$.

(a) $\frac{1}{3}$ (b) $\frac{1}{2}$

(c) $\frac{1}{4}$ (d) none of these

2. If A and B are two events such that $P(A)=0.4$, $P(B)=0.8$ and $P\left(\frac{B}{A}\right)=0.6$, find $P(A\cup B)$:

(a) 0.24 (b) 0.96

(c) 0.04 (d) none of these

3. Three fair coins are tossed. Find the probability that they are all tails, if one of the coins shows a tail.

(a) $\frac{2}{7}$ (b) $\frac{5}{14}$

(c) $\frac{1}{7}$ (d) none of these

4. A coin is tossed twice and the four possible outcomes are assumed to be equally likely. If E is the event, "Both head and tail have appeared and F be the event, at most one tail is observed ; find $P\left(\frac{E}{F}\right)$ and $P\left(\frac{F}{E}\right)$.

(a) $\frac{2}{3}, 1$ (b) $\frac{1}{3}, \frac{2}{3}$

(c) $1, \frac{2}{3}$ (d) none of these

5. A coin is tossed twice if the coin shows head it is tossed again but if it shows a tail then a die is tossed. If 8 possible outcomes are equally likely. Find the probability that the die shows a number greater than 4, if it is known that the first throw of the coin results in a tail.

(a) $\frac{1}{3}$ (b) $\frac{2}{3}$ (c) $\frac{2}{5}$ (d) $\frac{4}{15}$

6. A die is rolled. If the outcome is an odd number, what is the probability that it is a prime number?

(a) $\frac{3}{8}$ (b) $\frac{7}{9}$

(c) $\frac{2}{3}$ (d) none of these

7. A die is thrown twice and the sum of the numbers appearing is observed to be 9. What is the conditional probability that the number 4 has appeared atleast once?

(a) $\frac{1}{2}$ (b) $\frac{2}{3}$

(c) $\frac{3}{4}$ (d) none of these

8. Two dice are thrown. Find the probability that the sum is 8 or greater than 8, if 4 appears on the first die.

(a) $\frac{3}{8}$ (b) $\frac{5}{8}$

(c) $\frac{1}{2}$ (d) none of these

9. A die is rolled. If the outcome is an odd number, what is the probability that it is a number greater than 1 ?

(a) $\frac{2}{3}$ (b) $\frac{1}{3}$

(c) $\frac{3}{8}$ (d) $\frac{5}{6}$

10. In a class 45% students read English, 30% read French and 20% read both English and French. One student is selected at random. Find the probability that he reads English, if it is known that he reads French.

(a) $\frac{1}{3}$ (b) $\frac{2}{3}$

(c) $\frac{5}{6}$ (d) none of these

11. In the previous question, find the probability that he reads French, if it is known that he reads English.
(a) $\frac{4}{9}$ (b) $\frac{5}{9}$ (c) $\frac{2}{9}$ (d) $\frac{1}{9}$

12. *A* couple has two children. Find the probability that both are boys, if it is known that one of the children is a boy.
(a) $\frac{1}{9}$ (b) $\frac{1}{3}$ (c) $\frac{2}{3}$ (d) $\frac{4}{5}$

13. In the previous question find the probability that both are boys, if it is known that the older child is a boy.
(a) $\frac{3}{8}$ (b) $\frac{1}{2}$ (c) $\frac{5}{8}$ (d) $\frac{3}{4}$

Directions (for Q. Nos. 14 to 17) *A bag contains 3 red and 4 black balls and another bag has 4 red and 2 black balls. One bag is selected at random and from the selected bag a ball is drawn. Let E be the event that the first bag is selected , F be the event that the second bag is selected, G be the event that ball drawn is red.*

14. Find $P(E)$.
(a) $\frac{1}{2}$ (b) $\frac{3}{4}$ (c) $\frac{1}{4}$ (d) $\frac{5}{8}$

15. Find $P(F)$.
(a) $\frac{3}{4}$ (b) $\frac{1}{2}$ (c) $\frac{1}{4}$ (d) $\frac{1}{6}$

16. Find $P\left(\frac{G}{E}\right)$.
(a) $\frac{5}{6}$ (b) $\frac{5}{14}$ (c) $\frac{3}{7}$ (d) none

17. Find $P\left(\frac{G}{F}\right)$.
(a) $\frac{2}{3}$ (b) $\frac{1}{9}$ (c) $\frac{5}{9}$ (d) $\frac{4}{5}$

18. Two balls are drawn from a bag containing 2 white, 3 red and 4 black balls one by one without replacement. What is the probability that atleast one ball is red?
(a) $\frac{7}{12}$ (b) $\frac{5}{12}$
(c) $\frac{3}{10}$ (d) none of these

19. A bag contains 6 red and 9 blue balls. Two successive drawing of four balls are made such that the balls are not replaced before the second draw. Find the probability that the first draw gives 4 red balls and second draw gives 4 blue balls.
(a) $\frac{3}{715}$ (b) $\frac{7}{715}$
(c) $\frac{15}{233}$ (d) none of these

20. An urn contains 4 white 6 black and 8 red balls. If 3 balls are drawn one by one without replacement, find the probability of getting all white balls.
(a) $\frac{5}{204}$ (b) $\frac{1}{204}$
(c) 13/204 (d) none of these

21. Two numbers are selected at random from the integers 1 through 9. If the sum is even, find the probability that both numbers are odd.
(a) 5/8 (b) 3/8
(c) 3/10 (d) none of these

22. A box contains 25 tickets, numbered 1, 2, 3, .. 25. *A* ticket is drawn and then another ticket is drawn without replacement. Find the probability that both tickets will show odd numbers.
(a) $\frac{37}{50}$ (b) $\frac{13}{50}$
(c) 13/25 (d) none of these

20.6 Independent Events

Events are said to be independent, if the occurrence of one does not depend upon the occurrence of the other. Suppose an urn contains *m* red balls and *n* green balls. Two balls are drawn from the urn one after the other.

If the ball drawn in the first draw is not replaced back in the bag, then two events of drawing the ball are dependent because first draw of the ball determine the probability of drawing the second ball.

If the ball drawn in the first draw is replaced back in the bag, then two events are independent because first draw of a ball has no effect on the second draw.

Theorem 1. Two events A and B associated with the same sample space of a random experiment are independent if and only if $P(A \cap B) = P(A) \cdot P(B)$

Theorem 2. If $A_1, A_2, A_3 \ldots A_n$ are independent events associated with a random experiment, then

$$P(A_1 \cap A_2 \cap A_3 \ldots \cap A_n) = P(A_1)\,P(A_2) \ldots P(A_n)$$

Theorem 3. If $A_1, A_2 \ldots A_n$ are n independent events associated with a random experiment, then

$$P(A_1 \cup A_2 \cup \ldots \cup A_n) = 1 - P(\overline{A}_1)\,P(\overline{A}_2) \ldots P(\overline{A}_n)$$

Important Results

If A and B are independent events then the following events are also independent.

(i) $A \cap \overline{B}$

(ii) $\overline{A} \cap B$

(iii) $\overline{A} \cap \overline{B}$

20.7 Law of Total Probability

Let $E_1, E_2, \ldots E_n$ be n mutually exclusive and exhaustive events associated with a random experiment. If A is any event which occurs with E_1 or E_2 or ... or E_n, then

$$P(A) = P(E_1)\,P\left(\frac{A}{E_1}\right) + P(E_2)\,P\left(\frac{A}{E_2}\right) + \ldots P(E_n)\,P\left(\frac{A}{E_n}\right)$$

Baye's Rule

Let $E_1, E_2, \ldots E_n$ be n mutually exclusive and exhaustive events associated with a random experiment. If A is any event which occurs with E_1 or E_2 or ... or E_n, then

$$P\left(\frac{E_i}{A}\right) = \frac{P(E_i)\,P\left(\frac{A}{E_i}\right)}{\sum_{i=1}^{n} P(E_i)\,P\left(\frac{A}{E_i}\right)},\ i = 1, 2, \ldots n$$

***Exp.* 1)** A coin is tossed twice and all 4 outcomes are equally likely. Let A be the event that first throw results in a head and B be the event that second throw results in a tail, then show that the events A and B are independent.

Solution $S = \{HH, HT, TH, TT\}$

$A = \{HH, HT\}$

$B = \{HT, TT\}$

$A \cap B = \{HT\}$

$\therefore \quad P(A) = \frac{2}{4} = \frac{1}{2},\ P(B) = \frac{2}{4} = \frac{1}{2}$ and $P(A \cap B) = \frac{1}{4}$

Clearly $P(A \cap B) = \frac{1}{4} = P(A) \cdot P(B)$

Hence A and B are independent events.

***Exp.* 2)** A bag contains 10 red balls and 10 green balls. Two balls are drawn at random, one at a time, with replacement. Let A be the event that first ball is red, B be the event that second ball is green and C be the event that both balls are either red or green, then show that the events A, B and C are pair wise independent and A, B, C are mutually dependent.

Solution We have, $P(A) = \frac{1}{2}, \quad P(B) = \frac{1}{2},$

$$P(C) = \frac{1}{2} \times \frac{1}{2} + \frac{1}{2} \times \frac{1}{2} = \frac{1}{2}$$

$P(A \cap B)$ = Probability that the first is red and second is green

$\Rightarrow \quad P(A) \cdot P(B) = \frac{1}{2} \times \frac{1}{2} = \frac{1}{4}$

$P(B \cap C)$ = Probability that both the balls are green

$\Rightarrow \quad P(B) \cdot P(C) = \frac{1}{2} \times \frac{1}{2} = \frac{1}{4}$

and $P(A \cap C)$ = Probability that both the balls are red

$\Rightarrow \quad P(A)\ P(C) = \frac{1}{2} \times \frac{1}{2} = \frac{1}{4}$

Hence A, B, C are pairwise independent

Now, $P(A \cap B \cap C)$ = Probability that the first ball is red and the second ball is green and the first and second are both red or green = 0

and $P(A)\ P(B)\ P(C) = \frac{1}{8}$

$\therefore \quad P(A \cap B \cap C) \neq P(A)\ P(B)\ P(C)$

Thus, A, B, C are not mutually independent.

***Exp.* 3)** (For explanation of law of total probability) There are two bags. The first bag contains 4 white and 5 black balls and the second bag contains 5 white and 4 black balls. Two balls are drawn at random from the first bag and are put into the second bag without noticing their colours. Then two balls are drawn from the second bag. Find the probability that the balls are white and black.

Solution A white and a black ball can be drawn from the second bag in the following mutually exclusive ways :

(i) By transferring 2 white balls from the first bag to the second bag and then drawing a white and a black ball from it.

(ii) By transferring 2 black balls from the first bag to the second bag and then drawing a white and a black ball from it .

(iii) By transferring 1 white and 1 black ball from first bag to the second bag and then drawing a white and a black ball from it.

Let A, B, C and D be the events as defined below :

A = Two white balls are drawn from the first bag

B = Two black balls are drawn from the first bag.

C = One white and one black ball is drawn from the first bag.

D = Two balls drawn from the second bag are white and black.

We, have $P(A) = \frac{{}^4C_2}{{}^9C_2} = \frac{6}{36} = \frac{1}{6}$

$$P(B) = \frac{{}^5C_2}{{}^9C_2} = \frac{10}{36} = \frac{5}{18}$$

$$P(C) = \frac{{}^4C_1 \times 5C_1}{{}^9C_2} = \frac{20}{36} = \frac{5}{9}$$

If A has already occurred, *i.e.* if two white balls have been transferred from the first bag to the second bag, then the second bag will contain 7 white and 4 black balls, therefore the probability of drawing a white and a black from the second bag is

$$P\left(\frac{D}{A}\right) = \frac{{}^7C_1 \times {}^4C_1}{{}^{11}C_2} = \frac{28}{55}$$

Similarly, $P\left(\frac{D}{B}\right) = \frac{{}^5C_1 \times {}^6C_1}{{}^{11}C_2} = \frac{30}{55} = \frac{6}{11}$

and $P\left(\frac{D}{C}\right) = \frac{{}^6C_1 \times {}^5C_1}{{}^{11}C_2} = \frac{30}{55} = \frac{6}{11}$

$\therefore$ By the law of total probability, we have

$$P(D) = P(A)\ P\left(\frac{D}{A}\right) + P(B)P\left(\frac{D}{B}\right) + P(C)\ P\left(\frac{D}{C}\right)$$

$$= \frac{1}{6}\times\frac{28}{55} + \frac{5}{18}\times\frac{6}{11} + \frac{5}{9}\times\frac{6}{11}$$

$$= \frac{14}{165} + \frac{5}{33} + \frac{10}{33} = \frac{14+25+50}{165} = \frac{89}{165}$$

Exp. 4) (For explanation of Baye's rule) Three boxes contain 6 red, 4 black, ; 5 red, 5 black and 4 red, 6 black balls respectively. One of the box is selected at random and a ball is drawn from it. If the ball drawn is red, find the probability that it is drawn from the first bag.

Solution Let A, B, C and D be the events defined as follows :

A = first box is chosen B = second box is chosen

C = third box is chosen D = ball drawn is red.

Since there are three boxes and one of the three boxes is chosen at random, therefore $P(A) = P(B) = P(C) = \frac{1}{3}$

If A has already occurred, then first box has been chosen which contains 6 red and 4 black balls. The probability of drawing a red ball from it is $\frac{6}{10}$. So, $P\left(\frac{D}{A}\right) = \frac{6}{10}$

Similarly, $P\left(\frac{D}{B}\right) = \frac{5}{10}$ and $P\left(\frac{D}{C}\right) = \frac{4}{10}$

We are required to find $P\left(\frac{A}{D}\right)$ *i.e.,* given that the ball drawn is red, what is the probability that it is drawn from the first box.

By Baye's rule.

$$P\left(\frac{A}{D}\right) = \frac{P(A)\cdot P\left(\frac{D}{A}\right)}{P(A)\,.\,P\left(\frac{D}{A}\right) + P(B)\cdot P\left(\frac{D}{B}\right) + P(C)\cdot P\left(\frac{D}{C}\right)}$$

$$= \frac{\frac{1}{3}\times\frac{6}{10}}{\left(\frac{1}{3}\times\frac{6}{10}\right) + \left(\frac{1}{3}\times\frac{5}{10}\right) + \left(\frac{1}{3}\times\frac{4}{10}\right)} = \frac{2}{5}$$

Introductory Exercise 20.4

Directions (for Q. Nos. 1 to 5) *Let A and B be independent events such that* $P(A) = 0.6$ *and* $P(B) = 0.4$

1. Find $P(A \cap B)$.

(a) 0.24 (b) 0.76

(c) 0.56 (d) none of these

2. Find $P(A \cup B)$.

(a) 0.24 (b) 0.76

(c) 0.36 (d) none of these

3. Find $P(\bar{A} \cap B)$.

(a) 0.24 (b) 0.16

(c) 0.36 (d) none of these

4. Find $P(A \cap \bar{B})$.

(a) 0.24 (b) 0.56

(c) 0.36 (d) 0.76

5. Find $P(\bar{A} \cap \bar{B})$.

(a) 0.76 (b) 0.54

(c) 0.36 (d) 0.24

6. If A and B are two independent events such that $P(\bar{A}) = 0.65$, $P(A \cup B) = 0.65$ and $P(B) = p$, find the value of p.

(a) $\frac{7}{13}$ (b) $\frac{6}{13}$

(c) $\frac{37}{65}$ (d) none of these

7. An unbiased die is tossed twice. Find the probability of getting a 1, 2, 3 or 4 on the first toss and a 4, 5 or 6 on the second toss.

(a) $\frac{1}{3}$ (b) $\frac{2}{3}$ (c) $\frac{5}{6}$ (d) $\frac{1}{6}$

8. Two persons A and B throw a die alternatively till one of them gets a three and wins the game. Find their respective probabilities of winning.

(a) $\frac{6}{11}, \frac{5}{11}$ (b) $\frac{5}{11}, \frac{8}{11}$

(c) $\frac{3}{11}, \frac{7}{11}$ (d) $\frac{8}{11}, \frac{3}{11}$

9. Two persons A and B throw a coin alternatively till one of them gets head and wins the game. Find their respective probabilities of winning.

(a) $\frac{1}{3}, \frac{5}{6}$ (b) $\frac{3}{5}, \frac{4}{5}$

(c) $\frac{2}{3}, \frac{1}{3}$ (d) $\frac{1}{6}, \frac{5}{6}$

10. Three persons A, B, C throw a die in succession till one gets a six and wins the game. Find their respective probabilities of winning.

(a) $\frac{36}{91}, \frac{30}{91}, \frac{25}{91}$ (b) $\frac{10}{71}, \frac{16}{91}, \frac{22}{81}$

(c) $\frac{13}{61}, \frac{15}{61}, \frac{17}{61}$ (d) none of these

11. *A* and *B* take turn in throwing two dice; the first to throw 9 being awarded. Find the ratio of probabilities of their winning if *A* has the first throw.
(a) 7/8 (b) 9/8
(c) 8/7 (d) 9/10

12. From a pack of 52 cards, two are drawn one by one without replacement. Find the probabilities that both of them are kings.
(a) $\frac{11}{21}$ (b) $\frac{13}{121}$ (c) $\frac{1}{221}$ (d) $\frac{1}{121}$

13. Ashmit can solve 80% of the problem given in a book and Amisha can solve 70%. What is the probability that at least one of them will solve a problem, selected at random from the book?
(a) 0.60 (b) 0.06
(c) 0.94 (d) 0.56

14. The probability that *A* hits a target is $\frac{1}{3}$ and the probability that *B* hits it, is $\frac{2}{5}$. What is the probability that the target will be hit, if each one of *A* and *B* shoots the target?
(a) $\frac{5}{6}$ (b) $\frac{3}{5}$ (c) $\frac{11}{15}$ (d) $\frac{1}{6}$

15. A problem is given to three students whose chances of solving it are $\frac{1}{2}, \frac{1}{3}$ and $\frac{1}{4}$ respectively. What is the probability that the problem will be solved?
(a) $\frac{1}{4}$ (b) $\frac{1}{2}$ (c) $\frac{3}{4}$ (d) $\frac{7}{12}$

16. The probabilities of *A*, *B*, *C* solving a problem are $\frac{1}{3}, \frac{2}{7}$ and $\frac{3}{8}$ respectively. If all the three try to solve the problem simultaneously, find the probability that exactly one of them will solve it.
(a) $\frac{25}{52}$ (b) $\frac{25}{56}$
(c) 13/42 (d) none of these

17. *A*, *B* and *C* shoot to hit a target. If *A* hits the target 4 times in 5 trials, *B* hits it 3 times in 4 trials and *C* hits it 2 times in 3 trials. What is the probability that the target is hit by atleast 2 persons?
(a) $\frac{5}{6}$ (b) $\frac{3}{4}$
(c) $\frac{4}{5}$ (d) $\frac{1}{9}$

18. An airgun can take a maximum of 4 shots at a balloon at some distance. The probabilities of hitting the balloon at the first, second, third and fourth shot are 0.1, 0.2, 0.3 and 0.4 respectively. What is the probability that the balloon is hit?
(a) 0.6976 (b) 0.6576
(c) 0.786 (d) none of these

19. The probability that *A* can solve a problem is $\frac{2}{3}$ and the probability that *B* can solve the same problem is $\frac{3}{5}$. Find the probability that atleast one of *A* and *B* will be able to solve the problem.
(a) $\frac{12}{15}$ (b) $\frac{13}{15}$
(c) $\frac{19}{45}$ (d) none of these

20. In the previous question (number 19). Find the probability that none of the two will be able to solve the problem.
(a) $\frac{13}{15}$ (b) $\frac{4}{15}$
(c) $\frac{2}{15}$ (d) $\frac{23}{30}$

Directions (for Q. Nos. 21 to 24) *The probabilities that a student will receive an A, B, C or D grade are 0.4, 0.3, 0.2 and 0.1 respectively. Find the probability that a student will receive*

21. Not an *A* grade.
(a) 0.4 (b) 0.6
(c) 0.56 (d) none of these

22. At most a *C* grade.
(a) 0.3 (b) 0.7
(c) 0.36 (d) none of these

23. *B* or *C* grade.
(a) 0.2 (b) 0.5 (c) 0.8 (d) 0.6

24. Atleast *B* grade.
(a) 0.21 (b) 0.3
(c) 0.7 (d) none of these

Directions (for Q. Nos. 25 to 28) *Ajay and his wife Kajol appear in an interview for two vaccancies in the same post. The probability of Ajay's selection is* $\frac{1}{7}$ *and that of his wife Kajol's selection is* $\frac{1}{5}$. *What is the probability that*

25. Both of them will be selected?
(a) $\frac{1}{12}$ (b) $\frac{1}{35}$
(c) $\frac{13}{35}$ (d) $\frac{12}{35}$

26. Only one of them will be selected ?
(a) $\frac{5}{7}$ (b) $\frac{1}{5}$ (c) $\frac{2}{7}$ (d) $\frac{2}{35}$

27. None of them will be selected?
(a) $\frac{12}{35}$ (b) $\frac{6}{35}$
(c) $\frac{24}{35}$ (d) none

28. Atleast one of them will be selected?
(a) $\frac{11}{35}$ (b) $\frac{24}{35}$ (c) $\frac{2}{7}$ (d) $\frac{1}{35}$

29. *A* speaks truth in 60% and *B* in 80% of the cases. In what percentage of cases are they likely to contradict each other narrating the same incident?
(a) 44% (b) 36% (c) 64% (d) 48%

Directions (for Q. Nos. 30 and 31) *The odds against a husband who is 50 years old, living till he is 70 are 7 : 5 and the odds against his wife who is now 40, living till she is 60 are 5 : 3. Find the probability that*

30. The couple will be alive 20 years hence.
(a) $\frac{21}{32}$ (b) $\frac{5}{32}$
(c) $\frac{15}{32}$ (d) $\frac{12}{35}$

31. Atleast one of them will be alive 20 years hence.
(a) $\frac{61}{96}$ (b) $\frac{31}{96}$
(c) $\frac{41}{70}$ (d) none of these

32. Three critics review a book. Odds in favour of the book are 5 : 2, 4 : 3 and 3 : 4 respectively for the critics. Find the probability that majority are in favour of the book.
(a) $\frac{108}{343}$ (b) $\frac{209}{343}$
(c) $\frac{1}{7}$ (d) $\frac{1}{243}$

33. An article manufactured by a company consists of two parts *X* and *Y*. In the process of manufacture of the part *X*, 9 out of 100 parts may be defective. Similarly, 5 out of 100 are likely to be defective in the manufacture of the part *Y*. Calculate the probability that the assembled product will not be defective.
(a) 0.6485 (b) 0.6565
(c) 0.8645 (d) none of these

34. A bag contains 4 red and 3 black balls. A second bag contains 2 red and 4 black balls. One bag is selected at random. From the selected bag, one ball is drawn. Find the probability that the ball drawn is red.
(a) $\frac{23}{42}$ (b) $\frac{19}{42}$
(c) $\frac{7}{32}$ (d) $\frac{16}{39}$

35. In a toys making factory, machine *A*, *B* and *C* manufacture respectively 25%, 35% and 40% of the total toys. Of their output 5%, 4% and 2% respectively are defective toys. A toy is drawn at random from the product. What is the probability that the toy drawn is defective?
(a) 0.225 (b) 0.345
(c) 0.235 (d) none of these

36. A box contains 20 bulbs. The probability that the box contains exactly 2 defective bulbs is 0.4 and the probability that the box contains exactly 3 defective bulbs is 0.6. Bulbs are drawn at random one by one without replacement and tested till the defective bulbs are found. What is the probability that the testing procedure ends at the twelfth testing?
(a) 0 (b) 1
(c) can't be determined (d) none of these

37. In a toys making factory, machines *A*, *B* and *C* manufacture respectively 25%, 35% and 40% of the total toys of their output 5%, 4% and 2% respectively are defective toys. A toy is drawn at random from the product. If the toy drawn is found to be defective, what is the probability that it is manufactured by the machine *B*?
(a) $\frac{17}{69}$ (b) $\frac{28}{69}$
(c) $\frac{35}{69}$ (d) none

38. An architecture company built 200 bridges 400 hospitals and 600 hotels. The probability of damage due to earthquake of a bridge, hospital and hotel is 0.01, 0.03 and 0.15 respectively. One of the construction gets damaged with earthquake. What is the probability that it is a bridge?
(a) $\frac{1}{26}$ (b) $\frac{1}{52}$
(c) $\frac{7}{52}$ (d) none of these

39. There are 3 boxes each containing 3 red and 5 green balls. Also there are 2 boxes, each containing 4 red and 2 green balls. A green ball is selected at random. Find the probability that this green ball is from a box of the first group.
(a) $\frac{54}{61}$ (b) $\frac{45}{61}$
(c) $\frac{8}{31}$ (d) none of these

40. A man speaks truth 3 out of 4 times. He throws a die and reports that it is a six. Find the probability that it is actually a six.
(a) $\frac{3}{8}$ (b) $\frac{5}{8}$
(c) $\frac{7}{8}$ (d) $\frac{1}{12}$

41. A card from a pack of 52 cards is lost. From the remaining cards of pack, two cards are drawn and are found to be diamonds. Find the probability of the missing card to be diamond.
(a) $\frac{39}{50}$ (b) $\frac{11}{50}$
(c) $\frac{23}{25}$ (d) $\frac{3}{26}$

CAT-Test

Questions Helping you bell the CAT

LEVEL 01 > BASIC LEVEL EXERCISE

1 The digits 1, 2, 3, 4, 5, 6, 7, 8, 9 are written in random order to form a nine digit number. Find the probability that this number is divisible by 4 :

(a) $\frac{4}{9}$ (b) $\frac{2}{9}$

(c) $\frac{17}{81}$ (d) none of these

2 A four digit number is formed with the digits 1, 3, 4, 5 without repetition. Find the chance that the number is divisible by 5 :

(a) $\frac{3}{4}$ (b) $\frac{1}{4}$

(c) $\frac{9}{16}$ (d) $\frac{1}{16}$

3 Five persons entered the lift cabin on the ground floor of an 8-floor house. Suppose each of them independently and with equal probability can leave the cabin at any floor beginning with the first. Find out the probability that all persons leaving at different floors :

(a) $\frac{365}{2401}$ (b) $\frac{360}{2401}$

(c) $\frac{35}{2410}$ (d) none of these

4 If from each of the three boxes containing 3 white and 1 black, 2 white and 2 black, 1 white and 3 black balls, one ball is drawn at random, then the probability that 2 white and 1 black ball will be drawn is :

(a) $\frac{13}{32}$ (b) $\frac{27}{32}$

(c) $\frac{19}{32}$ (d) none of these

5 A fair coin is tossed repeatedly. If tail appears on first four tosses, then the probability of head appearing on fifth toss equals :

(a) $\frac{5}{12}$ (b) $\frac{1}{2}$

(c) $\frac{5}{6}$ (d) $\frac{1}{6}$

6 There are four calculators and it is known that exactly two of them are defective. They are tested one by one , in a random order till both the defective calculators are identified. Then the probability that only two tests are required is :

(a) $\frac{5}{6}$ (b) $\frac{1}{2}$ (c) $\frac{1}{6}$ (d) $\frac{1}{3}$

7 20 girls, among whom are A and B sit down at a round table. The probability that there are 4 girls between A and B is :

(a) $\frac{17}{19}$ (b) $\frac{2}{19}$ (c) $\frac{13}{19}$ (d) $\frac{6}{19}$

8 Two integers x and y are chosen with replacement out of the set {0, 1, 2, 3, ... 10}. Then the probability that $|x - y| > 5$ is :

(a) $\frac{7}{11}$ (b) $\frac{40}{121}$ (c) $\frac{35}{121}$ (d) $\frac{30}{121}$

9 The probability that the birthdays of 4 different persons will fall in exactly two calendar months is :

(a) $\frac{77}{1728}$ (b) $\frac{17}{87}$

(c) $\frac{11}{144}$ (d) none of these

10 If 6 objects are distributed at random among 6 persons, the probability that atleast one of them will not get any thing is

(a) $6 \cdot (6!)$ (b) $\frac{5^6}{6!}$

(c) $\frac{6^6 - 6!}{6^6}$ (d) none of these

11 There is 4 volume encyclopaedia among 40 books arranged on a shelf in a random order. If the volumes are not necessarily kept side by side, the probability that they occur in increasing order from left to right is :

(a) $\frac{1}{24}$ (b) $\frac{1}{12}$

(c) $\frac{1}{10}$ (d) none of these

12 Four numbers are multiplied together. Then the probability that the product will be divisible by 5 or 10 is
(a) $\frac{169}{625}$ (b) $\frac{369}{625}$
(c) $\frac{169}{1626}$ (d) none of these

13 8 couples (husband and wife) attend a dance show 'Nach Baliye' in a popular TV channel ; A lucky draw in which 4 persons picked up for a prize is held, then the probability that there is atleast one couple will be selected is :
(a) $\frac{8}{39}$ (b) $\frac{15}{39}$
(c) $\frac{12}{13}$ (d) none of these

14 Three persons A, B and C are to speak at a function along with 4 other persons. if they all speak in random order, the probability that A speaks before B and B speaks before C is :
(a) $\frac{5}{6}$ (b) $\frac{1}{6}$
(c) $\frac{1}{2}$ (d) $\frac{1}{3}$

15 A bag contains 16 coins of which 2 coins are counterfeit with heads on the both sides. The rest are fair coins. One is selected at random from the bag and tossed. The probability of getting a head is :
(a) $\frac{3}{16}$ (b) $\frac{13}{16}$
(c) $\frac{9}{16}$ (d) $\frac{7}{16}$

16 A committee of five persons is to be chosen from a group of 9 people. The probability that a certain married couple will either serve together or not at all is :
(a) 4/9 (b) 5/9
(c) 13/18 (d) none of these

17 A speaks truth in 60% cases and B speaks truth in 80% cases. The probability that they will say the same thing while describing a single event is :
(a) 0.36 (b) 0.56
(c) 0.48 (d) 0.20

18 Two squares are chosen at random on a chessboard, the probability that they have a side in common is :
(a) $\frac{3}{32}$ (b) $\frac{1}{32}$
(c) 1/18 (d) none of these

19 An old person forgets the last two digits of a telephone number, remembering only that these are different dialled at random. The probability that the number is dialled correctly is :
(a) 1/90 (b) 81/91
(c) 2/99 (d) none of these

20 Three squares of a chessboard are chosen at random, the probability that two are of one colour and one of another is
(a) $\frac{67}{992}$ (b) $\frac{16}{21}$
(c) $\frac{31}{32}$ (d) none of these

21 The probability that a leap year selected at random contains either 53 Sundays or 53 Mondays, is :
(a) $\frac{17}{53}$ (b) $\frac{1}{53}$
(c) $\frac{3}{7}$ (d) none of these

22 In order to get atleast once a head with probability $P \geq 0.9$, the number of times a coin needs to be tossed is :
(a) 3 (b) 2
(c) 5 (d) 4

23 Out of 13 applicants for a job, there are 5 women and 8 men. It is desired to select 2 persons for the job. The probability that atleast one of the selected persons will be a woman is :
(a) $\frac{25}{39}$ (b) $\frac{31}{65}$ (c) $\frac{25}{69}$ (d) $\frac{5}{13}$

24 Nine squares are chosen at random on a chessboard. What is the probability that they form a square of size 3×3 ?
(a) $\frac{9}{{}^{64}C_9}$ (b) $\frac{36}{{}^{64}C_9}$
(c) $\frac{6}{{}^{64}C_9}$ (d) none of these

25 Seven digits from the numbers 1, 2, 3, 4, 5, 6, 7, 8 and 9 are written in random order. The probability that this seven digit number is divisible by 9 is :
(a) $\frac{7}{9}$ (b) $\frac{1}{9}$ (c) $\frac{2}{9!}$ (d) $\frac{4}{9}$

26 From the set of first ten natural numbers two distinct numbers are picked randomly. Find the probability that they are co-primes.
(a) 31/45 (b) 14/45
(c) 2/3 (d) 28/45

LEVEL 02 > HIGHER LEVEL EXERCISE

1 What is the probability that four S's come consecutively in the word MISSISSIPPI?

(a) $\frac{4}{165}$ (b) $\frac{4}{135}$

(c) $\frac{24}{165}$ (d) none

2 Each coefficient in the equation $ax^2 + bx + c = 0$ is determined by throwing ordinary six faced die. Find the probability that the equation will have real roots.

(a) $\frac{34}{161}$ (b) $\frac{43}{216}$

(c) $\frac{25}{36}$ (d) none of these

3 A and B throw alternately a pair of dice. A wins if he throws 6 before B throws 7 and B wins if he throws 7 before A throws 6. Find their respective chance of winning, if A begins.

(a) $\frac{13}{16}, \frac{31}{16}$ (b) $\frac{30}{61}, \frac{31}{61}$

(c) $\frac{31}{61}, \frac{41}{61}$ (d) $\frac{38}{61}, \frac{23}{61}$

4 A consignment of 15 wristwatches contains 4 defectives. The wristwatches are selected at random, one by one and examined. The ones examined are not put back. What is the probability that ninth one examined is the last defective?

(a) $\frac{11}{195}$ (b) $\frac{17}{195}$

(c) $\frac{8}{195}$ (d) $\frac{16}{195}$

5 In a test, an examinee either guesses or copies or knows the answer to a multiple choice question with four choices. The probability that he makes a guess is $\frac{1}{3}$ and the probability that he copies the answer is $1/6 \cdot$ The probability that his answer is correct, given that he copied it, is 1/8. Find the probability that he knew the answer to the question, given that he correctly answered it.

(a) $\frac{17}{39}$ (b) $\frac{13}{29}$

(c) $\frac{24}{29}$ (d) $\frac{24}{39}$

6 Given that the sum of two non-negative quantities is 200, the probability that their product is not less than $\frac{3}{4}$ times their greatest product value is :

(a) $\frac{99}{200}$ (b) $\frac{101}{200}$

(c) $\frac{87}{100}$ (d) none of these

7 A pack of cards consists of 9 cards numbered 1 to 9. Three cards are drawn at random with replacement. Then the probability of getting 1 even and 2 odd numbered cards is :

(a) $\frac{3}{143}$ (b) $\frac{100}{243}$ (c) $\frac{50}{343}$ (d) $\frac{7}{72}$

8 Three numbers are to be selected at random without replacement from the set of numbers $\{1, 2, \ldots n\}$. The conditional probability that the third number lies between the first two, if the first number is known to be smaller than the second is :

(a) $\frac{1}{3}$ (b) $\frac{2}{3}$ (c) $\frac{5}{6}$ (d) $\frac{7}{12}$

9 Two numbers b and c are chosen at random with replacement from the numbers 1, 2, 3, 4, 5, 6, 7, 8 and 9. The probability that $x^2 + bx + c > 0$ for all $x \in R$ is :

(a) $\frac{23}{81}$ (b) $\frac{7}{9}$ (c) $\frac{32}{81}$ (d) $\frac{65}{729}$

10 The probabilities that a student passes in Mathematics, Physics and Chemistry are m, p and c, respectively. Of these subjects the student has 75% chance of passing in atleast one, a 50% chance of passing in atleast two and a 40% chance of passing in exactly, two, which of the following relations are true.

(a) $p + m + c = \frac{27}{20}$ (b) $p + m + c = \frac{13}{20}$

(c) $pmc = \frac{1}{10}$ (d) both (a) and (c)

11 A student appears for tests A, B and C. The student is successful if he passes either in tests A and B or tests A and C. The probabilities of the student passing in tests A, B, C are p, q and 1/2 respectively. If the probability that the student is successful is $\frac{1}{2}$ then,

(a) $p = 1, q = 0$ (b) $p = 0, q = 1$

(c) $\frac{p}{q} = 1$ (d) infinitely many solutions

12 If $\frac{1+4p}{p}, \frac{1-p}{4}, \frac{1-2p}{2}$ are probabilities of three mutually exclusive events then

(a) $p = \frac{1}{2}$ (b) $p = \frac{3}{4}$

(c) $p = \frac{1}{3}$ (d) none of these

13 A letter is takenout at random from 'ASSISTANT' and another is taken out from "STATISTICS'. The probability that they are the same letters is :

(a) $\frac{35}{96}$ (b) $\frac{19}{90}$

(c) $\frac{19}{96}$ (d) none of these

14 Two numbers a and b are chosen at random from the set of first 30 natural numbers. The probability that $a^2 - b^2$ is divisible by 3 is :

(a) $\frac{37}{87}$ (b) $\frac{47}{87}$

(c) $\frac{17}{29}$ (d) none of these

15 A man takes a step forward with probability 0.4 and backward with probability 0.6. The probability that at the end of eleven steps he is one step away from the starting point is

(a) ${}^{11}C_6(0.1)^{11}$ (b) ${}^{11}C_6(0.24)^5$

(c) ${}^{11}C_6(0.2)^{11}$ (d) none of these

16 Three of the six vertices of a regular hexagon are chosen at random. The probability that the triangle with these three vertices is equilateral equals :

(a) $\frac{1}{6}$ (b) $\frac{1}{3}$

(c) $\frac{1}{10}$ (d) none of these

17 A man can take a step forward, backward, left or right with equal probability. Find the probability that after nine steps he will be just one step away from his initial position.

(a) $\frac{3696}{7^4}$ (b) $\frac{3969}{4^7}$

(c) $\frac{4^4}{10}$ (d) none of these

18 Urn A contains six red and four black balls and urn B has four red and six black balls. One ball is drawn at random from urn A and placed in urn B. Then one ball is transfered at random from urn B to urn A. If one ball is now drawn at random from urn A, find the probability that it is red.

(a) $\frac{32}{65}$ (b) $\frac{32}{55}$

(c) $\frac{23}{55}$ (d) $\frac{56}{65}$

19 The digits 1, 2, 3, ..., 9 are written in random order to form a nine digit number. Find the probability that this number is divisible by 11.

(a) $\frac{11}{63}$ (b) $\frac{11}{81}$

(c) $\frac{11}{126}$ (d) none of these

20 A terror outfit, works under the pseudonym of Mafia Wars, uses 12 satellite phones, during its operation to communicate with each other. Each of the 12 terrorists is armed with a satellite phone, an AK-47 and hand grenades among other explosives. Except the four terrorists, who are hidden in a tiny staff washroom of a prominent hotel, no two terrorists are positioned at the same location. The terrorists who are hidden in the washroom are codenamed as Alpha and the ones who are hidden at other surrounding locations are codenamed as Beta. Due to location differences Beta terrorists cannot communicate without the satellite phone, at all. In order to speak to any of the Alpha terrorist a Beta terrorist can call on any one of the phones available with Beta, similarly to speak to any Beta terrorist an Alpha can call from any one of the phones available with them. A conference call can be made between any three satellite phones. If three phones are chosen randomly from the 12 phones, then what is the probability that the terrorists can make a conference call?

(a) 9/11 (b) 51/55

(c) 10/11 (d) 54/55

21 Zuckerberg, my facebook friend, recently returned from his honeymoon trip to three European cities – Paris, Milan and Zurich, where he had clicked some photos before uploading them on facebook in three different folders naming them on the cities he had visited. The folders Paris, Milan and Zurich have 3, 4, and 5 photos, respectively. He asks his six year old niece Olivia Bee that if she could download these photos and edit them using the Instagram and put them back but only one photo in each folder. Within no time she edits all the photos and uploads back quickly one photo in each folder. What's the probability that she uploads at least two photos of the same city and no folder has the photo uploaded back to its original folder, after editing?

(a) 1/11 (b) 1/12

(c) 3/11 (4) 1/3

22 In a regular decagon there are diagonals of distinct sizes. If all the possible diagonals are drawn and you choose any one diagonal at random then what is the probability that it is neither the shortest one nor it is a longest one?

(a) 4/7 (b) 3/7

(c) 6/7 (d) 5/7

Hints & Solutions

☑ Introductory *Exercise 20.1*

1 Here the sample space $S = \{H, T\} \Rightarrow n(S) = 2$

Event of getting head $= \{H\} \Rightarrow n(E) = 1$

$\therefore$ Probability of getting a head is given by $P(E) = \frac{1}{2}$

Solutions (for Q. Nos. 2 to 5)

$S = \{HH, HT, TH, TT\} \Rightarrow n(S) = 4$

2 $E = \{HT, TH\} \Rightarrow n(E) = 2$

$\therefore \quad P(E) = \frac{n(E)}{n(S)} = \frac{2}{4} = \frac{1}{2}$

3 $E = \{HH, HT, TH\} \Rightarrow n(E) = 3$

$\therefore \quad P(E) = \frac{3}{4}$

4 $E = \{H, H\} \Rightarrow n(E) = 1$

$\therefore \quad P(E) = \frac{1}{4}$

5 $E = \{H, H\} \Rightarrow n(E) = 1$

$\therefore \quad P(E) = \frac{1}{4}$

Solutions (for Q. Nos. 6 to 12)

$S = \{HHH, HHT, HTH, HTT, THH, THT, TTH, TTT\}$

$\Rightarrow \quad n(S) = 8$

6 $E = \{HTT, THT, TTH\} \Rightarrow n(E) = 3$

$\therefore \quad P(E) = \frac{3}{8}$

7 $E = \{HHT, HTH, THH\} \Rightarrow n(E) = 3$

$\therefore \quad P(E) = \frac{3}{8}$

8 $E = \{HHH, HHT, HTH, HTT, THH, THT, TTH\}$

$\Rightarrow \quad n(E) = 7$

$\therefore \quad P(E) = \frac{7}{8}$

9 $E = \{HHT, HTH, THH\} \Rightarrow n(E) = 3$

$\therefore \quad P(E) = \frac{3}{8}$

10 $E = \{HHH, HHT, HTH, THH\} \Rightarrow n(E) = 4$

$\therefore \quad P(E) = \frac{4}{8} = \frac{1}{2}$

11 $E = \{HHT, HTH, HTT, THH, THT, TTH\}$

$\Rightarrow \quad n(E) = 6$

$\therefore \quad P(E) = \frac{6}{8} = \frac{3}{4}$

12 $E = \{HHH, HHT, HTH, THH\} \Rightarrow n(E) = 4$

$\therefore \quad p(E) = \frac{4}{8} = \frac{1}{2}$

Solutions (for Q. Nos. 13 to 16)

$S = \{1, 2, 3, 4, 5, 6\} \Rightarrow n(S) = 6$

13 $E = \{1, 2, 3, 4, 5, 6\} \Rightarrow n(E) = 6$

$\therefore \quad P(E) = \frac{6}{6} = 1$

14 $E = \{3, 6\} \Rightarrow n(E) = 2$

$\therefore \quad P(E) = \frac{2}{6} = \frac{1}{3}$

15 $E = \{2, 3, 5\} \Rightarrow n(E) = 3$

$\therefore \quad P(E) = \frac{3}{6} = \frac{1}{2}$

16 $E = \{2, 4, 6\} \Rightarrow n(E) = 3$

$\therefore \quad P(E) = \frac{3}{6} = \frac{1}{2}$

Solutions (for Q. Nos. 17 and 18)

$S = \{HHH, HHT, HTH, THH, TTH, THT, HTT, TTT\}$

$\Rightarrow \quad n(S) = 8$

17 $E = \{HHT, HTH, THH, TTH, THT, HTT\}$

$\Rightarrow n(E) = 6 \quad \therefore \quad P(E) = \frac{6}{8} = \frac{3}{4}$

18 $E = \{TTT\} \Rightarrow n(E) = 1$

$\therefore \quad P(E) = \frac{1}{8}$

Solutions (for Q. Nos. 19 to 27)

$S = \{(1, 1), (1, 2), (1, 3), (1, 4), (1, 5), (1, 6), (2, 1), (2, 2), \ldots. (6, 5), (6, 6)\}$

$\Rightarrow \quad n(S) = 6 \times 6 = 36$

19 $E = \{(6, 3), (5, 4), (4, 5), (3, 6)\}$

$n(E) = 4 \quad \therefore \quad P(E) = \frac{4}{36} = \frac{1}{9}$

20 $E = \{(6, 4), (5, 5), (4, 6), (6, 5), (5, 6), (6, 6)\}$

$n(E) = 6$

$\therefore \quad P(E) = \frac{6}{36} = \frac{1}{6}$

21 $E = \{(6, 3), (5, 4), (4, 5), (3, 6), (6, 5), (5, 6)\}$

$\Rightarrow \quad n(E) = 6$

$\therefore \quad P(E) = \frac{6}{36} = \frac{1}{6}$

22 $E = \{(1, 1), (2, 2), (3, 3), (4, 4), (5, 5), (6, 6)\}$; $n(E) = 6$

$\therefore \quad P(E) = \frac{6}{36} = \frac{1}{6}$

23 $E = \{(2, 2), (4, 4), (6, 6)\} \quad \Rightarrow \quad n(E) = 3$

$\therefore \quad P(E) = \frac{3}{36} = \frac{1}{12}$

24. $E = \{(2, 3), (2, 6), (4, 3), (4, 6), (6, 3), (6, 6) (3, 2), (6, 2), (3, 4), (6, 4), (3, 6)\} \Rightarrow n(E) = 11$

$\therefore \quad P(E) = \frac{11}{36}$

25 $E = \{(1, 2), (1, 5), (2, 1), (2, 4), (3, 3), (3, 6), (4, 2), (4, 5), (5, 1), (5, 4), (6, 3), (6, 6), (1, 3), (2, 2), (2, 6), (3, 1), (3, 5), (4, 4), (5, 3), (6, 2)\} \Rightarrow n(E) = 20$

$\therefore \quad P(E) = \frac{20}{36} = \frac{5}{9}$

26 $E = \{(1, 1), (1, 2), (1, 4), (1, 6), (2, 1), (2, 3), (2, 5), (3, 2), (3, 4), (4, 1), (4, 3), (5, 2), (5, 6), (6, 1), (6, 5)\}$

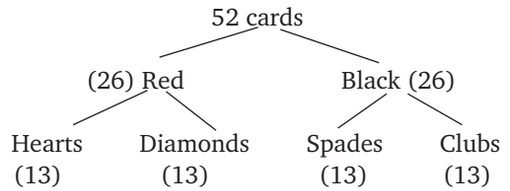
$\Rightarrow \quad n(E) = 15$

$\therefore \quad P(E) = \frac{15}{36} = \frac{5}{12}$

27 $E = \{(1, 5), (2, 5), (3, 5), (4, 5), (5, 5), (6, 5), (5, 1), (5, 2), (5, 3), (5, 4), (5, 6)\} \Rightarrow n(E) = 11$

$\therefore \quad P(E) = \frac{11}{36}$

Solutions (for Q. Nos. 28 to 35) : $S = \{52 \text{ cards}\}$



In each of the four suits there is one ace, one king, one queen and one jack (or knave) and rest 9 cards are numbered.

$\therefore \quad n(S) = 52$

28 $n(E) = 26$

$\therefore \quad P(E) = \frac{26}{52} = \frac{1}{2}$

29 $n(E) = 4 \quad \therefore \quad P(E) = \frac{4}{52} = \frac{1}{13}$

30 Since drawn card must be black so there are only two queens.

Hence $n(E) = 2$

$\therefore \quad P(E) = \frac{2}{52} = \frac{1}{26}$

31 There are 26 black cards (including two queens). Besides it there are two more queens (in red colours)

Thus $n(E) = 26 + 2 = 28$

$\therefore \quad P(E) = \frac{28}{52} = \frac{7}{13}$

32 There are 4 kings and 4 queens

$\therefore \quad E = K \cup Q$

$\therefore \quad n(E) = 4 + 4 = 8$

$\therefore \quad P(E) = \frac{8}{52} = \frac{2}{13}$

33 There are 13 hearts (including one queen and one king). Besides it there are 3 queens and 3 kings in remaining 3 suits each.

Thus $n(E) = 13 + 3 + 3 = 19$

$\therefore \quad P(E) = \frac{19}{52}$

34 There are 13 spades (including one king). Besides there are 3 more kings in remaining 3 suits).

Thus $n(E) = 13 + 3 = 16$

Hence $n(\bar{E}) = 52 - 16 = 36$

$\therefore \quad P(\bar{E}) = \frac{36}{52} = \frac{9}{13}$

35 There are 4 aces and 4 kings

$\therefore \quad n(E) = 4 + 4 = 8$

$\therefore \quad n(\bar{E}) = 52 - 8 = 44$

$\therefore \quad P(\bar{E}) = \frac{44}{52} = \frac{11}{13}$

36 There are 4 aces, 4 kings and 4 jacks and their selection can be made in following ways.

$${}^{12}C_1 \times {}^{8}C_1 \times {}^{4}C_1 = 12 \times 8 \times 4$$

$$n(E) = 12 \times 8 \times 4$$

Total selection can be made $= {}^{52}C_3 = 52 \times 51 \times 50$

$$P(E) = \frac{12 \times 8 \times 4}{52 \times 51 \times 50} = \frac{16}{5525}$$

37 $E = \{(1, 1, 1, 1), (2, 2, 2, 2) \ldots\ldots (13, 13, 13, 13)\}$

$\therefore \quad n(E) = 13$

and $n(S) = {}^{52}C_4 = 270725$

$\therefore \quad P(E) = \frac{n(E)}{n(S)} = \frac{13}{270725} = \frac{1}{20825}$

38 $n(E) = {}^{13}C_1 \times {}^{13}C_1 \times {}^{13}C_1 \times {}^{13}C_1 = (13)^4$

$n(S) = {}^{52}C_4 = 270725$

$\therefore \quad P(E) = \frac{n(E)}{n(S)} = \frac{(13)^4}{270725} = \frac{2197}{20825}$

39 $n(E) = {}^{13}C_1 \times {}^{12}C_1 \times {}^{11}C_1 \times {}^{10}C_1 = 13 \times 12 \times 11 \times 10$

$n(S) = {}^{52}C_4 = 270725$

$\therefore \quad P(E) = \frac{13 \times 12 \times 11 \times 10}{270725} = \frac{264}{4165}$

Solutions (for Q. Nos. 40 to 43) $n(S) = 6 \times 6 \times 6 \times 6 = 6^4$

40 $n(E) = 6$

$\because \quad E = \{(1, 1, 1, 1), (2, 2, 2, 2), (3, 3, 3, 3) \ldots (6, 6, 6, 6)\}$

$\therefore \quad P(E) = \frac{n(E)}{n(S)} = \frac{6}{6^4} = \frac{1}{6^3} = \frac{1}{216}$

41 $n(E) = {}^6C_1 \times {}^5C_1 \times {}^4C_1 \times {}^3C_1 = 360 \;\; \therefore \;\; P(E) = \dfrac{360}{6^4} = \dfrac{5}{18}$

42 Select a number which occurs on two dice out of six numbers (1, 2, 3, 4, 5, 6). This can be done in ${}^6C_1$, ways.

Now select two distinct number out of remaining 5 numbers which can be done in ${}^5C_2$ ways. Thus these 4 numbers can be arranged in $\dfrac{4!}{2!}$ ways.

So, the number of ways in which two dice show the same face and the remaining two show different faces is

$${}^6C_1 \times {}^5C_2 \times \frac{4!}{2!} = 720$$

$\therefore \quad n(E) = 720 \;\; \therefore \;\; P(E) = \dfrac{720}{6^4} = \dfrac{5}{9}$

43 There are 3 possible cases-

(i) 2 similar faces + 2 different faces

(ii) 3 similar faces + 1 different face

(iii) all 4 faces are similar

$\therefore$ Required number of ways

$$= \left({}^6C_1 \times {}^5C_2 \times \frac{4!}{2!}\right) + \left({}^6C_1 \times {}^5C_1 \times \frac{4!}{3!}\right) + \left({}^6C_1 \times \frac{4!}{4!}\right)$$

$$= (6 \times 10 \times 12) + (6 \times 5 \times 4) + 6 = 846$$

$\therefore \quad n(E) = 846$ and $n(S) = 6^4$

$\therefore \quad P(E) = \dfrac{846}{6^4} = \dfrac{47}{72}$

44 $E = \{2, 3, 5, 7, 11, 13, 17, 19\}$

$\Rightarrow \quad n(E) = 8;\; S = \{1, 2, 3, 4, \ldots 20\} \Rightarrow n(S) = 20$

$\therefore \quad P(E) = \dfrac{n(E)}{n(S)} = \dfrac{8}{20} = \dfrac{2}{5}$

45 $S = \{1, 2, 3, 4, \ldots . 18\} \;\; \Rightarrow \;\; n(S) = 18$

$E_1 = \{2, 4, 6, 8, 10, 12, 14, 16, 18\} \Rightarrow n(E_1) = 9$

$E_2 = \{3, 6, 9, 12, 15, 18) \;\; \Rightarrow \;\; n(E_2) = 6$

$(E_1 \cap E_2) = E_3 = \{6, 12, 18\} \;\; \Rightarrow \;\; n(E_3) = 3$

$\therefore \quad E = E_1 \cup E_2 = E_1 + E_2 - E_3$

$n(E) = 9 + 6 - 3,\; n(E) = 12$

where $E = \{2, 3, 4, 6, 8, 9, 10, 12, 14, 15, 16, 18\}$

$\therefore \quad P(E) = \dfrac{n(E)}{n(S)} = \dfrac{12}{18} = \dfrac{2}{3}$

NOTE For any problem refer set theory and number system.

46 $n(S) = {}^{100}C_2 = \dfrac{100 \times 99}{2} = 4950$

$n(E) = {}^{25}C_2 = 300 \;\; \therefore \;\; P(E) = \dfrac{300}{4950} = \dfrac{2}{33}$

Hint There are total 25 prime numbers upto 100.

47 $n(S) = {}^{100}C_2 = 4950$

$n(E) = {}^{75}C_2 = 2775 \qquad (100 - 25 = 75)$

$\therefore \quad P(E) = \dfrac{2775}{4950} = \dfrac{37}{66}$

48 $366 = 7 \times 52 + 2$

It means a leap year has 52 full weeks and 2 more days. These 2 days can be :

(i) Sunday and Monday (ii) Monday and Tuesday

(iii) Tuesday and Wednesday (iv) Wednesday and Thursday

(v) Thursday and Friday (vi) Friday and Saturday

(vii) Saturday and Sunday

Clearly atleast there are 52 Sundays. Now, for having 53 Sundays in the year, one of the above 2 consecutive, days must be Sunday. Thus, out of the above 7 possibilities, 2 possibilities are in favour [(i) and (vii)] of the event that one of the two days is a Sunday.

$\therefore$ Required probability $= \dfrac{2}{7}$

49 $n(S) = 8 + 4 = 12;\;\; n(E) = 8$

$\therefore \quad P(E) = \dfrac{8}{12} = \dfrac{2}{3}$

50 $n(S) = {}^{12}C_4 = 495;\; n(E) = {}^8C_4 = 70$

$\therefore \quad P(E) = \dfrac{70}{495} = \dfrac{14}{99}$

51 $n(S) = {}^{12}C_4 = 495 \Rightarrow n(E) = {}^4C_4 = 1$

$\therefore \quad P(E) = \dfrac{1}{495}$

52 $n(S) = {}^{12}C_4 = 495 \Rightarrow n(E) = {}^8C_2 \times {}^4C_1 = 112$

$\therefore \quad P(E) = \dfrac{112}{495}$

53 $n(S) = 495 \Rightarrow n(E) = {}^4C_3 = 4$

$\therefore \quad P(E) = \dfrac{4}{495}$

54 Total number of outcomes $= 2 + 7 = 9$

Favourable number of cases $= 2$

$\therefore \quad P(E) = \dfrac{2}{9}$

55 Total number of outcomes $= 5 + 7 = 12$

Number of cases against the occurrence of event $= 5$

$\therefore$ Number of cases in favour of event $= 12 - 5 = 7$

$\therefore \quad P(E) = \dfrac{7}{12}$

56 $S = \{GG, GB, BG, BB\}$ and $E = \{GG, GB, BG\}$

$\therefore \quad P(E) = \dfrac{n(E)}{n(S)} = \dfrac{3}{4}$

57 $n(S) = {}^5C_2 = 10;\; n(E) = ({}^2C_1 \times {}^3C_1) + ({}^2C_2) = 7$

$\therefore \quad P(E) = \dfrac{7}{10}$

58 $n(S) = {}^{20}C_2 = 190;\; n(E) = {}^{15}C_2 = 105$

$\therefore \quad P(E) = \dfrac{105}{190} = \dfrac{21}{38}$

59 $n(S) = {}^{20}C_4 = 4845;\; n(E) = ({}^5C_3 \times {}^{15}C_1) + ({}^5C_4) = 155$

$\therefore \quad P(E) = \dfrac{155}{4845} = \dfrac{31}{969}$

☑ Introductory *Exercise 20.2*

1 $P(A)=\frac{1}{4}, P(B)=\frac{1}{2}$ and $P(A\cap B)=\frac{7}{50}$

$\therefore \quad P(A \text{ or } B)=P(A\cup B)=P(A)+P(B)-P(A\cap B)$

$=\frac{1}{4}+\frac{1}{2}-\frac{7}{50}=\frac{61}{100}$

2 P (neither A nor B) $=P$ ($\bar{A}$ and $\bar{B}$)

$=P(\bar{A}\cap\bar{B})=P(\overline{A\cup B})=1-P(A\cup B)=1-\frac{61}{100}=\frac{39}{100}$

3 $P(A\cup B)=P(A)+P(B)-P(A\cap B)=\frac{3}{10}+\frac{1}{2}-\frac{1}{5}=\frac{6}{10}=\frac{3}{5}$

4 $P(A\cup B)=P(A)+P(B)-P(A\cap B)$

$\frac{3}{5}=\frac{2}{5}+\frac{1}{2}-P(A\cap B)\Rightarrow P(A\cap B)=\frac{3}{10}$

5 $P(\bar{A})=1-P(A)=1-\frac{2}{5}=\frac{3}{5}$

6 $P(\bar{B})=1-P(B)=1-\frac{1}{2}=\frac{1}{2}$

7 $P(A\cup B)=P(A)+P(B)-P(A\cap B)$

$=\frac{2}{5}+\frac{1}{2}-0=\frac{9}{10}$ $(\because P(A\cap B)=0)$

8 $P(\bar{A}\cap\bar{B})=P(\overline{A\cup B})=1-P(A\cup B)=1-\frac{9}{10}=\frac{1}{10}$

9 $P(\bar{A}\cap B)=P(B)-P(A\cap B)$

$=P(B)=\frac{1}{2}$ $(\because P(A\cap B)=0)$

10 $P(A\cap\bar{B})=P(A)-P(A\cap B)=2/5$

11 $P(A\cup B)=P(A)+P(B)$

$0\cdot 65=0\cdot 35+P(B)$ $(\because P(A)=1-P(\bar{A}))$

$\Rightarrow \quad P(B)=0.30$

12 Let $P(A)=x$, then $P(B)=\frac{3}{2}x$ and $P(C)=\frac{1}{2}\times\frac{3}{2}x=\frac{3}{4}x$

$\therefore \quad P(A)+P(B)+P(C)=P(A\cup B\cup C)=P(S)=1$

$\therefore \quad x+\frac{3}{2}x+\frac{3}{4}x=1\Rightarrow x=\frac{4}{13}$

$\therefore \quad P(A)=\frac{4}{13}$

13 $n(S)=6\times 6=36$

Let A = Event of getting an even number on the first die

$\therefore \quad n(A)=3\times 6=18$

and B = Event of getting a total of 8

$n(B)=5$

$$A=\begin{Bmatrix}(2,1),(2,2),(2,3)\ldots.(2,6)\\(4,1)\ldots\ldots\ldots\ldots\ldots\ldots(4,6)\\(6,1)\ldots\ldots\ldots\ldots\ldots\ldots(6,6)\end{Bmatrix}$$

$B=\{(6,2),(5,3),(4,4),(3,5),(2,6)\}$

$\therefore \quad n(A)=3\times 6=18$ and $n(B)=5$

$\therefore \quad (A\cap B)=\{(2,6),(6,2),(4,4)\}$

$\therefore \quad n(A\cap B)=3$

$P(A)=\frac{18}{36}=\frac{1}{2}, \quad P(B)=\frac{5}{36}$

and $P(A\cap B)=\frac{3}{36}=\frac{1}{12}$

$\therefore$ P (Even number on first die or a total of 8)

$=p(A \text{ or } B)=P(A\cup B)=P(A)+P(B)-P(A\cap B)$

$=\frac{1}{2}+\frac{5}{36}-\frac{1}{12}=\frac{5}{9}$

14 $A=\{(5,1),)\ (5,2),(5,3),(5,4),(5,5),(5,6)\}$

$B=\{(1,5),(2,5),(3,5),(4,5),(5,5),(6,5)\}$

$A\cap B=\{(5,5)\}$

Also $n(S)=36$

$\therefore \quad P(A)=\frac{6}{36}=\frac{1}{6}\Rightarrow P(B)=\frac{6}{36}=\frac{1}{6}$

and $P(A\cap B)=\frac{1}{36}$

$\therefore$ Required probability $=P(A)+P(B)-P(A\cap B)$

$=\frac{1}{6}+\frac{1}{6}-\frac{1}{36}=\frac{11}{36}$

15 $n(S)=36$

$A=\{(1,1),)\ (2,2),(3,3),(4,4),(5,5),(6,6)\}$

$B=\{(2,6),(3,5),(4,4),(5,3),(6,2)\}$

$(A\cap B)=\{(4,4)\}$

$n(A)=6, \quad n(B)=5, \quad n(A\cap B)=1$

$\therefore$ Required probability $=P(A\cup B)$

$=P(A)+P(B)-P(A\cap B)$

$=\frac{6}{36}+\frac{5}{36}-\frac{1}{36}=\frac{10}{36}=\frac{5}{18}$

16 See the solution of question number 14

P (atleast one die shows 6) $=\frac{11}{36}$

17 $n(S)=52$

$A\rightarrow$ The event of getting a heart

$B\rightarrow$ The event of getting a king

then $A\cap B\rightarrow$ The event of getting a king of heart.

$\therefore \quad P(A)=\frac{13}{52}=\frac{1}{4}, \quad P(B)=\frac{4}{52}=\frac{1}{13}$ and $P(A\cap B)=\frac{1}{52}$

$\therefore$ P (a heart or a king) $=P(A \text{ or } B)=P(A\cup B)$

$=P(A)+P(B)-P(A\cap B)$

$=\frac{1}{4}+\frac{1}{13}-\frac{1}{52}=\frac{4}{13}$

18 $n(S)={}^{52}C_2=1326$

Let A = event of getting both red cards

and B = event of getting both queens

then $A\cap B$ = event of getting two red queens

$$n(A) = {}^{26}C_2 = 325,\ n(B) = {}^{4}C_2 = 6$$

$$n(A \cap B) = {}^{2}C_2 = 1$$

$$\therefore \quad P(A) = \frac{325}{1326}, \quad P(B) = \frac{6}{1326} = \frac{1}{221}$$

$$P(A \cap B) = \frac{1}{1326}$$

$\therefore P$ (both red or both queens) $= P(A \cup B)$

$$= P(A) + P(B) - P(A \cap B)$$

$$= \frac{325}{1326} + \frac{1}{221} - \frac{1}{1326} = \frac{55}{221}$$

19 $n(S) = 52$

Let A, B, C be the events of getting a red card, a heart and a king respectively.

then $n(A) = 26, \quad n(B) = 13, \quad n(C) = 4$

Clearly $n(A \cap B) = 13, \quad n(B \cap C) = 1,$

$$n(A \cap C) = 2, \quad n(A \cap B \cap C) = 1$$

$$\therefore\ P(A) = \frac{26}{52} = \frac{1}{2}, \quad P(B) = \frac{13}{52} = \frac{1}{4}, \quad P(C) = \frac{4}{52} = \frac{1}{13}$$

$$P(A \cap B) = \frac{13}{52} = \frac{1}{4},\ P(B \cap C) = \frac{1}{52},$$

$$P(A \cap C) = \frac{2}{52} = \frac{1}{26} \Rightarrow P(A \cap B \cap C) = \frac{1}{52}$$

$\therefore P$ (a red card, or a heart or a king) $= P(A \cup B \cup C)$

$$= P(A) + P(B) + P(C) - (P(A \cap B) + P(B \cap C) + P(A \cap C) + P(A \cap B \cap C)$$

$$= \frac{1}{2} + \frac{1}{4} + \frac{1}{13} - \left(\frac{1}{4} + \frac{1}{52} + \frac{1}{26}\right) + \frac{1}{52} = \frac{7}{13}$$

20 $n(S) = {}^{52}C_4$. Let E_1, E_2, E_3, E_4 be the events of getting all spades, all clubs, all hearts and all diamonds respectively.

Then $n(E_1) = {}^{13}C_4,\ n(E_2) = {}^{13}C_4$

$$n(E_3) = {}^{13}C_4;\ n(E_4) = {}^{13}C_4$$

$$\therefore \quad P(E_1) = \frac{{}^{13}C_4}{{}^{52}C_4}, \quad P(E_2) = \frac{{}^{13}C_4}{{}^{52}C_4},$$

$$P(E_3) = \frac{{}^{13}C_4}{{}^{52}C_4}, \quad P(E_4) = \frac{{}^{13}C_4}{{}^{52}C_4}$$

Since E_1, E_2, E_3 and E_4 are mutually exclusive events.

$\therefore P$ (getting all the 4 cards of the same suit)

$P(E_1$ or E_2 or E_3 or $E_4) = P(E_1) + P(E_2) + P(E_3) + P(E_4)$

$$= 4 \times \left(\frac{{}^{13}C_4}{{}^{52}C_4}\right) = \frac{44}{4165}$$

21 $n(S) = 52$

A = The event of getting a king

B = The event of getting a queen

$(A \cap B)$ = The event of getting a king and a queen both

$$\therefore \quad n(A) = 4, \quad n(B) = 4, \quad n(A \cap B) = 0$$

$$P(A) = \frac{4}{52}, \quad P(B) = \frac{4}{52}$$

$$\therefore \quad P(A \cup B) = P(A) + P(B) = \frac{4}{52} + \frac{4}{52} = \frac{2}{13}$$

22 $n(S) = {}^{52}C_2 = 1326$

Let A be the event of getting two black cards and B be the event of getting two jacks and $(A \cap B)$ be the event of getting two black jacks.

$$\therefore \quad n(A) = {}^{26}C_2, \quad n(B) = {}^{4}C_2, \quad n(A \cap B) = {}^{2}C_2$$

$$\therefore \quad P(A) = \frac{{}^{26}C_2}{{}^{52}C_2}, \quad P(B) = \frac{{}^{4}C_2}{{}^{52}C_2}, \quad P(A \cap B) = \frac{{}^{2}C_2}{{}^{52}C_2}$$

$\therefore$ Required probability $= P(A \cup B)$

$$= P(A) + P(B) - P(A \cap B) = \frac{{}^{26}C_2}{{}^{52}C_2} + \frac{{}^{4}C_2}{{}^{52}C_2} - \frac{{}^{2}C_2}{{}^{52}C_2}$$

$$= \frac{325}{1326} + \frac{1}{221} - \frac{1}{1326} = \frac{55}{221}$$

23 $n(S) = 300$

Let A be the event of getting a number divisible by 3 and B be the event of getting a number divisible by 5 and $(A \cap B)$ be event of getting a number divisible by 3 and 5 both

$$\therefore \quad n(A) = 100, \quad n(B) = 60, \quad n(A \cap B) = 20$$

$$\therefore\ P(A) = \frac{100}{300} = \frac{1}{3},\ P(B) = \frac{60}{300} = \frac{1}{5},\ P(A \cap B) = \frac{20}{600} = \frac{1}{30}$$

$$\therefore\ P(A \cup B) = P(A) + P(B) - P(A \cap B) = \frac{1}{3} + \frac{1}{5} - \frac{1}{30} = \frac{1}{2}$$

24 $n(S) = 100$

Let A be the event of getting a number divisible by 2 and B be the event of getting a number divisible by 3 and C be the event of getting of number divisible by 5.

$\therefore (A \cap B)$ be the event of getting a number divisible by both 2 and 3.

$(B \cap C)$ be the event of getting a number divisible by both 3 and 5.

$(A \cap C)$ be the event of getting a number divisible by both 2 and 5.

$(A \cap B \cap C)$ be the event of getting a number divisible by A, B and C.

Now, $n(A) = 50, \quad n(B) = 33, \quad n(C) = 20, \quad n(A \cap B) = 16,$

$$n(B \cap C) = 6,\ n(A \cap C) = 10,\ n(A \cap B \cap C) = 3$$

$$\therefore \quad P(A) = \frac{50}{100} = \frac{1}{2}, \quad P(B) = \frac{33}{100},$$

$$P(C) = \frac{20}{100} = \frac{1}{5}, \quad n(A \cap B) = \frac{16}{100}$$

$$n(B \cap C) = \frac{6}{100}, \quad n(A \cap C) = \frac{10}{100},$$

$$n(A \cap B \cap C) = \frac{3}{100}$$

Required probability $= P(A \cup B \cup C)$

$$= P(A) + P(B) + P(C) - [P(A \cap B) + P(B \cap C) + P(A \cap C)] + P(A \cap B \cap C)$$

$$= \frac{50}{100} + \frac{33}{100} + \frac{20}{100} - \left(\frac{16}{100} + \frac{6}{100} + \frac{10}{100}\right) + \frac{3}{100}$$

$$= \frac{74}{100}$$

25 $n(S) = 5 + 8 + 10 = 23$

$n(A) = 5$

$n(B) = 8$ $[n(A \cap B) = 0]$

$\therefore \quad P(A) = \frac{5}{23}$ and $P(B) = \frac{8}{23}$ $P(A \cap B) = 0$

$\therefore \quad P(A \cup B) = P(A) + P(B) = \frac{5}{23} + \frac{8}{23} = \frac{13}{23}$

26 $n(S) = {}^{30}C_2$

Let A be the event of getting two oranges and
B be the event of getting two non-defective fruits and $(A \cap B)$ be the event of getting two non-defective oranges

$\therefore P(A) = \frac{{}^{20}C_2}{{}^{30}C_2}, P(B) = \frac{{}^{22}C_2}{{}^{30}C_2}$ and $P(A \cap B) = \frac{{}^{15}C_2}{{}^{30}C_2}$

$\therefore \quad P(A \cup B) = P(A) + P(B) - P(A \cap B)$

$= \frac{{}^{20}C_2}{{}^{30}C_2} + \frac{{}^{22}C_2}{{}^{30}C_2} - \frac{{}^{15}C_2}{{}^{30}C_2} = \frac{316}{435}$

Hint There are 20 oranges, and $30 - (3 + 5) = 22$ non-defective fruits and $20 - 5 = 15$ non-defective oranges.

27 $n(S) = 100$

$n(A) = 40, \quad n(B) = 20, \quad n(A \cap B) = 5$

$\therefore \quad P(A \cup B) = P(A) + P(B) - P(A \cap B)$

$= \frac{40}{100} + \frac{20}{100} - \frac{5}{100}$

$P(A \cup B) = \frac{55}{100} = 55\%$

28 $P(A) = \frac{2}{5}, \quad P(B) = \frac{1}{3}$

$\therefore \quad P(A \cup B) = \frac{2}{5} + \frac{1}{3} = \frac{11}{15}$

($\because$ A and B are mutually exclusive events)

29 $P(H_1) = \frac{1}{3}, P(H_2) = \frac{1}{4}, P(H_3) = \frac{1}{5}, P(H_4) = \frac{1}{6}$

$\therefore P(H_1 \cup H_2 \cup H_3 \cup H_4) = P(H_1) + P(H_2) + P(H_3) + P(H_4)$

$= \frac{1}{3} + \frac{1}{4} + \frac{1}{5} + \frac{1}{6} = \frac{57}{60}$

Hint Here, H_1, H_2, H_3 and H_4 are the mutually exclusive events.

☑ Introductory *Exercise 20.3*

1 $P\left(\frac{A}{B}\right) = \frac{1}{2}$ (see the example 1)

2 $P(A \cup B) = 0.96$ (see the example 1)

3 Here $S = \{HHH, HHT, HTH, THH, HTT, THT, TTH, TTT\}$

Let A be the event that one of the coins shows a tail

$\therefore \quad A = \{HHT, HTH, THH, HTT, THT, TTH, TTT\}$

$\therefore \quad P(A) = \frac{7}{8}$

Now, let B be the event that they are all tails

$\therefore \quad B = \{TTT\}$

$\therefore \quad P(B) = \frac{1}{8}$

$\therefore \quad (A \cap B) = \{TTT\} \Rightarrow P(A \cap B) = \frac{1}{8}$

$\therefore \quad P\left(\frac{B}{A}\right) = \frac{P(A \cap B)}{P(A)} = \frac{1/8}{7/8} = \frac{1}{7}$

4 Here sample space $S = \{HH, HT, TH, TT\}$

$E = \{HT, TH\}$

$F = \{HH, HT, TH\}$

$\therefore \quad E \cap F = \{HT, TH\}$

$\therefore \quad P(E) = \frac{2}{4} = \frac{1}{2}$ and $P(F) = \frac{3}{4}$

and $P(E \cap F) = \frac{2}{4} = \frac{1}{2}$

$\therefore \quad P\left(\frac{E}{F}\right) = \frac{P(E \cap F)}{P(F)} = \frac{1/2}{3/4} = \frac{2}{3}$

$P\left(\frac{F}{E}\right) = \frac{P(E \cap F)}{P(E)} = \frac{1/2}{1/2} = 1$

5 Here sample space

$S = \{HH, HT, T1, T2, T3, T4, T5, T6\}$

Let A be the event that the die shows a number greater than 4 and B be the event that the first throw of the coin results in a tail then,

$A = \{T5, T6\}$

$B = \{T1, T2, T3, T4, T5, T6\}$

$\therefore$Required probability $= P\left(\frac{A}{B}\right) = \frac{P(A \cap B)}{P(B)} = \frac{2/8}{6/8} = \frac{1}{3}$

6 $S = \{1, 2, 3, 4, 5, 6\}$

Let A be the event of getting an odd number and
B be the event of getting a prime number

$\therefore \quad A = \{1, 3, 5\}, \quad B = \{2, 3, 5\}$

and $(A \cap B) = \{3, 5\}$

$\therefore \quad P(A) = \frac{3}{6} = \frac{1}{2}, \quad P(B) = \frac{3}{6} = \frac{1}{2}, \quad P(A \cap B) = \frac{2}{6} = \frac{1}{3}$

$\therefore$Required probability $= P\left(\frac{B}{A}\right) = \frac{P(A \cap B)}{P(A)} = \frac{1/3}{1/2} = \frac{2}{3}$

7 Let A be the event of getting the sum 9 and B be the event of getting atleast one 4.

Then $A = \{(3, 6), (4, 5), (5, 4), (6, 3)\}$

$B = \{(1, 4), (2, 4), (3, 4), (4, 4), (5, 4), (6, 4), (4, 1), (4, 2), (4, 3), (4, 5), (4, 6)\}$

then $A \cap B = \{(4, 5)(5, 4)\}$

$\therefore \quad$ Required probability $= P\left(\frac{B}{A}\right) = \frac{P(A \cap B)}{P(A)}$

$= \frac{n(A \cap B)}{n(A)} = \frac{2}{4} = \frac{1}{2}$

8 Let A = the event of getting 4 on the first die.

and B = the event of getting the sum 8 or greater

$\therefore$ $A = \{(4, 1),(4, 2), (4, 3), (4, 4), (4, 5), (4, 6)\}$

$B = \{(4, 4), (4, 5), (4, 6), (5, 4), (5, 5), (5, 6), (6, 2), (2, 6), (3, 5), (3, 6), (5, 3), (6, 3), (6, 4), (6, 5), (6, 6)\}$

$\therefore$ $A \cap B = \{(4, 4)\}, (4, 5), (4, 6)\}$

$\therefore$ Required probability $= P\left(\frac{B}{A}\right) = \frac{P(A \cap B)}{P(A)}$

$$= \frac{n(A \cap B)}{n(A)} = \frac{3}{6} = \frac{1}{2}$$

9 Let A = event of getting an odd number

and B = the event of getting a number greater than 1.

$\therefore$ $A = \{1, 3, 5\}$, $B = \{3, 5\}$, $A \cap B = \{3, 5\}$

$\therefore$ Required probability $= P\left(\frac{B}{A}\right) = \frac{P(A \cap B)}{P(A)} = \frac{n(A \cap B)}{n(A)} = \frac{2}{3}$

10 Let A be the event of reading English and B be the event of reading French.

Then $P(A) = \frac{45}{100} = \frac{9}{20}$,

$P(B) = \frac{30}{100} = \frac{3}{10}$

and $P(A \cap B) = \frac{20}{100} = \frac{1}{5}$

$\therefore$ $P\left(\frac{A}{B}\right) = \frac{P(A \cap B)}{P(B)} = \frac{\frac{1}{5}}{\frac{3}{10}} = \frac{2}{3}$

11 $P\left(\frac{B}{A}\right) = \frac{P(A \cap B)}{P(A)} = \frac{1/5}{9/20} = \frac{4}{9}$

12 $S = (B_1B_2, B_1G_2, G_1B_2, G_1G_2)$

Where $B \rightarrow$ Boy and $G \rightarrow$ Girl

Let A be the event that both are boys

and B be the event that one of two is a boy.

Then $A = \{B_1B_2\}$ and $B = \{B_1B_2, B_1G_2, G_1B_2\}$

So $A \cap B = \{B_1B_2\}$

$\therefore$ Required probability $= P\left(\frac{A}{B}\right) = \frac{n(A \cap B)}{n(B)} = \frac{1}{3}$

13 A be the event that both children are boys

and B be the event that the other child is a boy.

then $A = \{B_1, B_2\}$ and $B = \{B_1B_2, B_1G_2\}$

So $(A \cap B) = \{B_1B_2\}$

$\therefore$ Required probability $= P\left(\frac{A}{B}\right) = \frac{n(A \cap B)}{n(B)} = \frac{1}{2}$

14 $P(E) = \frac{1}{2}$ **15** $P(F) = \frac{1}{2}$

16 $P\left(\frac{G}{E}\right)$ = Probability of drawing a red ball when first bag is selected

= Probability of drawing a red ball from first bag $= \frac{3}{7}$

17 $P\left(\frac{G}{F}\right)$ = Probability of drawing a red ball from second bag

$= \frac{4}{6} = \frac{2}{3}$

18 Let A be the event of not getting a red ball in first draw and B be the event of not getting a red ball in second draw. Then Required probability

= Probability that atleast one ball is red

= 1 – Probability that none is red

$= 1 - P(A \text{ and } B) = 1 - P(A \cap B)$

$= 1 - P(A) \cdot P\left(\frac{B}{A}\right) = 1 - \left(\frac{2}{3} \times \frac{5}{8}\right)$

$= \frac{7}{12}$

Here $P(A) = \frac{6}{9} = \frac{2}{3}$

and $P\left(\frac{B}{A}\right) = \frac{5}{8}$ [There are 5 balls (excluding 3 red balls) after the selection of one non-red ball]

19 Let A be the event drawing 4 red ball in first draw and B be the event of drawing 4 blue balls in the second draw.

Then $P(A) = \frac{{}^6C_4}{{}^{15}C_4} = \frac{15}{1365} = \frac{1}{91}$

$P\left(\frac{B}{A}\right) = \frac{{}^9C_4}{{}^{11}C_4} = \frac{126}{330} = \frac{21}{55}$

Hence, the required probability $= P(A \cap B)$

$= P(A)\, P\left(\frac{B}{A}\right)$

$= \frac{1}{91} \times \frac{21}{55} = \frac{3}{715}$

20 Let A, B, C be the events of getting a white ball in first, second and third draw respectively, then

Required probability $= P(A \cap B \cap C)$

$= P(A)\, P\left(\frac{B}{A}\right) P\left(\frac{C}{A \cap B}\right)$

Now, $P(A)$ = Probability of drawing a white ball in first draw $= \frac{4}{18} = \frac{2}{9}$

When a white ball is drawn in the first draw there are 17 balls left in the urn, out of which 3 are white.

$\therefore$ $P\left(\frac{B}{A}\right) = \frac{3}{17}$

Since the ball drawn is not replaced, therefore after drawing a white ball in the second draw there are 16 balls left in the urn, out of which 2 are white.

$\therefore$ $P\left(\frac{C}{A \cap B}\right) = \frac{2}{16} = \frac{1}{8}$

Hence the required probability

$= \frac{2}{9} \times \frac{3}{17} \times \frac{1}{8} = \frac{1}{204}$

21 There are 4 even numbers and 5 odd numbers

Let A = the event of choosing odd numbers

B = the event of getting the sum an even number.

Then $A \cap B$ = The event of choosing odd numbers whose sum is even.

$\therefore \quad n(B) = {}^4C_2 + {}^5C_2 = 16$

and $\quad n(A \cap B) = {}^5C_2 = 10$

$\therefore$ Required probability $= P\left(\frac{A}{B}\right)$

$$= \frac{n(A \cap B)}{n(B)}$$

$$= \frac{10}{16} = \frac{5}{8}$$

22 Let A be the event of drawing an odd numbered ticket in the first draw and B be the event of drawing an odd numbered ticket in the second draw. Then

Required probability $= P(A \cap B) = P(A)\, P\left(\frac{B}{A}\right)$

$P(A) = \frac{13}{25}$, since there 13 odd numbers 1, 3, 5, … 25.

Since the ticket drawn in the first draw is not replaced, therefore second ticket drawn is from the remaining 24 tickets, out of which 12 are odd numbered.

$\therefore \quad P\left(\frac{B}{A}\right) = \frac{12}{24} = \frac{1}{2}$

Hence, Required probability $= \frac{13}{25} \times \frac{1}{2} = \frac{13}{50}$

☑ Introductory *Exercise 20.4*

1 $P(A \cap B) = P(A) \cdot P(B) = 0.6 \times 0.4 = 0.24$

2 $P(A \cup B) = P(A) + P(B) - P(A \cap B)$

$= 0.6 + 0.4 - 0.24 = 0.76$

3 $P(\overline{A} \cap B) = \{1 - P(A)\}\, P(B)$

$= 0.4 \times 0.4 = 0.16$

4 $P(A \cap \overline{B}) = P(A)\, \{1 - P(B)\}$

$= 0.6 \times 0.6 = 0.36$

5 $P(\overline{A} \cap \overline{B}) = \{1 - P(A)\}\, \{1 - P(B)\}$

$= 0.4 \times 0.6 = 0.24$

6 $P(\overline{A}) = 0.65 \Rightarrow P(A) = 0.35$

$P(A \cup B) = P(A) + P(B) - P(A \cap B)$

$\Rightarrow \quad P(A \cup B) = P(A) + P(B) - P(A) \cdot P(B)$

$\Rightarrow \quad 0.65 = 0.35 + p - 0.35p$

$\Rightarrow \quad 0.65p = 0.30 \Rightarrow p = 6/13$

7 $S = \{1, 2, 3, 4, 5, 6\}$, for each case

Let A = event of getting a 1,2, 3 or 4 on the first toss

and B = event of getting a 4, 5 or 6 on the second toss

Then, clearly A and B are independent events.

$\therefore \quad P(A) = \frac{4}{6} = \frac{2}{3}$ and $P(B) = \frac{3}{6} = \frac{1}{2}$

So, required probability $= P(A \cap B)$

$$= P(A) \cdot P(B) = \frac{2}{3} \times \frac{1}{2} = \frac{1}{3}$$

8 Let E = the event that A gets a three

and F = the event that B gets a three

Then, $\quad P(E) = \frac{1}{6}, \quad P(F) = \frac{1}{6}$

$$P(\overline{E}) = \frac{5}{6}, \quad P(\overline{F}) = \frac{5}{6}$$

Suppose A wins then, he gets a three in 1st or 3rd of 5th … throw etc.

$\therefore P(A \text{ wins}) = P[E \text{ or } (\overline{E}\ \overline{F}\ E) \text{ or } (\overline{E}\ \overline{F}\ \overline{E}\ \overline{F}\ E) \text{ or } \ldots \infty]$

$= P[E \text{ or } (\overline{E} \text{ and } \overline{F} \text{ and } E) \text{ or } (\overline{E} \text{ and } \overline{F} \text{ and } \overline{E} \text{ and } \overline{F} \text{ and } E)$ or ....]

$= P(E) + P(\overline{E} \text{ and } \overline{F} \text{ and } E) + P(\overline{E} \text{ and } \overline{F} \text{ and } \overline{E} \text{ and } \overline{F} \text{ and } E)$ + ... ∞

$= P(E) + P(\overline{E})\, P(\overline{F})\, P(E) + P(\overline{E})\, P(\overline{F})$ $\cdot P(\overline{E})\, P(\overline{F}) \cdot P(E) + \ldots \infty$

$= \frac{1}{6} + \frac{5}{6} \times \frac{5}{6} \times \frac{1}{6} + \frac{5}{6} \times \frac{5}{6} \times \frac{5}{6} \times \frac{5}{6} \times \frac{1}{6} + \ldots \infty$

$= \frac{1}{6} + \frac{1}{6}\left(\frac{5}{6}\right)^2 + \frac{1}{6}\left(\frac{5}{6}\right)^4 + \ldots \infty$

$= \frac{1}{6}\left[1 + \left(\frac{5}{6}\right)^2 + \left(\frac{5}{6}\right)^4 + \ldots \infty\right]$

$= \frac{1}{6} \cdot \frac{1}{\left[1 - \left(\frac{5}{6}\right)^2\right]} = \left(\frac{1}{6} \cdot \frac{36}{11}\right) = \frac{6}{11}$

Thus, $P(A \text{ wins}) = \frac{6}{11}$ and $P(B \text{ wins}) = \frac{5}{11}$

9 We have, $P(H) = \frac{1}{2}$ and $P(T) = \frac{1}{2}$

Now, A wins if he throws a head in 1st ,or 3rd or 5th or ... draw.

$\therefore P(A \text{ wins}) = P[H \text{ or } (T\,TH) \text{ or } (T\,T\,T\,TH)$ or $(T\,T\,T\,T\,T\,TH)$ or …]

$= P(H) + P(T\,TH) + P(T\,T\,T\,TH) + \ldots$

$= P(H) + P(T)\, P(T)\, P(H) + P(T)\, P(T) P(T)$ $P(T)\, P(H) + \ldots$

$= \frac{1}{2} + \left(\frac{1}{2}\right)^2 \frac{1}{2} + \left(\frac{1}{2}\right)^4 \frac{1}{2} + \ldots \infty$

$= \frac{1}{2} + \left(\frac{1}{2}\right)^3 + \left(\frac{1}{2}\right)^5 + \ldots \infty$

$$= \frac{1}{2}\left[1 + \left(\frac{1}{2}\right)^2 + \left(\frac{1}{2}\right)^4 + \ldots \infty\right]$$

$$= \frac{1}{2} \cdot \frac{1}{\left[1 - \left(\frac{1}{2}\right)^2\right]} = \left(\frac{1}{2} \times \frac{4}{3}\right) = \frac{2}{3}$$

Thus $P(A \text{ wins}) = \frac{2}{3}$ and $P(B \text{ wins}) = \left(1 - \frac{2}{3}\right) = \frac{1}{3}$

10 Let E be the event of 'getting a six'. Then $\bar{E}$ is the event of 'not getting a six'.

Then $P(E) = \frac{1}{6}$ and $P(\bar{E}) = \frac{5}{6}$

Now, A wins if he throws a six in 1st, 4th or 7th or ... draw.

$\therefore P(A \text{ wins}) = P(E \text{ or } (\bar{E}\,\bar{E}\,\bar{E}\,E) \text{ or } (\bar{E}\,\bar{E}\,\bar{E}\,\bar{E}\,\bar{E}\,\bar{E}\,E) \text{ or ... }]$

$$= P(E) + P(\bar{E}\,\bar{E}\,\bar{E}\,E) + P(\bar{E}\,\bar{E}\,\bar{E}\,\bar{E}\,\bar{E}\,\bar{E}\,E) + \ldots$$

$$= \frac{1}{6} + \left(\frac{5}{6}\right)^3 \cdot \frac{1}{6} + \left(\frac{5}{6}\right)^6 \cdot \frac{1}{6} + \ldots \infty$$

$$= \frac{1}{6}\left[1 + \left(\frac{5}{6}\right)^3 + \left(\frac{5}{6}\right)^6 + \ldots \infty\right]$$

$$= \frac{1}{6} \cdot \frac{1}{\left[1 - \left(\frac{5}{6}\right)^3\right]} = \left(\frac{1}{6} \cdot \frac{216}{91}\right) = \frac{36}{91}$$

Now, B wins if he throws a six in 2nd or 5th or 8th or ..draw.

$\therefore P(B \text{ wins}) = P[(\bar{E}E) \text{ or } (\bar{E}\,\bar{E}\,\bar{E}\,\bar{E}\,\bar{E}\,E) \text{ or } (\bar{E}\,\bar{E}\,\bar{E}\,\bar{E}\,\bar{E}\,\bar{E}\,\bar{E}\,E)$ or ...]

$$= P(\bar{E}E) + P(\bar{E}\,\bar{E}\,\bar{E}\,\bar{E}\,\bar{E}\,E) + P(\bar{E}\,\bar{E}\,\bar{E}\,\bar{E}\,\bar{E}\,\bar{E}\,\bar{E}\,E) + \ldots$$

$$= \frac{5}{6} \cdot \frac{1}{6} + \left(\frac{5}{6}\right)^4 \cdot \frac{1}{6} + \left(\frac{5}{6}\right)^7 \cdot \frac{1}{6} + \ldots \infty$$

$$= \frac{5}{36}\left[1 + \left(\frac{5}{6}\right)^3 + \left(\frac{5}{6}\right)^6 + \ldots \infty\right]$$

$$= \frac{5}{36} \cdot \frac{1}{\left[1 - \left(\frac{5}{6}\right)^3\right]} = \left(\frac{5}{36} \cdot \frac{216}{91}\right) = \frac{30}{91}$$

Thus, $P(A \text{ wins}) = \frac{36}{91}$ and $P(B \text{ wins}) = \frac{30}{91}$

$\therefore P(A \text{ wins or } B \text{ wins}) = P(A \text{ wins}) + P(B \text{ wins})$

$$= \frac{36}{91} + \frac{30}{91} = \frac{66}{91}$$

and $P(C \text{ wins}) = 1 - P(A \text{ wins or } B \text{ wins})$

$$= 1 - \frac{66}{91} = \frac{25}{91}$$

11 Let E = Event of getting a sum 9 on two dice.

Then, $E = \{(3, 6), (4, 5), (5, 4), (6, 3)\}$

$\therefore PE = \frac{4}{36} = \frac{1}{9}$

and $P(\bar{E}) = \frac{8}{9}$

$\therefore P(A \text{ wins}) = P[E_1 \text{ or } \bar{E}_1\,\bar{E}_2E_3 \text{ or } \bar{E}_1\bar{E}_2\bar{E}_3\bar{E}_4E_5 \text{ or ... }]$

$$= \left[\frac{1}{9} + \frac{8}{9} \cdot \frac{8}{9} \cdot \frac{1}{9} + \frac{8}{9} \cdot \frac{8}{9} \cdot \frac{8}{9} \cdot \frac{8}{9} \cdot \frac{1}{9} + \ldots \infty\right]$$

$$= \frac{9}{17}$$

$\therefore P(B \text{ wins}) = \left(1 - \frac{9}{17}\right) = \frac{8}{17}$

$\therefore$ Required ratio $= \frac{9}{8}$

12 Required probability $= \frac{4}{52} \times \frac{3}{51} = \frac{1}{221}$

13 Let A = the event that Ashmit solves the problem.

and B = the event that Amisha solves the problem.

Clearly, A and B are independent events.

Now, $P(A) = \frac{80}{100} = \frac{8}{10}$ and $P(B) = \frac{70}{100} = \frac{7}{10}$

$\therefore P(A \cap B) = P(A) \cdot P(B) = \frac{8}{10} \times \frac{7}{10} = \frac{56}{100}$

So $P(A \text{ or } B) = P(A \cup B)$

$$= P(A) + P(B) - P(A \cap B)$$

$$= \frac{8}{10} + \frac{7}{10} - \frac{56}{100} = \frac{94}{100} = 0.94$$

14 Let A = the event that A hits the target

and B = the event that B hits the target

As given, we have $P(A) = \frac{1}{3}$ and $P(B) = \frac{2}{5}$

Clearly, A and B are independent events

$\therefore P(A \cap B) = P(A) \cdot P(B) = \frac{1}{3} \times \frac{2}{5} = \frac{2}{15}$

$\therefore P$ (target is hit) $= P(A \text{ hits or } B \text{ hits})$

$$= P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

$$= \frac{1}{3} + \frac{2}{5} - \frac{2}{15} = \frac{3}{5}$$

15 Let A, B, C be the respective events of solving the problem and $\bar{A}, \bar{B}, \bar{C}$ be the respective events of not solving the problem. Then A, B, C are independent events

$\therefore \bar{A}, \bar{B}, \bar{C}$ are independent events

Now, $P(A) = \frac{1}{2}\ P(B) = \frac{1}{3}$ and $P(C) = \frac{1}{4}$

$P(\bar{A}) = \frac{1}{2}$, $P(\bar{B}) = \frac{2}{3}$ and $P(\bar{C}) = \frac{3}{4}$

$\therefore P(\text{none solves the problem})$

$= P(\text{not } A) \text{ and } (\text{not } B) \text{ and } (\text{not } C)]$

$= P(\bar{A} \cap \bar{B} \cap \bar{C})$

$= P(\bar{A})\,P(\bar{B})\,P(\bar{C})$ $\quad (\because \bar{A}, \bar{B} \text{and } \bar{C} \text{ are independent})$

$= \frac{1}{2} \times \frac{2}{3} \times \frac{3}{4} = \frac{1}{4}$

Hence, P(the problem will be solved)

$= 1 - P$ (none solves the problem)

$= 1 - \frac{1}{4} = \frac{3}{4}$

16 Let A, B, C respectively. Then $\bar{A}, \bar{B}, \bar{C}$ are the respective events of not solving the problem by them

Now, $P(A)=\frac{1}{3}$, $P(B)=\frac{2}{7}$ and $P(C)=\frac{3}{8}$

$\therefore$ $P(\bar{A})=\frac{2}{3}$, $P(\bar{B})=\frac{5}{7}$ and $P(\bar{C})=\frac{5}{8}$

$\therefore$ The probability that exactly one of them will solve it

$= P\{[A \cap (\text{not } B) \cap (\text{not } C)]$ or $[(\text{not } A) \cap B \cap (\text{not } C)]$ or $[(\text{not } A) \cap (\text{not } B) \cap C]\}$

$= P\{(A \cap \bar{B} \cap \bar{C}) \cup (\bar{A} \cap B \cap \bar{C}) \cup (\bar{A} \cap \bar{B} \cap C)\}$

$= P(A \cap \bar{B} \cap \bar{C}) + P(\bar{A} \cap B \cap \bar{C}) + P(\bar{A} \cap \bar{B} \cap C)$

$[\because (A \cap \bar{B} \cap \bar{C}) \cap (\bar{A} \cap B \cap \bar{C}) \cap (\bar{A} \cap \bar{B} \cap C) = \phi]$

$= P(A)\,P(\bar{B})\,P(\bar{C}) + P(\bar{A}).\,P(B).\,P(\bar{C}) + P(\bar{A}).\,P(\bar{B}).\,P(C)$

$= \left(\frac{1}{3}\times\frac{5}{7}\times\frac{5}{8}\right) + \left(\frac{2}{3}\times\frac{2}{7}\times\frac{5}{8}\right) + \left(\frac{2}{3}\times\frac{5}{7}\times\frac{3}{8}\right)$

$= \frac{25}{168} + \frac{5}{42} + \frac{5}{28} = \frac{25}{56}$

17 Let A, B, C be the events that A hits the target, B hits the target and C hits the target respectively.

Then, $P(A)=\frac{4}{5}$, $P(B)=\frac{3}{4}$, $P(C)=\frac{2}{3}$

$P(\bar{A})=\frac{1}{5}$, $P(\bar{B})=\frac{1}{4}$, $P(\bar{C})=\frac{1}{3}$

Case 1. $P(A, B,$ and $C,$ all hit the target$) = P(A \cap B \cap C)$

$= P(A)\,P(B)\,P(C) = \frac{4}{5}\times\frac{3}{4}\times\frac{2}{3} = \frac{2}{5}$

Case II. $P(A$ and B hit but not $C) = P[A \cap B \cap \bar{C}]$

$= P(A)\,P(B)\,P(\bar{C})$

$= \frac{4}{5}\times\frac{3}{4}\times\frac{1}{3} = \frac{1}{5}$

Case III. $P(A$ and C hit but not $B) = P(A \cap C \cap \bar{B})$

$= P(A)\,P(C)\,P(\bar{B})$

$= \frac{4}{5}\times\frac{2}{3}\times\frac{1}{4} = \frac{2}{15}$

Case IV. $P(B$ and C hit but not $A) = P(B \cap C \cap \bar{A})$

$= P(B)\,P(C)\,P(\bar{A}) = \frac{3}{4}\times\frac{2}{3}\times\frac{1}{5} = \frac{1}{10}$

All the above cases being mutually exclusive,we have the required probability $= \frac{2}{5}+\frac{1}{5}+\frac{2}{15}+\frac{1}{10} = \frac{5}{6}$

18 Let $P_1 = 0.1, P_2 = 0.2, P_3 = 0.3, P_4 = 0.4$

$\therefore$ P (The balloon is hit) $= P$ (the balloon is hit atleast once)

$= 1 - P$(the balloon is hit in none of the shots)

$= 1 - (1-P_1)(1-P_2)(1-P_3)(1-P_4)$

$= 1 - (0.9)(0.8)(0.7)(0.6) = 0.6976$

19 $P(A)=\frac{2}{3}$, $P(B)=\frac{3}{5}$

Required probability $= P(A$ or $B) = P(A \cup B)$ be the events of solving the problem by A, B, C

$= P(A) + P(B) - P(A)\,P(B) = \frac{2}{3}+\frac{3}{5}-\frac{2}{3}\cdot\frac{3}{5} = \frac{13}{15}$

20 $P(\text{none}) = 1 - P(\text{atleast one}) = 1 - P(A \cup B) = 1 - \frac{13}{15} = \frac{2}{15}$

21 $P(\text{not } A) = 1 - P(A) = 1 - 0.4 = 0.6$

22 $P(\text{at most } C) = P(D \text{ or } C) = P(D) + P(C) = (0.1) + (0.2) = 0.3$

23 $P(B \text{ or } C) = P(B) + P(C)$

$= (0.3) + (0.2) = 0.5$

24 $P(\text{atleast } B) = P(B \text{ or } A) = P(B) + P(A) = (0.3) + (0.4) = 0.7$

Solutions (for Q. Nos. 25 to 28) *Let E = the event that Ajay is selected and F = the event that Kajol is selected Clearly, E and F are independent events*

Now, $P(E)=\frac{1}{7}$ and $P(F)=\frac{1}{5}$

$\therefore$ $P(\bar{E})=\frac{6}{7}$ *and* $P(\bar{E})=\frac{4}{5}$

25 $P(\text{Both of them will be selected}) = P(E \text{ and } F) = P(E \cap F)$

$= P(E)\,P(F) = \frac{1}{7}\times\frac{1}{5} = \frac{1}{35}$

26 $P(\text{only one of them will be selected})$

$= P[(E \text{ and not } F) \text{ or } (F \text{ and not } E)]$

$= P[(E \cap \bar{F}) \cup (F \cap \bar{E})]$

$= P(E \cap \bar{F}) + P(F \cap \bar{E})$

$= P(E)\,P(\bar{F}) + P(F)\,P(\bar{E}) = \frac{1}{7}\times\frac{4}{5} + \frac{1}{5}\times\frac{6}{7} = \frac{2}{7}$

27 $P(\text{none of them will be selected})$

$= P[(\text{not } E) \text{ and } (\text{not } F)]$

$= P(\bar{E} \cap \bar{F}) = P(\bar{E}) \times P(\bar{F}) = \frac{6}{7}\times\frac{4}{5} = \frac{24}{35}$

28 $P(\text{atleast one of them will be selected})$

$= 1 - P(\text{none will be selected})$

$= 1 - \frac{24}{35} = \frac{11}{35}$

29 Let E = the event that A speaks the truth

and F = the event that B speaks the truth

then $\bar{E}$ = the event that A tells a lie

and $\bar{F}$ = the event that B tells a lie.

Clearly, E and F are independent events, So, E and $\bar{F}$ as well as $\bar{E}$ and F are independent.

Now, $P(E)=\frac{60}{100}=\frac{3}{5}$, $P(F)=\frac{80}{100}=\frac{4}{5}$

$\therefore$ $P(\bar{E})=\frac{2}{5}$, $P(\bar{F})=\frac{1}{5}$

$\therefore$ $P(A$ and B contradict each other$)$

$= P(A$ speaks the truth and B tells a lie$)$

or (A tells a lie and B speaks the truth)

$= P[(E \cap \bar{F}) \cup (\bar{E} \cup F)]$

$= P(E \cap \bar{F}) + P(\bar{E} \cap F)$

$= P(E)\,P(\bar{F}) + P(\bar{E})\,P(F)$

$= \frac{3}{5}\times\frac{1}{5} + \frac{2}{5}\times\frac{4}{5} = \frac{11}{25} \Rightarrow 44\%$

So A and B contradict each other in 44% cases.

Solutions (for Q. Nos. 30 and 31) *Let E = the event that the husband will be alive 20 years hence and F = the event that the wife will be alive 20 years hence.*

Then $P(E)=\frac{5}{12}$ *and* $P(F)=\frac{3}{8}$

$\therefore \quad P(\bar{E})=\frac{7}{12}$ *and* $P(\bar{F})=\frac{5}{8}$

Clearly, E and F are independent events.

30 P(Couple will be alive 20 years hence)
$= P(E \text{ and } F) = P(E \cap F)$
$= P(E).\ P(F) = \frac{5}{12}\times\frac{3}{8}=\frac{5}{32}$

31 P(atleast one of them will be alive 20 years hence)
$= 1 - P$(none will be alive 20 years hence)
$= 1 - P(\bar{E}\cap\bar{F})$
$= 1 - P(\bar{E})\,P(\bar{F})$ $(\therefore \bar{E}$ and $\bar{F}$ are independent)
$= 1-\left(\frac{7}{12}\times\frac{5}{8}\right)=\frac{61}{96}$

32 Let A, B, C denote the events of favouring the book by the first, the second and the third critic respectively.
Then $P(A)=5/7,\quad P(B)=4/7$ and $P(C)=3/7$
$\therefore \quad P(\bar{A})=2/7,\quad P(\bar{B})=3/7$ and $P(\bar{C})=4/7$
$\therefore$ Required probability
$= P$ (two favour the book or three favour the book)
$= P$ (two favour the book) $+ P$ (three favour the book)
$= P[\{A \text{ and } B \text{ (not } C)\} \text{ or } \{A \text{ and (not } B) \text{ and } C\}$
or $\{(\text{not } A) \text{ and } B \text{ and } C\}] + P(A \text{ and } B \text{ and } C)$
$= P[(A\cap B\cap\bar{C})\cup P(A\cap\bar{B}\cap C)\cup(\bar{A}\cap B\cap C)]$
$+ P(A\cap B\cap C)$
$= P(A)\,P(B)P(\bar{C}) + P(A)\,P(\bar{B})\,P(C) + P(\bar{A})P(B)P(C)$
$+ P(A)\,P(B)\,P(C)$
$=\left(\frac{5}{7}\times\frac{4}{7}\times\frac{4}{7}\right)+\left(\frac{5}{7}\times\frac{3}{7}\times\frac{3}{7}\right)+\left(\frac{2}{7}\times\frac{4}{7}\times\frac{3}{7}\right)+\left(\frac{5}{7}\times\frac{4}{7}\times\frac{3}{7}\right)$
$=\frac{209}{343}$

33 Required probability
$= P$ (X not defective and Y not defective)
$= P(\bar{X})\,P(\bar{Y}) = \{1 - P(X)]\ \{1 - P(Y)\}$
$=\frac{91}{100}\times\frac{95}{100}=\frac{8645}{10000}=0.8645$

34 A red ball can be drawn in two mutually exclusive ways
(i) Selecting bag I and then drawing a red ball from it.
(ii) Selecting bag II and then drawing a red ball form it.
Let E_1, E_2 and A denote the events defined as follows :
E_1 = selecting bag I, E_2 = selecting bag II
A = drawing a red ball.
Since one of the two bags is selected randomly, therefore
$P(E_1)=\frac{1}{2}$ and $P(E_2)=\frac{1}{2}$.
Now, $P\left(\frac{A}{E_1}\right)$ = probability of drawing a red ball when the first bag has been chosen = 4/7
$P\left(\frac{A}{E_2}\right)$ = probability of drawing a red ball when the second bag has been selected = 2/6
Using the law of total probability, we have
$P(\text{red ball}) = P(A) = P(E_1)\,P\left(\frac{A}{E_1}\right)+P(E_2)P\left(\frac{A}{E_2}\right)$
$=\frac{1}{2}\times\frac{4}{7}+\frac{1}{2}\times\frac{2}{6}=\frac{19}{42}$

35 Let E_1, E_2, E_3 and A be the events defined as follows.
E_1 = the toy is manufactured by machine A
E_2 = the toy is manufactured by machine B
E_3 = the toy is manufactured by machine C
and A = the toy is defective then
$P(E_1)=\frac{25}{100}=\frac{1}{4}$
$P(E_2)=\frac{35}{100}=\frac{7}{20}$
$P(E_3)=\frac{40}{100}=\frac{2}{5}$
and $P\left(\frac{A}{E_1}\right)$ = Probability that the toy drawn is defective given the condition that it is a manufactured by machine A = 5/100
Similarly, $P\left(\frac{A}{E_2}\right)=\frac{4}{100}$ and $P\left(\frac{A}{E_3}\right)=\frac{2}{100}$
Using law of total probability, we have
$P(A)=P(E_1)\,P\left(\frac{A}{E_1}\right)+P(E_2)\,P\left(\frac{A}{E_2}\right)+P(E_3)\,P\left(\frac{A}{E_3}\right)$
$=\frac{25}{100}\times\frac{5}{100}+\frac{35}{100}\times\frac{4}{100}+\frac{40}{100}\times\frac{2}{100}$
$=0.345$

36 The testing procedure may terminate at the twelfth testing in two mutually exclusive ways
(i) When lot contain 2 defective bulbs.
(ii) When lot contains 3 defective bulbs .
Consider the following events :
A = testing procedure ends the twelfth testing
E_1 = lot contains 2 defective bulbs.
E_2 = lot contains 3 defective bulbs.
Required Probability = $P(A)$
$= P(A\cap E_1)\cap P(A\cap E_2)$
$= P(A\cap E_1) + P(A\cap E_2)$
$= P(E_1)\,P\left(\frac{A}{E_1}\right)+P(A_2)\,P\left(\frac{A}{E_2}\right)$

Now, $P\left(\frac{A}{E_1}\right)$ = Probability that first 11 draws contain 10 non defective and one defective and 12^{th} draw contains a defective article.

$$= \frac{{}^{18}C_{10} \times {}^{2}C_1}{{}^{20}C_{11}} \times \frac{1}{9}$$

and $P\left(\frac{A}{E_2}\right)$ = Probability that first 11 draws contain 9 non-defective and 2 defective articles and twelfth draw contains a defective article.

$$= \frac{{}^{17}C_9 \times {}^{3}C_2}{{}^{20}C_{11}} \times \frac{1}{9}$$

Hence, Required probability

$$= 0.4 \times \frac{{}^{18}C_{10} \times {}^{2}C_1}{{}^{20}C_{11}} \times \frac{1}{9} + 0.6 \times \frac{{}^{17}C_9 \times {}^{3}C_2}{{}^{20}C_{11}} \times \frac{1}{9}$$

37 Let E_1, E_2, E_3 and A be the events defined as follows :

E_1 = the toy is manufactured by machine A
E_2 = the toy is manufactured by machine B
E_3 = the toy is manufactured by machine C
A = the toy is defective

Then $P(E_1)$ = probability that the toy drawn is manufactured by machine $A = 25/100$

Similarly,

$$P(E_2) = 35/100 \quad \text{and} \quad P(E_3) = 40/100$$

$p(A/E_1)$ = probability that the toy drawn is defective given that it is manufactured by machine $A = \frac{5}{100}$

Similarly $P\left(\frac{A}{E_2}\right) = \frac{4}{100}, \quad P\left(\frac{A}{E_3}\right) = \frac{2}{100}$

Now, required probability

$$= \frac{P(E_2)\,P\left(\frac{A}{E_2}\right)}{P(E_1)\,P\left(\frac{A}{E_1}\right) + P(E_2)\,P\left(\frac{A}{E_2}\right) + P(E_3)\,P\left(\frac{A}{E_3}\right)}$$

$$= \frac{\frac{35}{100} \times \frac{4}{100}}{\frac{25}{100} \times \frac{5}{100} + \frac{35}{100} \times \frac{4}{100} + \frac{40}{100} \times \frac{2}{100}} = \frac{28}{69}$$

38 Let E_1, E_2, E_3 and A be the events defined as follows :

E_1 = construction chosen is a bridge.
E_2 = construction chosen is a hospital
E_3 = construction chosen is a hotel.
A = construction gets damaged

Since there are 1200 constructions, therefore

$$P(E_1) = \frac{200}{1200} = \frac{1}{6}, \quad P(E_2) = \frac{400}{1200} = \frac{1}{3}$$

and $$P(E_3) = \frac{600}{1200} = \frac{1}{2}$$

It is given that $P\left(\frac{A}{E_1}\right)$ =Probability that a construction gets damaged is a bridge = 0.01

Similarly, $P\left(\frac{A}{E_2}\right) = 0.03$ and $P\left(\frac{A}{E_3}\right) = 0.15$

We are required to find $P\left(\frac{E_1}{A}\right)$ by Baye's rule.

$$P\left(\frac{E_1}{A}\right) = \frac{P(E_1)\,P\left(\frac{A}{E_1}\right)}{P(E_1)\,P\left(\frac{A}{E_1}\right) + P(E_2)\,P\left(\frac{A}{E_2}\right) + P(E_3)\,P\left(\frac{A}{E_3}\right)}$$

$$= \frac{\frac{1}{6} \times 0.01}{\frac{1}{6} \times 0.01 + \frac{1}{3} \times 0.03 + \frac{1}{2} \times 0.15} = \frac{1}{1+6+45} = \frac{1}{52}$$

39 Let E_1, E_2 and A be the events defined as follows :

E_1 = selecting a box from the first group
E_2 = selecting a box from the second group and
A = ball drawn is green

Since there are 5 boxes out of which 3 boxes belong to first group and 2 boxes belong the second group. Therefore

$$P(E_1) = 3/5,\ P(E_2) = 2/5$$

If E_1 has already occurred, then a box from the first group is chosen. The box chosen contains 5 green balls and 3 red balls. Therefore the probability of drawing a green ball from it is $5/8$.

So $$P\left(\frac{A}{E_1}\right) = \frac{5}{8}$$

Similarly, $$P\left(\frac{A}{E_2}\right) = \frac{2}{6} = \frac{1}{3}$$

Now, we have to find $P\left(\frac{E_1}{A}\right)$

By Baye's rule, we have

$$P\left(\frac{E_1}{A}\right) = \frac{P(E_1)\,P\left(\frac{A}{E_1}\right)}{P(E_1)\,P\left(\frac{A}{E_1}\right) + P(E_2)\,P\left(\frac{A}{E_2}\right)} = \frac{\frac{3}{5} \times \frac{5}{8}}{\frac{3}{5} \times \frac{5}{8} + \frac{2}{5} \times \frac{1}{3}} = \frac{45}{61}$$

40 Let E_1, E_2 and A be the events defined as follows :

E_1 = six occurs, E_2 = six does not occur and A = the man reports that it is a six.

We have, $$P(E_1) = \frac{1}{6},\ P(E_2) = \frac{5}{6}$$

Now $P\left(\frac{A}{E_1}\right)$ = probability that the man reports that there is a six on the die given that six has occurred on the die.

= probability that the man speaks truth = 3/4

and $P\left(\frac{A}{E_2}\right)$ = probability that the man reports that there is six on the die given that six has not occurred on the die.

= probability that the man does not speak truth

$$= 1 - \frac{3}{4} = \frac{1}{4}$$

We have to find $P\left(\frac{E_1}{A}\right)$

By Baye's rule, we have

$$P\left(\frac{E_1}{A}\right)=\frac{P(E_1)\,P\left(\frac{A}{E_1}\right)}{P(E_1)\,P\left(\frac{A}{E_1}\right)+P(E_2)\,P\left(\frac{A}{E_2}\right)}$$

$$=\frac{1/6\times 3/4}{1/6\times 3/4+5/4\times 1/4}=\frac{3}{8}$$

41 Let E_1, E_2, E_3, E_4 and A be the events as defined below :

E_1 = the missing card is diamond
E_2 = the missing card is heart
E_3 = the missing card is spade
E_4 = the missing card is club
A = drawing two diamonds cards from the remaining cards

Then $P(E_1)=\frac{13}{52}=\frac{1}{4}$, $P(E_2)=\frac{13}{52}=\frac{1}{4}$

$P(E_3)=\frac{13}{52}=\frac{1}{4}$ and $P(E_4)=\frac{13}{52}=\frac{1}{4}$

$P\left(\frac{A}{E_1}\right)$ = probability of drawing two diamonds cards given that one diamond card is missing $=\frac{{}^{12}C_2}{{}^{51}C_2}$

$P\left(\frac{A}{E_2}\right)$ = probability of drawing two diamond cards given that one heart card is missing $=\frac{{}^{13}C_2}{{}^{51}C_2}$

Similarly, $P\left(\frac{A}{E_3}\right)=\frac{{}^{13}C_2}{{}^{51}C_2}$ and $P\left(\frac{A}{E_4}\right)=\frac{{}^{13}C_2}{{}^{31}C_2}$

By, Baye's rule

Required probability $=P\left(\frac{E_1}{A}\right)$

$$=\frac{P(E_1)P\left(\frac{A}{E_1}\right)}{P(E_1)P\left(\frac{A}{E_1}\right)+P(E_2)P\left(\frac{A}{E_2}\right)+P(E_3)P\left(\frac{A}{E_3}\right)+P(E_4)P\left(\frac{A}{E_4}\right)}$$

$$=\frac{11}{50}$$

☑ Level 01 *Basic Level Exercise*

1 Total possible nine digit numbers = 9!

Out of these 9! numbers only those numbers are divisible by 4 which have their last digits as even natural number and the numbers formed by their last two digits are divisible by 4. The possible numbers of last two digits are 12, 32, 52, 72, 92, 24, 64, 84, 16, 36, 56, 76, 96, 28, 48, 68.

Thus there are 16 ways of choosing the last two digits. Corresponding to each of these ways the remaining 7 digits can be arranged in 7! ways. Therefore, the total number of 9 digits numbers divisible by 4 is $16\times 7!$.

Hence, required probability $=16\times 7!/9!=2/9$

2 Total possible number of 4 digits = $4!=24$

The number is divisible by 5 if unit digit itself is 5. Therefore we fix 5 at unit place and then remaining 3 places can be filled up in 3! ways.

Hence, the required probability = $3!/4!=6/24=1/4$

3 Excluding ground floor there are 7 floors. A person can leave the cabin at any of the 7 floors. Therefore, the total number of ways in which each of the 5 persons can leave the cabin at any of the 7 floors = 7^5.

$\therefore$ Exhaustive number of ways = 7^5

Five persons can leave the cabin at five different floors in ${}^7P_5$ ways.

$\therefore$ The favourable number of cases = ${}^7P_5$

Hence, the required probability $=\frac{{}^7P_5}{7^5}=\frac{360}{2401}$

4 Box 1 Box 2 Box 3

$3W$ $2W$ $1W$

$1B$ $2B$ $3B$

There can be three mutually exclusive cases of drawing 2 white balls and 1 black ball.

	Box 1	Box 2	Box 3
Case 1	$1W$	$1W$	$1B$
Case 2	$1W$	$1B$	$1W$
Case 3	$1B$	$1W$	$1W$

$\therefore$ Required probability

$=P(W_1\cap W_2\cap B_3)\cup(W_1\cap B_2\cap W_3)\cup(B_1\cap W_2\cap W_3)$

$=P(W_1)\,P(W_2)\,P(B_3)+P(W_1)\,P(B_2)\,P(W_3)$

$+P(B_1)\,P(W_2)\,P(W_3)$

$$=\frac{3}{4}\times\frac{2}{4}\times\frac{3}{4}+\frac{3}{4}\times\frac{2}{4}\times\frac{1}{4}+\frac{1}{4}\times\frac{2}{4}\times\frac{1}{4}=\frac{26}{64}=\frac{13}{32}$$

5 Since coin is fair *i.e.,* with equal probability a heads and a tail can be obtained. Also all the trials are independent so the probability that head appears on the fifth toss does not depend upon previous results of the tosses.

$\therefore$ Required probability = $1/2$

6 The total number of ways in which two calculators can be chosen out of four calculators is ${}^4C_2=6$. If only two tests are required to identify defective calculators, then in first two tests defective calculators are identified. This can be done in one way only.

$\therefore$ Required probability = $1/6$

7 20 girls can be seated around a round table in 19! ways.
So, exhaustive number of cases = 19!
Excluding A and B, out of remaining 18 girls, 4 girls can be selected ${}^{18}C_4$ ways which can be arranged in 4! ways.
Remaining $20-(4-2)=14$ girls can be arranged in 14! ways. Also A and B mutually can be arranged in 2! ways.
$\therefore$ Required number of arrangements
$$= {}^{18}C_4 \times 4! \times 2! \times 14!$$
$$= 18! \times 2$$
$\therefore$ Required probability $= \dfrac{18! \times 2}{19!} = \dfrac{2}{19}$

8 Since x and y can take values from 0 to 10. So, the total number of ways of selecting x and y is $11 \times 11 = 121$
Now, $|x-y|>5 \Rightarrow x-y<-5$ or $x-y>5$
There are 30 pairs of values of x and y satisfying these two inequalities, so favourable number of ways = 30
Hence, required probability $= \dfrac{30}{121}$

9 Since a persons's birthday can fall in any of the 12 months.
So, total number of ways = 12^4.
Now, any two months can be chosen in ${}^{12}C_2$ ways. The 4 persons birthday can fall in these two months in 2^4 ways. Out of these 2^4 ways there are two ways when all of the four birthdays fall in one month.
So, favourable number of ways $= \dfrac{{}^{12}C_2 \times (2^4-2)}{12^4} = \dfrac{77}{1728}$

10 6 objects can be distributed among 6 persons in 6^6 ways.
$\therefore$ Total number of ways $= 6^6$
The number of ways of distribution in which each one gets only one thing is 6!. So, the number of distribution in which atleast one of them does not get any thing is $6^6 - 6!$
Hence, required probability $= \dfrac{6^6-6!}{6^6}$

11 Total number of ways of arranging 40 books on a shelf = 40!
Out of 40 places, 4 places for the four volumes can be chosen in ${}^{40}C_4$ ways. In the remaining 36 places the remaining 36 books can be arranged in 36! ways. In the 4 places four volumes of encyclopedia can be arranged in increasing order in one way only.
So, favourable number of ways = ${}^{40}C_4 \times 36!$
Hence, required probability $= \dfrac{{}^{40}C_4 \times 36!}{40!} = \dfrac{1}{24}$

12 The divisibility of the product of four numbers depends upon the value of the last digit of each number. The last digit of a number can be any of the 10 digits 0, 1, 2 ... 9 . So, the total number of ways of selecting last digits of four numbers is $10 \times 10 \times 10 \times 10 = 10^4$.
If the product of the 4 numbers is not divisible by 5 or 10. Then the number of choices for the last digit of each number is 8 (excluding 0 or 5).
So, favourable number of ways = $8 \times 8 \times 8 \times 8 = 8^4$
$\therefore$ The probability that the product is not divisible by 5 or 10
$$= \frac{8^4}{10^4} = \left(\frac{8}{10}\right)^4$$
Hence, Required probability $= 1 - \left(\dfrac{8}{10}\right)^4 = \dfrac{369}{625}$

13 P(selecting atleast one couple) $= 1 - P$(selecting none of the couples for the prize.)
$$= 1 - \left(\frac{{}^{16}C_1 \times {}^{14}C_1 \times {}^{12}C_1 \times {}^{10}C_1}{{}^{16}C_4}\right) = \frac{15}{39}$$

14 Total number of ways in which 7 (= 4 + 3) persons can speak is 7!.
The number of ways in which A, B, C speak in the given order is ${}^7C_3$ ways and remaining 4 persons can be arranged in 4! ways.
$\therefore$ Favourable number of ways = ${}^7C_3 \times 4!$
$\therefore$ Required probability $= \dfrac{{}^7C_3 \times 4!}{7!} = \dfrac{1}{6}$

15 Let A be the event of selecting a counterfeit coin and B the event of getting head, then
Required probability $= P(A \cap B) \cup (\overline{A} \cap B)$
$$= P(A \cap B) + P(\overline{A} \cap B)$$
$$= P(A)P\left(\frac{B}{A}\right) + P(\overline{A})P\left(\frac{B}{\overline{A}}\right)$$
$$= \frac{2}{16} \times 1 + \frac{14}{16} \times \frac{1}{2} = \frac{9}{16}$$

16 Total number of ways in which 5 people can be chosen out of 9 people = ${}^9C_5 = 126$
Number of ways in which the couple serves the committee
$$= {}^7C_3 \times {}^2C_2 = 35$$
Number of ways in which the couple does not serve the committee = ${}^7C_5 = 21$
$\therefore$ Favourable number of cases = 35 + 21 = 56
Hence, the required probability $= \dfrac{56}{126} = \dfrac{4}{9}$

17 E_1 = The event in which A speaks truth
E_2 = The event in which B speaks truth
Then $P(E_1) = \dfrac{60}{100} = \dfrac{3}{5}$, $P(E_2) = \dfrac{80}{100} = \dfrac{4}{5}$
and $P(\overline{E}_1) = \dfrac{2}{5}$, $P(\overline{E}_2) = \dfrac{1}{5}$
$\therefore$ Required probability $= P[(E_1 \cap E_2) \cup (\overline{E}_1 \cap \overline{E}_2)]$
$$= P(E_1 \cap E_2) + P(\overline{E}_1 \cap \overline{E}_2)$$
$$= P(E_1).P(E_2) + P(\overline{E}_1).P(\overline{E}_2)$$
$$= \left(\frac{3}{5} \times \frac{4}{5}\right) + \left(\frac{2}{5} \times \frac{1}{5}\right) = \frac{14}{25} = 0.56$$

18 Two different squares can be chosen in 64×63 ways. For each of the four corner squares, the favourable number of cases is 2. For each of the 24 non-corner squares on all the four sides of the chessboard, the favourable number of cases is 3. For each of the 36 remaining squares, the favourable number of cases is 4.

Thus, the total number of favourable cases

$$= 4 \times 2 + 24 \times 3 + 36 \times 4 = 224$$

Hence, the required probability $= \dfrac{224}{64 \times 63} = \dfrac{1}{18}$

19 The last two digits can be dialled in ${}^{10}P_2 = 90$ ways.

Out of these 90 cases only one case is favourable.

Hence, the required probability $= \dfrac{1}{90}$.

20 3 squares on a chessboard can be chosen in ${}^{64}C_3$ ways .

Two squares of one colour and third square of different colour can be chosen in two mutually exclusive way.

(i) 2 white and one black (ii) 2 black and one white

Thus the favourable number of cases

$$= {}^{32}C_2 \times {}^{32}C_1 + {}^{32}C_1 \times {}^{32}C_2 = 2({}^{32}C_2 \times {}^{32}C_1)$$

Hence, the required probability $= \dfrac{2({}^{32}C_2 \times {}^{32}C_1)}{{}^{64}C_3} = \dfrac{16}{21}$

21 A leap year contains 366 days comprising of 52 full weeks and 2 extra days. Thus there can be following 7 possibilities for 2 extra days.

(i) Sunday, Monday, (ii) Monday, Tuesday
(iii) Tuesday, Wednesday (iv) Wednesday, Thursday
(v) Thursday, Friday (vi) Friday, Saturday
(vii) Saturday, Sunday

Let A be the event that the leap year contains 53 Sundays.
and B be the event that leap year contains 53 Mondays.

Then, we have $P(A) = \dfrac{2}{7}, \quad P(B) = \dfrac{2}{7}, \quad P(A \cap B) = \dfrac{1}{7}$

So, required probability $= P(A \cup B)$

$$= P(A) + P(B) - P(A \cap B) = \frac{2}{7} + \frac{2}{7} - \frac{1}{7} = \frac{3}{7}$$

22 Since, the probability of getting atleast one head in n times

$$= 1 - \left(\frac{1}{2}\right)^n$$

Therefore, $1 - \left(\dfrac{1}{2}\right)^n \geq 0.9 \Rightarrow \left(\dfrac{1}{2}\right)^n \leq 0.1$

$\Rightarrow \qquad 2^n \geq 10 \Rightarrow n \geq 4$

Hence, the least value of n is 4.

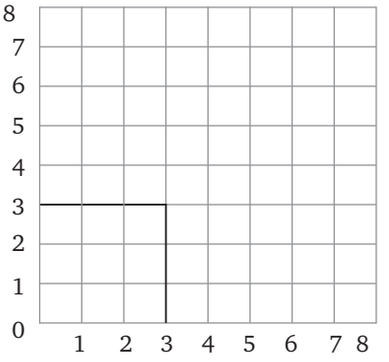
23 Total number of ways in which 2 persons can be selected out of 13 persons is ${}^{13}C_2$

Now, favourable number of cases $= \dfrac{{}^5C_1 \times {}^8C_1 + {}^5C_2}{{}^{13}C_2} = \dfrac{25}{39}$

24 We can choose 9 squares out of 64 squares in ${}^{64}C_9$ ways.

Hence, exhaustive number of cases $= {}^{64}C_9$

From the figure it is clear that the given square of size 3×3



can be formed by using four consecutive horizontal and 4 consecutive vertical lines, which can be done in

$${}^6C_1 \times {}^6C_1 = 36 \text{ ways}$$

Basically you can make 6 squares of size 3×3 in vertical direction and 6 squares of the size 3×3 in horizontal direction. Hence total $6 \times 6 = 36$ squares can be chosen.

$\therefore$ The required probability $= \dfrac{36}{{}^{64}C_9}$

25 Total 7 digit numbers can be formed from the 9 digits $= {}^9P_7$.

There are four exclusive cases of selecting 7 digits out of 9 digits which can form 7 digit numbers which are divisible by 9.

2, 3, 4, 5, 6, 7, 9 } 36 removing 1 and 8
1, 3, 4, 5, 6, 8, 9 } 36 removing 2 and 7
1, 2, 4, 5, 7, 8, 9} 36 removing 3 and 6
1, 2, 3, 6, 7, 8, 9 } 36 removing 4 and 5

All the 7 numbers of each of the 4 sets can be arranged in 7! ways. Hence the favourable number of numbers $= 4 \times 7!$

$\therefore$ Required probability $= \dfrac{4 \times 7!}{{}^9P_7} = \dfrac{1}{9}$

26 Total number of ways of selecting 2 distinct numbers from the set of 10 natural numbers $= {}^{10}C_2 = 42$

Sets of co-primes are (1, 2), (1, 3), (1, 4), … (1, 10); (2, 3), (2, 5), (2, 7), (2, 9); (3, 4), (3, 5), (3, 7), (3, 8), (3, 10); (4, 5), (4, 7), (4, 9); (5, 6), (5, 7), (5, 8), (5, 9); (6, 7); (7, 8), (7, 9), (7, 10); (8, 9); (9, 10)

Thus total pairs of co-primes

$$= 9 + 4 + 5 + 3 + 4 + 1 + 3 + 1 + 1 = 31$$

Therefore the required probability = 31/45.

Hence choice (a) is the correct one.

Hint How to find the number of sets of two co-prime numbers?

Number of co-prime numbers of 10 which are below

$$10 = 10 \times \left(1 - \frac{1}{2}\right) \times \left(1 - \frac{1}{5}\right) = 4$$

Number of co-prime numbers of 9 which are below

$$9 = 9 \times \left(1 - \frac{1}{3}\right) = 6$$

Number of co-prime numbers of 8 which are below

$$8 = 8 \times \left(1 - \frac{1}{2}\right) = 4$$

Number of co-prime numbers of 7 which are below

$$7 = 7 \times \left(1 - \frac{1}{7}\right) = 6$$

Number of co-prime numbers of 6 which are below

$$6 = 6 \times \left(1 - \frac{1}{2}\right) \times \left(1 - \frac{1}{3}\right) = 2$$

Number of co-prime numbers of 5 which are below

$$5 = 5 \times \left(1 - \frac{1}{5}\right) = 4$$

Number of co-prime numbers of 4 which are below

$$4 = 4 \times \left(1 - \frac{1}{2}\right) = 2$$

Number of co-prime numbers of 3 which are below

$$3 = 3 \times \left(1 - \frac{1}{3}\right) = 2$$

Number of co-prime numbers of 2 which are below

$$2 = 2 \times \left(1 - \frac{1}{2}\right) = 1$$

Therefore total number of sets of co-prime numbers (or pairs) = 4 + 6 + 4 + 6 + 2 + 4 + 2 + 2 + 1 = 31.

☑ Level 02 *Higher Level Exercise*

1 Total number of words that can be formed from the letters of the word MISSISSIPPI is $\frac{11!}{4!\,4!\,2!}$

When all the S's are together then the number of words can be formed $= \frac{8!}{4!\,2!}$

$$\therefore \quad \text{Required probability} = \frac{\frac{8!}{4!\,2!}}{\frac{11!}{4!\,4!\,2!}} = \frac{4}{165}$$

2 Since each of the coefficients a, b and c can take values from 1 to 6. Therefore the total number of equations

$$= 6 \times 6 \times 6 = 216$$

Hence the exhaustive number of cases = 216

Now, the roots of the equation $ax^2 + bx + c = 0$ will be real if $b^2 - 4ac \geq 0 \Rightarrow b^2 \geq 4ac$

Following are the number of favourable cases

a	c	ac	$4ac$	b^2 ($\geq 4ac$)	b	Number of cases
1	1	1	4	4, 9, 16, 25, 36	2, 3, 4, 5, 6	$1 \times 5 = 5$
1 2	2 1	2	8	9, 16, 25, 36	3, 4, 5, 6	$2 \times 4 = 8$
1 3	3 1	3	12	16, 25, 36	4, 5, 6	$2 \times 3 = 6$
1 2 4	4 2 2	4	16	16, 25, 36	4, 5, 6	$3 \times 3 = 9$
1 5	5 1	5	20	25, 36	5, 6	$2 \times 2 = 4$
1 2 3 6	6 3 2 1	6	24	25, 36	5, 6	$4 \times 2 = 8$
2 4	4 2	8	32	36	6	$2 \times 1 = 2$
3	3	9	36	36	6	$1 \times 1 = 1$
					Total	= 43

Note $\rightarrow ac = 7$ is not possible

Since $b^2_{(\max)} = 36$ and $4ac \leq b^2$ hence $ac = 10, 11, 12, \ldots$ etc. is not possible.

Hence , total number of favourable cases = 43

So, the required probability $= \frac{43}{216}$.

3 6 can be thrown with a pair of dice in the following ways

(1, 5), (5, 1), (2, 4), (4, 2), (3, 3)

So, probability of throwing a '6'$= \frac{5}{36}$

and probability of not throwing a '6' $= \frac{31}{36}$

And 7 can be thrown with a pair of dice in the following ways.

(1, 6), (6, 1), (2, 5), (5, 2), (3, 4), (4, 3)

so probability of throwing a '7' $= \frac{6}{36} = \frac{1}{6}$

and probability of not throwing a '7' $= \frac{5}{6}$

Let E_1 be the event of the throwing a '6' in a single throw of a pair of dice and E_2 be the event of throing a 7 in a single throw of a pair of dice.

Then $P(E_1) = \frac{5}{36}, \quad P(E_2) = \frac{1}{6}$

and $P(\bar{E}_1) = \frac{31}{36}, \quad P(\bar{E}_2) = \frac{5}{6}$

A wins if he throws '6' in first or third or fifth .. throws.

Probability of A throwing a 6 in first throw $= p(E_1) = \frac{5}{36}$

and probability of A throwing a 6 in third throw

$$= P(\bar{E}_1 \cap \bar{E}_2 \cap E_1) = P(\bar{E}_1)\,P(\bar{E}_2)\,P(E_1) = \frac{31}{36} \times \frac{5}{6} \times \frac{5}{36}$$

Similarly, probability of A throwing a '6' in fifth throw

$$= P(\bar{E}_1)\,P(\bar{E}_2)\,P(\bar{E}_1)\,P(\bar{E}_2)\,P(E_1)$$

$$= \left(\frac{31}{36}\right)^2 \times \left(\frac{5}{6}\right)^2 \times \frac{5}{36}$$

Hence, probability of winning of A

$$= P[E_1 \cup (\bar{E}_1 \cap \bar{E}_2 \cap E_1) \cup (\bar{E}_1 \cap \bar{E}_2 \cap \bar{E}_1 \cap \bar{E}_2 \cap E_1) \cup \ldots]$$

$$= P(E_1) + P(\bar{E}_1 \cap \bar{E}_2 \cap E_1) + P(\bar{E}_1 \cap \bar{E}_2 \cap \bar{E}_1 \cap \bar{E}_2 \cap \bar{E}_1) + \ldots$$

$$= \frac{5}{36} + \left(\frac{31}{36} \times \frac{5}{6}\right) \times \frac{5}{36} + \left(\frac{31}{36} \times \frac{5}{6}\right)^2 \times \frac{5}{36} + \ldots$$

$$= \frac{\frac{5}{36}}{1 - \left(\frac{31}{36}\right) \times \left(\frac{5}{6}\right)} = \frac{30}{61}$$

Thus, probability of winning of $B = 1 - \frac{30}{61} = \frac{31}{61}$

4 Let A be the event of getting exactly 3 defectives in the examination of 8 wristwatches.
And B be the event of getting ninth wristwatch defective. Then

Required probability $= P(A \cap B) = P(A)\, P\left(\frac{B}{A}\right)$

Now, $$P(A) = \frac{{}^4C_3 \times {}^{11}C_5}{{}^{15}C_8}$$

And $P\left(\frac{B}{A}\right)$ = Probability that the nineth examined wristwatch is defective given that there were 3 defectives in the first 8 pieces examined $= \frac{1}{7}$

Hence, required probability $= \frac{{}^4C_3 \times {}^{11}C_5}{{}^{15}C_8} \times \frac{1}{7} = \frac{8}{195}$

5 Let E_1, E_2, E_3 and A be the events defined as follows :
E_1 = the examinee guesses the answer
E_2 = the examinee copies the answer
E_3 = the examinee knows the answer and
A = the examinee answers correctly
We have $P(E_1) = \frac{1}{3}$, $P(E_2) = \frac{1}{6}$

Since E_1, E_2 and E_3 are mutually exclusive and exhaustive events therefore

$$P(E_1) + P(E_2) + P(E_3) = 1$$

$$\Rightarrow \quad P(E_3) = \frac{1}{2}$$

If E_1 has already occurred, then the examinee guesses. Since there are four choices out of which only one is correct, therefore the probability that he answers correctly given that he has made a guess is $\frac{1}{4}$ *i.e.,* $P\left(\frac{A}{E_1}\right) = \frac{1}{4}$

It is a given that $P\left(\frac{A}{E_2}\right) = \frac{1}{8}$ and $P\left(\frac{A}{E_3}\right)$ is the probability that he answers correctly given that he knew the answer = 1
By Baye's rule,

Required probability $= P\left(\frac{E_3}{A}\right)$

$$= \frac{P(E_3)\, P\left(\frac{A}{E_3}\right)}{P(E_1)\, P\left(\frac{A}{E_1}\right) + P(E_2)\, P\left(\frac{A}{E_2}\right) + P(E_3)\, P\left(\frac{A}{E_3}\right)}$$

$$= \frac{\frac{1}{2} \times 1}{\frac{1}{3} \times \frac{1}{4} + \frac{1}{6} \times \frac{1}{8} + \frac{1}{2} \times 1} = \frac{24}{29}$$

6 Let x and y be the two non-negative integers
since $x + y = 200$

$\therefore \quad (xy)_{\max} = 100 \times 100 = 10000$ ($xy_{\max}$ at $x = y$)

Now, $\quad xy \not< \frac{3}{4} \times 10000 \quad \Rightarrow \quad xy \geq \frac{3}{4} \times 10000$

$\Rightarrow \quad xy \geq 7500 \quad \Rightarrow \quad x\,(200 - x) \geq 7500$

$\Rightarrow \quad x^2 - 200x + 7500 \leq 0$

$\Rightarrow \quad 50 \leq x \leq 150$

So favourable number of ways = 150 − 50 + 1 = 101
Total number of ways = 200
Hence, required probability $= \frac{101}{200}$

7 Let $E_i (i = 1, 2, 3$ etc.) denote the event of drawing an even numbered card in i^{th} draw and $F_i\,(i = 1, 2, 3)$ denote the event of drawing an odd numbered card in i^{th} draw, then required probability

$$= P[(E_1 \cap F_2 \cap F_3) \cup (F_1 \cap E_2 \cap F_3) \cup (F_1 \cap F_2 \cap E_3)]$$

$$= P(E_1)\, P(F_2)\, P(F_3) + P(F_1)\, P(E_2)\, P(F_3) + P(F_1)\, P(F_2)\, P(E_3)$$

$$= \frac{4}{9} \times \frac{5}{9} \times \frac{5}{9} + \frac{5}{9} \times \frac{4}{9} \times \frac{5}{9} + \frac{5}{9} \times \frac{5}{9} \times \frac{4}{9}$$

$$= 3 \times \frac{4 \times (5)^2}{(9)^3} = \frac{100}{243}$$

8 Consider the following events
A = The first number is less than the second number
B = The third number lies between the first and the second.
Now, we have to find $P\left(\frac{B}{A}\right)$.

Also, we have $P\left(\frac{B}{A}\right) = \frac{P(A \cap B)}{P(A)}$

Any 3 numbers can be chosen out of n numbers in ${}^nC_3$ ways.
Let the selected numbers be x_1, x_2, x_3. Then they satisfy exactly one of the following inequalities.

$$x_1 < x_2 < x_3, \quad x_1 < x_3 < x_2, \quad x_2 < x_1 < x_3,$$
$$x_2 < x_3 < x_1, \quad x_3 < x_1 < x_2, \quad x_3 < x_2 < x_1$$

The total number of ways of selecting three numbers and then arranging them $= {}^nC_3 \times 3! = {}^nP_3$

$\therefore \quad P(A) = \frac{{}^nC_3 \times 3}{{}^nC_3 \times 3!}$

and $P(A \cap B) = \dfrac{{}^{n}C_3}{{}^{n}C_3 \times 3!}$

Hence $P\left(\dfrac{B}{A}\right) = \dfrac{P(A \cap B)}{P(A)} = \dfrac{1}{3}$

9 Since b and c each can assume 9 values from 1 to 9.

So, total number of ways of choosing b and c is $9 \times 9 = 81$

Now, $x^2 + bx + c > 0$ for all $x \in R$

$\Rightarrow \quad D < 0$

$\Rightarrow \quad b^2 - 4ac < 0 \Rightarrow b^2 - 4c < 0$

$\Rightarrow \quad b^2 < 4c$

Alternatively $x^2 + bx + c > 0$

$\Rightarrow \quad \left(x + \dfrac{b}{2}\right)^2 + \dfrac{4c - b^2}{4} > 0$

$\Rightarrow \quad 4c - b^2 > 0$

$\Rightarrow \quad b^2 < 4c$

Now, the following table shows the possible values of b and c for which $b^2 < 4c$

c	b	Total
1	1,	1
2	1, 2	2
3	1, 2, 3	3
4	1, 2, 3,	3
5	1, 2, 3, 4	4
6	1, 2, 3, 4	4
7	1, 2, 3, 4, 5	5
8	1, 2, 3, 4, 5	5
9	1, 2, 3, 4, 5	5
		32

So, favourable number of cases = 32

Hence required probability = 32/ 81

10 We have, $P(A \cup B \cup C) = 3/4$

i.e., $P(A) + P(B) + P(C) - P(A \cap B)$

$-P(B \cap C) - P(A \cap C) + P(A \cup B \cup C) = 3/4$

and $P(A \cap B) + P(B \cap C) + P(A \cap C) - 2P(A \cap B \cap C) = \dfrac{1}{2}$

and $P(A \cap B) + P(B \cap C) + P(A \cap C) - 3P(A \cap B \cap C) = \dfrac{2}{5}$

Solving the above equations (last two), we get

$$P(A \cap B \cap C) = \frac{1}{2} - \frac{2}{5} = \frac{1}{10}$$

$\Rightarrow \quad P(A)\,P(B)\,P(C) = \dfrac{1}{10} \quad \Rightarrow \quad pmc = \dfrac{1}{10}$

Also, $P(A) + P(B) + P(C) - [P(A \cap B)$

$$+ P(B \cap C) + P(A \cap C)] + P(A \cup B \cup C) = \frac{3}{4}$$

$$p + m + c - \left(\frac{1}{2} + \frac{2}{10}\right) + \frac{1}{10} = \frac{3}{4}$$

$\Rightarrow \quad p + m + c = 27/20$

11 Let E, F, G be the events that the student is successful in tests A, B and C respectively. Then the probability that the students is successful is

$= P[(E \cap F \cap \bar{G}) \cup (E \cap \bar{F} \cap G) \cup (E \cap F \cap G)]$

$= P(E \cap F \cap \bar{G}) + P(A \cap \bar{F} \cap G) + P(E \cap F \cap G)$

$= P(E)\,P(F)\,P(\bar{G}) + P(E)\,P(\bar{F})\,P(G) + P(E)\,P(F)\,P(G)$

$= pq\left(1 - \dfrac{1}{2}\right) + p(1-q)\left(\dfrac{1}{2}\right) + pq\left(\dfrac{1}{2}\right)$

$= \dfrac{pq + p - pq + pq}{2} = \dfrac{p(1+q)}{2}$

But the probability that the student is successful $= 1/2$

$\therefore \quad \dfrac{P(1+q)}{2} = \dfrac{1}{2} \quad \Rightarrow \quad p(1+q) = 1$

This is satisfied by $p = 1$, $q = 0$

Also there are other values (infinite numbers) of p, q for which the above relation is satisfied.

Hence, (d) is the correct option.

12 Since $\dfrac{1+4p}{p}, \dfrac{1-p}{4}, \dfrac{1-2p}{2}$ are the probabilities of 3 mutually exclusive events, therefore

$$0 \le \frac{1+4p}{p} \le 1, \quad 0 \le \frac{1-p}{4} \le 1, \quad 0 \le \frac{1-2p}{2} \le 1$$

and $0 \le \dfrac{1+4p}{p} + \dfrac{1-p}{4} + \dfrac{1-2p}{2} \le 1$

$\Rightarrow -\dfrac{1}{4} \le p \le \dfrac{3}{4}, \quad -1 \le p \le 1, \quad -\dfrac{1}{2} \le p \le \dfrac{1}{2}$ and $\dfrac{1}{2} \le p \le \dfrac{5}{2}$

$\Rightarrow \quad \max\left\{-\dfrac{1}{4}, -1, -\dfrac{1}{2}, \dfrac{1}{2}\right\} \le p \le \min\left\{\dfrac{3}{4}, 1, \dfrac{1}{2}, \dfrac{5}{2}\right\}$

$\Rightarrow \quad \dfrac{1}{2} \le p \le \dfrac{1}{2} \Rightarrow p = \dfrac{1}{2}$

13 ASSISTANT $\rightarrow$ *AA I N SSS TT*, STATISTICS $\rightarrow$ *A II C SSS TTT*

Here N and C are not common and same letters can be *A, I, S, T*. Therefore

Probability of choosing $A = \dfrac{{}^{2}C_1}{{}^{9}C_1} \times \dfrac{{}^{1}C_1}{{}^{10}C_1} = \dfrac{1}{45}$

Probability of choosing $I = \dfrac{1}{{}^{9}C_1} \times \dfrac{{}^{2}C_1}{{}^{10}C_1} = \dfrac{1}{45}$

Probability of choosing $S = \dfrac{{}^{3}C_1}{{}^{9}C_1} \times \dfrac{{}^{3}C_1}{{}^{10}C_1} = \dfrac{1}{10}$

Probability of choosing $T = \dfrac{{}^{2}C_1}{{}^{9}C_1} \times \dfrac{{}^{3}C_1}{{}^{10}C_1} = \dfrac{1}{15}$

Hence, required probability $= \dfrac{1}{45} + \dfrac{1}{45} + \dfrac{1}{10} + \dfrac{1}{15} = \dfrac{19}{90}$

14 Out of 30 numbers 2 numbers can be chosen in ${}^{30}C_2$ ways.

So, exhaustive number of cases $= {}^{30}C_2 = 435$

Since $a^2 - b^2$ is divisible by 3 iff either a and b are divisible by 3 or none of a and b is divisible by 3. Thus, the favourable numbers, of cases $= {}^{10}C_2 + {}^{20}C_2 = 235$

Hence, required probability $= \dfrac{235}{435} = \dfrac{47}{87}$

15 The man will be one step away from the starting point if (A) either he is one step ahead or (B) one step behind the starting point. Therefore, required probability = $P(A) + P(B)$

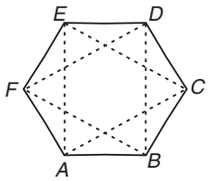
The man will be one step ahead at the end of eleven steps if he moves six steps forward and five steps backward. The probability of this event = ${}^{11}C_6(0.4)^6\,(0.6)^5$. The man will be one step behind at the end of the eleven steps if he moves six steps backward and five steps forward. The probability of this event = ${}^{11}C_6(0.6)^6\,(0.4)^5$.

Hence, the required probability

$$= {}^{11}C_6(0.4)^6(0.6)^5 + {}^{11}C_6(0.6)^6\,(0.4)^5$$

$$= {}^{11}C_6(0.4)^5\,(0.6)^5\,(0.4 + 0.6) = {}^{11}C_6(0.24)^5$$

16 There are 6 vertices in a hexagon. Using 3 vertices out of 6 vertices we can form ${}^6C_3$ triangles. But there can be only two triangles out of ${}^6C_3$ triangles which are equilateral (see the figure, (i) ΔACE, (ii) ΔBDF)



Hence, the required probability $= 2/{}^6C_3 = 2/20 = 1/10$

17 Let F, B, L and R denote the forward, backward, left and right steps (or movements) then the following mutually exclusive ways are possible.

F	B	L	R
0	0	4	5
1	1	3	4
2	2	2	3
3	3	1	2
4	4	0	1
0	0	5	4
1	1	4	3
2	2	3	2
3	3	2	1
4	4	1	0

In this case he cancels out his forward and backward movements by moving equal steps in forward and backward directions each and he creates a difference of 1 step by moving one step extra either in right or left direction.

F	B	L	R
4	5	0	0
3	4	1	1
2	3	2	2
1	2	3	3
0	1	4	4
5	4	0	0
4	3	1	1
3	2	2	2
2	1	3	3
1	0	4	4

In this case he cancels out his left or right movement by moving equal number of steps in left and right directions each and he creates a difference of 1 step by moving one step extra either in forward or backward directions.

The number of permutations of these five arrangements is

$$4\left[\frac{9!}{5!\,4!} + \frac{9!}{1!1!3!4!} + \frac{9!}{2!2!2!3!} + \frac{9}{3!3!1!2!} + \frac{9!}{4!4!1!}\right]$$

$$= 4(126 + 2520 + 7560 + 5040 + 630) = 4 \times 15876$$

But the total number of ways of arranging nine steps = 4^9.

$\therefore$ The required probability $= \dfrac{4 \times 15876}{4^9} = \dfrac{3969}{4^7}$

18 Let E_{rr} denote that a red colour ball is transferred from urn A to urn B tourn then a red colour ball is transferred from urn B to urn

E_{rb} denote that a red colour ball is transferred from urn A to urn B then a black colour ball is transferred from urn B to urn A

E_{br} denote that a black colour ball is transferred from urn. A to urn B then a red colour ball is transferred from urn B to urn A.

E_{bb} denote that a black colour ball is transferred from urn A to urn B then a black colour ball is transferred from urn B to urn A.

Then $P(E_{rr}) = \left(\frac{6}{10}\right)\left(\frac{5}{11}\right) = \frac{3}{11}$, $P(E_{rb}) = \left(\frac{6}{10}\right)\left(\frac{6}{11}\right) = \frac{18}{55}$

$$P(E_{br}) = \left(\frac{4}{10}\right)\left(\frac{4}{11}\right) = \frac{8}{55},\ P(E_{bb}) = \left(\frac{4}{10}\right)\left(\frac{7}{11}\right) = \frac{14}{55}$$

Let A be the event of drawing a red colour ball after these transfers. Then $P\left(\frac{A}{E_{rr}}\right) = \frac{6}{10}$, $P\left(\frac{A}{E_{rb}}\right) = \frac{5}{10}$

$$\Rightarrow \qquad P\left(\frac{A}{E_{br}}\right) = \frac{7}{10},\ P\left(\frac{A}{E_{bb}}\right) = \frac{6}{10}$$

Therefore, the required probability is

$$P(A) = P(E_{rr})\,P\left(\frac{A}{E_{rr}}\right) + P(E_{rb})\,P\left(\frac{A}{E_{rb}}\right) + P(E_{br})\,P\left(\frac{A}{E_{br}}\right) + P(E_{bb})\,P\left(\frac{A}{E_{bb}}\right)$$

$$= \left(\frac{3}{11}\right)\left(\frac{6}{10}\right) + \left(\frac{5}{10}\right)\left(\frac{18}{55}\right) + \left(\frac{8}{55}\right)\left(\frac{7}{10}\right) + \left(\frac{14}{55}\right)\left(\frac{6}{10}\right)$$

$$= \frac{90 + 90 + 56 + 84}{550} = \frac{32}{55}$$

19 A number is divisible by 11 only if the difference of the sum of the digits at odd places and sum of the digits at even places is divisible by 11 *i.e,* 0, 11, 22, 33 ....

Here the sum of all the 9 digits (1, 2, 3, ...9) is 45.

We cannot create the difference of zero

since $x + y = 45$, which is odd hence cannot be broken into two equal parts in integers. Now, we will look for the possibilities of 11 which are as follows :

{1, 2, 6, 8}{1, 2, 5, 9}{1, 3, 6, 7}

{1, 3, 5, 8} {1, 3, 4, 9}{1, 4, 5, 7}

{2, 3, 5, 7}{2, 3, 4, 8}{2, 4, 5, 6} and {4, 7, 8, 9}{5, 6, 8, 9}

The above set of values either gives the sum of 17 or 28.

Since if the sum of 4 digits at even places be 17 or 28 then the sum of rest of the digits (*i.e.,* digits at odd places) be 28 or 17 respectively and thus we can get the difference of 11.

Further we cannot get the difference of 22 or 33...

So there is only possible difference that can be created is 11 and there are only 11 set of values given above containing 4 digits which can be arranged in 4! ways and the remaining 5 digits can be arranged in 5! ways.

Thus the favourable number of numbers

$$= 11 \times 4! \times 5!$$

But the total number of ways of arranging a nine digit number is ${}^{9}P_{9} = 9!$

$\therefore$ Exclusive number of cases = $9!$

$\therefore$ Required probability = $\dfrac{11 \times 4! \times 5!}{9!} = \dfrac{11}{126}$.

20 The number of ways of choosing any three phones out of total 12 phones = ${}^{12}C_3 = 220$

The number of conference calls that can be made from the 216 given phones = ${}^{12}C_3 - {}^{4}C_3 = 216$

Therefore the required probability = $\dfrac{216}{220} = \dfrac{54}{55}$

Hence choice (d) is the correct one.

21 Probability of uploading 3 photos, after editing, such that at least 2 photos are from the same folder

= 1 – Probability of uploading 3 photos, after editing, from three different folders

$$= 1 - \frac{{}^{3}C_1 \times {}^{4}C_1 \times {}^{5}C_1}{{}^{12}C_3} = \frac{3}{11}$$

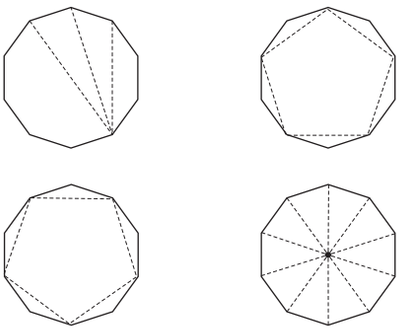
Probability that no folder has the photo uploaded back from its original folder, after editing

$$= 1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} = \frac{1}{3}$$

Therefore, the required probability = $\dfrac{3}{11} \times \dfrac{1}{3} = \dfrac{1}{11}$

Hence choice (a) is the correct one.

22 First of all you must know that there are diagonals of four distinct lengths. If $d_1 < d_2 < d_3 < d_4$ be the diagonals in that of their increasing length, then d_1 is a diagonal which is formed by connecting any two vertices, leaving one vertex between them and d_2 is a diagonal which is formed by connecting any two vertices, leaving two vertices between them and d_3 is a diagonal which is formed by connecting any two vertices, leaving three vertices between them and d_4 is a diagonal which is formed by connecting any two vertices, leaving four vertices between them.



Total number of diagonals = $\dfrac{10(7)}{2} = 35$

Number of shortest diagonals = $\dfrac{10(2)}{2} = 10$

Number of longest diagonals = $\dfrac{10}{2} = 5$

Number of diagonals which are neither the shortest nor the longest = 35 – (10 + 5) = 20.

Therefore, the required probability = $\dfrac{20}{35} = \dfrac{4}{7}$

Hence choice (a) is the correct one.

Hint Total number of diagonals in a regular polygon of n side = $\dfrac{n(n-3)}{2}$

The number of the longest diagonals = number of pairs of opposite points in a decagon.

CHAPTER 21

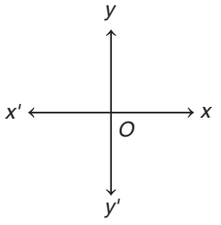
Co-ordinate Geometry

It is one of those chapters which contributes least number of problems in CAT. Perhaps this chapter is more or less algebraic instead of being logical, since most of the problems require formula to solve them. But some other MBA entrance exams ask the question from this chapter. It is not fool proof but this chapter may be optional particularly for CAT aspirants who feel difficulty in algebraic problems. But it does not mean that this chapter is difficult or can not be learned.

21.1 Cartesian Coordinate System

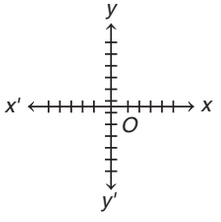
Rectangular Co-ordinate Axes

Let $X'OX$ and $Y'OY$ be the two mutually perpendicular lines through any point O in the plane of paper. The point O is called the origin. The line $X'OX$ is called the X-axis and the line $Y'OY$ is called the Y-axis. These two lines taken together are called the **co-ordinate axes.**



Cartesian Co-ordinate of a Point

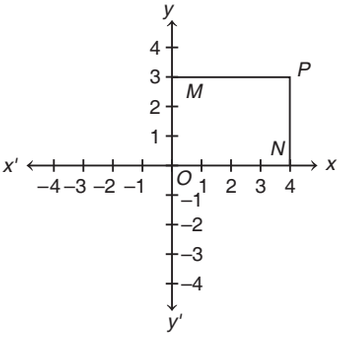
Each axes is calibrated as a scale into several points which are equidistant from each other.



Chapter Checklist

- *Cartesian Coordinate System*
- *Some Important Formulae*
- *Condition of Collinearity of Three Points*
- *Important Results*
- *Important Points in a Triangle*
- *Shifting of Origin*
- *Straight Line*
- *Equations of Lines Parallel to the Co-ordinate Axes*
- *Different Standard Forms of the Equations of a Straight Line*
- *Reduction (or Transformation) of the General Equation*
- *Point of Intersection of Two Lines*
- *Condition of Concurrency of Three Lines*
- *Angle Between Two Straight Lines*
- *Condition for Parallelism and Perpendicularity of two lines*
- *Distance of a Point From a Given Line or Length of Perpendicular From the Point (x_1, y_1) to the Straight Line $ax+by+c=0$*
- ***CAT Test***

The point O is assumed to be zero.



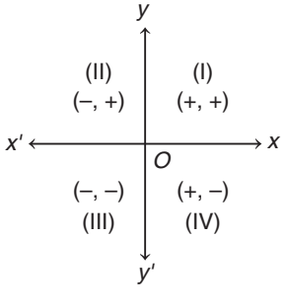
Let P be any point on the plane, then we draw a perpendicular from P on the X-axis and another on the Y-axis. Then the distance MP (which is parallel to the X-axis) is called the x-coordinate or abscissa of point P.

Similarly, the length PN (which is parallel to the Y-axis) is called the y-coordinate or ordinate of point P.

Then the position of the point P in the plane with respect to the coordinate axes is represented by the ordered pair (x, y). The ordered pair (x, y) is called the coordinates of point P.

Quadrants

In the adjacent figure the two axes intersect each other perpendicular at point O. The regions XOY, $X'OY$, $X'OY'$ and $Y'OX$ are known as first, second, third and fourth quadrant respectively.



The nature of values of x and y in different quadrants is different which is shown in figure also given below

Quadrant	Sign of (x, y)
I	$(+, +)$
II	$(-, +)$
III	$(-, -)$
IV	$(+, -)$

For example, let P be a point in second quadrant, then it is denoted as $(-1, 2), (-2, 3), (-3, 5), (-6, 8), (-7, 10)$ etc.

The coordinates of point O (i.e, origin) are taken as $(0, 0)$. The coordinates of any point on X-axis are of the form $(x, 0)$ and the coordinates of any point on Y-axis are of the form$(0, y)$.

21.2 Some Important Formulae

Distance Formula

The distance between two points $P(x_1, y_1)$ and $Q(x_2, y_2)$ is given by $PQ = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$

Also, Distance of point (x_1, y_1) from origin $= \sqrt{x_1^2 + y_1^2}$

Section Formula

If $R(x, y)$ divides the line segment joined by the points $P(x_1, y_1)$ and $Q(x_2, y_2)$ internally in the ratio $m : n$ then

$$x = \frac{mx_2 + nx_1}{m + n},\ y = \frac{my_2 + ny_1}{m + n}$$

If $R(x, y)$ divides the line segment joined by the points $P(x_1, y_1)$ and $Q(x_2, y_2)$ externally in the ratio $m : n$, then

$$x = \frac{mx_2 - nx_1}{m - n},\ y = \frac{my_2 - ny_1}{m - n}$$

Area of Plane

Area of a Triangle

The area of a triangle ABC whose vertices are $A(x_1, y_1)$, $B(x_2, y_2)$ and $C(x_3, y_3)$ is denoted by Δ.

$$\therefore \quad \Delta = \frac{1}{2}\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$$

$$= \frac{1}{2}[x_1(y_2 - y_3) + x_2(y_3 - y_1) + x_3(y_1 - y_2)]$$

Area of a Polygon

The area of the polygon whose vertices are

$$(x_1, y_1), (x_2, y_2), (x_3, y_3), \ldots, (x_n, y_n) \text{ is}$$

$$\Delta = \frac{1}{2}[(x_1 y_2 - x_2 y_1) + (x_2 y_3 - x_3 y_2) + \ldots + (x_n y_1 - x_1 y_n)]$$

21.3 Condition for Collinearity of Three Points

The three given points are collinear *i.e.,* lie on the same straight line if

(i) Area of triangle ABC is zero.

(ii) Slope of AB = Slope of BC = Slope of AC

(iii) Distance between A and B + distance between B and C = Distance between A and C.

(iv) Find the equation of the line passing through any two points , if third point satisfies the equation of the line then three points are collinear.

21.4 Important Results

1. If the vertices of a triangle have integral co-ordinates then the triangle can not be equilateral.
2. In order to prove that a given figure is a square, parallelogram, rectangle etc. We will prove the following points given in the table below corresponding the name of the figure.

S.N.	Name of the figure	Conditions
1.	Square	Four sides are equal and the diagonals are also equal
2.	Rhombus	Four sides are equal
3.	Rectangle	Opposite sides are equal and diagonals are also equal
4.	Parallelogram	Opposite sides are equal
5.	Parallelogram but not a rectangle	Opposite sides are equal but the diagonals are not equal.
6.	Rhombus but not a square	All sides are equal but the diagonals are not equal

21.5 Important Points in a Triangle

Centroid

If (x_1, y_1), (x_2, y_2) and (x_3, y_3) are the vertices of a triangle, then the coordinates of its centroid are

$$\left(\frac{x_1 + x_2 + x_3}{3}, \frac{y_1 + y_2 + y_3}{3}\right)$$

Incentre

If $A(x_1, y_1)$, $B(x_2, y_2)$ and $C(x_3, y_3)$ are the vertices of a triangle ABC such that $BC = a$, $CA = b$ and $AB = c$, then the coordinates of its centre are

$$\left(\frac{ax_1 + bx_2 + cx_3}{a+b+c}, \frac{ay_1 + by_2 + cy_3}{a+b+c}\right)$$

NOTE If the equations of the sides of the triangle are given then we find the bisectors of internal angles and then their point of intersection to determine the incentre.

Circumcentre

If 'O' is the circumcentre of a triangle ABC, then $OA = OB = OC$ and OA is called the circumradius.

To find the circumcentre of ΔABC, we use the relation $OA = OB = OC$. This gives two simultaneous linear equation and their solution provides the coordinates of circumcentre.

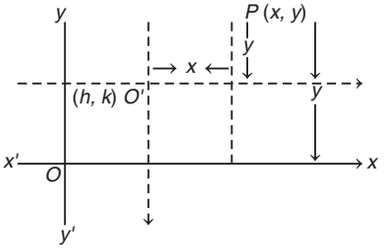
Orthocentre

To determine the orthocentre, first we find equations of lines passing through vertices and perpendicular to the opposite sides. Solving any two of these three equations we get the coordinates of orthocentre.

NOTE The circumcentre O, centroid G and othrocentre O' of a triangle ABC are collinear such that G divides $O'O$ in the ratio 2:1 *i.e.,* $O'G : OG = 2:1$

21.6 Shifting of Origin

Let O be the origin and $X'OX$ and $Y'OY$ be the axis of x and y respectively. Let O' and P be two points in the plane having coordinates (h, k) and (x, y) respectively referred to $X'OX$ and $Y'OY$ as coordinate axes.



Let the origin be transferred to O' and let $X'O'X$ and $Y'O'Y$ be new rectangular axes. Let the co-ordinates of P referred to new axes as the co-ordinate axes be (X, Y)

Thus if (x, y) are coordinates of a point referred to old axis and (X, Y) are the coordinates of the same point referred to new axis then.

$$x = X + h$$

and $$y = Y + k$$

If therefore the origin is shifted at a point (h, k) we must substitute $X + h$ and $Y + k$ for x and y respectively.

The transformation formula from new axes to old axes is

$$X = x - h, \quad Y = y - k$$

The coordinates of the old origin referred to the new axes are $(-h, -k)$

21.7 Straight Line

A straight line is a curve such that every point on the line segment joining any two points on it lies on it.

The general form of the equation of straight line

$$ax + by + c = 0$$

where a, b and c are real constants and x, y are two unknowns.

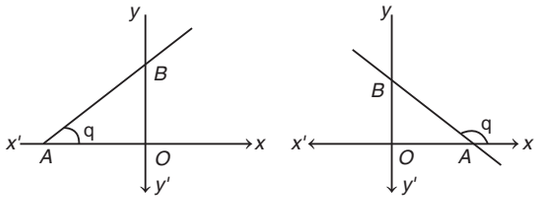
Slope (or Gradient) *of a Line*

$$m = \tan\theta = -\frac{a}{b}$$

$$\{\because ax + by + c = 0 \Rightarrow by = -ax - c \Rightarrow y = -\frac{a}{b}x - \frac{c}{b}$$

$$\Rightarrow \quad y = mx + c, \quad \text{where } m = -\frac{a}{b} \text{ and } c \text{ is a constant}\}$$

Here m is called the slope or gradient of a line and c is the intercept on y-axis. The slope of a line is always measured in anticlockwise.

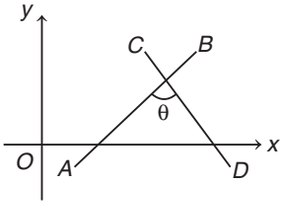


Slope of a line in terms of coordinates of any two points on it.

If (x_1, y_1) and (x_2, y_2) are coordinates of any two points on a line, then its slope is

$$m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{\text{Difference of ordinates}}{\text{Difference of abscissa}} = \frac{\text{rise}}{\text{run}}$$

Angle Between two Lines



$$\tan\theta = \pm\left(\frac{m_2 - m_1}{1 + m_1 m_2}\right)$$

Condition of Parallelism of Lines

If the slopes of two lines is m_1 and m_2 and if they are parallel then,

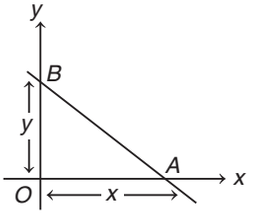
$$m_1 = m_2$$

Condition of Perpendicularity of Lines

If the slopes of two lines is m_1 and m_2 and if they are perpendicular to each other, then

$$m_1 \,.\, m_2 = -1$$

Intercepts of a Line on The Axis



If a straight line cuts x-axis at A and the y-axis at B then OA and OB are known as the intercepts of the line on x-axis and y-axis respectively where O is the origin.

Introductory Exercise 21.1

1. The point (– 2, 3) lies in the quadrant :
(a) First (b) Second
(c) Third (d) Fourth

2. The point (2, – 3) lies in the quadrant :
(a) First (b) Second
(c) Third (d) Fourth

3. Find the distance between the points (– 5, 3) and (3, 1) :
(a) $2\sqrt{7}$ (b) $3\sqrt{14}$ (c) $5\sqrt{17}$ (d) $2\sqrt{17}$

4. Let the vertices of a triangle ABC be (4, 3), (7, – 1), (9, 3) then the triangle is :
(a) Scalene (b) Isosceles
(c) Equilateral (d) none of (a), (b),(c)

5. Let the vertices of a triangle ABC be (4, 4), (3, 5), (– 1, – 1), then the triangle is :
(a) scalene (b) equilateral
(c) right angled (d) none of (a), (b), (c)

6. Let the vertices of a triangle ABC be (7, 9), (3, – 7), and (– 3, 3) then the triangle is :
(a) right angled (b) equilateral
(c) isosceles (d) both (a) and (c)

7. A (– 3, 2) and B (5, 4) are the end points of a line segment, find the coordinates of the mid points of the line segment :
(a) (1, 3) (b) (2, 3) (c) (3, 2) (d) (4, 3)

8. In the previous question (no. 7) find the co-ordinates of the point which divides AB in the ratio 2 : 3 :
(a) $\left(\frac{1}{5}, \frac{14}{5}\right)$ (b) (2, 3) (c) $\left(\frac{1}{5}, 3\right)$ (d) $\left(3, \frac{1}{2}\right)$

9. Find the co-ordinates of the point which divides the join of the points (2, 4) and (6, 8) externally in the ratio 5 : 3 :
(a) (5, 6) (b) (12, 14) (c) (3, 8) (d) (2, 7)

10. The coordinates of the vertices of a triangle are (3, 1), (2, 3) and (– 2, 2). Find the coordinates of the centroid of the triangle ABC :
(a) (1, 2) (b) (2, 3) (c) (4, 5) (d) (5, 6)

11. Find the co-ordinates of the incentre of the triangle whose vertices are the points (4, – 2), (5, 5) and (– 2, 4) :
(a) $\left(\frac{7}{3}, \frac{2}{3}\right)$ (b) $\left(\frac{5}{2}, \frac{5}{2}\right)$
(c) $\left(\frac{6}{5}, 5\right)$ (d) none of these

12. Find the coordinates of the circum centre of the triangle whose vertices are (8, 6), (8, –2) and (2, –2) :
(a) (2, 3) (b) (5, 2)
(c) (5, 3) (d) (7, 2)

13. If the coordinates of the mid points of the sides of a triangle are (1, 1), (2, – 3) and (3, 4). Find its centroid:
(a) $\left(3, \frac{2}{3}\right)$ (b) $\left(2, \frac{3}{4}\right)$
(c) $\left(2, \frac{2}{3}\right)$ (d) none of these

14. If the previous problem (no. 13) find the incentre for the given triangle :
(a) $\left(8, \frac{3}{2}\right)$ (b) $\left(\frac{7}{2}, 5\right)$
(c) $(2\sqrt{3}, 5)$ (d) none of these

15. $A(-2, -1)$, $B(1, 0)$, $C(4, 3)$ and $D(1, 2)$ are the four points of a quadrilateral. The quadrilateral is a :
(a) Square (b) Rhombus
(c) Parallelogram (d) none of (a), (b),(c)

16. The three vertices of a parallelogram taken in a order are $(-1, 0)$, $(3, 1)$ and $(2, 2)$ respectively. Find the coordinates of the fourth vertex :
(a) $(-1, 2)$ (b) $(-2, 1)$
(c) $(2, 3)$ (d) $(3, -2)$

17. If the coordinates of the mid points of the sides of a triangle are $(1, 2)$, $(0, -1)$ and $(2, -1)$. Find the coordinates of its vertices :
(a) $(1, -4)$, $(3, 2)$, $(-1, 2)$ (b) $(1, 2)$, $(2, 3)$, $(3, -4)$
(c) $(3, 4)$, $(5, 2)$, $(1, 2)$ (d) none of these

18. Points $A(4, -1)$, $B(6, 0)$, $C(7, 2)$ and $D(5, 1)$ are the vertices of the following quadrilateral which is a :
(a) Square (b) Rectangle
(c) Rhombus (d) none of (a), (b), (c)

19. Find the area of quadrilateral formed by joining the points $(-4, 2)$, $(1, -1)$, $(4, 1)$ and $(2, 5)$:
(a) 25.4 (b) 20.5
(c) 24.5 (d) none of these

20. Find (x, y) if $(3, 2)$, $(6, 3)$, (x, y) and $(6, 5)$ are the vertices of a parallelogram :
(a) (5, 6) (b) (6, 5) (c) (9, 6) (d) (9, 5)

21. Determine the ratio in which $y - x + 2 = 0$ divides the line joining $(3, -1)$ and $(8, 9)$:
(a) 3 : 5 (b) 4 : 3
(c) 2 : 3 (d) none of these

22. If the area of the quadrilateral whose angular points taken in order are $(1, 2)$, $(-5, 6)$, $(7, -4)$ and $(h - 2)$ be zero, find the value of h :
(a) 2 (b) 3 (c) 5 (d) 6

23. The co-ordinates of A, B, C are (6, 3), (– 3, 5), (4, – 2) respectively and P is a point (x, y), then find the value of $\frac{\Delta PBC}{\Delta ABC}$:
(a) $\frac{x + y - 2}{7}$ (b) $\frac{x - y}{4}$
(c) $\frac{x + y - 3}{5}$ (d) none of these

24. Find the slope of the line joining the points $(7, 5)$ and $(9, 7)$:
(a) 1 (b) 2
(c) $\frac{1}{2}$ (d) 3

25. If $A(-2, 1)$, $B(2, 3)$ and $C(-2, -4)$ are three points, find the angle between BA and BC :
(a) $\tan^{-1}\left(\frac{3}{5}\right)$ (b) $\tan^{-1}\left(\frac{2}{3}\right)$
(c) $\tan^{-1}\left(\frac{3}{2}\right)$ (d) none of these

26. What is the slope of the line perpendicular to the line passing through the points (3, 5) and (– 4, 2) ?
(a) $-\frac{3}{5}$ (b) $-\frac{2}{3}$
(c) $-\frac{7}{3}$ (d) none of these

27. A line passes through the points $A(2, -3)$ and $B(6, 3)$. Find the slope of the line which is parallel to AB :
(a) $\frac{2}{3}$ (b) $\frac{3}{2}$
(c) $\frac{1}{2}$ (d) $\frac{3}{4}$

28. In the previous question (no. 27), find the slope of the line which is perpendicular to AB :
(a) $-\frac{4}{3}$ (b) $\frac{5}{6}$
(c) $-\frac{2}{3}$ (d) none of these

29. Points $A(6, 6)$, $B(2, 3)$ and $C(4, 7)$ are the vertices of a triangle which is :
(a) right angled
(b) acute angled
(c) obtuse angled
(d) none of the above

30. Three points $A(1, -2)$, $B(3, 4)$ and $C(4, 7)$ form :
(a) a straight line
(b) an equilateral triangle
(c) a right angled triangle
(d) none of (a), (b), (c)

21.8 Equations of Lines Parallel to the Co-ordinate Axes

Equation of a line parallel to x-axis and at a distance k from it is $y = k$. Equation of a line parallel to the y-axis and at a distance h from it is $x = h$.

Equation of the x-axis is $y = 0$

Equation of the y-axis is $x = 0$

21.9 Different Standard Forms of the Equations of a Straight Line

Slope Intercept Form

(a) The equation of a line with slope m and making an intercept on y-axis is $y = mx + c$.

(b) The equation of a line with slope m and passing through the origin (here $c = 0$) is $y = mx$.

Point Slope Form

The equation of a line passes through the point (x_1, y_1) and has the slope 'm' is $y - y_1 = m(x - x_1)$

Two Point Form

The equation of a line passing through two points (x_1, y_1) and (x_2, y_2) is $y - y_1 = \left(\frac{y_2 - y_1}{x_2 - x_1}\right)(x - x_1)$

Intercept Form

The equation of a line which cuts off intercepts a and b respectively from the x-axis and y-axis is $\frac{x}{a} + \frac{y}{b} = 1$.

Normal (or Perpendicular) *Form*

The equation of the straight line on which the length of the perpendicular from the origin (0, 0) is p and this perpendicular makes an angle α with x-axis is $x\cos\alpha + y\sin\alpha = p$.

Distance (or Symmetrical) *Form*

The equation of the straight line passing through (x_1, y_1) and making an angle θ with positive direction of x-axis is

$$\frac{x - x_1}{\cos\theta} = \frac{y - y_1}{\sin\theta} = r$$

Where r is the distance of the point (x, y) on the line from the point (x_1, y_1)

- Since different values of r determine different points on the line, therefore the above form of the line is also called parametric form or symmetric form.

21.10 Reduction (or Transformation) of the General Equation

The general equation of a straight line is $Ax + By + C = 0$ which can be transformed into various standard forms.

(i) General Equation $(Ax + By + C = 0) \rightarrow$ Slope Intercept form $(y = mx + c)$

$$Ax + By + C = 0 \quad \Rightarrow \quad By = -Ax - C$$

$$\Rightarrow \qquad y = \left(-\frac{A}{B}\right)x + \left(-\frac{C}{B}\right) \quad \Rightarrow y = mx + c$$

where $\quad m = -\frac{A}{B} = -\frac{\text{Coefficient of } x}{\text{Coefficient of } y}$

and intercept on y-axis $= -\frac{C}{B} = -\frac{\text{Constant term}}{\text{Coefficient of } y}$

(ii) General Equation $(Ax + By + C = 0)$

$$\rightarrow \text{Intercept form} \left(\frac{x}{a} + \frac{y}{b} = 1\right)$$

$$Ax + By + C = 0$$

$$\Rightarrow \qquad \frac{Ax}{-C} + \frac{By}{-C} = 1$$

$$\Rightarrow \qquad \frac{x}{\left(-\frac{C}{A}\right)} + \frac{y}{\left(-\frac{C}{B}\right)} = 1$$

$$\Rightarrow \qquad \frac{x}{a} + \frac{y}{b} = 1$$

$\Rightarrow$ Where, intercept on x-axis $= -\frac{C}{A} = -\frac{\text{Constant term}}{\text{Coefficient of } x}$

Intercept on y-axis $= -\frac{C}{B} = -\frac{\text{Constant term}}{\text{Coefficient of } y}$

(iii) General Equation $(Ax + By + C = 0)$

$$\rightarrow \text{Normal Form } (x\cos\alpha + y\sin\alpha = p)$$

$$Ax + By + C = 0 \qquad \ldots(\text{i})$$

$$x\cos\alpha + y\sin\alpha - p = 0 \qquad \ldots(\text{ii})$$

Comparing eqs. (i) and (ii)

$$\frac{A}{\cos\alpha} = \frac{B}{\sin\alpha} = \frac{C}{-p}$$

$$\Rightarrow \qquad \cos\alpha = -\frac{Ap}{C} \quad \text{and} \quad \sin\alpha = -\frac{Bp}{C}$$

$$\Rightarrow \quad 1 = \cos^2\alpha + \sin^2\alpha = \frac{p^2}{C^2}(A^2 + B^2)$$

or $$p^2 = \frac{C^2}{A^2 + B^2} \Rightarrow p = \frac{C}{\sqrt{A^2 + B^2}}$$

$\therefore$ $$\cos\alpha = \frac{-A}{\sqrt{A^2 + B^2}}, \sin\alpha = \frac{B}{\sqrt{A^2 + B^2}}$$

$\therefore$ The required equation is

$$-\frac{A}{\sqrt{A^2 + B^2}}x - \frac{B}{\sqrt{A^2 + B^2}}y = \frac{C}{\sqrt{A^2 + B^2}}$$

21.11. Point of Intersection of Two Lines

Let the equations of two lines be

$$a_1x + b_1y + c_1 = 0 \quad \ldots(i)$$

and $$a_2x + b_2y + c_2 = 0 \quad \ldots(ii)$$

Let (x_1, y_1) be the coordinates of the point of intersection of the two lines.

Then $$a_1x_1 + b_1y_1 + c_1 = 0 \quad \ldots(iii)$$

and $$a_2x_1 + b_2y_1 + c_2 = 0 \quad \ldots(iv)$$

$\therefore$ By the method of cross multiplication

$$\frac{x_1}{b_1c_2 - b_2c_1} = \frac{y_1}{c_1a_2 - c_2a_1} = \frac{1}{a_1b_2 - a_2b_1}$$

$\therefore$ $$x_1 = \frac{b_1c_2 - b_2c_1}{a_1b_2 - a_2b_1}, y_1 = \frac{c_1a_2 - c_2a_1}{a_1b_2 - a_2b_1},$$

where $a_1b_2 - a_2b_1 \neq 0$

Thus the coordinates of the point of intersection of the two lines are $\frac{b_1c_2 - b_2c_1}{a_1b_2 - a_2b_1}, \frac{c_1a_2 - c_2a_1}{a_1b_2 - a_2b_1}$

Remark To find the coordinates of the point of intersection of two non parallel lines, we solve the given equations simultaneously and the values of *x* and *y* so obtained determine the coordinates of the point of intersection.

21.12 Condition of Concurrency of Three Lines

Three lines are said to be concurrent if they pass through a common point *i.e.,* they meet at a single common point.

Thus if three lines are concurrent the point of intersection of any two lines lies on the third line.

Let $$a_1x + b_1y + c_1 = 0 \quad \ldots(i)$$

$$a_2x + b_2y + c_2 = 0 \quad \ldots(ii)$$

$$a_3x + b_3y + c_3 = 0 \quad \ldots(iii)$$

be three concurrent lines then

$$a_3(b_1c_2 - b_2c_1) + b_3(c_1a_2 - c_2a_1) + c_3(a_1b_2 - a_2b_1) = 0$$

$\Rightarrow$ $$\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = 0$$

Which is the required condition for concurrency of three lines.

- Find the point of intersection of any two lines by solving them simultaneously. If this point satisfies the third equation also, then the given lines are concurrent.

21.13 Angle Between Two Straight Lines

Let the two straight lines be

$$y = m_1x + c_1 \quad \ldots(i)$$

and $$y = m_2x + c_2 \quad \ldots(ii)$$

and θ be the angle between them,

then $$\theta = \tan^{-1}\left|\frac{a_2b_1 - a_1b_2}{a_1a_2 + b_1b_2}\right|$$

21.14 Conditions for Parallelism and Perpendicularity of Two Lines

(i) If the two lines $a_1x + b_1y + c_1 = 0$ and $a_2x + b_2y + c_2 = 0$ are parallel,

Then $m_1 = m_2 \Rightarrow -\frac{a_1}{b_1} = \frac{-a_2}{b_2}$

$\Rightarrow$ $$\frac{a_1}{a_2} = \frac{b_1}{b_2}$$

(ii) If the two lines $a_1x + b_1y + c_1 = 0$ and $a_2x + b_2y + c_2 = 0$ are perpendicular,

then $m_1 . m_2 = -1$

$\Rightarrow -\frac{a_1}{b_1} \times -\frac{a_2}{b_2} = -1 \Rightarrow a_1a_2 + b_1b_2 = 0$

Thus two lines $a_1x + b_1y + c_1 = 0$ and $a_2x + b_2y + c_2 = 0$ are

(i) Coincident, if $\frac{a_1}{a_2} = \frac{b_1}{b_2} = \frac{c_1}{c_2}$

(ii) Parallel, if $\frac{a_1}{a_2} = \frac{b_1}{b_2} \neq \frac{c_1}{c_2}$

(iii) Intersecting, if $\frac{a_1}{a_2} \neq \frac{b_1}{b_2}$

(iv) Perpendicular, if $\frac{a_1}{a_2} \neq \frac{b_1}{b_2}$

21.15 Distance of a Point From a Given Line or Length of Perpendicular From the Point (x_1, y_1) to the Straight Line $ax + by + c = 0$

Let the length of perpendicular be p,

then $$p = \frac{|ax_1 + by_1 + c|}{\sqrt{a^2 + b^2}}$$

Distance Between Parallel Lines

If two lines are parallel, then they have the same distance between these throughout.

Therefore to find the distance between two parallel lines find the coordinates of any point on one of the given lines, preferably putting $x = 0$ or $y = 0$

Then the perpendicular distance of this point from the other line is the required distance between the lines.

Alternatively Let the two parallel lines be $ax + by + c_1 = 0$ and $ax + by + c_2 = 0$, then the perpendicular distance between the lines is $\left| \frac{c_2 - c_1}{\sqrt{a^2 + b^2}} \right|$

Equations of Straight Lines Passing Through (x_1, y_1) making angle θ with the given line $y = mx + c$

$$y - y_1 = \frac{m \pm \tan\theta}{1 \mp m\tan\theta}(x - x_1)$$

Equation of any Line Passing Through the Point of Intersection of Two Given Lines

Any line passing through the point of intersection of the lines $a_1x + b_1y + c_1 = 0$ and $a_2x + b_2y + c_2 = 0$ can be represented by the equation $(a_1x + b_1y + c_1) + \lambda(a_2x + b_2y + c_2) = 0$ where λ is an arbitrary constant.

Position of a Point with Respect to a Line

Any line $ax + by + c = 0$ $(c \neq 0)$ divides the whole plane into two parts (i) One part containing the origin called the origin side, (ii) the other part not containing the origin called non-origin side of the line. The length of the perpendicular from the origin on the line $ax + by + c = 0$ is $\frac{c}{\sqrt{a^2 + b^2}}$; if $c > 0$

If $c > 0$, we say that the origin is on the positive side of the line and if $c < 0$, the origin is said to be on the negative side of the line. A point $P(x_1, y_1)$ is on the origin side or non-origin side of the line $ax + by + c = 0$ according as $ax_1 + by_1 + c$ and c are the same or opposite sign. If $c > 0$, then $P(x_1, y_1)$ is on the origin side or non-origin side of line $ax + by + c = 0$ according as $ax_1 + by_1 + c$ is positive or negative.

Equations of Bisectors of the Angles Between Two Given Lines

Let $a_1x + b_1y + c = 0$ and $a_2x + b_2y + c_2 = 0$ be the equations of two given lines AB and AC respectively then the equations of the two bisectors are $\frac{a_1x + b_1y + c_1}{\sqrt{a_1^2 + b_1^2}} = \pm \frac{a_2x + b_2y + c_2}{\sqrt{a_2^2 + b_2^2}}$

Introductory Exercise 21.2

1. Find the equation of the line with slope $\frac{2}{3}$ and intercept on the y-axis is 5 :
(a) $y = \frac{2}{3}x + 5$ (b) $y = \frac{3}{2}x + 5$
(c) $y = 3x + 6$ (d) none of these

2. Find the slope and the intercept on the y-axis of the line $\sqrt{3}x + 3y = 6$:
(a) $\frac{1}{\sqrt{2}}$ (b) $\frac{1}{5}$
(c) $\frac{2}{\sqrt{3}}$ (d) $-\frac{1}{\sqrt{3}}$

3. Find the equation of the line passing through the point $(2, -3)$ and having its slope $\frac{5}{4}$:
(a) $4x - 5y = 20$ (b) $3x - 2y = 5$
(c) $5x - 4y = 22$ (d) none of these

4. Find the equation of the line which cuts off intercepts 2 and 3 from the axes :
(a) $9x - 7y = 6$ (b) $3x + 2y = 6$
(c) $4x + 3y = 7$ (d) none of these

5. Find the intercepts made by the line $3x + 4y - 12 = 0$ on the axes :
(a) 2 and 3 (b) 4 and 3
(c) 3 and 5 (d) none

6. Find the equation of the line through the points $(-1, -2)$ and $(-5, 2)$:
(a) $2x + y = 3$ (b) $3x - 2y + 7 = 0$
(c) $x + y + 3 = 0$ (d) none of these

7. Find the equation of the straight line passing through the point $(-1, 4)$ and having a gradient of 2.5 :
(a) $2x - 5y + 13 = 0$ (b) $5x - 9y = 13$
(c) $13x - 15y + 17 = 0$ (d) $5x - 2y + 13 = 0$

8. Find the equation of the straight line which makes equal intercepts on the axes passes through the point $(3, -5)$. :
(a) $x - y = 2$ (b) $x + y + 2 = 0$
(c) $y - x + 2 = 0$ (d) none of these

9. Find the equation of the straight line making intercepts on the axes equal in magnitude but opposite in sign and passing through the point $(-5, -8)$:
(a) $x - y = 7$ (b) $2x + y = 3$
(c) $x - y = 3$ (d) none of these

10. Find the equation of the line passing through the point $(-4, -5)$ and perpendicular to the line joining the points (1, 2) and (5, 6) :
(a) $x + y + 17 = 0$ (b) $3x + 2y + 11 = 0$
(c) $x + y + 9 = 0$ (d) $x - y + 20 = 0$

11. A straight line intersects the x-axis at A and the y-axis at B. AB is divided internally at $C(8, 10)$ in the ratio 5 : 4. Find the equation of AB :
(a) $x + y = 18$ (b) $x + y + 2 = 0$
(c) $x + y - 2 = 0$ (d) none of these

12. Find the equation of the straight line which passes through the point (3, 4) and has intercepts on the axes such that their sum is 14 :
(a) $4x + 3y = 24$
(b) $x + y = 7$
(c) $3x + 7y = 43$
(d) both (a) and (b)

13. A straight line passes through the points $(a, 0)$ and $(0, b)$. The length of the line segment contained between the axis is 13 and the product of the intercepts on the axes is 60. Find the equation of the straight line :
(a) $5x + 12y = 60$
(b) $7x - 12y = 50$
(c) $5x + 12y + 60 = 0$
(d) both (a) and (c)

14. A firm produces 50 units of a good for ₹ 320 and 80 units for ₹ 380. Supposing that the cost curve is a straight line, estimate the cost of producing 110 units :
(a) ₹ 330 (b) ₹ 1665
(c) ₹ 440 (d) ₹ 365

15. Find the equation of the line on which length of the perpendicular from the origin is 5 and the angle which this perpendicular makes with the x-axis is 60° :
(a) $x\sqrt{3} + 2y + 8 = 0$ (b) $x + \sqrt{2}y - 7 = 0$
(c) $x + \sqrt{3}y = 10$ (d) none of (a),(b), (c)

16. Find the equation of the line which passes through the point $(3, -4)$ and makes an angle of 60° with the positive direction of x-axis :
(a) $x\sqrt{2} + y\sqrt{3} = 0$
(b) $\sqrt{3}x - y = 4 + 3\sqrt{3}$
(c) $x\sqrt{3} + y = 3\sqrt{2} + 5$
(d) none of (a), (b),(c)

17. Find the equation of the line joining the points of intersection of $2x + y = 4$ with $x - y + 1 = 0$ and $2x - y - 1 = 0$ with $x + y - 8 = 0$:
(a) $2x + 3y + 6 = 0$ (b) $3x + 2y + 12 = 0$
(c) $3x - 2y + 1 = 0$ (d) none of (a), (b),(c)

18. Find the equation of one of the two lines which pass through the point (4, 5) which make an acute angle 45° with the line $2x - y + 7 = 0$:
(a) $x - 2y = 0$ (b) $7x + 5y - 3 = 0$
(c) $3x + y + 8 = 0$ (d) $x - 3y + 11 = 0$

19. Find the equation of the straight line which passes through the point $(5, -6)$ which is parallel to the line $8x + 7y + 5 = 0$:
(a) $3x - 5y + 8 = 0$ (b) $7x + 8y + 5 = 0$
(c) $7x - 8y + 2 = 0$ (d) $8x + 7y + 2 = 0$

20. Find the equation of the straight line which passes through the point of intersection of the straight lines $x + y = 8$ and $3x - 2y + 1 = 0$ and is parallel to the straight line joining the points (3, 4) and (5, 6) :
(a) $x - y + 2 = 0$ (b) $x + y - 2 = 0$
(c) $3x - 4y + 8 = 0$ (d) none of these

21. Find the length of the perpendicular from the point $(3, -2)$ to the straight line $12x - 5y + 6 = 0$:
(a) 5 (b) 4
(c) 6 (d) 8

22. Find the distance between two parallel lines $5x + 12y - 30 = 0$ and $5x + 12y - 4 = 0$
(a) 3 (b) 7
(c) $\frac{5}{2}$ (d) 2

23. Find the equation of the line through the point of intersection of $2x - 3y + 1 = 0$ and $x + y - 2 = 0$ which is parallel to the y-axis.
(a) $x = 1$ (b) $8x = 7$
(c) $x + 3 = 0$ (d) $x = 6$

24. Find the equation of the line which passes through the point of intersection of the lines $x + 2y - 3 = 0$ and $4x - y + 7 = 0$ and is parallel to the line $y - x + 10 = 0$.
(a) $2x + 2y + 5 = 0$ (b) $3x - 3y + 10 = 0$
(c) $3x + 2y - 8 = 0$ (d) none of these

25. Find the equation of the line which passes through the point of intersection of the lines $2x - y + 5 = 0$ and $5x + 3y - 4 = 0$ and is perpendicular to the line $x - 3y + 21 = 0$
(a) $2x + y + 8 = 0$ (b) $3x + 4y - 7 = 0$
(c) $3x + y = 0$ (d) none of these

26. Find the equation of the line through the intersection of the lines $3x + 4y = 7$ and $x - y + 2 = 0$ having slope 3.
(a) $4x - 3y + 7 = 0$ (b) $21x - 7y + 16 = 0$
(c) $8x + y + 8 = 0$ (d) none of these

27. Find the equation of the straight line which passes through the point of intersection of the straight lines $3x - 4y + 1 = 0$ and $5x + y - 1 = 0$ and cuts off equal intercepts from the axis.
(a) $32x + 32y + 11 = 0$ (b) $23x + 23y = 11$
(c) $9x + 18y + 5 = 0$ (d) none of these

28. A straight line $\frac{x}{a} - \frac{y}{b} = 1$ passes through the point (8, 6) and cuts off a triangle of area 12 units from the axes of coordinates. Find the equations of the straight line.
(a) $3x - 2y = 12$ (b) $4x - 3y = 12$
(c) $3x - 8y + 24 = 0$ (d) both (a) and (c)

29. Find the equations of the bisectors of the angle between the straight line $3x + 4y + 2 = 0$ and $5x - 12y - 6 = 0$.
(a) $8x + y + 7 = 0$ (b) $16x - 12y - 1 = 0$
(c) $x + 8y + 4 = 0$ (d) both (b) and (c)

30. Find the area of the triangle formed by the lines whose equations are $2y - x = 5$, $y + 2x = 7$ and $y - x = 1$.
(a) $\frac{3}{10}$ (b) 10
(c) 6 (d) $\frac{2}{5}$

31. Find the coordinates of the orthocentre of the triangle whose vertices are (1, 2), (2, 3) and (4, 3).
(a) (2, 5) (b) (3, 4)
(c) (1, 6) (d) none of these

32. Two vertices of a triangle ABC are $B(5, -1)$ and $C(-2, 3)$. If the orthocentre of the triangle is the origin, find the third vertex.
(a) $\left(\frac{7}{2}, \frac{13}{2}\right)$ (b) $\left(\frac{3}{2}, \frac{11}{2}\right)$
(c) $(-4, -7)$ (d) none of these

33. The area of a triangle is 5. Two of its vertices are (2, 1) and (3, – 2). The third vertex lies on $y = x + 3$. Find the third vertex :
(a) $\left(\frac{2}{7}, \frac{13}{5}\right)$
(b) $\left(\frac{7}{2}, \frac{13}{2}\right)$
(c) $\left(\frac{9}{2}, \frac{13}{2}\right)$
(d) $\left(\frac{7}{2}, \frac{13}{2}\right)$ or $\left(-\frac{3}{2}, \frac{3}{2}\right)$

34. A straight line L is perpendicular to the line $5x - y = 1$. The area of the triangle formed by the line L and coordinate axes is 5. Find the equation of the line :
(a) $x + 5y = \pm 5\sqrt{2}$ (b) $x - 3y = 0$
(c) $2x + y = 0$ (d) $x + 4y = 5\sqrt{2}$

35. (1, 2) and (3, 8) are a pair of a opposite vertices of square. Find the diagonals of the square passing through (1, 2) :
(a) $x - 2y = 1$ (b) $2x + 7y = 0$
(c) $3x + 2y + 7 = 0$ (d) $3x - y = 1$

CAT-Test

Questions Helping you bell the CAT

LEVEL 01 › BASIC LEVEL EXERCISE

1 The number of integral points (integral point means both the coordinates should be integer) exactly in the interior of the triangle with vertices (0, 0), (0, 21) and (21, 0) is
(a) 133 (b) 190
(c) 233 (d) 105

2 Two squares have centers at the origin of a coordinate plane and sides parallel to the axes. The smaller square has an area of 27 sq. units and the larger square has an area of 91 sq. units. How many points with only integer coordinates are outside the smaller square region and inside the larger square region?
(a) 45 (b) 54
(c) 56 (d) 64

3 The diagonals of a parallelogram *PQRS* are along the lines $x + 3y = 4$ and $6x - 2y = 7$. Then *PQRS* must be a
(a) Rectangle (b) Square
(c) Cyclic Quadrilateral (d) Rhombus

4 What is the minimum value of $|c|$, if the lines $y = mx + 4$, $x = m + c$ and $y = 3$ are concurrent?
(a) 0 (b) 1
(c) 2 (d) 3

5 Two points (1, 1) and (1, 5) lie on the circumference of a circle. Which of the following cannot be the area of that circle?
(a) $2\sqrt{2}\pi$ (b) 4π
(c) $3\sqrt{3}\pi$ (d) 6.67π

6 Consider four circles $(x \pm 1)^2 + (y \pm 1)^2 = 1$. Find the equation of larger circle touching these four circles.
(a) $x^2 + y^2 = (\sqrt{2} + 1)^2$ (b) $x^2 + y^2 = (\sqrt{2} - 1)^2$
(c) $x^2 + y^2 = (2 - \sqrt{2})^2$ (d) none of these

7 What's the area of a triangle whose coordinates are $(-7, 4)$, $(3, -2)$, $(-1, -5)$?
(a) 27 (b) 26
(c) 25 (d) 33

Hints & Solutions

☑ Introductory *Exercise 21.1*

1 The point $(-2, 3)$ lies in the second quadrant.

2 The point $(2, -3)$ lies in the fourth quadrant.

3 Distance between two points $= \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$

Let $(x_1, y_1) \equiv (-5, 3)$ and $(x_2, y_2) \equiv (3, 1)$

$\therefore$ Required distance $= \sqrt{(3+5)^2 + (1-3)^2}$

$= \sqrt{64+4} = \sqrt{68} = 2\sqrt{17}$ unit

4 Let $A \equiv (4, 3)$, $B \equiv (7, -1)$, $C \equiv (9, 3)$

$$AB = \sqrt{(7-4)^2 + (-1-3)^2} = \sqrt{25} = 5$$

$$BC = \sqrt{(9-7)^2 + (3+1)^2} = \sqrt{20} = 2\sqrt{5}$$

$$CA = \sqrt{(4-9)^2 + (3-3)^2} = \sqrt{25} = 5$$

$\therefore \quad AB = CA = 5$

Hence ABC is an isosceles triangle.

5 Let $A \equiv (4, 4)$, $B \equiv (3, 5)$, $C \equiv (-1, -1)$

Then $AB = \sqrt{(3-4)^2 + (5-4)^2} = \sqrt{2}$

$$BC = \sqrt{(-1-3)^2 + (-1-5)^2} = \sqrt{52}$$

$$AC = \sqrt{(-1-4)^2 + (-1-4)^2} = \sqrt{50}$$

$\therefore \quad AB^2 + AC^2 = BC^2$

Hence by the Pythagoras Theorem, ABC is a right angled triangle.

6 Let $A \equiv (7, 9)$, $B \equiv (3, -7)$ and $C \equiv (-3, 3)$

Then $AB = \sqrt{(3-7)^2 + (-7-9)^2} = \sqrt{272}$

$$BC = \sqrt{(-3-3)^2 + (3+7)^2} = \sqrt{136}$$

$$AC = \sqrt{(7+3)^2 + (9-3)^2} = \sqrt{136}$$

$\therefore \quad AB^2 = BC^2 + AC^2$

Hence by Pythagoras Theorem, triangle ABC is a right angled triangle.

Also, since $BC = CA$, hence ABC is an isosceles triangle.

Thus ABC is a right angled isoceles triangle.

7 The coordinates of the mid points of AB

$$= \left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right) = \left(\frac{-3+5}{2}, \frac{2+4}{2}\right) = (1, 3)$$

8 Here $(x_1, y_1) = (-3, 2)$ and $(x_2, y_2) = (5, 4)$

The coordinates of the point which divides AB in the ratio $2:3$

$$= \left(\frac{2\times 5 + 3\times -3}{2+3}, \frac{2\times 4 + 3\times 2}{2+3}\right) = \left(\frac{1}{5}, \frac{14}{5}\right)$$

9 The required coordinates of the point which divides the join of $(2, 4)$ and $(6, 8)$ externally in the ratio $5:3$ are $\left(\frac{mx_2 - nx_1}{m-n}, \frac{my_2 - ny_1}{m-n}\right)$

Here, $m : n = 5:3$, $(x_1, y_1) = (2, 4)$, $(x_2, y_2) = (6, 8)$

Hence the required co-ordinates $= (12, 14)$.

10 Let the co-ordinate of the centroid of ΔABC be (x, y), then

$$(x, y) = \left(\frac{x_1 + x_2 + x_3}{3}, \frac{y_1 + y_2 + y_3}{3}\right)$$

$$= \left(\frac{3+2-2}{3}, \frac{1+3+2}{3}\right) = (1, 2)$$

11 Let $A \equiv (4, -2)$, $B \equiv (5, 5)$ and $C \equiv (-2, 4)$

Then $a = BC = \sqrt{(-2-5)^2 + (4-5)^2} = 5\sqrt{2}$

$$b = AC = \sqrt{(4+2)^2 + (-2-4)^2} = 6\sqrt{2}$$

$$c = AB = \sqrt{(5-4)^2 + (5+2)^2} = 5\sqrt{2}$$

and $(x_1, y_1) \equiv (4, -2)$, $(x_2, y_2) \equiv (5, 5)$,

$(x_3, y_3) \equiv (-2, 4)$

$\therefore$ The coordinates of the incentre of the ΔABC are

$$\left(\frac{ax_1 + bx_2 + cx_3}{a+b+c}, \frac{ay_1 + by_2 + cy_3}{a+b+c}\right)$$

$= \left(\frac{5}{2}, \frac{5}{2}\right)$ {Substitute the values of (a, b, c)

x_1, x_2, x_3, y_1, y_2 and y_3}

12 Let $S(x, y)$ be the circumcentre, then $AS = BS = CS = R$, where R is the circumradius

Now $(AS)^2 = (BS)^2$ where $S \equiv (x, y)$,

$A \equiv (8, 6)$, $B \equiv (8, -2)$

$\therefore \quad (x-8)^2 + (y-6)^2 = (x-8)^2 + (y+2)^2$

$\Rightarrow \quad 36 - 12y = 4 + 4y$

$\Rightarrow \quad y = 2$

Again $(BS)^2 = (CS)^2$, where $S \equiv (x, y)$

$B \equiv (8, -2)$, $C \equiv (2, -2)$

$\therefore \quad (x-8)^2 + (y+2)^2 = (x-2)^2 + (y+2)^2$

$\Rightarrow \quad x^2 + 64 - 16x + y^2 + 4 + 4y$

$= x^2 + 4 - 4x + y^2 + 4 + 4y$

$\Rightarrow \quad -12x + 60 = 0 \; x = 5$

$\therefore$ The circumcentre $S \equiv (x, y) = (5, 2)$

13 Let $P(1, 1), Q(2, -3), R(3, 4)$ be the midpoints of sides AB, BC and CA respectively triangle ABC.

Let $A(x_1, y_1), B(x_2, y_2)$ and $C(x_3, y_3)$ be the vertices of triangle ABC.

Then, P is the mid point of AB

$$\Rightarrow \quad \frac{x_1 + x_2}{2} = 1, \frac{y_1 + y_2}{2} = 1$$

$$\Rightarrow \quad x_1 + x_2 = 2 \quad \text{and} \quad y_1 + y_2 = 2 \qquad \ldots(i)$$

Q is the mid point of BC

$$\Rightarrow \quad \frac{x_2 + x_3}{2} = 2, \frac{y_2 + y_3}{2} = -3$$

$$\Rightarrow \quad x_2 + x_3 = 4 \quad \text{and} \quad y_2 + y_3 = -6 \qquad \ldots(ii)$$

R is the mid point of AC

$$\Rightarrow \quad x_1 + x_3 = 6 \quad \text{and} \quad y_1 + y_3 = 8 \qquad \ldots(iii)$$

From eqs (i), (ii) and (iii), we get

$$(x_1, y_1) \equiv (2, 8), \quad (x_2, y_2) \equiv (0, -6)$$

and $\quad (x_3, y_3) \equiv (4, 0)$

Then the coordinates of the centroid

$$= \left(\frac{x_1 + x_2 + x_3}{3}, \frac{y_1 + y_2 + y_3}{3}\right)$$

$$= \left(\frac{2 + 0 + 4}{3}, \frac{8 - 6 + 0}{3}\right) = \left(2, \frac{2}{3}\right)$$

14 Since $\quad (x_1, y_1) \equiv A(2, 8), \quad (x_2, y_2) \equiv B(0, -6)$

and $\quad (x_3, y_3) \equiv C(4, 0)$

Now, $a = BC = 2\sqrt{3}$, $b = AC = 2\sqrt{17}$, $c = AB = 10\sqrt{2}$

The coordinates of the in-centre of the triangle ABC are

$$\left(\frac{ax_1 + bx_2 + cx_3}{a + b + c}, \frac{ay_1 + by_2 + cy_3}{a + b + c}\right)$$

$\therefore$ Required coordinates of incentre are

$$\left(\frac{2\sqrt{13} + 20\sqrt{2}}{\sqrt{13} + \sqrt{17} + 5\sqrt{2}}, \frac{2\sqrt{13} - 6\sqrt{17}}{\sqrt{13} + \sqrt{17} + 5\sqrt{2}}\right)$$

15 Let A, B, C and D be the vertices of the quadrilateral whose coordinates are $(-2, -1)$ $(1, 0)$, $(4, 3)$ and $(1, 2)$ respectively.

Now, $AB = \sqrt{10}$, $BC = \sqrt{18}$, $DC = \sqrt{10}$, $AD = \sqrt{18}$

$\therefore$ $AB = CD$ and $BC = AD$ *i.e.,* the opposite sides are equal.

Hence $ABCD$ is a parallelogram.

16 Let $A(-1, 0)$, $B(3, 1)$, $C(2, 2)$ and $D(x, y)$ be the vertices of a parallelogram $ABCD$ taken in order. Since the diagonals of a parallelogram bisect each other.

$\therefore$ Coordinates of the mid point of AC

= Coordinates of the mid point of BD

$$\Rightarrow \quad \left(\frac{-1 + 2}{2}, \frac{0 + 2}{2}\right) = \left(\frac{3 + x}{2}, \frac{1 + y}{2}\right)$$

$$\Rightarrow \quad \left(\frac{1}{2}, 1\right) = \left(\frac{3 + x}{2}, \frac{y + 1}{2}\right)$$

$$\Rightarrow \quad \frac{3 + x}{2} = \frac{1}{2} \quad \text{and} \quad \frac{y + 1}{2} = 1$$

$$\Rightarrow \quad x = -2 \quad \text{and} \quad y = 1$$

Hence the fourth, vertex of the parallelogram is $(-2, 1)$

17 Solve as the question no. 13 has been solved. The required vertices of the triangle are $(1, -4)$, $(3, 2)$, $(-1, 2)$.

18 Let the vertices be $A(4, -1)$, $B(6, 0)$, $C(7, 2)$, $D(5, 1)$, then the coordinates of the mid point of AC are

$$\left(\frac{4 + 7}{2}, \frac{-1 + 2}{2}\right) = \left(\frac{11}{2}, \frac{1}{2}\right)$$

Coordinates of the mid point of BD are

$$\left(\frac{6 + 5}{2}, \frac{0 + 1}{2}\right) = \left(\frac{11}{2}, \frac{1}{2}\right)$$

Thus AC and BD have the same mid point. Hence $ABCD$ is a parallelogram.

Now, $\quad AB = \sqrt{5}, BC = \sqrt{5}$

$\therefore$ $\quad AB = BC$

So, $ABCD$ is a parallelogram whose adjacent sides are equal. Hence, $ABCD$ is a rhombus.

Also, we have $\quad AC = 3\sqrt{2}$

and $\quad BD = \sqrt{2}$

Clearly, $AC \neq BD$. So $ABCD$ is not a square.

19 Let A, B, C, D be the points $(-4, 2)$, $(1, -1)$, $(4, 1)$ and $(2, 5)$ respectively. Then the area of the quadrilateral $ABCD$

$$= \frac{1}{2}\{-4 \times -1 - 2 \times 1 + 1 \times 1 - 4 \times -1 + 4 \times 5 - 2 \times 1 + 2 \times 2 \times -5 \times -4\}$$

$$= \frac{1}{2}(4 - 2 + 1 + 4 + 20 - 2 + 4 + 20)$$

$$= \frac{49}{2} = 24 \cdot 5 \text{ square units.}$$

Hint $\begin{matrix} -4 & & 1 \\ 2 & & -1 \end{matrix} \quad \begin{matrix} 4 \\ 1 \end{matrix} \quad \begin{matrix} 2 & & -4 \\ 5 & & 2 \end{matrix}$

NOTE Area of quadrilateral $= \frac{1}{2}\{(x_1y_2 - x_2y_1) + (x_2y_3 - x_2y_3) + (x_3y_4 - x_4y_3) + (x_4y_1 - x_1y_4)\}$

20 Let A, B, C, D be the points $(3, 2)$, $(6, 3)$, $(x\ y)$ and $(6, 5)$ respectively.

Since $ABCD$ is a parallelogram, the diagonals AC and BD must bisect each other *i.e.,* the mid points of AC and the mid point of BD must coincide and hence the coordinates of the two mid points are the same

$$\therefore \quad \frac{3 + x}{2} = \frac{6 + 6}{2} \quad \text{and} \quad \frac{2 + y}{2} = \frac{3 + 5}{2}$$

or $\quad 3 + x = 12 \quad$ and $\quad 2 + y = 8$

or $\quad x = 9 \quad$ and $\quad y = 6$

Hence $\quad (x, y) = (9, 6)$

21 Let the line $y - x + 2 = 0$ divide the join of $(3, -1)$ and $(8, 9)$ at the point P in the ratio $k : 1$. Then the coordinates of P are $\left(\frac{k \cdot 8 + 1.3}{k+1}, \frac{k \cdot 9 + 1(-1)}{k+1}\right) = \left(\frac{8k+3}{k+1}, \frac{9k-1}{k+1}\right)$

Since, this point lies on the line $y - x + 2 = 0$, we have

$$\frac{9k-1}{k+1} - \frac{8k+3}{k+1} + 2 = 0 \quad \text{or} \quad k = \frac{2}{3}$$

Hence the required ratio is $k : 1 = \frac{2}{3} : 1 = 2 : 3$

22 Let the points be $A(1, 2)$, $B(-5, 6)$, $C(7, -4)$, $D(h, -2)$

Given, area of the quadrilateral $ABCD = 0$

or $$\frac{1}{2}\{(6 + 10) + (20 - 42) + (-14 + 4h) + (2h + 2)\} = 0$$

or $$h = 3$$

23 Area of $\Delta PBC = \frac{1}{2}\{(5x + 3y) + (6 - 20) + (4y + 2x)\}$

$$= \frac{1}{2}(7x + 7y - 14) = \frac{7}{2}(x + y - 2)$$

and area of ΔABC

$$= \frac{1}{2}\{(30 + 9) + (6 - 20) + (12 + 12)\}$$

$$= \frac{49}{2}$$

Hence $\frac{\Delta PBC}{\Delta ABC} = \frac{x + y - 2}{7}$

24 Slope of the line $= \frac{y_2 - y_1}{x_2 - x_1} = \frac{7-5}{9-7} = 1$

Here $(x_1, y_1) \equiv (7, 5)$ and $(x_2, y_2) \equiv (9, 7)$

25 Let m_1 and m_2 be the slopes of BA and BC respectively.

Then $$m_1 = \frac{3-1}{2-(-2)} = \frac{1}{2}$$

and $$m_2 = \frac{-4-3}{-2-2} = \frac{7}{4}$$

Let θ be the angle between BA and BC. Then

$$\tan\theta = \left|\frac{m_2 - m_1}{1 + m_1 m_2}\right| = \left|\frac{\frac{7}{4} - \frac{1}{2}}{1 + \frac{7}{4} \times \frac{1}{2}}\right| = \pm\frac{2}{3}$$

$$\Rightarrow \quad \theta = \tan^{-1}\left(\frac{2}{3}\right)$$

26 If m_1 be the slope of the line passing through the points $A(3, 5)$ and $B(-4, 2)$, then

$$m_1 = \frac{2-5}{-4-3} = \frac{3}{7}$$

If m_2 be the slope of the perpendicular line CD then

$$m_1 \cdot m_2 = -1$$

or $$\frac{3}{7} m_2 = -1$$

or $$m_2 = -\frac{7}{3}$$

27 Let m_1 be the slope of line AB

$\therefore$ $$m_1 = \frac{3-(-3)}{6-2} = \frac{3}{2}$$

If m_2 be the slope of a line parallel to AB, then

$$m_2 = m_1 = \frac{3}{2}$$

28 Let m_3 be the slope of line perpendicular to AB, then

$$m_1 \cdot m_3 = -1$$

$\Rightarrow$ $$\frac{3}{2} \cdot m_3 = -1$$

$\Rightarrow$ $$m_3 = -\frac{2}{3}$$

29 $$m_1 = \text{Slope of } AB = \frac{3-6}{2-6} = \frac{3}{4}$$

$$m_2 = \text{Slope of } BC = \frac{7-3}{4-2} = 2$$

and $$m_3 = \text{Slope of } AC = \frac{7-6}{4-6} = -\frac{1}{2}$$

$\therefore$ $$m_2 \cdot m_3 = 2 \times -\frac{1}{2} = -1$$

This shows that BC is perpendicular to AC.
Hence, ABC is a right-angled triangle.

30 $$m_1 = \text{Slope of } AB = \frac{4-(-2)}{3-1} = 3$$

and $$m_2 = \text{Slope of } BC = \frac{7-4}{4-3} = 3$$

$\therefore$ $$m_1 = m_2$$

$\therefore$ AB is parallel to BC and B is common to both AB and BC.
Hence, the point $A(1, -2)$, $B(3, 4)$ and $C(4, 7)$ are collinear.

☑ Introductory *Exercise 21.2*

1 The equation of the line with slope 2/3 and intercept on the Y-axis 5 is $y = \frac{2}{3}x + 5 (\because y = mx + c)$

2 We have $\sqrt{3}x + 3y = 6$

or $3y = -\sqrt{3}x + 6$

or $y = -\frac{1}{\sqrt{3}}x + 2$

Comparing the above equation with $y = mx + c$ we get

$$m = -\frac{1}{\sqrt{3}} \quad \text{and} \quad c = 2$$

Hence slope is $\left(-\frac{1}{\sqrt{3}}\right)$ and intercept on the y-axis is 2.

3 We have $m = \frac{5}{4}$ and $(x_1, y_1) = (2, -3)$

$\therefore$ The equation of the line as point slope form is

$$y - y_1 = m(x - x_1)$$

or $y - (-3) = \frac{5}{4}(x - 2)$

or $y + 3 = \frac{5}{4}(x - 2)$

or $5x - 4y = 22$

4 Here $a = 2$ and $b = 3$

$\therefore$ The required equation of the line is $\frac{x}{2} + \frac{y}{3} = 1$

$\Rightarrow$ $3x + 2y = 6$

5 We have $3x + 4y - 12 = 0$

$\Rightarrow$ $3x + 4y = 12$

$\Rightarrow$ $\frac{3x}{12} + \frac{4y}{12} = 1 \Rightarrow \frac{x}{4} + \frac{y}{3} = 1$

Which is of the form $\frac{x}{a} + \frac{y}{b} = 1$

Thus the required intercepts on the axes are 4 and 3.

6 The equation of the line through the points $(-1, -2)$ and $(-5, 2)$ is $(y - y_1) = \frac{y_2 - y_1}{x_2 - x_1}(x - x_1)$

where $(x_1, y_1) \equiv (-1, -2)$

and $(x_2, y_2) \equiv (-5, 2)$

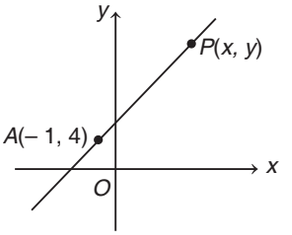
$\therefore$ Required equation is

$$y - (-2) = \frac{2 - (-2)}{-5 - (-1)}[x - (-1)]$$

or $y + 2 = \frac{4}{-4}(x + 1)$

or $x + y + 3 = 0$

7 Let $(-1, 4)$ be the point as shown in figure and let $P(x, y)$ be any point on the line. Then the gradient (or slope) of the line $\frac{y - 4}{x - (-1)} = 2.5$



$\Rightarrow$ $\frac{y - 4}{x + 1} = \frac{5}{2}$

$\Rightarrow$ $5x - 2y + 13 = 0$

8 Let the equation of the straight line in the intercept form be

$$\frac{x}{a} + \frac{y}{b} = 1 \qquad \ldots(i)$$

Since the intercepts are equal, therefore $a = b$

$\therefore$ From eq. (i)

$$x + y = a \qquad \ldots(ii)$$

Since this line passes through the point $(3, -5)$

$\therefore$ $3 + (-5) = a \Rightarrow a = -2$

$\therefore$ From eq. (ii), the required equation of the straight line is $x + y = -2$ or $x + y + 2 = 0$

9 Let the equation of the straight line be

$$\frac{x}{a} + \frac{y}{b} = 1 \qquad \ldots(i)$$

Since intercepts a, b are equal in magnitude but opposite in sign.

$\therefore$ $b = -a$

$\therefore$ From eq. (i) $\frac{x}{a} + \frac{y}{(-a)} = 1$

or $x - y = a \qquad \ldots(ii)$

Since this line passes through the point $(-5, -8)$.

$\therefore$ $-5 - (-8) = a$

$\Rightarrow$ $a = 3$

Hence, from (ii) the required equation of the line is $x - y = 3$

10 Let m_1 = slope of the line 'joining' (1, 2) and (5, 6)

$\therefore$ $m_1 = \frac{6 - 2}{5 - 1} = \frac{4}{4} = 1$

If m_2 be the slope of the perpendicular line, then $m_1 m_2 = -1 \Rightarrow m_2 = -1 (\because m_1 = 1)$

$\therefore$ The required line has slope $m_2 = -1$ and passes through the point $(-4, -5)$

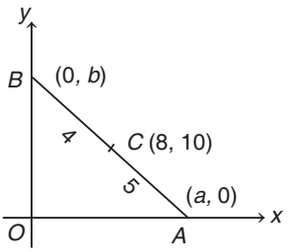
Hence, the required equation of the line in the point slope form is

$$(y - y_1) = m_2 (x_2 - x_1)$$

or $$y - (-5) = -1\{x - (-4)\}$$

or $$x + y + 9 = 0$$

11 Let the equation of the line AB be $\frac{x}{a} + \frac{y}{b} = 1$ …(i)



Then the coordinates of` A and B are respectively $(a, 0)$ and $(0, b)$.

Since $C(8, 10)$ divides AB in the ratio $5 : 4$, we have

$$\frac{5 \times 0 + 4 \times a}{5 + 4} = 8$$

and $$\frac{5 \times b + 4 \times 0}{5 + 4} = 10$$

or $$a = 18 \quad \text{and} \quad b = 18$$

Hence from eq. (i), the required equation of the line AB is

$$\frac{x}{18} + \frac{y}{18} = 1 \quad \text{or} \quad x + y = 18$$

12 Let the equation of the line in the intercept form be $\frac{x}{a} + \frac{y}{b} = 1$, where a and b are intercepts on the axes.

Then $$a + b = 14 \quad \text{or} \quad b = 14 - a$$

Since the line $\frac{x}{a} + \frac{y}{b} = 1$ passes through the point $(3, 4)$;

$\therefore$ $$\frac{3}{a} + \frac{4}{b} = 1 \quad \text{or} \quad \frac{3}{a} + \frac{4}{14 - a} = 1$$

or $$a^2 - 13a + 42 = 0 \text{ or } (a - 6)(a - 7) = 0$$

$\therefore$ $$a = 6, 7$$

If $a = 6$ then $b = 8$

If $a = 7$ then $b = 7$

Hence the required equation of the line are

$$\frac{x}{6} + \frac{y}{8} = 1 \quad \text{and} \quad \frac{x}{7} + \frac{y}{7} = 1$$

or $$4x + 3y = 24 \text{ and } x + y = 7$$

13 Since the line passes through $A(a, 0)$ and $B(0, b)$, it makes intercepts a and b on the axes of x and y. Let the equation of the line be

$$\frac{x}{a} + \frac{y}{b} = 1 \quad \text{…(i)}$$

By the given conditions,

$$AB = 13 \Rightarrow a \,.\, b = 60 \quad \text{…(ii)}$$

From eq. (i) $\sqrt{a^2 + b^2} = 13$

$\Rightarrow$ $$a^2 + b^2 = 169$$

$\Rightarrow$ $$a + b = \pm 17$$

Again $(a - b)^2 = (a + b)^2 - 4ab = 289 - 240 = 49$

$\therefore$ we get $a = 12, b = 5$ and $a = -12, b = -5$

$\therefore$ The required equations of the straight line are

$$\frac{x}{12} + \frac{y}{5} = 1 \quad \text{and} \quad \frac{x}{-12} + \frac{y}{-5} = 1$$

i.e., $5x + 12y = 60$ and $5x + 12y + 60 = 0$

14 Let the equation of the cost curve as a straight line be

$$y = mx + c \quad \text{…(i)}$$

where x = number of units of a good produced
and y = cost of x units in rupees.

Given, when $x = 50$, $y = 320$ and when $x = 80$, $y = 380$

from eq. (i) $$320 = 50m + c \quad \text{…(ii)}$$

and $$380 = 80m + c \quad \text{…(iii)}$$

Subtracting eqs. (ii) from (iii), we get $m = 2$

Substituting $m = 2$ in eq. (ii), we get $c = 220$

$\therefore$ From eq. (i) $y = 2x + 220$

when $x = 110$, $y = 2 \times 110 + 220 = 440$

Hence , the required cost of producing 110 units is ₹ 440.

15 Here $p = 5$ and $\alpha = 60°$

$\therefore$ The required equation of the line is

$$x \cos\alpha + y \sin\alpha = p$$

or $$x \cos 60° + y \sin 60° = 5$$

$\Rightarrow$ $$x + \sqrt{3}y = 10$$

$$\left(\because \sin 60° = \frac{\sqrt{3}}{2} \text{ and } \cos 60° = \frac{1}{2}\right)$$

16 Here $(x_1, y_1) \equiv (3, -4)$ and $\theta = 60°$

The required equation of the line in the symmetric form is

$$\frac{x - x_1}{\cos\theta} = \frac{y - y_1}{\sin\theta}$$

$\Rightarrow$ $$\frac{x - 3}{\cos 60°} = \frac{y - (-4)}{\sin 60°}$$

$\Rightarrow$ $$\sqrt{3}x - y = 4 + 3\sqrt{3}$$

17 We have $$2x + y = 4 \quad \text{…(i)}$$

and $$x - y + 1 = 0 \quad \text{…(ii)}$$

Solving eqs. (i) and (ii), we get

$$x = 1 \quad \text{and} \quad y = 2$$

$\therefore$ The point of intersection of eqs. (i) and (ii) is $(1, 2)$.

Again $$2x - y - 1 = 0 \quad \text{…(iii)}$$

$$x + y - 8 = 0 \quad \text{…(iv)}$$

Solving eqs. (iii) and (iv), we get $(x, y) \equiv (3, 5)$

$\therefore$ The point of intersection of (3) and (4) is (3, 5)

$\therefore$ The required equation of the straight line joining the points of intersection (1, 2), (3, 5) is

$$y - 2 = \frac{(5-2)}{(3-1)} \cdot (x - 1)$$

$$\Rightarrow \quad 3x - 2y + 1 = 0$$

18 The equation of the line through the point (4, 5) is

$$y - 5 = m(x - 4) \qquad \ldots(i)$$

where m is the slope of the line.

Now the given line is $2x - y + 7 = 0$

$$\Rightarrow \quad y = 2x + 7 \qquad \ldots(ii)$$

If m_1 be the slope of the line (ii), then $m_1 = 2$

If eq. (i) makes an angle of 45° with eq. (ii), then we have

$$\tan 45^\circ = \frac{m_1 \sim m}{1 + m \,.\, m_1} = \frac{2 - m}{1 + 2m} \quad i.e., \quad \frac{2 \sim m}{1 + 2m}$$

$$\therefore \quad \text{either } 1 = \frac{m-2}{1+2m} \text{ or } 1 = \frac{2-m}{1+2m}$$

If $\frac{m-2}{1+2m} = 1$ then $m = -3$

If $\frac{2-m}{1+2m} = 1$ then $m = \frac{1}{3}$

Hence, from (i) the required equation of the two lines is

$y - 5 = -3(x - 4)$ and $y - 5 = \frac{1}{3}(x - 4)$

$$\Rightarrow \quad 3x - y - 17 = 0 \quad \text{and} \quad x - 3y + 11 = 0$$

19 The equation of any straight line parallel to the line $8x + 7y + 5 = 0$ is $8x + 7y + c = 0$ …(i)

where c is an arbitrary constant.

If the line (i) passes through the point (5, – 6), then

$$8 \times 5 + 7 \times (-6) + c = 0$$

$$\Rightarrow \quad c = 2$$

Hence from (i), the required equation of the straight line is $8x + 7y + 2 = 0$

20 Solving $x + y = 8$ and $3x - 2y + 1 = 0$, we get the point of intersection.

$\therefore$ The point of intersection is (3, 5).

Now, the equation of the line joining the points

$$(3, 4) \text{ and } (5, 6) \text{ is } (y - 4) = \frac{(6-4)}{(5-3)}(x - 3)$$

$$\Rightarrow \quad x - y + 1 = 0 \qquad \ldots(i)$$

$\therefore$ The equation of the line parallel to the line

$$x - y + 1 = 0 \text{ is}$$

$$x - y + c = 0 \qquad \ldots(ii)$$

Where c is an arbitrary constant. If the line passes through the point (3, 5) then

$$3 - 5 + c = 0 \quad \text{or} \quad c = 2$$

Hence from (2), the required equation of the line is $x - y + 2 = 0$.

21 Length of the perpendicular from the point (3, – 2) to the straight line $12x - 5y + 6 = 0$ is

$$\frac{12 \times 3 - 5 \times -2 + 6}{\sqrt{(12)^2 + (-5)^2}} = \frac{36 + 10 + 6}{\sqrt{169}} = 4 \text{ units.}$$

22 Putting $y = 0$ in $5x + 12y - 30 = 0$, we get

$$5x - 30 = 0 \quad \text{or} \quad x = 6$$

$\therefore$ (6, 0) is a point on the first line $5x + 12y - 30 = 0$

Required distance between the parallel lines = Perpendicular distance of the point (6, 0) from the second line $5x + 12y - 4 = 0$.

$$= \frac{5.6 + 12.0 - 4}{\sqrt{5^2 + 12^2}} = \frac{30 - 4}{13} = 2 \text{ units}$$

23 The equation of the line through the point of intersection of $2x - 3y + 1 = 0$ and $x + y - 2 = 0$, is

$$(2x - 3y + 1) + k(x + y - 2) = 0$$

$$i.e., \quad (2 + k)x + (k - 3)y + (1 - 2k) = 0 \qquad \ldots(i)$$

If this line is parallel to the y-axis, then its equation must be of the form $x = h$, *i,e,* the coefficient of y in (i) must be zero.

$$\therefore \quad k - 3 = 0 \quad \text{or} \quad k = 3$$

Hence, from (i) the required equation of the line is $(2 + 3)x + 0 \,.\, y + (1 - 2 \times 3) = 0$ [Putting $k = 3$]

$$\Rightarrow \quad x = 1$$

24 The equation of any line passing through the point of intersection of the lines $x + 2y - 3 = 0$ and $4x - y + 7 = 0$ is

$$x + 2y - 3 + k(4x - y + 7) = 0 \qquad \ldots(i)$$

or $\quad (1 + 4k)\, x + (2 - k)y + (7k - 3) = 0 \qquad \ldots(ii)$

$m_1 = \text{Slope of the line (ii)} = \frac{4k+1}{k-2}$

and $m_2 = (\text{Slope of the line } y - x + 10 = 0) = 1$

If the line (i) be parallel to the line $y - x + 10 = 0$

then $\quad \frac{4k+1}{k-2} = 1 \quad \Rightarrow \quad k = -1$

Hence from (i), the required equation of the line is

$$(x + 2y - 3) - 1 \,.\, (4x - y + 7) = 0$$

$$\Rightarrow \quad 3x - 3y + 10 = 0$$

25 Solving $2x - y + 5 = 0$ and $5x + 3y - 4 = 0$, we get $x = -1$ and $y = 3$ *i.e.,* the point of intersection of the given lines is (– 1, 3).

$\therefore$ The equation of any line perpendicular to the line

$$x - 3y + 21 = 0 \text{ is } 3x + y + k = 0 \qquad \ldots(i)$$

If this line (i) passes through the point (– 1, 3) then

$$3 \times -1 + 3 + k = 0$$

$$\Rightarrow \quad k = 0$$

$\therefore$ From (i), the required equation of the line is $3x + y = 0$.

26 The equation of any line passing through the intersection of the lines $3x + 4y - 7 = 0$ and $x - y + 2 = 0$ is

$$(3x + 4y - 7) + k(x - y + 2) = 0 \quad \ldots(i)$$

Slope of the line $= -\dfrac{3 + k}{4 - k} = 3$

$$\Rightarrow \quad k = \frac{15}{2}$$

Hence, from (i) the required equation of the line is

$$(3x + 4y - 7) + \frac{15}{2}(x - y + 2) = 0$$

$$\Rightarrow \quad 21x - 7y + 16 = 0$$

27 The equation of any line passing through the point of intersection of the lines $3x - 4y + 1 = 0$ and $5x + y - 1 = 0$ is

$$(3x - 4y + 1) + k(5x + y - 1) = 0 \quad \ldots(i)$$

for intercept of this line with the x-axis, $y = 0$

$$\therefore \quad 3x + 1 + k(5x - 1) = 0$$

$$\Rightarrow \quad x = \frac{k - 1}{5k + 3}$$

For intercept of the line (i) on the y-axis, $x = 0$

$$\therefore \quad -4y + 1 + k(y - 1) = 0$$

$$\Rightarrow \quad y = \frac{k - 1}{k - 4}$$

Since the intercepts on the axes are equal.

$$\therefore \quad \frac{k - 1}{5k + 3} = \frac{k - 1}{k - 4} \quad \Rightarrow \quad k = 1, \text{ or } x = -\frac{7}{4}$$

But $k \neq 1$, because if $k = 1$, the line (i) becomes $8x - 3y = 0$ which passes through the origin and therefore cannot make non-zero intercepts on the axis.

$$\therefore \quad k = -\frac{7}{4} \text{ and from (i), we get}$$

$$3x - 4y + 1 - \frac{7}{4}(5x + y - 1) = 0$$

$\Rightarrow 23x + 23y = 11$, which is the required equation of the line.

28 We have $\dfrac{x}{a} - \dfrac{y}{b} = 1 \quad \ldots(i)$

Since (i) passes through the point (8, 6)

$$\therefore \quad \frac{8}{a} - \frac{6}{b} = 1 \quad \ldots(ii)$$

The line (i) meets the x-axis at the point given by $y = 0$ and from (i) $x = a$ *i.e,* the line (i) meets the x-axis at the point $A(a, 0)$.

Similarly, the line meets the y-axis ($x = 0$) at the point $B(0, -b)$.

By the given condition, area of $\Delta = 12$

$$\Rightarrow \quad \frac{1}{2}ab = 12$$

$$\Rightarrow \quad ab = 24 \quad \Rightarrow \quad b = \frac{24}{a}$$

Substituting $b = \dfrac{24}{a}$ in (ii), we get

$$\frac{8}{a} = \frac{6}{\frac{24}{a}} = 1 \quad \Rightarrow \quad a = 4 \text{ or } -8 \text{ and } b = 6 \text{ or } -3$$

Hence, from (i) the equation of the straight line are

$$\frac{x}{4} - \frac{y}{6} = 1 \quad \text{and} \quad \frac{x}{-8} - \frac{-y}{-3} = 1$$

$$\Rightarrow \quad 3x - 2y = 12 \quad \text{and} \quad 3x - 8y + 24 = 0$$

29 The equation of the lines may be written as $3x + 4y + 2 = 0$ and $-5x + 12y + 6 = 0$ in which the constant terms 2 and 6 are both positive.

The equation of the bisector of the angle in which the origin lies is $\dfrac{3x + 4y + 2}{\sqrt{3^3 + 4^2}} = \dfrac{-5x + 12y + 6}{\sqrt{(-5)^2 + (12)^2}}$

$$\Rightarrow \quad 16x - 12y - 1 = 0$$

The equation of the other bisector is

$$\frac{3x + 4y + 2}{\sqrt{3^2 + 4^2}} = \frac{-(-5x + 12y + 6)}{\sqrt{(-5)^2 + (12)^2}}$$

$$\Rightarrow \quad x + 8y + 4 = 0$$

30 Let the equations of the sides BC, CA and AB of the triangle ABC be represented by

$$2y - x = 5 \quad \ldots(i)$$

$$y + 2x = 7 \quad \ldots(ii)$$

$$y - x = 1 \quad \ldots(iii)$$

Solving the above 3 eqs. (i), (ii) and (iii), we get

$A(2, 3)$, $B(3, 4)$ and $C\left(\dfrac{9}{5}, \dfrac{17}{5}\right)$

$\therefore$ The area of ΔABC

$$= \frac{1}{2}\left\{2 \times 4 - 3 \times 3 + 3 \times \frac{17}{5} - 4 \times \frac{9}{5} + \frac{9}{5} \times 3 - \frac{17}{5} \times 2\right\}$$

$$= \frac{1}{2}\left(8 - 9 + \frac{51}{5} - \frac{36}{5} + \frac{27}{5} - \frac{34}{5}\right) = \frac{3}{10} \text{ units.}$$

31 Let $A(1, 2)$, $B(2, 3)$ and $C(4, 3)$ be the vertices of ΔABC.

$m_1 =$ Slope of $BC = \dfrac{3 - 3}{4 - 2} = 0$ *i.e., BC* is parallel to the x-axis.

$\therefore$ The perpendicular from $A(1, 2)$ to BC is parallel to the y-axis and its equation is $x = h$, which passes through $A(1, 2)$

$\therefore h = 1$ *i..e,* the equation of the perpendicular from $A(1, 2)$ on BC is $x = 1 \quad \ldots(i)$

$$m_2 = \text{Slope of } AC = \frac{3 - 2}{4 - 1} = \frac{1}{3}$$

If m_2' be the slope of a line perpendicular to AC then $m_2 m_2' = -1$ or $\frac{1}{3} \cdot m_2' = -1$ or $m_2' = -3$

$\therefore$ The equation of the perpendicular from $B(2, 3)$ on AC whose slope is -3 is

$$y - 3 = -3(x - 2)$$

$$\Rightarrow \quad 3x + y = 9 \qquad \ldots(ii)$$

The orthocentre is the point of intersection of two lines (i) and (ii)

$\therefore$ From eqs. (i) and (iii), we get

$$3 \times 1 + y = 9$$

$$\Rightarrow \quad y = 6$$

$\therefore$ The required coordinates of the orthocentre are (1, 6)

32 Let $A(x_1, y_1)$ be the third vertex. Let AD, BE, CF be the perpendiculars from the vertices on the opposite side BC, CA, AB respectively. Then the orthocentre $O(0, 0)$ is the point of intersection of AD, BE and CF.

Since AD *i.e.* OA is perpendicular to BC.

$\therefore$ Slope of $BA \times$ slope of $BC = -1$

or $$\frac{y_1 - 0}{x_1 - 0} \times \frac{3 - (-1)}{-2 - 5} = -1$$

$$\Rightarrow \quad y_1 = \frac{7x_1}{4} \qquad \ldots(i)$$

Again, since OB is perpendicular to CA

$$\therefore \quad \frac{-1 - 0}{5 - 0} \times \frac{y_1 - 3}{x_1 + 2} = -1$$

$$\Rightarrow \quad 5x_1 + 10 = y_1 - 3$$

$$\Rightarrow \quad x_1 = -4 \qquad \left(\because y_1 = \frac{7x_1}{4}\right)$$

From eq. (i), $y_1 = \frac{7x_1}{4} = \frac{7 \times (-4)}{4} = -7$

Hence, the required coordinates of the third vertex A are $(x_1, y_1) = (-4, -7)$

33 Let (x_1, y_1) be the third vertex then

$$y_1 = x_1 + 3 \qquad \ldots(i)$$

The area of the triangle formed by the points (2, 1), (3, -2) and (x_1, y_1)

$$= \frac{1}{2}\{-4 - 3 + 3y_1 + 2x_1 + x_1 - 2y_1\}$$

$$= \frac{1}{2}(3x_1 + y_1 - 7)$$

By the given condition,

$$\pm \frac{1}{2}(3x_1 + y_1 - 7) = 5$$

$$\Rightarrow \quad 3x_1 + y_1 - 7 = \pm 10$$

$$\Rightarrow \quad 3x_1 + y_1 = 17 \qquad \ldots(ii)$$

and $$3x_1 + y_1 = -3 \qquad \ldots(iii)$$

Solving eqs. (i) and (ii) we get

$$x_1 = \frac{7}{2}, y_1 = \frac{13}{2}$$

Solving eqs. (i) and (iii) we get

$$x_1 = -\frac{3}{2} \text{ and } y_1 = \frac{3}{2}$$

Hence, the coordinates of the third vertex is either $\left(\frac{7}{2}, \frac{13}{2}\right)$ or $\left(-\frac{3}{2}, \frac{3}{2}\right)$

34 Equation of any line L perpendicular to

$$5x - y = 1 \text{ is } x + 5y = k \qquad \ldots(i)$$

Where k is an arbitrary constant.

If this line cuts x-axis at A and y-axis at B, then for A, $y = 0$ and from (i) $x = k$ *i.e.,* A is the point $(k, 0)$ for B, $x = 0$ and from (i) $y = \frac{k}{5}$ *i.e.,* B is the point $\left(0, \frac{k}{5}\right)$

$\therefore$ Area of the given $\Delta OAB = \frac{1}{2}(x_1 y_2 - x_2, y_1)$

$$= \frac{1}{2}\left(\frac{k^2}{5} - 0\right) = \frac{k^2}{10}$$

But the given condition $\frac{k^2}{10} = 5$

or $$k^2 = 50$$

$$\therefore \quad k = \pm 5\sqrt{2}$$

Hence, from (i), the required equation of the line is

$$x + 5y = 5\sqrt{2}$$

or $$x + 5y = -5\sqrt{2}$$

35 Let $ABCD$ be the square and let (1, 2) and (3, 8) be the coordinates of opposite vertices A and C respectively.

The equation of the diagonal AC is

$$y - 2 = \frac{8 - 2}{3 - 1}(x - 1)$$

$$\Rightarrow \quad 3x - y = 1$$

☑ Level 01 *Basic Level Exercise*

1. Total integral points $= 1 + 2 + 3 + \ldots + 19 = \dfrac{19 \times 20}{2} = 190.$

Hence choice (b) is the correct one.

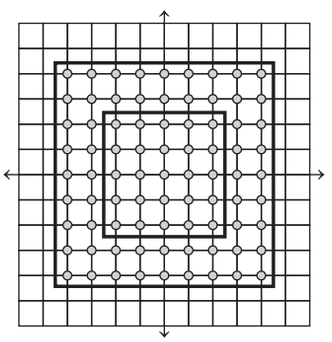
2. Area of the larger square is 91, so each side of this square will be little larger than 9 but less than 10.

From the following figure you can understand that each side of this square will have 9 integral points. So the total integral points this square will contain $= 9 \times 9 = 81$.

And, area of the smaller square is 27, so each side of this square will be little larger than 5 but less than 6. From the following figure you can understand that each side of this square will have 5 integral points. So the total number of integral points contained by this square $= 5 \times 5 = 25$

So the number of integer coordinates outside the smaller square region and inside the larger square region is

$$81 - 25 = 56$$



Hence choice (c) is the correct one.

3. Slope of $x + 3y = 4$ is $-\dfrac{1}{3}$. And slope of $6x - 2y = 7$ is 3.

Therefore, these two lines are perpendicular which shows that diagonals are perpendicular.

Hence *PQRS* must be a rhombus.

4. Since all three lines pass through a common point, therefore they will satisfy each other as follows.

$$3 = m(m + c) + 4$$

$$\Rightarrow \quad m^2 + cm + 1 = 0$$

Since m is a real number, so the discriminant must be non-negative. That means, $c^2 - 4 \geq 0$

$$\Rightarrow c^2 \geq 4 \quad \Rightarrow c \geq 2 \text{ or } -c \geq 2$$

$$\Rightarrow \quad |c| \geq 2$$

Therefore, the least possible value of $|c|$ is 2.

Hence choice (c) is the correct one.

5. The distance between the given points

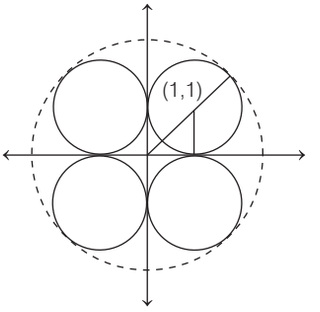
$$= \sqrt{(1-1)^2 + (1-5)^2} = 4$$

Since the given points lie on the circumference of the circle, so the diameter of the circle must be greater than or equal to 4. That means the radius of this circle must be greater than or equal to 2. That is $r \geq 2$.

Therefore the area of the circle, $\pi r^2 \geq 4\pi$

Hence choice (a) is the correct one.

6. First we draw the four circles each with radius 1 unit and all of them would be symmetric as shown in the following diagram. So it is obvious that the centre of the larger circle would be origin (0, 0).



And the radius of the larger circle = distance between the origin and the centre of the smaller circle + radius of the smaller circle $= \sqrt{2} + 1$

Therefore the equation of the larger circle

$$= x^2 + y^2 = (\sqrt{2} + 1)^2$$

7. First of all draw a rectangle encapsulating the triangle.

Now, area of the desired triangle = Area of rectangle – Area of all the three triangles I, II and III.

Length of the rectangle $= 3 - (-7) = 10$

Breadth of the rectangle $= 4 - (-5) = 9$

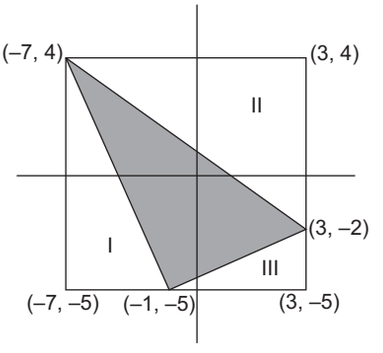
Therefore, area of the rectangle

$$= 10 \times 9 = 90$$

$$\text{Area of triangle I} = \frac{1}{2}(9 \times 6) = 27$$

$$\text{Area of triangle II} = \frac{1}{2}(10 \times 6) = 30$$

$$\text{Area of triangle III} = \frac{1}{2}(4 \times 3) = 6$$



Therefore area of the desired triangle

$$= 90 - (27 + 30 + 6) = 27.$$

Hence choice (a) is the correct one.
